1 FLTK Programming Manual	1
1.1 Preface	2
1.1.1 Organization	2
1.1.2 Conventions	3
1.1.3 Abbreviations	4
1.1.4 Copyrights and Trademarks	4
1.2 Introduction to FLTK	4
1.2.1 History of FLTK	5
1.2.2 Features	5
1.2.3 Licensing	6
1.2.4 What Does "FLTK" Mean?	6
1.2.5 FLUID	7
1.2.6 Building and Installing FLTK with CMake	7
1.2.7 Building and Installing FLTK Under UNIX and macOS with make	7
1.2.8 Building FLTK Under Microsoft Windows	10
1.2.8.1 Free and Commercial Microsoft Visual Studio Versions	10
1.2.8.2 Using the Visual C++ DLL Library	10
1.2.8.3 GNU toolsets (Cygwin or MinGW) hosted on Windows	11
1.2.9 Internet Resources	11
1.2.10 Reporting Bugs	12
1.3 FLTK Basics	12
1.3.1 Writing Your First FLTK Program	12
1.3.1.1 Creating the Widgets	13
1.3.1.2 Creating Widget Hierarchies	13
1.3.1.3 Get/Set Methods	14
1.3.1.4 Redrawing After Changing Attributes	14
1.3.1.5 Labels	14
1.3.1.6 Showing the Window	14
1.3.1.7 The Main Event Loop	14
1.3.2 Naming Conventions	15
1.3.3 Header Files	15
1.3.4 Compiling Programs that Use FLTK	15
1.3.4.1 Compiling Programs with Standard Compilers	15
1.3.4.2 Compiling Programs with the 'fltk-config' Script	16
1.3.4.3 Compiling Multiple Source Files with 'fltk-config'	17
1.3.4.4 Compiling Programs with Makefiles	18
1.3.4.5 Compiling Programs with Microsoft Visual C++	18
1.4 Common Widgets and Attributes	19
1.4.1 Buttons	19
1.4.2 Text	20
1.4.3 Valuator	20
1.4.4 Groups	21

1.4.5 Setting the Size and Position of Widgets	22
1.4.6 Colors	22
1.4.7 Box Types	23
1.4.7.1 Making Your Own Boxtypes	23
1.4.8 Labels and Label Types	25
1.4.9 Callbacks	29
1.4.10 When and Reason	30
1.4.11 Shortcuts	30
1.5 Coordinates and Layout Widgets	30
1.5.1 The Widget Coordinate System	30
1.5.2 Layout and Container Widgets	31
1.5.2.1 The FI_Flex Layout Widget	31
1.5.2.2 The FI_Grid Layout Widget	32
1.5.2.3 The FI_Pack Layout Widget	33
1.5.2.4 The FI_Scroll Container Widget	33
1.5.2.5 The FI_Tabs Container Widget	34
1.5.2.6 The FI_Tile Layout Widget	34
1.5.2.7 The FI_Wizard Container Widget	34
1.6 How Does Resizing Work?	35
1.6.1 Resizing can be disabled	35
1.6.2 Resizing can be simple	35
1.6.3 Resizing can be complex	36
1.6.4 Practical examples	37
1.7 Designing a Simple Text Editor	40
1.7.1 Determining the Goals of the Text Editor	40
1.7.2 Chapter 1: A Minimal App	41
1.7.3 Chapter 2: Adding a Menu Bar	41
1.7.4 Chapter 3: Adding a Text Editor widget	43
1.7.5 Chapter 4: Reading and Writing Files	44
1.7.6 Chapter 5: Cut, Copy, and Paste	46
1.7.7 Chapter 6: Find and Find Next	47
1.7.8 Chapter 7: Replace and Replace Next	47
1.7.9 Chapter 8: Editor Features	49
1.7.10 Chapter 9: Split Editor	50
1.7.11 Chapter 10: Syntax Highlighting	51
1.8 Drawing Things in FLTK	54
1.8.1 When Can You Draw Things in FLTK?	54
1.8.2 What Units Do FLTK Functions Use?	55
1.8.3 Drawing Functions	56
1.8.3.1 Boxes	57
1.8.3.2 Clipping	57
1.8.3.3 Colors	58

1.8.3.4 Color Contrast	61
1.8.3.5 Line Dashes and Thickness	62
1.8.3.6 Drawing Fast Shapes	63
1.8.3.7 Drawing Complex Shapes	65
1.8.3.8 Drawing Text	68
1.8.3.9 Fonts	70
1.8.3.10 Character Encoding	71
1.8.3.11 Drawing Overlays	71
1.8.4 Drawing Images	71
1.8.4.1 Direct Image Drawing	72
1.8.4.2 Direct Image Reading	73
1.8.4.3 Image Classes	74
1.8.5 Offscreen Drawing	75
1.9 Handling Events	76
1.9.1 The FLTK Event Model	76
1.9.2 Mouse Events	77
1.9.2.1 FL_PUSH	77
1.9.2.2 FL_DRAG	77
1.9.2.3 FL_RELEASE	78
1.9.2.4 FL_MOVE	78
1.9.2.5 FL_MOUSEWHEEL	78
1.9.3 Focus Events	78
1.9.3.1 FL_ENTER	78
1.9.3.2 FL_LEAVE	78
1.9.3.3 FL_FOCUS	78
1.9.3.4 FL_UNFOCUS	78
1.9.4 Keyboard Events	79
1.9.4.1 FL_KEYBOARD, FL_KEYDOWN, FL_KEYUP	79
1.9.4.2 FL_SHORTCUT	79
1.9.5 Widget Events	80
1.9.5.1 FL_DEACTIVATE	80
1.9.5.2 FL_ACTIVATE	80
1.9.5.3 FL_HIDE	80
1.9.5.4 FL_SHOW	80
1.9.6 Clipboard Events	80
1.9.6.1 FL_PASTE	80
1.9.6.2 FL_SELECTIONCLEAR	80
1.9.7 Drag and Drop Events	81
1.9.7.1 Dropped filenames	81
1.9.7.2 FL_DND_ENTER	81
1.9.7.3 FL_DND_DRAG	81
1.9.7.4 FL_DND_LEAVE	81

1.9.7.5 FL_DND_RELEASE	81
1.9.8 Other events	82
1.9.8.1 FL_SCREEN_CONFIGURATION_CHANGED	82
1.9.8.2 FL_FULLSCREEN	82
1.9.9 Fl::event_*() methods	82
1.9.10 Event Propagation	83
1.9.11 FLTK Compose-Character Sequences	84
1.10 Adding and Extending Widgets	84
1.10.1 Subclassing	84
1.10.2 Making a Subclass of Fl_Widget	84
1.10.3 The Constructor	85
1.10.4 Protected Methods of Fl_Widget	85
1.10.5 Handling Events	88
1.10.6 Drawing the Widget	89
1.10.7 Resizing the Widget	89
1.10.8 Making a Composite Widget	89
1.10.9 Cut and Paste Support	91
1.10.10 Drag And Drop Support	91
1.10.11 Making a subclass of Fl_Window	91
1.11 Using OpenGL	92
1.11.1 Using OpenGL in FLTK	92
1.11.2 Making a Subclass of Fl_Gl_Window	92
1.11.2.1 Defining the Subclass	92
1.11.2.2 The draw() Method	93
1.11.2.3 The handle() Method	93
1.11.3 OpenGL and support of HighDPI displays	94
1.11.4 Using OpenGL in Normal FLTK Windows	94
1.11.5 Using FLTK widgets in OpenGL Windows	95
1.11.6 OpenGL Drawing Functions	95
1.11.7 Speeding up OpenGL	96
1.11.8 Using OpenGL Optimizer with FLTK	97
1.11.9 Using OpenGL 3.0 (or higher versions)	98
1.12 FLTK Runtime Options	100
1.12.1 Runtime Options	100
1.12.2 Obtaining Current Settings	100
1.12.3 Administrative Tool	100
1.12.4 List of Options	101
1.13 Advanced FLTK	101
1.13.1 Multithreading	101
1.13.2 FLTK multithread locking - Fl::lock() and Fl::unlock()	102
1.13.3 Simple multithreaded examples using Fl::lock	103
1.13.4 FLTK multithreaded "lockless programming"	105

1.13.5 FLTK multithreaded Constraints	106
1.14 Unicode and UTF-8 Support	106
1.14.1 About Unicode, ISO 10646 and UTF-8	107
1.14.2 Unicode in FLTK	109
1.14.3 Illegal Unicode and UTF-8 Sequences	109
1.14.4 FLTK Unicode and UTF-8 Functions	110
1.14.5 FLTK Unicode Versions of System Calls	113
1.15 Constants and Enumerations	114
1.15.1 Version Numbers	114
1.15.2 Events	115
1.15.3 Callback "When" Conditions	115
1.15.4 Fl::event_button() Values	116
1.15.5 Fl::event_key() Values	116
1.15.6 Fl::event_state() Values	117
1.15.7 Alignment Values	118
1.15.8 Fonts	118
1.15.9 Colors	119
1.15.9.1 Color Constants	119
1.15.10 Cursors	120
1.15.11 FD "When" Conditions	121
1.15.12 Damage Masks	121
1.16 GLUT Compatibility	121
1.16.1 Using the GLUT Compatibility Header File	121
1.16.2 Known Problems	122
1.16.3 Mixing GLUT and FLTK Code	123
1.16.4 class Fl_Glut_Window	123
1.16.4.1 Class Hierarchy	123
1.16.4.2 Include Files	123
1.16.4.3 Description	123
1.16.4.4 Members	123
1.16.4.5 Methods	124
1.17 Forms Compatibility	124
1.17.1 Importing Forms Layout Files	125
1.17.2 Using the Compatibility Header File	125
1.17.3 Problems You Will Encounter	125
1.17.4 Additional Notes	127
1.18 Operating System Issues	129
1.18.1 Accessing the OS Interfaces	129
1.18.2 The Wayland/X11 hybrid library	129
1.18.3 The UNIX (X11) Interface	130
1.18.3.1 Handling Other X Events	130
1.18.3.2 Drawing using Xlib	132

1.18.3.3 Changing the Display, Screen, or X Visual	133
1.18.3.4 Using a Subclass of <code>Fl_Window</code> for Special X Stuff	134
1.18.3.5 Setting the Icon of a Window	136
1.18.3.6 X Resources	136
1.18.3.7 Display Scaling Factor	137
1.18.4 The Windows Interface	137
1.18.4.1 Using filenames with non-ASCII characters	137
1.18.4.2 Responding to <code>WM_QUIT</code>	137
1.18.4.3 Handling Other Windows API Messages	137
1.18.4.4 Drawing Things Using the Windows GDI	138
1.18.4.5 HighDPI support	138
1.18.4.6 Display Scaling Factor	138
1.18.4.7 Setting the Icon of a Window	138
1.18.4.8 How to Not Get a MSDOS Console Window	139
1.18.4.9 Known Windows Bugs and Problems	139
1.18.5 The Apple OS X Interface	139
1.18.5.1 Setting the icon of an application	141
1.18.5.2 Drawing Things Using Quartz	141
1.18.5.3 Internationalization	142
1.18.5.4 OpenGL and 'retina' displays	142
1.18.5.5 <code>Fl_Double_Window</code>	143
1.18.5.6 Mac File System Specifics	143
1.18.6 The Wayland Interface	143
1.18.6.1 HiDPI display support	144
1.18.6.2 Window icons	145
1.18.6.3 Window titlebars	145
1.19 Migrating Code from FLTK 1.3 to 1.4	145
1.19.1 Changes in Header Files	146
1.19.2 <code>Fl_Preferences</code>	146
1.19.3 <code>Fl::add_timeout</code> and friends	147
1.19.4 New <code>FL_OVERRIDE</code> Macro	147
1.19.5 <code>Fl_Image::copy()</code> 'const'	147
1.19.6 Using X11 specific code with a "hybrid" FLTK library	148
1.19.7 Modern CMake	149
1.19.8 New <code>FL_HELVETICA</code> Font on Windows	150
1.20 Software License	151
1.21 Example Source Code	156
1.21.1 Example Applications: Overview	156
1.21.1.1 <code>adjuster</code>	156
1.21.1.2 <code>animated</code>	156
1.21.1.3 <code>arc</code>	156
1.21.1.4 <code>ask</code>	157

1.21.1.5 bitmap	157
1.21.1.6 blocks	157
1.21.1.7 boxtype	157
1.21.1.8 browser	157
1.21.1.9 button	157
1.21.1.10 buttons	157
1.21.1.11 cairo_test	157
1.21.1.12 checkers	157
1.21.1.13 clipboard	157
1.21.1.14 clock	158
1.21.1.15 colbrowser	158
1.21.1.16 color_chooser	158
1.21.1.17 cube	158
1.21.1.18 CubeView	158
1.21.1.19 cursor	158
1.21.1.20 curve	158
1.21.1.21 demo	158
1.21.1.22 device	158
1.21.1.23 doublebuffer	159
1.21.1.24 editor	159
1.21.1.25 fast_slow	159
1.21.1.26 file_chooser	159
1.21.1.27 fonts	159
1.21.1.28 forms	159
1.21.1.29 fractals	159
1.21.1.30 fullscreen	159
1.21.1.31 gl_overlay	159
1.21.1.32 glpuzzle	159
1.21.1.33 hello	160
1.21.1.34 help_dialog	160
1.21.1.35 icon	160
1.21.1.36 iconize	160
1.21.1.37 image	160
1.21.1.38 inactive	160
1.21.1.39 input	160
1.21.1.40 input_choice	160
1.21.1.41 keyboard	160
1.21.1.42 label	161
1.21.1.43 line_style	161
1.21.1.44 list_visuals	161
1.21.1.45 mandelbrot	161
1.21.1.46 menubar	161

1.21.1.47 message	161
1.21.1.48 minimum	161
1.21.1.49 native-filechooser	161
1.21.1.50 navigation	161
1.21.1.51 offscreen	161
1.21.1.52 output	162
1.21.1.53 overlay	162
1.21.1.54 pack	162
1.21.1.55 pixmap	162
1.21.1.56 pixmap_browser	162
1.21.1.57 preferences	162
1.21.1.58 radio	162
1.21.1.59 resizebox	162
1.21.1.60 rotated_text	162
1.21.1.61 resize	162
1.21.1.62 scroll	162
1.21.1.63 shape	163
1.21.1.64 subwindow	163
1.21.1.65 sudoku	163
1.21.1.66 symbols	163
1.21.1.67 table	163
1.21.1.68 tabs	163
1.21.1.69 threads	163
1.21.1.70 tile	163
1.21.1.71 tiled_image	164
1.21.1.72 tree	164
1.21.1.73 twowin	164
1.21.1.74 unittests	164
1.21.1.75 utf8	164
1.21.1.76 valuator	164
1.21.1.77 windowfocus	164
1.21.1.78 FLUID	164
1.21.2 Example Applications: Images	164
1.21.2.1 cairo_test	164
1.21.2.2 icon	165
1.21.2.3 unittests	165
1.22 FAQ (Frequently Asked Questions)	166
1.22.1 Where do I start learning FLTK?	166
1.22.2 How do I make a box with text?	166
1.22.3 Can I use FLTK to make closed-source commercial applications?	167
1.22.4 Hitting the 'Escape' key closes windows - how do I prevent this?	167

2 FI_Terminal Technical Documentation	169
2.1 The Escape Codes FI_Terminal Supports	169
2.2 Useful Terminal Escape Code Documentation	170
2.3 FI_Terminal Design Document	171
3 Development of the FLTK library	177
3.1 The Wayland backend for its developer	177
3.1.1 Introduction to Wayland	177
3.1.2 Building libfltk as a Wayland client	178
3.1.3 The hybrid Wayland/X11 platform	179
3.1.4 Listeners	179
3.1.5 Opening a Wayland connection	180
3.1.6 Wayland windows and surfaces	182
3.1.7 Menu windows and other popups	183
3.1.8 FI_Wayland_Graphics_Driver and FI_Cairo_Graphics_Driver	184
3.1.9 Wayland buffers	184
3.1.10 Throttling window redraws	185
3.1.11 Buffer factories	186
3.1.12 Displays and HighDPI support	187
3.1.13 Mouse and trackpad handling	189
3.1.14 Wayland cursors	189
3.1.15 Keyboard support	190
3.1.16 Support of text input methods	191
3.1.17 Interface with libdecor	192
3.1.18 Copy/Paste/Drag-n-Drop	193
3.1.19 EGL as support for OpenGL	193
3.1.20 FLTK-defined, Wayland-specific types	194
3.1.21 Documentation resources	196
3.2 Developer info for bundled libs	196
3.2.1 Introduction	196
3.2.2 Current status	196
3.2.3 How to update the bundled libraries	197
3.2.4 zlib:	198
3.2.5 png:	198
3.2.6 jpeg:	199
3.2.7 nanosvg:	199
3.2.8 libdecor:	200
3.3 Developer Information	200
3.3.1 Non-ASCII Characters	202
3.3.2 Document Structure	202
3.3.3 Creating Links	203
3.3.4 Paragraph Layout	203

3.3.5 Navigation Elements	204

1.1 Preface

This manual describes the Fast Light Tool Kit ("FLTK") version 1.4.4, a C++ Graphical User Interface ("GUI") toolkit for UNIX, Microsoft Windows, and Apple macOS.

Version 1.4.0 introduced support for a new windowing system under Linux/Unix: Wayland. FLTK applications under Linux/Unix run unchanged as Wayland or X11 clients depending on availability at run-time.

Each of the chapters in this manual is designed as a tutorial for using FLTK, while the appendices provide a convenient reference for all FLTK widgets, functions, and operating system interfaces.

This manual may be printed, modified, and/or used under the terms of the FLTK license provided in ↵ : [Software License](#).

1.1.1 Organization

This manual is organized into the following chapters and appendices:

- [Introduction to FLTK](#)
- [FLTK Basics](#)
- [Common Widgets and Attributes](#)

- [Designing a Simple Text Editor](#)
- [Drawing Things in FLTK](#)
- [Handling Events](#)
- [Adding and Extending Widgets](#)
- [Using OpenGL](#)
- [FLTK Runtime Options](#)
- [Advanced FLTK](#)
- [Unicode and UTF-8 Support](#)
- [Constants and Enumerations](#)
- [GLUT Compatibility](#)
- [Forms Compatibility](#)
- [Operating System Issues](#)
- [Migrating Code from FLTK 1.3 to 1.4](#)
- [Developer Information](#)
- [Software License](#)
- [Example Source Code](#)

1.1.2 Conventions

This manual was generated using Doxygen (see <https://www.doxygen.org/>) to process the source code itself, special comments in the code, and additional documentation files. In general, Doxygen recognizes and denotes the following entities as shown:

- classes, such as [Fl_Widget](#),
- methods, such as [Fl_Widget::callback\(Fl_Callback* cb, void* p\)](#),
- functions, such as [fl_draw\(const char *str, int x, int y\)](#),
- internal links, such as [Conventions](#),
- external links, such as <https://www.fltk.org/>.

Other code samples and commands are shown in `regular courier type`.

1.1.3 Abbreviations

The following abbreviations are used in this manual:

X11

The X Window System version 11.

Xlib

The X Window System interface library.

Windows, `WIN32`

The Microsoft Windows Application Programmer's Interface for Windows 2000, Windows XP, Windows Vista, Windows 7 and later Windows versions. FLTK uses the preprocessor definition `_WIN32` for the 32 bit and 64 bit Windows API.

macOS (aka Mac OS X), `APPLE`

The Apple desktop operating system macOS 10.0 and later. MacOS 8 and 9 support was dropped after FLTK 1.0.10. FLTK uses the preprocessor definition `__APPLE__` for macOS.

1.1.4 Copyrights and Trademarks

FLTK is Copyright © 1998 - 2025 by Bill Spitzak and others.

Use and distribution of FLTK is governed by the GNU Library General Public License with 4 exceptions, located in [Software License](#).

UNIX is a registered trademark of the X Open Group, Inc. Microsoft and Windows are registered trademarks of Microsoft Corporation. OpenGL is a registered trademark of Silicon Graphics, Inc. Apple, Macintosh, MacOS, macOS, and Mac OS X are registered trademarks of Apple Computer, Inc.

1.2 Introduction to FLTK

The Fast Light Tool Kit ("FLTK") is a cross-platform C++ GUI toolkit for UNIX®/Linux® (X11 and Wayland), Microsoft® Windows®, and Apple® macOS®. FLTK provides modern GUI functionality without bloat and supports 3D graphics via OpenGL® and its built-in GLUT emulation. It was originally developed by Mr. Bill Spitzak and is currently maintained by a small group of developers across the world with a central repository on GitHub.

1.2.1 History of FLTK

It has always been Bill's belief that the GUI API of all modern systems is much too high level. Toolkits (even FLTK) are *not* what should be provided and documented as part of an operating system. The system only has to provide arbitrary shaped but featureless windows, a powerful set of graphics drawing calls, and a simple *unalterable* method of delivering events to the owners of the windows. NeXT (if you ignored NextStep) provided this, but they chose to hide it and tried to push their own baroque toolkit instead.

Many of the ideas in FLTK were developed on a NeXT (but *not* using NextStep) in 1987 in a C toolkit Bill called "views". Here he came up with passing events downward in the tree and having the handle routine return a value indicating whether it used the event, and the table-driven menus. In general he was trying to prove that complex UI ideas could be entirely implemented in a user space toolkit, with no knowledge or support by the system.

After going to film school for a few years, Bill worked at Sun Microsystems on the (doomed) NeWS project. Here he found an even better and cleaner windowing system, and he reimplemented "views" atop that. NeWS did have an unnecessarily complex method of delivering events which hurt it. But the designers did admit that perhaps the user could write just as good of a button as they could, and officially exposed the lower level interface.

With the death of NeWS Bill realized that he would have to live with X. The biggest problem with X is the "window manager", which means that the toolkit can no longer control the window borders or drag the window around.

At Digital Domain Bill discovered another toolkit, "Forms". Forms was similar to his work, but provided many more widgets, since it was used in many real applications, rather than as theoretical work. He decided to use Forms, except he integrated his table-driven menus into it. Several very large programs were created using this version of Forms.

The need to switch to OpenGL and GLX, portability, and a desire to use C++ subclassing required a rewrite of Forms. This produced the first version of FLTK. The conversion to C++ required so many changes it made it impossible to recompile any Forms objects. Since it was incompatible anyway, Bill decided to incorporate his older ideas as much as possible by simplifying the lower level interface and the event passing mechanism.

Bill received permission to release it for free on the Internet, with the GNU general public license. Response from Internet users indicated that the Linux market dwarfed the SGI and high-speed GL market, so he rewrote it to use X for all drawing, greatly speeding it up on these machines.

Digital Domain has since withdrawn support for FLTK. While Bill is no longer able to actively develop it, he still contributes to FLTK in his free time and is a part of the FLTK development team.

FLTK was later ported to Windows and macOS. FLTK 1.4 added a "driver based" system of virtual device drivers that enabled porting to Wayland as well. Drawing features include Windows GDI+, Cairo (Wayland and X11), and improved text layout with Pango.

There have been experiments using this driver system to build FLTK based on SDL2, Android, and other graphics systems based solely on simple pixel drawing, but this experimental code is not included in FLTK 1.4. There are thoughts to enable more platforms in later FLTK versions.

1.2.2 Features

FLTK was designed to be statically linked. This was done by splitting it into many small objects and designing it so that functions that are not used do not have pointers to them in the parts that are used, and thus do not get linked in. This allows you to make an easy-to-install program or to modify FLTK to the exact requirements of your application without worrying about bloat. FLTK works fine as a shared library, though, and is now included with several Linux distributions.

Here are some of the core features unique to FLTK:

Note: sizes given below are mostly from 32-bit systems and FLTK 1.1 or earlier, this list needs updates for current FLTK (1.4).

- `sizeof(Fl_Widget) == 64` to 92 (120 in FLTK 1.4 on 64-bit Linux).
- The "core" (the "hello" program compiled & linked with a static FLTK library using gcc on a 486 and then stripped) is 114K. (FLTK 1.4 on 64-bit Linux: 1.1 MB).
- The FLUID program (which includes every widget) is 538k. (FLTK 1.4 with more widgets on 64-bit Linux: 2.3 MB and 2.0 MB on 32-bit Windows).
- Written directly atop core libraries (Xlib, Wayland, Windows or Cocoa) for maximum speed, and carefully optimized for code size and performance.
- Precise low-level compatibility between the X11, Windows and MacOS versions - only about 10% of the code is different.
- Interactive user interface builder program FLUID. Its output is human-readable and editable C++ source code.
- Support for overlay hardware, with emulation if none is available.
- Very small & fast portable 2-D drawing library to hide Xlib, Cairo, Windows, or macOS Quartz.
- OpenGL/Mesa drawing area widget.
- Support for OpenGL overlay hardware on both X11 and Windows, with emulation if none is available.
- Text widgets with cut & paste, undo, and support for Unicode text and international input methods.
- Compatibility header file for the GLUT library.
- Compatibility header file for the XForms library.

1.2.3 Licensing

FLTK comes with complete free source code. FLTK is available under the terms of the [GNU Library General Public License](#) with exceptions that allow for static linking. Contrary to popular belief, it can be used in commercial software - even Bill Gates could use it!

1.2.4 What Does "FLTK" Mean?

FLTK was originally designed to be compatible with the Forms Library written for SGI machines. In that library all the functions and structures started with "fl_". This naming was extended to all new methods and widgets in the C++ library, and this prefix was taken as the name of the library. It is almost impossible to search for "FL" on the Internet, due to the fact that it is also the abbreviation for Florida. After much debating and searching for a new name for the toolkit, which was already in use by several people, Bill came up with "FLTK", including a bogus excuse that it stands for "The Fast Light Toolkit".

1.2.5 FLUID

FLTK comes bundled with FLUID. FLUID, short for Fast Light User Interface Designer, is a graphical editor capable of generating C++ source code and header files ready for compilation. These files ultimately create the graphical user interface for an application.

The FLUID User Handbook is available at <https://www.fltk.org/documentation.php>. It can also be compiled from the FLTK source repository using the `fluid_docs` target in the CMake build environment.

1.2.6 Building and Installing FLTK with CMake

Starting with version 1.4, the recommended FLTK building system is CMake. CMake is a "Build System Generator" that can generate build environments for usage with Ninja, Make, and many more, for instance IDE's. See file README.CMake.txt of the FLTK source tree for more information.

Note

In FLTK 1.4 you can also use `configure` and `make` as follows to build and install FLTK. However, `configure/make` support will be dropped in FLTK 1.5.0.

1.2.7 Building and Installing FLTK Under UNIX and macOS with make

In most cases you can just type "make". This will run `configure` with the default of no options and then compile everything.

FLTK uses GNU autoconf to configure itself for your UNIX platform. The main things that the `configure` script will look for are the X11 and OpenGL (or Mesa) header and library files. If these cannot be found in the standard include/library locations you'll need to define the `CFLAGS`, `CXXFLAGS`, and `LDFLAGS` environment variables. For the Bourne and Korn shells you'd use:

```
CFLAGS=-Iincludedir; export CFLAGS
CXXFLAGS=-Iincludedir; export CXXFLAGS
LDFLAGS=-Llibdir; export LDFLAGS
```

For C shell and `tcsh`, use:

```
setenv CFLAGS "-Iincludedir"
setenv CXXFLAGS "-Iincludedir"
setenv LDFLAGS "-Llibdir"
```

By default `configure` will look for a C++ compiler named `CC`, `c++`, `g++`, or `gcc` in that order. To use another compiler you need to set the `CXX` environment variable:

```
CXX=xlc; export CXX
setenv CXX "xlc"
```

The `CC` environment variable can also be used to override the default C compiler (`cc` or `gcc`), which is used for a few FLTK source files.

You can run `configure` yourself to get the exact setup you need. Type `./configure <options>`, where some of the options are:

`--enable-cygwin`

Enable the Cygwin libraries under Windows

-enable-debug

Enable debugging code & symbols

-disable-gl

Disable OpenGL support

-disable-svg

Disable support of reading and writing of Scalable Vector Graphics (.svg) files.

-disable-print

Disable print support for an X11/Wayland platform

-enable-shared

Enable generation of shared libraries

-enable-threads

Enable multithreading support

-enable-wayland

This is the default for Linux and FreeBSD systems equipped with the Wayland software. Enable the use of Wayland for all window operations, of Cairo for all graphics, and of Pango for text drawing. Resulting FLTK apps run as Wayland clients if a Wayland compositor is available at run-time, and as X11 clients otherwise but keep using Cairo and Pango for all graphics.

-disable-xft

Disables the Xft library, resulting in non anti-aliased fonts (X11 platform). This is not recommended.

-enable-usecairo

All drawing operations use the Cairo library (rather than Xlib) producing antialiased graphics (X11 platform, implies **-enable-pango**).

-enable-pango

Enable the Pango library for drawing any text in any script with any font under X11/Wayland.

-enable-x11

When targeting Cygwin, build with X11 GUI instead of windows GDI. Also applicable to macOS platforms supplemented with XQuartz.

-enable-cairo

Enable support of class [Fl_Cairo_Window](#) (all platforms, requires Cairo as an external library).

-enable-cairoext

Enable the FLTK instrumentation for cairo extended use (implies `-enable-cairo`).

-disable-gdiplus

Don't use GDI+ when drawing curves and oblique lines (Windows platform).

-enable-cp936

Under X11, enable use of the GB2312 locale.

-bindir=/path

Set the location for executables. [default = \$prefix/bin]

-datadir=/path

Set the location for data files. [default = \$prefix/share]

-libdir=/path

Set the location for libraries. [default = \$prefix/lib]

-includedir=/path

Set the location for include files. [default = \$prefix/include]

-mandir=/path

Set the location for man pages. [default = \$prefix/man]

-prefix=/dir

Set the directory prefix for files. [default = /usr/local]

When the configure script is done you can just run the "make" command. This will build the library, FLUID tool, fltk-options (setup tool), and all of the test programs.

To install the library, become root and type "make install". This will copy the "fluid" executable to "bindir", the header files to "includedir", and the library files to "libdir".

1.2.8 Building FLTK Under Microsoft Windows

NOTE: This documentation section is currently under review. More up-to-date information for this release may be available in the files "README.Windows.txt" and "README.CMake.txt" and you should read these files to determine if there are changes that may be applicable to your build environment.

FLTK 1.4 is officially supported on Windows (2000,) 2003, XP, and later. Older Windows versions prior to Windows 2000 are not officially supported but may still work. The main reason is that the OS version needs to support UTF-8. FLTK 1.4 is known to work on recent versions of Windows such as Windows 7, Windows 8/8.1, Windows 10 and Windows 11, and has been reported to work in both 32-bit and 64-bit Windows versions.

Note

Libraries built by any one of the following build environments can not be mixed with object files from any of the other environments because they use incompatible C++ conventions internally.

FLTK currently supports the following development environments on the Windows platform:

1.2.8.1 Free and Commercial Microsoft Visual Studio Versions

Visual Studio 2015 Community or later versions use workspace and project files generated by CMake. Older versions and the commercial versions can be used as well, if they can open the project files generated by CMake. FLTK support of Visual C++ is limited to the support of CMake for these Visual Studio versions. Be sure to get your service packs!

Since FLTK 1.4 the project files MUST be generated with CMake. Please read "README.CMake.txt" for more information about this.

1.2.8.2 Using the Visual C++ DLL Library

The Visual Studio project files can be used to build a DLL version of the FLTK library if CMake option 'FLTK_↔ BUILD_SHARED_LIBS=ON' is set. Because of name mangling differences between PC compilers (even between different versions of Visual Studio) you can only use the DLL that is generated with the same compiler version that you built it with.

When compiling an application or DLL that uses the FLTK DLL with Visual Studio, you need to define the `FL_DLL` preprocessor symbol to get the correct linkage commands embedded within the FLTK header files.

New since FLTK 1.4.0: If you build your application project with CMake and use the CMake target 'fltk::fltk-shared' to link your application, then 'FL_DLL' is defined automatically for you (by CMake Compile Definition). If you use your own (hand-made) Visual Studio project you still need to define `FL_DLL` to compile all source files that use FLTK headers.

1.2.8.3 GNU toolsets (Cygwin or MinGW) hosted on Windows

If using Cygwin with the Cygwin shell, or MinGW with the Msys shell, these build environments behave very much like a Unix or macOS build and the notes above in the section on *Building and Installing FLTK Under UNIX and Apple macOS* apply, in particular the descriptions of using the "configure" script and its related options.

In general for a build using these tools, e.g. for the Msys shell with MinGW, it should suffice to "cd" into the directory where you have extracted the FLTK tarball and type:

```
./configure
make
```

This will build the FLTK libraries and they can then be utilised directly from the build location. NOTE: this may be simpler than "installing" them in many cases as different tool chains on Windows have different ideas about where the files should be "installed" to.

For example, if you "install" the libraries using Msys/MinGW with the following command

```
make install
```

then Msys will "install" the libraries to where it thinks the path "/usr/local/" leads to. If you only ever build code from within the Msys environment this works well, but the actual "Windows path" these files are located in will be something like "C:\msys\1.0\local\lib", depending on where your Msys installation is rooted, which may not be useful to other tools.

If you want to install your built FLTK libraries in a non-standard location you may do:

```
sh configure --prefix=C:/FLTK
make
```

Where the value passed to "prefix" is the path at which you would like FLTK to be installed.

A subsequent invocation of "make install" will then place the FLTK libraries and header files into that path.

The other options to "configure" may also be used to tailor the build to suit your environment.

1.2.9 Internet Resources

FLTK is available on the 'net in a bunch of locations:

FLTK Source Repository on GitHub

1.2.10 Reporting Bugs

To report a bug in FLTK, or for feature requests, please use <https://www.fltk.org/bugs.php> for information about where and how to post bugs, feature requests, or ask for help on using FLTK.

For general support and questions, please use the fltk.general newsgroup (see above, "NNTP Newsgroups") or the web interface to the newsgroups at <https://www.fltk.org/newsgroups.php>.

1.3 FLTK Basics

This chapter teaches you the basics of writing and compiling programs that use FLTK.

1.3.1 Writing Your First FLTK Program

Up to FLTK 1.3.x all FLTK programs were required to include the file `<FL/Fl.H>` as the first FLTK header file.

Since FLTK 1.4.0 this requirement was relaxed and `<FL/Fl.H>` needs only be included if the class `Fl` is used or if some other stuff like enumerations is used in the source code. Example code in this documentation may still include it "everywhere" even if it is no longer strictly required.

In addition the program must include a header file for each FLTK class it uses. Listing 1 shows a simple "Hello, World!" program that uses FLTK to display the window.

Listing 1 - "hello.cxx"

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Box.H>

int main(int argc, char **argv) {
    Fl_Window *window = new Fl_Window(340, 180);
    Fl_Box *box = new Fl_Box(20, 40, 300, 100, "Hello, World!");
    box->box(FL_UP_BOX);
    box->labelfont(FL_BOLD + FL_ITALIC);
    box->labelsize(36);
    box->labeltype(FL_SHADOW_LABEL);
    window->end();
    window->show(argc, argv);
    return Fl::run();
}
```

After including the required header files, the program then creates a window. All following widgets will automatically be children of this window.

```
Fl_Window *window = new Fl_Window(340, 180);
```

Then we create a box with the "Hello, World!" string in it. FLTK automatically adds the new box to `window`, the current grouping widget.

```
Fl_Box *box = new Fl_Box(20, 40, 300, 100, "Hello, World!");
```

Next, we set the type of box and the font, size, and style of the label:

```
box->box(FL_UP_BOX);
box->labelfont(FL_BOLD + FL_ITALIC);
box->labelsize(36);
box->labeltype(FL_SHADOW_LABEL);
```

We tell FLTK that we will not add any more widgets to `window`.

```
window->end();
```

Finally, we show the window and enter the FLTK event loop:

```
window->show(argc, argv);  
return Fl::run();
```

The resulting program will display the "Hello, World!" window:

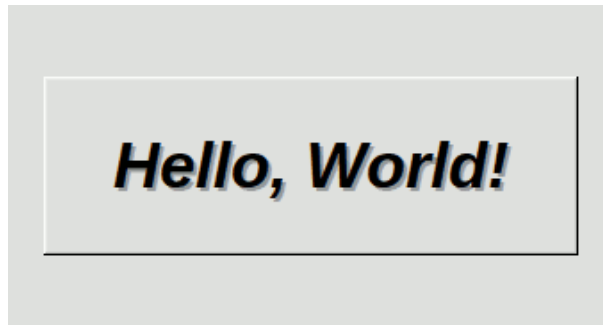

Figure 1.1 The Hello, World! Window

You can quit the program by closing the window or pressing the `ESCAPE` key.

1.3.1.1 Creating the Widgets

The widgets are created using the C++ `new` operator. For most widgets the arguments to the constructor are:

```
Fl_Widget(x, y, width, height, label)
```

The `x` and `y` parameters determine where the widget or window is placed on the screen. In FLTK the top left corner of the window or screen is the origin (i.e. `x = 0`, `y = 0`).

The `width` and `height` parameters determine the size of the widget or window. The maximum widget size is typically governed by the underlying window system or hardware.

[What Units Do FLTK Functions Use?](#) describes the unit FLTK employs for `x`, `y`, `width`, and `height`, and more generally, for all graphical quantities.

`label` is a pointer to a character string to label the widget with or `NULL`. If not specified the label defaults to `NULL`. The label string must be in static storage such as a string constant because FLTK does not make a copy of it - it just uses the pointer.

1.3.1.2 Creating Widget Hierarchies

Widgets are commonly ordered into functional groups, which in turn may be grouped again, creating a hierarchy of widgets. FLTK makes it easy to fill groups by automatically adding all widgets that are created between a `myGroup->begin()` and `myGroup->end()`. In this example, `myGroup` would be the *current* group.

Newly created groups and their derived widgets implicitly call `begin()` in the constructor, effectively adding all subsequently created widgets to itself until `end()` is called.

Calling `end()` on one group widget transfers the "current group" property to the **parent** of that widget. Calling `end()` on a top level window (which has no parent) sets the current group to `NULL`.

Setting the current group to `NULL` will stop automatic hierarchies. New widgets can now be added manually using `Fl_Group::add(...)` and `Fl_Group::insert(...)`.

1.3.1.3 Get/Set Methods

`box->box(FL_UP_BOX)` sets the type of box the [Fl_Box](#) draws, changing it from the default of `FL_NO_BOX`, which means that no box is drawn. In our "Hello, World!" example we use `FL_UP_BOX`, which means that a raised button border will be drawn around the widget. More details are available in the [Box Types](#) section.

You could examine the boxtype by doing `box->box()`. FLTK uses method name overloading to make short names for get/set methods. A "set" method is always of the form "void name(type)", and a "get" method is always of the form "type name() const".

1.3.1.4 Redrawing After Changing Attributes

Almost all of the get/set pairs are very fast, short inline functions and thus very efficient. However, *the "set" methods do not call `redraw()`* - you have to call it yourself. This greatly reduces code size and execution time. The only common exceptions are `value()` which calls `redraw()` and `label()` which calls `redraw_label()` if necessary.

1.3.1.5 Labels

All widgets support labels. In the case of window widgets, the label is used for the label in the title bar. Our example program calls the `labelfont()`, `labelsize()`, and `labeltype()` methods.

The `labelfont()` method sets the typeface and style that is used for the label, which for this example we are using `FL_BOLD` and `FL_ITALIC`.

The `labelsize()` method sets the height of the font in FLTK units.

The `labeltype()` method sets the type of label. FLTK supports normal, embossed, and shadowed labels internally, and more types can be added as desired.

A complete list of all label options can be found in the section on [Labels and Label Types](#).

1.3.1.6 Showing the Window

The `show()` method shows the widget or window. For windows you can also provide the command-line arguments to allow users to customize the appearance, size, and position of your windows.

1.3.1.7 The Main Event Loop

All FLTK applications (and most GUI applications in general) are based on a simple event processing model. User actions such as mouse movement, button clicks, and keyboard activity generate events that are sent to an application. The application may then ignore the events or respond to the user, typically by redrawing a button in the "down" position, adding the text to an input field, and so forth.

FLTK also supports idle, timer, and file pseudo-events that cause a function to be called when they occur. Idle functions are called when no user input is present and no timers or files need to be handled - in short, when the application is not doing anything. Idle callbacks are often used to update a 3D display or do other background processing.

Timer functions are called after a specific amount of time has expired. They can be used to pop up a progress dialog after a certain amount of time or do other things that need to happen at more-or-less regular intervals. FLTK timers are not 100% accurate, so they should not be used to measure time intervals, for example.

File functions are called when data is ready to read or write, or when an error condition occurs on a file. They are most often used to monitor network connections (sockets) for data-driven displays.

FLTK applications must periodically check ([Fl::check\(\)](#)) or wait ([Fl::wait\(\)](#)) for events or use the [Fl::run\(\)](#) method to enter a standard event processing loop. Calling [Fl::run\(\)](#) is equivalent to the following code:

```
while (Fl::wait());
```

[Fl::run\(\)](#) does not return until all of the windows under FLTK control are closed by the user or your program.

1.3.2 Naming Conventions

All public symbols in FLTK start with the characters 'F' and 'L':

- Functions are either `Fl::foo()` or `fl_foo()`.
- Class and type names are capitalized: `Fl_Foo`.
- [Constants and Enumerations](#) are uppercase: `FL_FOO`.
- All header files start with `<FL/...>`.

1.3.3 Header Files

The proper way to include FLTK header files is:

```
#include <FL/Fl_xyz.H>
```

Note

Case *is significant* on many operating systems, and the C standard uses the forward slash (/) to separate directories. *Do not use any of the following include lines:*

```
#include <FL\Fl_xyz.H>
#include <fl/fl_xyz.h>
#include <Fl/fl_xyz.h>
```

1.3.4 Compiling Programs that Use FLTK

Since FLTK 1.4 CMake is the recommended build system. The details below show the "old" methods and reference information in case you like to write your build configuration manually (e.g. Makefiles, Visual Studio, other IDE's ...).

CMake can simplify this task substantially. For now, refer to README.CMake.txt for further information.

Todo This section needs a major rework. Add a chapter "Building FLTK with CMake".

1.3.4.1 Compiling Programs with Standard Compilers

Under UNIX (and under Microsoft Windows when using the GNU development tools) you will probably need to tell the compiler where to find the header files. This is usually done using the `-I` option:

```
c++ -I/usr/local/include ...
```

Note

You need a C++ compiler to build FLTK. The commands given in this chapter are **examples** using 'c++'. Please replace this command with the C++ compiler suitable for your system or use the `fltk-config` script as described below (this is recommended).

1.3.4.2 Compiling Programs with the 'fltk-config' Script

The `fltk-config` script included with FLTK can be used on systems with a Posix compliant shell, for instance Unix/Linux, macOS, Windows with MinGW, MSYS2, or Cygwin.

Note

`fltk-config` is not designed to work on Windows with Visual Studio compilers. If it works, then only by accident and this is undefined behavior.

```
fltk-config --help
```

displays all available options.

`fltk-config` can be used to get the compiler and the options that are required by your compiler to build a program using the FLTK library:

```
fltk-config --cc
fltk-config --cxx
```

return the C and C++ compiler commands used to build FLTK.

```
c++ `fltk-config --cxxflags` ...
```

can be used to include the required compiler flags in the command line.

Similarly, when linking your application you will need to tell the compiler to use the FLTK library:

```
c++ ... -L/usr/local/lib -lfltk -lXext -lX11 ... -lm -ldl
```

Aside from the "fltk" library, there are also the following libraries

- "fltk_forms" for the XForms compatibility classes (deprecated)
- "fltk_gl" for the OpenGL and GLUT classes
- "fltk_images" for the image file classes, [Fl_Help_Dialog](#) widget, and system icon support.

The libraries are named `fltk.lib`, `fltk_forms.lib`, `fltk_gl.lib`, and `fltk_images.lib` under Windows.

Note

The separate `fltk_cairo` library is no longer necessary since FLTK 1.4.0. However, this release of FLTK builds a dummy `fltk_cairo` library for backwards compatibility. You are advised to remove the usage of the `fltk_cairo` library from your build systems and tools. **The `fltk_cairo` library will be removed in a future release.**

As before, the `fltk-config` script can be used to get the options that are required by your linker:

```
c++ ... `fltk-config --ldflags`
```

The forms, GL, and images libraries are included with the "--use-foo" options, as follows:

```
c++ ... `fltk-config --use-forms --ldflags`
c++ ... `fltk-config --use-gl --ldflags`
c++ ... `fltk-config --use-images --ldflags`
c++ ... `fltk-config --use-cairo --ldflags`
c++ ... `fltk-config --use-forms --use-gl --use-images --ldflags`
```

The option `--use-cairo` may be used to build your program with Cairo libs if you use Cairo in your code. It does no longer include the `fltk_cairo` lib but all necessary Cairo compiler flags and Cairo libs, if and only if FLTK has been built with the optional Cairo support by configure or CMake.

Finally, you can use the `fltk-config` script to compile one or more source files as a FLTK program.

The following examples will create an executable named `filename` (or `filename.exe` under Windows) from a single source file:

```
fltk-config --compile filename.cxx
fltk-config --use-forms --compile filename.cpp
fltk-config --use-gl --compile filename.C
fltk-config --use-images --compile filename.cc
fltk-config --use-cairo --compile filename.cpp
fltk-config --use-forms --use-gl --use-images --compile filename.cpp
```

Note

'`fltk-config --compile`' accepts only a limited set of file extensions for C++ source files: '`.cpp`', '`.cxx`', '`.cc`', and '`.C`' (capital 'C').

1.3.4.3 Compiling Multiple Source Files with 'fltk-config'

Before version 1.4.0 `fltk-config` accepted only a single source file and no additional compiler options or libraries. Since FLTK 1.4.0 it is possible to use additional compiler flags, more than one source file, and additional link libraries.

This is intended to be used for quick prototyping and not for production code development. It can be used to test compiler command options (like `-Wall` or `-Wextra`) or additional link libraries if these are required.

Building from more than one source file with flags and libraries can be achieved as follows:

```
fltk-config [USE-FLAGS] --compile MAIN [FLAGS] [SOURCES] [--link LFLAGS LIBS]
```

where

- arguments in `[. . .]` are optional
- `USE-FLAGS` are as described above, e.g. `--use-images`
- `MAIN` is the main C++ source file as documented above
- `FLAGS` are additional compiler flags
- `SOURCES` are additional source files or libraries
- `--link` is used to separate source files and flags from linker flags and libs
- `LFLAGS` are optional linker flags
- `LIBS` are additional libraries to link against

The final commandline is composed like this example:

```
$ fltk-config --compile main.cxx button.o -Wextra x1.a --link -L/usr/include/cairo/ -lcairo  
g++ {fltk-flags} -o main -Wextra main.cxx button.o x1.a {fltk-libs} -L/usr/include/cairo/ -lcairo
```

where `{fltk-flags}` are the compiler flags generated by `fltk-config` as before and `{fltk-libs}` are the usual linker flags and libraries. All optional parameters are used as-is, i.e. there is no syntax checking or special parsing except: the order of flags and source files is preserved (from the commandline) but all flags (`-something`) are positioned before all sources, i.e. arguments w/o leading dash ('-'). All compiler flags and libraries generated from the library build follow all options and source files given on the commandline, and finally everything after `--link` is appended.

1.3.4.4 Compiling Programs with Makefiles

The previous sections described how to use `fltk-config` to build a program from the command line, and this is very convenient for small test programs. But `fltk-config` can also be used to set the compiler and linker options as variables within a Makefile that can be used to build larger programs.

```
CXX      = $(shell fltk-config --cxx)
DEBUG    = -g
CXXFLAGS = $(shell fltk-config --use-gl --use-images --cxxflags) -I.
LDFLAGS  = $(shell fltk-config --use-gl --use-images --ldflags)
LDSTATIC = $(shell fltk-config --use-gl --use-images --ldstaticflags)
LINK     = $(CXX)

TARGET = cube
OBJS   = CubeMain.o CubeView.o CubeViewUI.o
SRCS   = CubeMain.cxx CubeView.cxx CubeViewUI.cxx

.SUFFIXES: .o .cxx

%.o: %.cxx
    $(CXX) $(CXXFLAGS) $(DEBUG) -c $<

all: $(TARGET)

$(TARGET): $(OBJS)
    $(LINK) -o $(TARGET) $(OBJS) $(LDSTATIC)

CubeMain.o:  CubeMain.cxx CubeViewUI.h
CubeView.o:  CubeView.cxx CubeView.h CubeViewUI.h
CubeViewUI.o: CubeViewUI.cxx CubeView.h

clean:
    rm -f *.o 2> /dev/null
    rm -f $(TARGET) 2> /dev/null
```

1.3.4.5 Compiling Programs with Microsoft Visual C++

In Visual C++ you will need to tell the compiler where to find the FLTK header files. This can be done by selecting "Settings" from the "Project" menu and then changing the "Preprocessor" settings under the "C/C++" tab.

You will also need to add the following libraries to the `Linker` settings:

- `fltk.lib` or `fltkd.lib`, the main FLTK library (postfix 'd' = Debug)
- all FLTK libraries your program requires (`fltk_gl`, `fltk_images`, ...)
- additional libraries like `libpng.lib`, `libjpeg.lib`, etc.
- the Windows Common Controls (`comctl32.lib`) and
- the GDIplus library if used to build FLTK (`gdiplus.lib`) and
- the Windows Socket (`ws2_32.lib`) libraries.

Note

There's a `Linker` setting "Additional Library Directories" or similar; the exact name depends on the Visual Studio version you're using. You can and **should** use this to simplify adding the libraries above. If you set this to the FLTK library path you can just use the library **names** and don't need to use the full paths to all libraries.

You must also define `_WIN32` if the compiler doesn't do this. Currently all known Windows compilers define `_WIN32` - unless you use Cygwin (that's correct, you must not define `_WIN32` if you use Cygwin).

More information can be found in `README.Windows.txt`.

You can build your Microsoft Windows applications as Console or Desktop applications. If you want to use the standard C `main()` function as the entry point, FLTK includes a `WinMain()` function that will call your `main()` function for you.

1.4 Common Widgets and Attributes

This chapter describes many of the widgets that are provided with FLTK and covers how to query and set the standard attributes.

1.4.1 Buttons

FLTK provides many types of buttons:

- `Fl_Button` - A standard push button.
- `Fl_Check_Button` - A button with a check box.
- `Fl_Light_Button` - A push button with a light.
- `Fl_Repeat_Button` - A push button that repeats when held.
- `Fl_Return_Button` - A push button that is activated by the `Enter` key.
- `Fl_Round_Button` - A button with a radio circle.

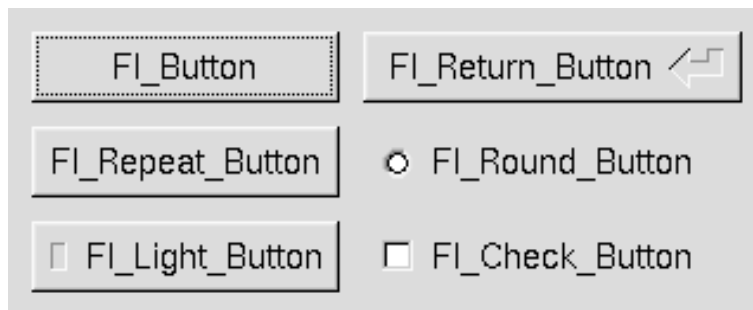

Figure 1.2 FLTK Button Widgets

All of these buttons just need the corresponding `<FL/Fl_xyz_Button.H>` header file. The constructor takes the bounding box of the button and optionally a label string:

```
Fl_Button *button = new Fl_Button(x, y, width, height, "label");
Fl_Light_Button *lbutton = new Fl_Light_Button(x, y, width, height);
Fl_Round_Button *rbutton = new Fl_Round_Button(x, y, width, height, "label");
```

Each button has an associated `type()` which allows it to behave as a push button, toggle button, or radio button:

```
button->type(FL_NORMAL_BUTTON);
lbutton->type(FL_TOGGLE_BUTTON);
rbutton->type(FL_RADIO_BUTTON);
```

For toggle and radio buttons, the `value()` method returns the current button state (0 = off, 1 = on). The `set()` and `clear()` methods can be used on toggle buttons to turn a toggle button on or off, respectively. Radio buttons can be turned on with the `setonly()` method; this will also turn off other radio buttons in the same group.

1.4.2 Text

FLTK provides several text widgets for displaying and receiving text:

- [Fl_Input](#) - A one-line text input field.
- [Fl_Output](#) - A one-line text output field.
- [Fl_Multiline_Input](#) - A multi-line text input field.
- [Fl_Multiline_Output](#) - A multi-line text output field.
- [Fl_Text_Display](#) - A multi-line text display widget.
- [Fl_Text_Editor](#) - A multi-line text editing widget.
- [Fl_Help_View](#) - A HTML text display widget.

The [Fl_Output](#) and [Fl_Multiline_Output](#) widgets allow the user to copy text from the output field but not change it.

The `value()` method is used to get or set the string that is displayed:

```
Fl_Input *input = new Fl_Input(x, y, width, height, "label");
input->value("Now is the time for all good men...");
```

The string is copied to the widget's own storage when you set the `value()` of the widget.

The [Fl_Text_Display](#) and [Fl_Text_Editor](#) widgets use an associated [Fl_Text_Buffer](#) class for the value, instead of a simple string.

1.4.3 Valuers

Unlike text widgets, valuers keep track of numbers instead of strings. FLTK provides the following valuers:

- [Fl_Counter](#) - A widget with arrow buttons that shows the current value.
- [Fl_Dial](#) - A round knob.
- [Fl_Roller](#) - An SGI-like dolly widget.
- [Fl_Scrollbar](#) - A standard scrollbar widget.
- [Fl_Slider](#) - A scrollbar with a knob.
- [Fl_Value_Slider](#) - A slider that shows the current value.

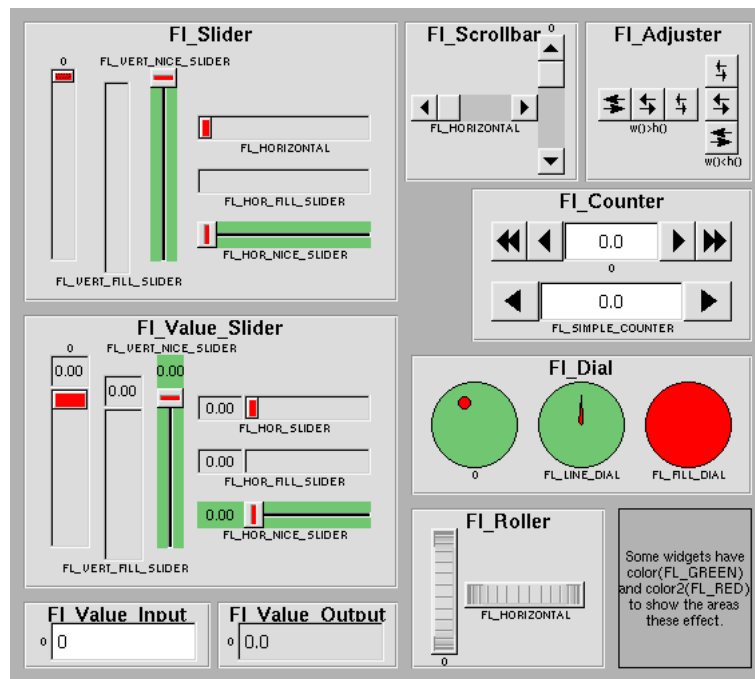

Figure 1.3 FLTK valuator widgets

The `value()` method gets and sets the current value of the widget. The `minimum()` and `maximum()` methods set the range of values that are reported by the widget.

1.4.4 Groups

The `FL_Group` widget class is used as a general purpose "container" widget. Besides grouping radio buttons, the groups are used to encapsulate windows, tabs, and scrolled windows. The following group classes are available with FLTK:

- `FL_Double_Window` - A double-buffered window on the screen.
- `FL_Flex` - A flexible container of one row or column of widgets. `FL_Flex` widgets may be nested, but see also `FL_Grid`.
- `FL_Gl_Window` - An OpenGL window on the screen.
- `FL_Grid` - A flexible container of one or more rows and columns of widgets arranged in a "grid" with auto-layout features. `FL_Grid` widgets can be nested with other `FL_Grid` or many `FL_Group` type widgets. Nesting with other self-resizing containers like `FL_Pack` and `FL_Tile` is not recommended but **may** work.
- `FL_Group` - The base container class; can be used to group any widgets together.
- `FL_Pack` - A collection of widgets that are packed into the group area.
- `FL_Scroll` - A scrolled window area.
- `FL_Tabs` - Displays child widgets as tabs.
- `FL_Tile` - A tiled window area.
- `FL_Window` - A window on the screen.
- `FL_Wizard` - Displays one group of widgets at a time.

1.4.5 Setting the Size and Position of Widgets

The size and position of widgets is usually set when you create them. You can access them with the `x()`, `y()`, `w()`, and `h()` methods.

You can change the size and position by using the `position()`, `resize()`, and `size()` methods:

```
button->position(x, y);
group->resize(x, y, width, height);
window->size(width, height);
```

If you change a widget's size or position after it is displayed you will have to call `redraw()` on the widget's parent.

1.4.6 Colors

FLTK stores the colors of widgets as a 32-bit unsigned number that is either an index into a color palette of 256 colors ($0 \leq \text{color} \leq 255$) or a 24-bit RGB color ($\text{color} > 255$). The color palette is *not* the X or Windows colormap, but instead is an internal table with fixed contents.

See the [Colors](#) section of [Drawing Things in FLTK](#) for implementation details.

There are symbols for naming some of the more common colors:

- `FL_BLACK`
- `FL_RED`
- `FL_GREEN`
- `FL_YELLOW`
- `FL_BLUE`
- `FL_MAGENTA`
- `FL_CYAN`
- `FL_WHITE`

Other symbols are used as the default colors for all FLTK widgets.

- `FL_FOREGROUND_COLOR`
- `FL_BACKGROUND_COLOR`
- `FL_INACTIVE_COLOR`
- `FL_SELECTION_COLOR`

The full list of named color values can be found in [FLTK Enumerations](#).

A color value can be created from its RGB components by using the `fl_rgb_color()` function, and decomposed again with `Fl::get_color()`:

```
Fl_Color c = fl_rgb_color(85, 170, 255); // RGB to Fl_Color
Fl::get_color(c, r, g, b);               // Fl_Color to RGB
```

The widget color is set using the `color()` method:

```
button->color(FL_RED); // set color using named value
```

Similarly, the label color is set using the `labelcolor()` method:

```
button->labelcolor(FL_WHITE);
```

The `Fl_Color` encoding maps to a 32-bit unsigned integer representing RGBI, so it is also possible to specify a color using a hex constant as a color map index:

```
button->color(0x000000ff); // colormap index #255 (FL_WHITE)
```

or specify a color using a hex constant for the RGB components:

```
button->color(0xff000000); // RGB: red
button->color(0x00ff0000); // RGB: green
button->color(0x0000ff00); // RGB: blue
button->color(0xffff0000); // RGB: white
```

Note

If TrueColor is not available, any RGB colors will be set to the nearest entry in the colormap.

1.4.7 Box Types

The type `FL_Boxtype` stored and returned in `FL_Widget::box()` is an enumeration defined in `Enumerations.H`.

These are the standard box types included with FLTK:

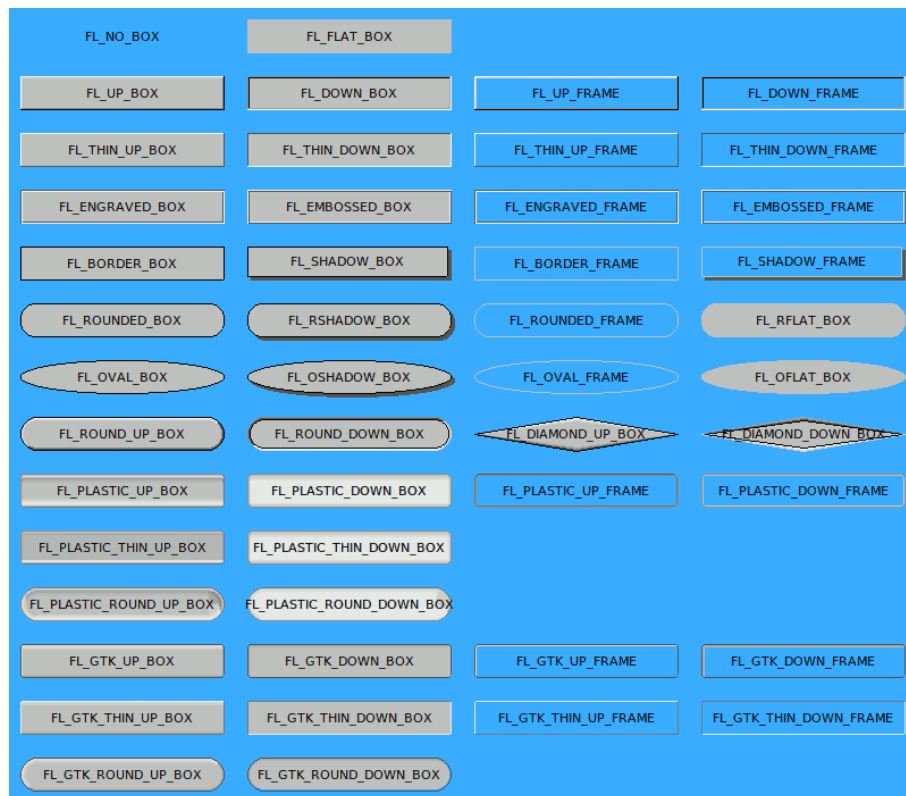

Figure 1.4 FLTK Standard Box Types

`FL_NO_BOX` means nothing is drawn at all, so whatever is already on the screen remains. The `FL_..._FRAME` types only draw their edges, leaving the interior unchanged. The blue color in the image above is the area that is not drawn by the frame types.

1.4.7.1 Making Your Own Boxtypes

You can define your own boxtypes by making a small function that draws the box and adding it to the table of boxtypes.

The Drawing Function

The drawing function is passed the bounding box and background color for the widget:

```
void xyz_draw(int x, int y, int w, int h, Fl_Color c) {
    ...
}
```

A simple drawing function might fill a rectangle with the given color and then draw a black outline:

```
void xyz_draw(int x, int y, int w, int h, Fl_Color c) {
    fl_color(c);
    fl_rectf(x, y, w, h);
    fl_color(FL_BLACK);
    fl_rect(x, y, w, h);
}
```

`Fl_Boxtype fl_down(Fl_Boxtype b)`

`fl_down()` returns the "pressed" or "down" version of a box. If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned. See [Drawing Functions](#) for more details.

`Fl_Boxtype fl_frame(Fl_Boxtype b)`

`fl_frame()` returns the unfilled, frame-only version of a box. If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned. See [Drawing Functions](#) for more details.

`Fl_Boxtype fl_box(Fl_Boxtype b)`

`fl_box()` returns the filled version of a frame. If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned. See [Drawing Functions](#) for more details.

Adding Your Box Type

The `Fl::set_boxtype()` method adds or replaces the specified box type:

```
#define XYZ_BOX FL_FREE_BOXTYPE

Fl::set_boxtype(XYZ_BOX, xyz_draw, 1, 1, 2, 2);
```

The last 4 arguments to `Fl::set_boxtype()` are the offsets for the `x`, `y`, `width`, and `height` values that should be subtracted when drawing the label inside the box.

A complete box design contains four box types in this order: a filled, neutral box (`UP_BOX`), a filled, depressed box (`DOWN_BOX`), and the same as outlines only (`UP_FRAME` and `DOWN_FRAME`). The function `fl_down(Fl_Boxtype)` expects the neutral design on a boxtype with a numerical value evenly dividable by two. `fl_frame(Fl_Boxtype)` expects the `UP_BOX` design at a value dividable by four.

1.4.8 Labels and Label Types

The `label()`, `align()`, `labelfont()`, `labelsize()`, `labeltype()`, `image()`, and `deimage()` methods control the labeling of widgets.

`label()`

The `label()` method sets the string that is displayed for the label. Symbols can be included with the label string by escaping them using the "@" symbol - "@@" displays a single at sign. These are the available symbols:

Figure 1.5 FLTK label symbols

The @ sign may also be followed by the following optional "formatting" characters, in this order:

- '#' forces square scaling, rather than distortion to the widget's shape.
- '+[1-9] or -[1-9] tweaks the scaling a little bigger or smaller.
- '\$' flips the symbol horizontally, '%' flips it vertically.
- '[0-9] - rotates by a multiple of 45 degrees. '5' and '6' do no rotation while the others point in the direction of that key on a numeric keypad. '0', followed by four more digits rotates the symbol by that amount in degrees.

Thus, to show a very large arrow pointing downward you would use the label string "@+92->".

Symbols and text can be combined in a label, however the symbol must be at the beginning and/or at the end of the text. If the text spans multiple lines, the symbol or symbols will scale up to match the height of all the lines.

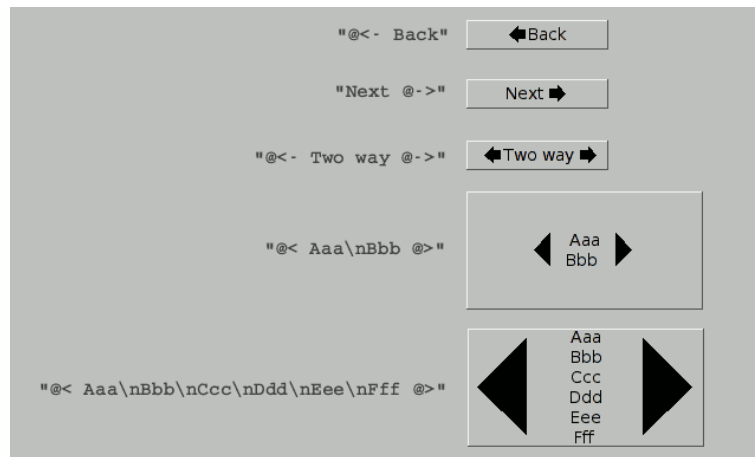

Figure 1.6 FLTK symbols and text

`align()`

The `align()` method positions the label. The following constants are defined and may be OR'd together as needed:

- `FL_ALIGN_CENTER` - center the label in the widget.
- `FL_ALIGN_TOP` - align the label at the top of the widget.
- `FL_ALIGN_BOTTOM` - align the label at the bottom of the widget.
- `FL_ALIGN_LEFT` - align the label to the left of the widget.
- `FL_ALIGN_RIGHT` - align the label to the right of the widget.
- `FL_ALIGN_LEFT_TOP` - The label appears to the left of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_RIGHT_TOP` - The label appears to the right of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_LEFT_BOTTOM` - The label appears to the left of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_RIGHT_BOTTOM` - The label appears to the right of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_INSIDE` - align the label inside the widget.
- `FL_ALIGN_CLIP` - clip the label to the widget's bounding box.
- `FL_ALIGN_WRAP` - wrap the label text as needed.
- `FL_ALIGN_TEXT_OVER_IMAGE` - show the label text over the image.
- `FL_ALIGN_IMAGE_OVER_TEXT` - show the label image over the text (default).
- `FL_ALIGN_IMAGE_NEXT_TO_TEXT` - The image will appear to the left of the text.
- `FL_ALIGN_TEXT_NEXT_TO_IMAGE` - The image will appear to the right of the text.
- `FL_ALIGN_IMAGE_BACKDROP` - The image will be used as a background for the widget.

labeltype()

The `labeltype()` method sets the type of the label. The following standard label types are included:

- `FL_NORMAL_LABEL` - draws the text.
- `FL_NO_LABEL` - does nothing.
- `FL_SHADOW_LABEL` - draws a drop shadow under the text.
- `FL_ENGRAVED_LABEL` - draws edges as though the text is engraved.
- `FL_EMBOSED_LABEL` - draws edges as though the text is raised.
- `FL_ICON_LABEL` - draws the icon ([Fl_Image](#)) associated with the text.
- `FL_IMAGE_LABEL` - draws the image ([Fl_Image](#)) associated with the text.
- `FL_MULTI_LABEL` - draws multiple parts side by side, see [Fl_Multi_Label](#).

Note

Some of these labeltypes are no longer necessary for normal widgets. Widgets allow for an image and a text side by side, depending on the widget's `align()` flag. `FL_MULTI_LABEL` was designed to be used with [Fl_Menu_Item](#)'s to support icons or small images, typically left of the menu text.

As of this writing (FLTK 1.4.0) `Fl_Menu_Items` support only one label part (text **or** image), but using [Fl_Multi_Label](#) as the label can extend this to more than one part.

See also

class [Fl_Multi_Label](#), [Fl_Widget::align\(\)](#)

image() and deimage()

The `image()` and `deimage()` methods set an image that will be displayed with the widget. The `deimage()` method sets the image that is shown when the widget is inactive, while the `image()` method sets the image that is shown when the widget is active.

To make an image you use a subclass of [Fl_Image](#).

Making Your Own Label Types

Label types are actually indexes into a table of functions that draw them. The primary purpose of this is to use this to draw the labels in ways inaccessible through the `fl_font()` mechanism (e.g. `FL_ENGRAVED_LABEL`) or with program-generated letters or symbology.

Label Type Functions

To setup your own label type you will need to write two functions: one to draw and one to measure the label. The draw function is called with a pointer to a `Fl_Label` structure containing the label information, the bounding box for the label, and the label alignment:

```
void xyz_draw(const Fl_Label *label, int x, int y, int w, int h, Fl_Align align) {
    ...
}
```

The label should be drawn *inside* this bounding box, even if `FL_ALIGN_INSIDE` is not enabled. The function is not called if the label value is `NULL`.

The measure function is called with a pointer to a `Fl_Label` structure and references to the width and height:

```
void xyz_measure(const Fl_Label *label, int &w, int &h) {
    ...
}
```

The function should measure the size of the label and set `w` and `h` to the size it will occupy.

Adding Your Label Type

The `Fl::set_labeltype()` method creates a label type using your draw and measure functions:

```
#define XYZ_LABEL FL_FREE_LABELTYPE

Fl::set_labeltype(XYZ_LABEL, xyz_draw, xyz_measure);
```

The label type number `n` can be any integer value starting at the constant `FL_FREE_LABELTYPE`. Once you have added the label type you can use the `labeltype()` method to select your label type.

The `Fl::set_labeltype()` method can also be used to overload an existing label type such as `FL_NORMAL_LABEL`.

Making your own symbols

It is also possible to define your own drawings and add them to the symbol list, so they can be rendered as part of any label.

To create a new symbol, you implement a drawing function `void drawit(Fl_Color c)` which typically uses the functions described in [Drawing Complex Shapes](#) to generate a vector shape inside a two-by-two units sized box around the origin. This function is then linked into the symbols table using `fl_add_symbol()`:

```
int fl_add_symbol(const char *name, void (*drawit)(Fl_Color), int scalable)
```

`name` is the name of the symbol without the "@"; `scalable` must be set to 1 if the symbol is generated using scalable vector drawing functions.

```
int fl_draw_symbol(const char *name, int x, int y, int w, int h, Fl_Color col)
```

This function draws a named symbol fitting the given rectangle.

1.4.9 Callbacks

Callbacks are functions that are called when the value of a widget changes. A callback function is sent a [Fl_Widget](#) pointer of the widget that changed and a pointer to data that you provide:

```
void xyz_callback(Fl_Widget *w, void *data) {
    ...
}
```

The `callback()` method sets the callback function for a widget. You can optionally pass a pointer to some data needed for the callback:

```
int xyz_data;

button->callback(xyz_callback, &xyz_data);
```

Note

You cannot delete a widget inside a callback, as the widget may still be accessed by FLTK after your callback is completed. Instead, use the [Fl::delete_widget\(\)](#) method to mark your widget for deletion when it is safe to do so.

Many programmers new to FLTK or C++ try to use a non-static class method instead of a static class method or function for their callback. Since callbacks are done outside a C++ class, the `this` pointer is not initialized for class methods.

To work around this problem, define a static method in your class that accepts a pointer to the class, and then have the static method call the class method(s) as needed. The data pointer you provide to the `callback()` method of the widget can be a pointer to the instance of your class.

```
class Foo {
    void my_callback(Fl_Widget *w);
    static void my_static_callback(Fl_Widget *w, void *f) { ((Foo *)f)->my_callback(w); }
    ...
}
...
w->callback(my_static_callback, (void *)this);
```

In an effort to make callbacks easier, more flexible, and type safe, FLTK provides three groups of macros that generate the code needed to call class methods directly with up to five custom parameters.

- `FL_FUNCTION_CALLBACK_#(WIDGET, FUNCTION, ...)` creates code for callbacks to functions and static class methods with up to five arguments. The `#` must be replaced by the number of callback arguments.
- `FL_METHOD_CALLBACK_#(WIDGET, CLASS, SELF, METH, ...)` creates code for callbacks to arbitrary public class methods
- `FL_INLINE_CALLBACK_#(WIDGET, ..., FUNCTION_BODY)` creates code for callback functions that are very close to (almost in the same line) the widget creation code, similar to lambda function in C++11. The last argument of this macro is the callback code.

The syntax is a bit unconventional, but the resulting code is flexible and needs no additional maintenance. It is also C++98 compatible. For example:

```
#include <FL/fl_callback_macros.H>
...
Fl_String *str = new Fl_String("FLTK");
Fl_Button *btn = new Fl_Button(10, 10, 100, 100);
FL_METHOD_CALLBACK_2(btn, Fl_String, str, insert, int, 2, const char*, "...");
...
Fl_Button *inline_cb_btn_2 = new Fl_Button(390, 60, 180, 25, "2 args");
FL_INLINE_CALLBACK_2( inline_cb_btn_2,
    const char *, text, "FLTK", int, number, 2,
    {
        fl_message("We received the message %s with %d!", text, number);
    }
);
```

See also

[Fl_Widget::callback\(Fl_Callback*, void*\)](#), [FL_FUNCTION_CALLBACK_3](#), [FL_METHOD_CALLBACK_1](#), [FL_INLINE_CALLBACK_2](#)

1.4.10 When and Reason

Normally callbacks are performed only when the value of the widget changes. You can change this using the `Fl_Widget::when()` method:

```
button->when (FL_WHEN_NEVER);
button->when (FL_WHEN_CHANGED);
button->when (FL_WHEN_RELEASE);
button->when (FL_WHEN_RELEASE_ALWAYS);
button->when (FL_WHEN_ENTER_KEY);
button->when (FL_WHEN_ENTER_KEY_ALWAYS);
button->when (FL_WHEN_CHANGED | FL_WHEN_NOT_CHANGED);
```

Within the callback, you can query why the callback was called using `Fl::callback_reason()`. For example, setting `myInput->when (FL_WHEN_RELEASE | FL_WHEN_CHANGED)`

for a text input field may return `FL_REASON_LOST_FOCUS` or `FL_REASON_CHANGED` as a callback reason.

1.4.11 Shortcuts

Shortcuts are key sequences that activate widgets such as buttons or menu items. The `shortcut()` method sets the shortcut for a widget:

```
button->shortcut (FL_Enter);
button->shortcut (FL_SHIFT + 'b');
button->shortcut (FL_CTRL + 'b');
button->shortcut (FL_ALT + 'b');
button->shortcut (FL_CTRL + FL_ALT + 'b');
button->shortcut (0); // no shortcut
```

The shortcut value is the key event value - the ASCII value or one of the special keys described in `Fl::event_key() Values` combined with any modifiers like `Shift`, `Alt`, and `Control`.

1.5 Coordinates and Layout Widgets

This chapter describes the coordinate systems that apply when positioning widgets manually, and some of the basics of FLTK layout widgets that are used to position widgets automatically.

1.5.1 The Widget Coordinate System

All widgets have constructors with `x` and `y` parameters to let the programmer specify the desired initial position of the top left corner during explicit manual layout within `Fl_Window` and `Fl_Group` container widgets.

This position is always relative to the enclosing `Fl_Window`, which is usually, but not always, the top-level application window, or a free-floating pop-up dialog window. In some cases it could also be a subwindow embedded in a higher-level window, as shown in the figure below.

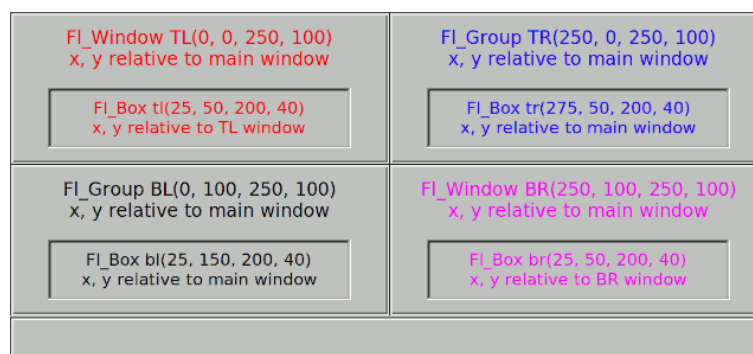

Figure 1.7 FLTK coordinate system

The positions of the TL and BR sub-windows and the TR and BL groups are all relative to the top-left corner of the main window. The positions of the boxes inside the TR and BL groups are also relative to the main window, but the boxes inside the TL and BR sub-windows are positioned relative to the enclosing sub-window.

In other words, the widget hierarchy and positions can be summarized as:

```
Fl_Window main window
  Fl_Window TL subwindow      # x, y relative to main window
    Fl_Box tl box             # x, y relative to TL subwindow
  Fl_Window BR subwindow      # x, y relative to main window
    Fl_Box br box             # x, y relative to BR subwindow
  Fl_Group TR group           # x, y relative to main window
    Fl_Box tr box             # x, y relative to main window
  Fl_Group BL group           # x, y relative to main window
    Fl_Box bl box             # x, y relative to main window
```

1.5.2 Layout and Container Widgets

There are four main groups of widgets derived from `Fl_Group` for a range of different purposes.

The first group are composite widgets that each contain a fixed set of components that work together for a specific purpose, rather than layout widgets as such, and are not discussed here.

The second group are basically containers offering the same manual layout features as `Fl_Group`, as described above, but which add one new capability. These widgets are `Fl_Scroll`, `Fl_Tabs` and `Fl_Wizard`.

The third group are layout managers that relocate and resize the child widgets added to them in order to satisfy a particular layout algorithm. These widgets are `Fl_Flex`, `Fl_Grid`, `Fl_Pack`, and `Fl_Tile`.

The final group consists of `Fl_Window` and its derivatives. Their special capability is that they can be top-level application windows and dialogs that interface with the operating system window manager, but can also be embedded within other windows and groups as shown in the example above. Note that the window manager may impose its own constraints on the position of top-level windows, and the `x` and `y` position parameters may be treated as hints, or even ignored. The `Fl_Window` class has an extra constructor that omits them.

Descriptions of layout and container widgets follow in alphabetical order.

1.5.2.1 The `Fl_Flex` Layout Widget

The `Fl_Flex` widget allows the layout of its direct children as a single row or column. If its `type()` is set to give the row or horizontal layout, the children are all resized to have the same height as the `Fl_Flex` and are moved next to each other. If set to give the column or vertical layout, the children are all resized to have the same width as the `Fl_Flex` and are then stacked below each other.

Widget positions (`x`, `y`) need not be given by the user because widgets are positioned inside the `Fl_Flex` container in the order of its children. Widget sizes can be set to (0, 0) as in `Fl_Pack` since they are calculated by `Fl_Flex`.

This is similar to `Fl_Pack` described below and `Fl_Flex` is designed to act as a drop-in replacement of `Fl_Pack` with some minor differences.

Other than `Fl_Pack` the `Fl_Flex` widget does **not** resize itself but resizes its children to fill the entire space of the `Fl_Flex` container. Single children of `Fl_Flex` can be set to fixed sizes to inhibit this resizing behavior. In this case the remaining space is distributed to all non-fixed widgets.

`Fl_Flex` widgets can be nested inside each other and with `Fl_Grid` in any combination.

The name `Fl_Flex` was inspired by the CSS 'flex' container.

Figure 1.8 Simple `Fl_Flex` Layout

`Fl_Flex` was added in FLTK 1.4.0.

1.5.2.2 The `Fl_Grid` Layout Widget

`Fl_Grid` is the most flexible layout container in FLTK 1.4. It is based on a flexible grid of **cells** that can be assigned one widget per cell which is the *anchor* of the widget. Widgets can span multiple rows and columns and the cells can constitute a sparse matrix. Widgets can be aligned inside their cells in several ways (left, right, top, bottom) and can stretch horizontally, vertically, or both, i.e. fill the entire cell.

Widget positions (x, y) need not be given by the user because widgets are assigned to a particular grid cell by row and column number. Widget sizes can be given as their **minimal** sizes and will be resized appropriately depending on the free space.

Optional margins around all cells inside the widget border and gaps between rows and cells make the layout even more flexible.

The `Fl_Grid` widget should be designed with a grid (matrix) and its minimal size in mind. It is designed to **enlarge** cells and widgets in a flexible way when the `Fl_Grid` widget itself is created or resized.

Additional free space inside the `Fl_Grid` container is distributed to widgets by considering minimal row heights, column widths, sizes of widgets, and row and column *weights*. These weights are used to distribute the free space proportionally according to the row and column weights.

`Fl_Grid` widgets can be nested inside each other and with `Fl_Flex` and other subclasses of `Fl_Group` in any combination.

Note

We don't recommend to use `Fl_Pack` as child widgets although this **may** work as well.

The name `Fl_Grid` was inspired by the CSS 'grid' container but it has some properties in common with HTML `<table>` containers as well, for instance row and column spanning.

Figure 1.9 Simple `Fl_Grid` Layout

`Fl_Grid` was added in FLTK 1.4.0.

1.5.2.3 The FL_Pack Layout Widget

The `FL_Pack` widget allows the layout of its direct children as a single row, or column. If its `type()` is set to give the row or horizontal layout, the children are all resized to have the same height as the `FL_Pack` and are moved next to each other. If set to give the column or vertical layout, the children are all resized to have the same width as the `FL_Pack` and are then stacked below each other. The `FL_Pack` then resizes itself to shrink-wrap itself around all of the children.

`FL_Pack` widgets are often used inside an `FL_Scroll`, as shown in the diagram below, to avoid having to deal with tricky resize behavior when used with nested widgets.

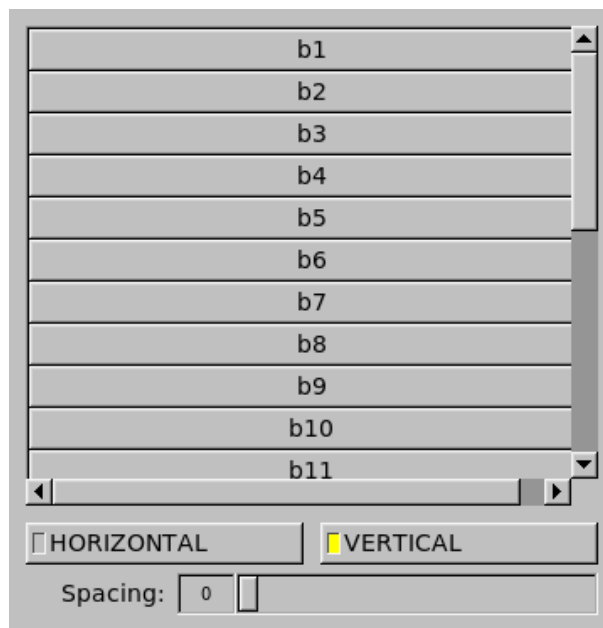

Figure 1.10 `FL_Pack` test program screenshot

Since FLTK 1.4.0 `FL_Flex` (described above) can in many cases be used as a drop-in replacement for `FL_Pack` if this "shrink-wrap" behavior is not required. Note that the `FL_Pack` layout algorithm can cause some issues because its widget size can change depending on its children and particularly because this is done late, i.e. during `draw()` and not as usual during `resize` of the window.

Note

We recommend that developers evaluate whether using `FL_Flex` or `FL_Grid` instead of `FL_Pack` can be a better solution with more predictable and reliable resizing behavior of the overall program layout.

1.5.2.4 The FL_Scroll Container Widget

The `FL_Scroll` container widget can hold an assortment of widgets that may extend beyond its own width and height, in which case horizontal and/or vertical scrollbars may appear automatically so that you can scroll and view the entire contents.

Figure 1.11 `FL_Scroll` container widget

1.5.2.5 The `Fl_Tabs` Container Widget

The `Fl_Tabs` widget provides a front-to-back stack of individual panels which usually contain `Fl_Group` widgets and their children. The user can switch between panels by clicking on the small tabs that protrude from the panels. The appearance of each tab is determined by the child widget's label and related attributes.

Figure 1.12 `Fl_Tabs` container widget

1.5.2.6 The `Fl_Tile` Layout Widget

The `Fl_Tile` widget allows the user to resize one or more of its children by dragging on the border between adjacent child widgets. However, the programmer must first explicitly layout the child widgets so that their borders exactly fill the width and height of the `Fl_Tile` without having any gaps between them, or at the edges. Some care is needed when initially positioning the children and setting the `resizable()` widget within the `Fl_Tile` to prevent squeezing a child to have a zero width or height. For more information see the `Fl_Tile` widget manual page, and [How Does Resizing Work?](#).

Figure 1.13 The `Fl_Tile` layout widget

1.5.2.7 The `Fl_Wizard` Container Widget

The `Fl_Wizard` widget derives from the `Fl_Tabs` class, but instead of having tabs that the user can click to select the corresponding panel, the programmer uses the `prev()`, `next()` or `value()` methods to show the appropriate panel. For example, the user might be able to click on "Next" and "Prev" navigation buttons or keys, as shown below.

Figure 1.14 `Fl_Wizard` container widget

1.6 How Does Resizing Work?

This chapter describes the basic mechanism behind the creation of resizable user interface elements in FLTK.

FLTK uses a simple, but very versatile system to resize even the most complex dialogs and interfaces. The resizing is implemented within the `Fl_Group` widget, and the exact resizing behavior of that group is determined by its `resizable()` attribute.

1.6.1 Resizing can be disabled

Summary:

```
group = new Fl_Group(xg, yg, wg, hg, "No Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
...
group->resizable((Fl_Widget*)0); // no resizing
group->end()
```

The `resizable` may be set to the NULL pointer, which means that the group will not resize. Note that this is the default behavior for `Fl_Window` and `Fl_Pack` derived widgets, and therefore the programmer must explicitly set the window's `resizable` attribute if they want to allow the window to be resized.

1.6.2 Resizing can be simple

Summary:

```
group = new Fl_Group(xg, yg, wg, hg, "Simple Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
...
group->resizable(group); // simple proportional resizing
group->end()
```

The `resizable` may be set to the group itself, which means that all widgets within the group will resize as the group itself is resized. This is the default behavior for `Fl_Group` widgets, and is shown in the diagram below.

If the group is stretched horizontally, the widths of the widgets within the group are adjusted proportionally. The same is true for vertical resizing.

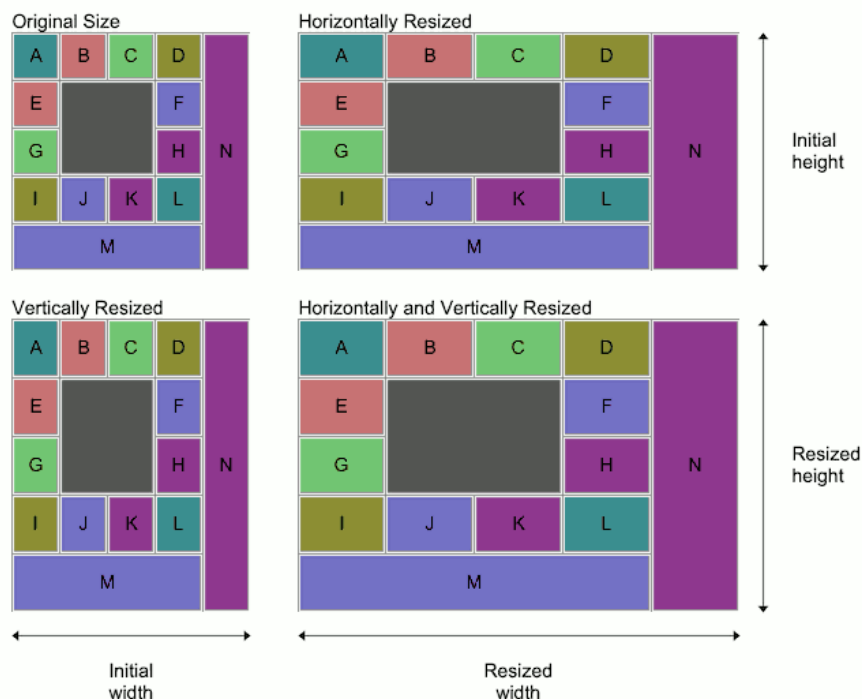

Figure 1.15 Proportional resizing example

1.6.3 Resizing can be complex

Summary:

```
group = new Fl_Group(xg, yg, wg, hg, "Complex Resizing");
child1 = new Fl_Box(xb, yb, wb, hb, "B"); // or other widget type
...
group->resizable(child1); // complex resizing
group->end()
```

It is when the group's `resizable` attribute is set to one of the group's child widgets, that things become really interesting.

In the diagram below, imagine vertical lines extending from the left and right sides of the yellow widget marked "resizable", and horizontal lines extending from the top and bottom sides. Exactly which widgets resize, and by how much, is determined by which ones lie completely or partially within this cross.

The widgets marked B, C, J, K and M clearly lie completely or partially within the vertical part of the cross; the widgets marked E, F, G, H and N lie completely or partially within the horizontal part of the cross; and the widgets marked A, D, I and L do not overlap with the cross at all. The resizing behavior is as follows:

- the width and height of the `resizable` widget increase to match the change in the width and height of the group widget as it is stretched;
- the widths of those widgets that overlap with the vertical part of the cross increase proportionally as the width of the group widget increases, but their heights remain unchanged, i.e. the widgets marked B, C, J, K and M;
- the heights of those widgets that overlap with the horizontal part of the cross increase proportionally as the height of the group widget increases, but their widths remain unchanged, i.e. the widgets marked E, F, G, H and N;
- the widths and heights of the remaining widgets stay the same, i.e. the widgets marked A, D, I and L stay the same size.

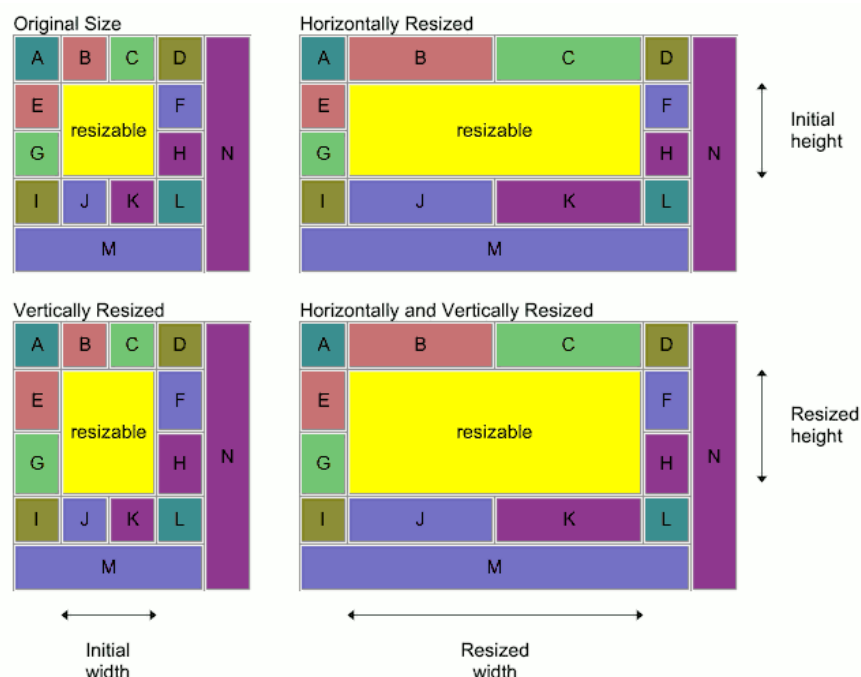

Figure 1.16 Complex resizing example

1.6.4 Practical examples

Why is this so powerful, you may ask. Well, every widget group can have a completely independent resizing strategy. By replacing one or more of the group's "normal" child widgets with another group widget where all of the above rules can be applied again, it is possible to create a hierarchy of group widgets with very complex layouts and resizing behavior.

Consider a simple dialog box, consisting of an icon box and a message area on the top and a button at the bottom right: which widget should be the `resizable` one?

Setting the `resizable` to be the icon box won't give us what we want:

Figure 1.17 Resizing dialog example (a)

The message text area would be the logical choice so that the user can expand the dialog to see if there is more of an explanation below the short error message. This results in the behavior shown in the diagram below.

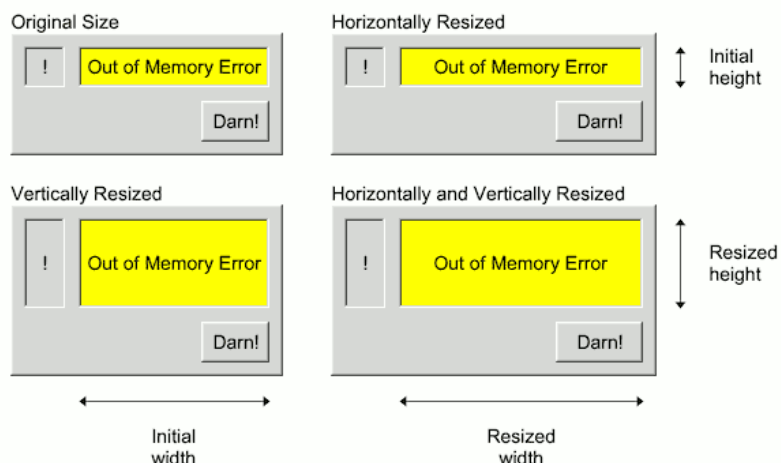

Figure 1.18 Resizing dialog example (b)

The result is close to what we want, but not quite: the text area will fully resize, the "!" icon box will resize vertically but not horizontally, which we can live with, but the "Darn!" button will - wait a minute - resize horizontally?

That's ugly. How do we stop that from happening? Simple: put it in its own group and set the `resizable` to an invisible box widget, as shown in the diagram below.

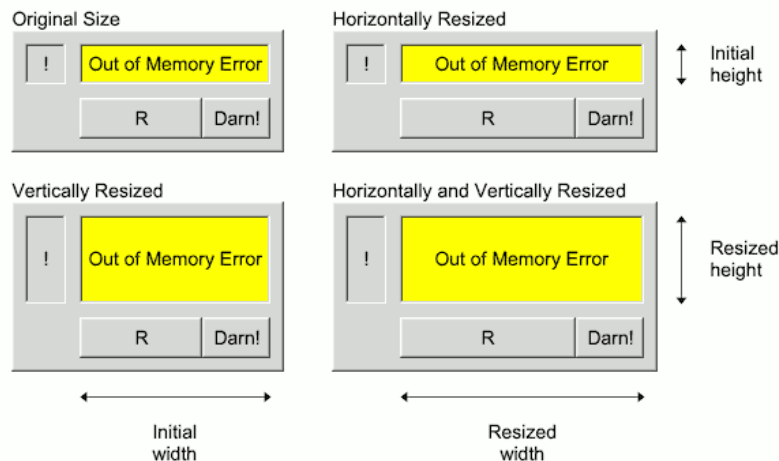

Figure 1.19 Resizing dialog example (c)

Now the invisible box, shown as "R", takes all of the horizontal resizing and the "Darn!" box will stay as it is. Here's the skeleton code:

```
dialog = new Fl_Window(300, 100);
icon = new Fl_Box(0, 0, 50, 50, "!");
text = new Fl_Box(50, 0, 250, 40, "Out of Memory Error");
btns = new Fl_Group(50, 50, 250, 50); // parent group
darn = new Fl_Button(200, 50, 100, 50, "Darn!");
R = new Fl_Box(50, 50, 150, 50); // "invisible" box "R"
R->hide(); // make sure it's invisible
btns->resizable(R); // make "R" parent group resizable
btns->end();
dialog->resizable(text);
dialog->end();
```

Imagine instead that you have a group that has a button, an input field, another button and a second input field, all next to each other, and you want the input fields to resize equally, but not the buttons. How could you achieve this?

Setting either of the input fields to be the `resizable` leaves the other one fixed, as shown below:

Figure 1.20 Resizing input fields example (b)

The answer is to leave the `resizable` of the group set to itself, and to create two equal size subgroups, each of which will resize equally. Add a button and input field to each subgroup, and set each subgroup's `resizable` to the input field, as shown below. Tada!

Figure 1.21 Resizing input fields example (b)

In FLTK it is possible to solve almost any layout and resizing problem by introducing an invisible box into a group, or an extra group into the widget hierarchy. It might take some thought to achieve exactly what you want and sometimes it is necessary to introduce parallel hierarchies in order to get widgets in different groups to resize together.

Imagine you have a group containing three widgets in a row, and you want the widget in the middle to stay the same size when the group is stretched and the ones on either side and the padding between them to resize symmetrically. As described earlier, the default resizing behavior for a group results in proportional resizing of the child widgets (and also of the margins and padding between them) as shown below, which is clearly not what you want.

Figure 1.22 Resizing a row of widgets (a)

Simply adding a group around A and B and setting its `resizable` to A, as in the previous `btn-input` example, will mean that B stays the same size, but the other widgets won't resize symmetrically, so what else is needed? It isn't immediately obvious how to solve this problem, even for experienced FLTK users. This is possibly because users are generally advised to design widgets so that they don't overlap.

Albrecht Schlosser proposed an innovative technique that involves an invisible box that deliberately overlaps others to achieve the desired behavior. For the current example, this means inserting two new groups into the existing group and adding a hidden resizable widget.

The first group, shown in red below, extends from the left edge of the parent group to the middle of the gap between boxes B and C on the right. This first group contains boxes A and B, where A is the first group's `resizable` attribute.

The second group, shown in blue, extends from the right edge of the first group to the right edge of the parent group. This second group contains box C, where C is the second group's `resizable`.

The extra box widget is added to the parent group and is set as the group's `resizable`. The three `resizable` widgets are shown in yellow.

The clever bit is that this extra box widget is not horizontally aligned with any of the existing groups and widgets in the usual way, but instead overlaps the right and left parts of the two new groups by the same small amount, which means that its midpoint is aligned with the edge between the groups.

Note that, for clarity, the height of the original group has been increased to allow space for the additional annotation and to highlight the extra resizable box in the extra space at the bottom of the group. This is fine for the horizontal-only resizing shown here, but means that widgets A, B and C will never change height because the extra resizable box does not overlap them vertically. Only the padding below them will be resized.

Figure 1.23 Resizing a row of widgets (b)

In a real application, you probably want to allow widgets A, B and C to resize vertically while the height of any padding or widgets above or below remains fixed, so the extra resizable box has to lie within the height of widgets A, B and C. Obviously after calling `hide()` on the box it is no longer visible, and may therefore be the same height as the other widgets, or a fraction of the height, as shown below.

Figure 1.24 Resizing a row of widgets (c)

To summarize the key points of the new technique:

- The new resizable widget must overlap the widgets on each side by exactly the same amount.
- The width of the new resizable widget is not fixed, but should probably be a relatively small value to avoid potential problems.
- The total width of the two new groups must equal the width of the existing group and there can be no offsets or gaps between them because margins and gaps will affect the resizing behavior.
- The same principles apply to vertical resizing.

1.7 Designing a Simple Text Editor

This chapter guides you through the design of a simple FLTK-based text editor. The complete source code for our text editor can be found in the `test/editor.cxx` file.

The tutorial comprises multiple chapters, and you can activate the relevant code by adjusting the `TUTORIAL_↔CHAPTER` macro at the top of the source file to match the chapter number.

Each chapter builds on the previous one. The documentation, as well as the source code, can be read sequentially, maintaining a consistent program structure while introducing additional features step by step.

Note

The tutorial uses several global variables for brevity. Additionally, the order of code blocks is rather uncommon but helps to keep related features within a chapter.

1.7.1 Determining the Goals of the Text Editor

As our first step, we define what we want our text editor to do:

1. Edit a single text document.
2. Provide a menubar/menus for all functions.
3. Load from a file.
4. Save to a file.
5. Keep track of when the file has been changed.
6. Cut/copy/delete/paste menus.
7. Search and replace functionality.
8. Multiple views of the same text.
9. "C" language syntax highlighting.

1.7.2 Chapter 1: A Minimal App

Let's ensure that we can set up our build process to compile and verify our code as we add features. We begin by writing a minimal program with no other purpose than opening a window.

The code for that is barely longer than a "Hello, world" program and is marked in the source code as `TUTORIAL`↔
`_CHAPTER = 1.`

```
#include <FL/Fl_Double_Window.H>
#include <FL/Fl.H>

Fl_Double_Window *app_window = NULL;

void tut1_build_app_window() {
    app_window = new Fl_Double_Window(640, 480, "FLTK Editor");
}

int main (int argc, char **argv) {
    tut1_build_app_window();
    app_window->show(argc, argv);
    return Fl::run();
}
```

Passing `argc` and `argv` to `Fl_Double_Window::show()` allows FLTK to parse command line options, providing the user with the ability to change the color or graphical scheme of the editor at launch time.

`Fl::run()` will return when no more windows in the app are visible. In other words, if all windows in an app are closed, hidden, or deleted. Pressing "Escape" or clicking the "Close" button in the window frame will close our only window, prompting `Fl::run()` to return, effectively ending the app.

When building FLTK from source, the CMake environment includes the necessary rules to build the editor. You can find more information on how to write your own CMake files in the `README.CMake.txt` text in the top FLTK directory.

For Linux and macOS, FLTK comes with the `fltk-config` script that generates the compiler commands for you:

```
fltk-config --compile editor.cxx
```

If the code compiles and links correctly, running the app will pop up an empty application window on the desktop screen. You can close the window and quit the app by pressing the 'Escape' key or by clicking the "Close" button in the window frame.

Congratulations, you've just built a minimal FLTK app.

1.7.3 Chapter 2: Adding a Menu Bar

In this chapter, we will handle the window title and add the main menu bar with a File menu and a Quit button.

We need to declare a variable to track track changes in the text, and a buffer for the current filename.

```
// remove `main()` from chapter 1, but keep the rest of the code, then add...

#include <FL/Fl_Menu_Bar.H>
#include <FL/fl_ask.H>
#include <FL/filename.H>
#include <FL/fl_string_functions.h>

Fl_Menu_Bar *app_menu_bar = NULL;
bool text_changed = false;
char app_filename[FL_PATH_MAX] = "";
```

The window title is either "FLTK Editor" if the text is not saved in any file, or the filename, followed by an * if the text changed. Note that we have two ways to set the label of a widget. `label()` will link a static text, and `copy_label()` which will copy and manage the label text.

```
void update_title() {
    const char *fname = NULL;
    if (app_filename[0])
        fname = fl_filename_name(app_filename);
```

```

if (fname) {
    char buf[FL_PATH_MAX + 3];
    buf[FL_PATH_MAX + 2] = '\\0'; // ensure that the buffer is always terminated
    if (text_changed) {
        snprintf(buf, FL_PATH_MAX+2, "%s *", fname);
    } else {
        snprintf(buf, FL_PATH_MAX+2, "%s", fname);
    }
    app_window->copy_label(buf);
} else {
    app_window->label("FLTK Editor");
}
}

```

Now instead of writing directly to `text_changed`, we write a function that can set and clear the flag, and update the title accordingly.

```

void set_changed(bool v) {
    if (v != text_changed) {
        text_changed = v;
        update_title();
    }
}

```

Let's do the same for changing the filename. If the new filename is NULL, the window title will revert to "FLTK Editor".

```

void set_filename(const char *new_filename) {
    if (new_filename) {
        fl_strncpy(app_filename, new_filename, FL_PATH_MAX);
    } else {
        app_filename[0] = 0;
    }
    update_title();
}

```

But enough of managing window titles. The following code will add the first widget to our window. A menubar is created at the top and all across the main window.

```

void menu_quit_callback(Fl_Widget *, void *) { /* TODO */ }

void tut2_build_app_menu_bar() {
    app_window->begin();
    app_menu_bar = new Fl_Menu_Bar(0, 0, app_window->w(), 25);
    app_menu_bar->add("File/Quit Editor", FL_COMMAND+'q', menu_quit_callback);
    app_window->callback(menu_quit_callback);
    app_window->end();
}

int main (int argc, char **argv) {
    tut1_build_app_window();
    tut2_build_app_menu_bar();
    app_window->show(argc, argv);
    return Fl::run();
}

```

`begin()` tells FLTK to add all widgets created hereafter to our `app_window`. In this particular case, it is redundant because creating the window in the previous chapter already called `begin()` for us.

In the next line, we create the menu bar and add our first menu item to it. Menus can be constructed like file paths, with forward slashes '/' separating submenus from menu items.

Our basic callback is simple:

```

void menu_quit_callback(Fl_Widget *, void *) {
    Fl::hide_all_windows();
}

```

`Fl::hide_all_windows()` will make all windows invisible, causing `Fl::run()` to return and `main` to exit.

The next line, `app_window->callback(menu_quit_callback)` links the same `menu_quit_callback` to the `app_window` as well. Assigning the window callback removes the default "Escape" key handling and allows the `menu_quit_callback` to handle that keypress with a friendly dialog box instead of just quitting the app.

The `Fl_Widget*` parameter in the callback will either be `app_window` if called through the window callback, or `app_menu_bar` if called by one of the menu items.

One of our goals was to keep track of text changes. If we know the text changed and is unsaved, we should notify the user that she is about to lose her work. We achieve this by adding a dialog box in the Quit callback that queries if the user really wants to quit, even if text was changed:

```
void menu_quit_callback(Fl_Widget *, void *) {
    if (text_changed) {
        int c = fl_choice("Changes in your text have not been saved.\n"
                          "Do you want to quit the editor anyway?",
                          "Quit", "Cancel", NULL);
        if (c == 1) return;
    }
    Fl::hide_all_windows();
}
```

1.7.4 Chapter 3: Adding a Text Editor widget

FLTK comes with a pretty capable builtin text editing widget. We will use this `Fl_Text_Editor` widget here to allow users to edit their documents.

`Fl_Text_Editor` needs an `Fl_Text_Buffer` to do anything useful. What might seem like an unnecessary extra step is a great feature: we can assign one text buffer to multiple text editors. In a later chapter, we will use this feature to implement a split editor window.

```
#include <FL/Fl_Text_Buffer.H>
#include <FL/Fl_Text_Editor.H>

Fl_Text_Editor *app_editor = NULL;
Fl_Text_Editor *app_split_editor = NULL; // for later
Fl_Text_Buffer *app_text_buffer = NULL;

// ... callbacks go here

void tut3_build_main_editor() {
    app_window->begin();
    app_text_buffer = new Fl_Text_Buffer();
    app_text_buffer->add_modify_callback(text_changed_callback, NULL);
    app_editor = new Fl_Text_Editor(0, app_menu_bar->h(),
    app_window->w(), app_window->h() - app_menu_bar->h());
    app_editor->buffer(app_text_buffer);
    app_editor->textfont(FL_COURIER);
    app_window->resizable(app_editor);
    app_window->end();
}
```

By setting the `app_editor` to be the `resizable()` property of `app_window`, we make our application window resizable on the desktop, and we ensure that resizing the window will only resize the text editor vertically, but not our menu bar.

To keep track of changes to the document, we add a callback to the text editor that will be called whenever text is added or deleted. The text modify callback sets our `text_changed` flag if text was changed:

```
// insert before tut3_build_main_editor()
void text_changed_callback(int, int n_inserted, int n_deleted, int, const char*, void*) {
    if (n_inserted || n_deleted)
        set_changed(true);
}
```

To wrap this chapter up, we add a "File/New" menu and link it to a callback that clears the text buffer, clears the current filename, and marks the buffer as unchanged.

```
// insert before tut3_build_main_editor()
void menu_new_callback(Fl_Widget*, void*) {
    app_text_buffer->text("");
    set_changed(false);
}

// insert at the end of tut3_build_main_editor()
...
// find the Quit menu and insert the New menu there
int ix = app_menu_bar->find_index(menu_quit_callback);
app_menu_bar->insert(ix, "New", FL_COMMAND+'n', menu_new_callback);
...
```

1.7.5 Chapter 4: Reading and Writing Files

In this chapter, we will add support for loading and saving text files, so we need three more menu items in the File menu: Open, Save, and Save As.

```
#include <FL/Fl_Native_File_Chooser.H>
#include <FL/platform.H>
#include <errno.h>

// ... add callbacks here

void tut4_add_file_support() {
    int ix = app_menu_bar->find_index(menu_quit_callback);
    app_menu_bar->insert(ix, "Open", FL_COMMAND+'o', menu_open_callback, NULL, FL_MENU_DIVIDER);
    app_menu_bar->insert(ix+1, "Save", FL_COMMAND+'s', menu_save_callback);
    app_menu_bar->insert(ix+2, "Save as...", FL_COMMAND+'S', menu_save_as_callback, NULL, FL_MENU_DIVIDER);
}
```

Note

The menu shortcuts `FL_COMMAND+'s'` and `FL_COMMAND+'S'` look the same at a first glance, but the second shortcut is actually `Ctrl-Shift-S` due to the capital letter 'S'. Also, we use `FL_COMMAND` as our menu shortcut modifier key. `FL_COMMAND` translates to `FL_CTRL` on Windows and Linux, and to `FL_META` on macOS, better known as the cloverleaf, or simply "the Apple key".

We implement the Save As callback first, because we will want to call it from the Open callback later. The basic callback is only a few lines of code.

```
void menu_save_as_callback(Fl_Widget*, void*) {
    Fl_Native_File_Chooser file_chooser;
    file_chooser.title("Save File As...");
    file_chooser.type(Fl_Native_File_Chooser::BROWSE_SAVE_FILE);
    if (file_chooser.show() == 0) {
        app_text_buffer->savefile(file_chooser.filename());
        set_filename(file_chooser.filename());
        set_changed(false);
    }
}
```

However if the user has already set a file name including path information, it is the polite thing to preload the file chooser with that information. This little chunk of code will separate the file name from the path before we call `file_chooser.show()`:

```
// insert before `if (file_chooser.show())...`
if (app_filename[0]) {
    char temp_filename[FL_PATH_MAX];
    fl_strlcpy(temp_filename, app_filename, FL_PATH_MAX);
    const char *name = fl_filename_name(temp_filename);
    if (name) {
        file_chooser.preset_file(name);
        temp_filename[name - temp_filename] = 0;
        file_chooser.directory(temp_filename);
    }
}
```

Great. Now let's add code for our File/Save menu. If no filename was set yet, it falls back to our Save As callback. `Fl_Text_Editor::savefile()` writes the contents of our text widget into a UTF-8 encoded text file.

```
void menu_save_callback(Fl_Widget*, void*) {
    if (!app_filename[0]) {
        menu_save_as_callback(NULL, NULL);
    } else {
        app_text_buffer->savefile(file_chooser.filename());
        set_changed(false);
    }
}
```

Now that we have a save method available, we can improve the `menu_quit_callback` and offer the option to save the current modified text before quitting the app. Here is the new quit callback code that replaces the old callback:

```
void menu_quit_callback(Fl_Widget *, void *) {
    if (text_changed) {
        int r = fl_choice("The current file has not been saved.\n"
                        "Would you like to save it now?",
                        "Cancel", "Save", "Don't Save");
    }
}
```

```

        if (r == 0)    // cancel
            return;
        if (r == 1) { // save
            menu_save_callback(NULL, NULL);
            return;
        }
    }
    Fl::hide_all_windows();
}

```

On to loading a new file. Let's write the function to load a file from a given file name:

```

void load(const char *filename) {
    if (app_text_buffer->loadfile(filename) == 0) {
        set_filename(filename);
        set_changed(false);
    }
}

```

A friendly app should warn the user if file operations fail. This can be done in three lines of code, so let's add an alert dialog after every `loadfile` and `savefile` call. This is exemplary for `load()`, and the code is very similar for the two other locations.

```

void load(const char *filename) {
    if (app_text_buffer->loadfile(filename) == 0) {
        set_filename(filename);
        set_changed(false);
    } else {
        fl_alert("Failed to load file\n%s\n%s",
                filename,
                strerror(errno));
    }
}

```

If the user selects our pulldown "Load" menu, we first check if the current text was modified and provide a dialog box that offers to save the changes before loading a new text file:

```

void menu_open_callback(Fl_Widget*, void*) {
    if (text_changed) {
        int r = fl_choice("The current file has not been saved.\n"
                        "Would you like to save it now?",
                        "Cancel", "Save", "Don't Save");

        if (r == 2)
            return;
        if (r == 1)
            menu_save_callback();
    }
    ...
}

```

If the user did not cancel the operation, we pop up a file chooser for loading the file, using similar code as in Save As.

```

...
Fl_Native_File_Chooser file_chooser;
file_chooser.title("Open File...");
file_chooser.type(Fl_Native_File_Chooser::BROWSE_FILE);
...

```

Again, we preload the file chooser with the last used path and file name:

```

...
if (app_filename[0]) {
    char temp_filename[FL_PATH_MAX];
    fl_strncpy(temp_filename, app_filename, FL_PATH_MAX);
    const char *name = fl_filename_name(temp_filename);
    if (name) {
        file_chooser.preset_file(name);
        temp_filename[name - temp_filename] = 0;
        file_chooser.directory(temp_filename);
    }
}
...

```

And finally, we pop up the file chooser. If the user cancels the file dialog, we do nothing and keep the current file. Otherwise, we call the `load()` function that we already wrote:

```

if (file_chooser.show() == 0)
    load(file_chooser.filename());
}

```

We really should support two more ways to load documents from a file. Let's modify the "show and run" part of `main()` to handle command line parameters and desktop drag'n'drop operations. For that, we refactor the last two lines of `main()` into a new function:

```
// ... new function here

int main (int argc, char **argv) {
    tut1_build_app_window();
    tut2_build_app_menu_bar();
    tut3_build_main_editor();
    tut4_add_file_support();
    // ... refactor those into the new function
    // app_window->show(argc, argv);
    // return Fl::run();
    return tut4_handle_commandline_and_run(argc, argv);
}
```

Our function to show the window and run the app has a few lines of boilerplate code. `Fl::args_to_utf8()` converts the command line argument from whatever the host system provides into Unicode. `Fl::args()` goes through the list of arguments and gives `args_handler()` a chance to handle each argument. It also makes sure that FLTK specific args are still forwarded to FLTK, so `"-scheme plastic"` and `"-background #aaccff"` will draw beautiful blue buttons in a plastic look.

`fl_open_callback()` lets FLTK know what to do if a user drops a text file onto our editor icon (Apple macOS). Here, we ask it to call the `load()` function that we wrote earlier.

```
// ... args_handler here

int tut4_handle_commandline_and_run(int &argc, char **argv) {
    int i = 0;
    Fl::args_to_utf8(argc, argv);
    Fl::args(argc, argv, i, args_handler);
    fl_open_callback(load);
    app_window->show(argc, argv);
    return Fl::run();
}
```

Last work item for this long chapter: what should our `args_handler` do? We could handle additional command line options here, but for now, all we want to handle is file names and paths. Let's make this easy: if the current arg does not start with a '-', we assume it is a file name, and we call `load()`:

```
int args_handler(int argc, char **argv, int &i) {
    if (argv[i] && argv[i][0] != '-') {
        load(argv[i]);
        i++;
        return 1;
    }
    return 0;
}
```

So this is our basic but quite functional text editor app in about 100 lines of code. The following chapters add some user convenience functions and show off some FLTK features including split editors and syntax highlighting.

1.7.6 Chapter 5: Cut, Copy, and Paste

The FLTK Text Editor widget comes with builtin cut, copy, and paste functionality, but as a courtesy, we should also offer these as menu items in the main menu.

In our feature list, we noted that we want to implement a split text editor. This requires that the callbacks know which text editor has the keyboard focus. Calling `Fl::focus()` may return `NULL` or other unknown widgets, so we add a little test in our callbacks:

```
void menu_cut_callback(Fl_Widget*, void* v) {
    Fl_Widget *e = Fl::focus();
    if (e && (e == app_editor || e == app_split_editor))
        Fl_Text_Editor::kf_cut(0, (Fl_Text_Editor*)e);
}
```

We can write very similar callbacks for undo, redo, copy, paste, and delete. Adding a new menu and the six menu items follows the same pattern as before. Using the Menu/Item notation will create an Edit menu for us:

```
void tut5_cut_copy_paste() {
    app_menu_bar->add("Edit/Undo",      FL_COMMAND+'z', menu_undo_callback);
    app_menu_bar->add("Edit/Redo",      FL_COMMAND+'Z', menu_redo_callback, NULL, FL_MENU_DIVIDER);
    app_menu_bar->add("Edit/Cut",      FL_COMMAND+'x', menu_cut_callback);
    app_menu_bar->add("Edit/Copy",     FL_COMMAND+'c', menu_copy_callback);
    app_menu_bar->add("Edit/Paste",    FL_COMMAND+'v', menu_paste_callback);
    app_menu_bar->add("Edit/Delete", 0, menu_delete_callback);
}
```

1.7.7 Chapter 6: Find and Find Next

Corporate called. They want a dialog box for their users that can search for some word in the text file. We can add this functionality using a callback and a standard FLTK dialog box.

Here is some code to find a string in a text editor. The first four lines make sure that we start our search at the cursor position of the current editor window. The rest of the code searches the string and marks it if found.

```
void find_next(const char *needle) {
    Fl_Text_Editor *editor = app_editor;
    Fl_Widget *e = Fl::focus();
    if (e && e == app_split_editor)
        editor = app_split_editor;
    int pos = editor->insert_position();
    int found = app_text_buffer->search_forward(pos, needle, &pos);
    if (found) {
        app_text_buffer->select(pos, pos + (int)strlen(needle));
        editor->insert_position(pos + (int)strlen(needle));
        editor->show_insert_position();
    } else {
        fl_alert("No further occurrences of '%s' found!", needle);
    }
}
```

The callbacks are short, using the FLTK text field dialog box and the `find_next` function that we already implemented. The last searched text is saved in `last_find_text` to be reused by `menu_find_next_callback`. If no search text was set yet, or it was set to an empty text, "Find Next" will forward to `menu_find_callback` and pop up our "Find Text" dialog.

```
char last_find_text[1024] = "";

void menu_find_callback(Fl_Widget*, void* v) {
    const char *find_text = fl_input("Find in text:", last_find_text);
    if (find_text) {
        fl_strlcpy(last_find_text, find_text, sizeof(last_find_text));
        find_next(find_text);
    }
}

void menu_find_next_callback(Fl_Widget*, void* v) {
    if (last_find_text[0]) {
        find_next(last_find_text);
    } else {
        menu_find_callback(NULL, NULL);
    }
}
```

And of course we need to add two menu items to our main application menu.

```
...
app_menu_bar->add("Find/Find...", FL_COMMAND+'f', menu_find_callback);
app_menu_bar->add("Find/Find Next", FL_COMMAND+'g', menu_find_next_callback, NULL, FL_MENU_DIVIDER);
...
```

1.7.8 Chapter 7: Replace and Replace Next

To implement the next feature, we will need to implement our own "Find and Replace" dialog box. To make this dialog box useful, it needs the following elements:

- a text input field for the text that we want to find
- a text input field for the replacement text
- a button to find the next occurrence
- a button to replace the current text and find the next occurrence
- a button to close the dialog

This is rather complex functionality, so instead of adding more global variables, we will pack this dialog into a class, derived from `Fl_Window`.

Note

The tutorial uses `Fl_Double_Window` instead of `Fl_Window` throughout. Historically, on some platforms, `Fl_Window` renders faster, but has a tendency to flicker. In today's world, this has very little relevance and FLTK optimizes both window types. `Fl_Double_Window` is recommended unless there is a specific reason to use `Fl_Window`.

Let's implement the text replacement code first:

```
char last_replace_text[1024] = "";

void replace_selection(const char *new_text) {
    Fl_Text_Editor *editor = app_editor;
    Fl_Widget *e = Fl::focus();
    if (e && e == app_split_editor)
        editor = app_split_editor;
    int start, end;
    if (app_text_buffer->selection_position(&start, &end)) {
        app_text_buffer->remove_selection();
        app_text_buffer->insert(start, new_text);
        app_text_buffer->select(start, start + (int)strlen(new_text));
        editor->insert_position(start + (int)strlen(new_text));
        editor->show_insert_position();
    }
}
```

As before, the first four lines anticipate a split editor and find the editor that has focus. The code then deletes the currently selected text, replaces it with the new text, selects the new text, and finally sets the text cursor to the end of the new text.

The Replace_Dialog class

The `Replace_Dialog` class holds pointers to our active UI elements as well as all the callbacks for the dialog buttons.

```
class Replace_Dialog : public Fl_Double_Window {
    Fl_Input *find_text_input;
    Fl_Input *replace_text_input;
    Fl_Button *find_next_button;
    Fl_Button *replace_and_find_button;
    Fl_Button *close_button;
public:
    Replace_Dialog(const char *label);
    void show() FL_OVERRIDE;
private:
    static void find_next_callback(Fl_Widget*, void*);
    static void replace_and_find_callback(Fl_Widget*, void*);
    static void close_callback(Fl_Widget*, void*);
};

Replace_Dialog *replace_dialog = NULL;
```

The constructor creates the dialog and marks it as "non modal". This will make the dialog hover over the application window like a toolbox window until the user closes it, allowing multiple "find and replace" operations. So here is our constructor:

```
Replace_Dialog::Replace_Dialog(const char *label)
: Fl_Double_Window(430, 110, label)
{
    find_text_input = new Fl_Input(100, 10, 320, 25, "Find:");
    replace_text_input = new Fl_Input(100, 40, 320, 25, "Replace:");
    Fl_Flex* button_field = new Fl_Flex(100, 70, w()-100, 40);
    button_field->type(Fl_Flex::HORIZONTAL);
    button_field->margin(0, 5, 10, 10);
    button_field->gap(10);
    find_next_button = new Fl_Button(0, 0, 0, 0, "Next");
    find_next_button->callback(find_next_callback, this);
    replace_and_find_button = new Fl_Button(0, 0, 0, 0, "Replace");
    replace_and_find_button->callback(replace_and_find_callback, this);
    close_button = new Fl_Button(0, 0, 0, 0, "Close");
    close_button->callback(close_callback, this);
    button_field->end();
    set_non_modal();
}
```

All buttons are created inside an `Fl_Flex` group. They will be arranged automatically by `Fl_Flex`, so there is no need to set x and y coordinates or a width or height. `button_field` will lay out the buttons for us.

Note

There is no need to write a destructor or delete individual widgets. When we delete an instance of `ReplaceDialog`, all children are deleted for us.

The `show()` method overrides the window's `show` method. It adds some code to preload the values of the text fields for added convenience. It then pops up the dialog box by calling the original `Fl_Double_Window::show()`.

```
void ReplaceDialog::show() {
    find_text_input->value(last_find_text);
    replace_text_input->value(last_replace_text);
    Fl_Double_Window::show();
}
```

The buttons in the dialog need callbacks to be useful. If callbacks are defined within a class, they must be defined `static`, but a pointer to the class can be provided through the `user_data` field. We have done that in the constructor by adding `this` as the last argument when setting the callback, for example in `close_button->callback(close_callback, this);`.

The callback itself can then extract the `this` pointer with a static cast:

```
void ReplaceDialog::close_callback(Fl_Widget*, void* my_dialog) {
    ReplaceDialog *dlg = static_cast<ReplaceDialog*>(my_dialog);
    dlg->hide();
}
```

The callback for the Find button uses our already implemented `find_next` function:

```
void ReplaceDialog::find_next_callback(Fl_Widget*, void* my_dialog) {
    ReplaceDialog *dlg = static_cast<ReplaceDialog*>(my_dialog);
    fl_strncpy(last_find_text, dlg->find_text_input->value(), sizeof(last_find_text));
    fl_strncpy(last_replace_text, dlg->replace_text_input->value(), sizeof(last_replace_text));
    if (last_find_text[0])
        find_next(last_find_text);
}
```

The Replace button callback calls our newly implemented `replace_selection` function and then continues on to the `find_next_callback`:

```
void ReplaceDialog::replace_and_find_callback(Fl_Widget*, void* my_dialog) {
    ReplaceDialog *dlg = static_cast<ReplaceDialog*>(my_dialog);
    replace_selection(dlg->replace_text_input->value());
    find_next_callback(NULL, my_dialog);
}
```

This long chapter comes close to its end. We are missing menu items that pop up our dialog and that allow a quick "Replace and Find Next" functionality without popping up the dialog. The code is quite similar to the "Find" and "Find Next" code in the previous chapter:

```
void menu_replace_callback(Fl_Widget*, void*) {
    if (!replace_dialog)
        replace_dialog = new ReplaceDialog("Find and Replace");
    replace_dialog->show();
}

void menu_replace_next_callback(Fl_Widget*, void*) {
    if (!last_find_text[0]) {
        menu_replace_callback(NULL, NULL);
    } else {
        replace_selection(last_replace_text);
        find_next(last_find_text);
    }
}

void tut7_implement_replace() {
    app_menu_bar->add("Find/Replace...", FL_COMMAND+'r', menu_replace_callback);
    app_menu_bar->add("Find/Replace Next", FL_COMMAND+'t', menu_replace_next_callback);
}
```

1.7.9 Chapter 8: Editor Features

Chapter 7 was long an intense. Let's relax and implement something simple here. We want menus with check boxes that can toggle some text editor features on and off:

```
void tut8_editor_features() {
    app_menu_bar->add("Window/Line Numbers", FL_COMMAND+'l', menu_linenumbers_callback, NULL, FL_MENU_TOGGLE);
    app_menu_bar->add("Window/Word Wrap", 0, menu_wordwrap_callback, NULL, FL_MENU_TOGGLE);
}
```

The `Fl_Widget` parameter in callbacks always points to the widget that causes the callback. Menu items are not derived from widgets, so to find out which menu item caused a callback, we can do this:

```
void menu_linenumbers_callback(Fl_Widget* w, void*) {
    Fl_Menu_Bar* menu = static_cast<Fl_Menu_Bar*>(w);
    const Fl_Menu_Item* linenum_item = menu->mvalue();
    if (linenum_item->value()) {
        app_editor->linenumber_width(40);
    } else {
        app_editor->linenumber_width(0);
    }
    app_editor->redraw();
}
```

Setting the width enables the line numbers, setting it to 0 disables the line number display. When changing the value of a widget, FLTK will make sure that the widget is redrawn to reflect the new value. When changing other attributes such as colors or fonts, FLTK assumes that many attributes are changed at the same time and leaves it to the user to call `Fl_Widget::redraw()` when done. Here we call `app_editor->redraw()` to make sure that the change in the line number setting is also drawn on screen.

Let's not forget to update the line number display for a potential split editor widget as well:

```
// add before the end of menu_linenumbers_callback
if (app_split_editor) {
    if (linenum_item->value()) {
        app_split_editor->linenumber_width(40);
    } else {
        app_split_editor->linenumber_width(0);
    }
    app_split_editor->redraw();
}
```

The word wrap feature is activated by calling `Fl_Text_Editor::wrap_mode()` with the parameters `Fl_Text_Display::WRAP_AT_BOUNDS` and 0. It's deactivated with `Fl_Text_Display::WRAP_NONE`. The implementation of the callback is the same as `menu_linenumbers_callback`.

1.7.10 Chapter 9: Split Editor

When editing long source code files, it can be really helpful to split the editor to view statements at the top of the text while adding features at the bottom of the text in a split text view.

FLTK can link multiple text editors to a single text buffer. Let's implement this now. This chapter will show you how to rearrange widgets in an existing widget tree.

Our initializer removes the main text editor from the widget tree and replaces it with an `Fl_Tile`. A tile can hold multiple widgets that can then be resized interactively by the user by clicking and dragging the divider between those widgets.

We start by replacing the editor widget with a tile group of the same size.

```
#include <FL/Fl_Tile.H>

Fl_Tile *app_tile = NULL;

void tut9_split_editor() {
    app_window->begin();
    app_tile = new Fl_Tile(app_editor->x(), app_editor->y(),
                          app_editor->w(), app_editor->h());
    app_window->remove(app_editor);
}
```

Next we add our existing editor as the first child of the tile and create another text editor `app_split_editor` as the second child of the tile, but it's hidden for now with a height of zero pixels.

Note

Creating the new `Fl_Tile` also calls `Fl_Tile::begin()`.

Adding `app_editor` to the tile would have also removed it from `app_window`, so `app_window->remove(app_editor)` in the code above is not really needed, but illustrates what we are doing.

```
app_tile->add(app_editor);
app_split_editor = new Fl_Text_Editor(app_tile->x(), app_tile->y()+app_tile->h(),
                                     app_tile->w(), 0);
app_split_editor->buffer(app_text_buffer);
app_split_editor->textfont(FL_COURIER);
app_split_editor->hide();
```

Now we clean up after ourselves and make sure that the resizables are all set correctly. Lastly, we add a menu item with a callback.

```
app_tile->end();
app_tile->size_range(0, 25, 25);
app_tile->size_range(1, 25, 25);
app_window->end();
app_window->resizable(app_tile);
app_tile->resizable(app_editor);
app_menu_bar->add("Window/Split", FL_COMMAND+'i', menu_split_callback, NULL, FL_MENU_TOGGLE);
}
```

Now with all widgets in place, the callback's job is to show and resize, or hide and resize the split editor. We can implement that like here:

```
void menu_split_callback(Fl_Widget* w, void*) {
    Fl_Menu_Bar* menu = static_cast<Fl_Menu_Bar*>(w);
    const Fl_Menu_Item* splitview_item = menu->mvalue();
    if (splitview_item->value()) {
        int h_split = app_tile->h()/2;
        app_editor->size(app_tile->w(), h_split);
        app_split_editor->resize(app_tile->x(), app_tile->y() + h_split,
                               app_tile->w(), app_tile->h() - h_split);
        app_split_editor->show();
    } else {
        app_editor->size(app_tile->w(), app_tile->h());
        app_split_editor->resize(app_tile->x(), app_tile->y()+app_tile->h(),
                               app_tile->w(), 0);
        app_split_editor->hide();
    }
    app_tile->resizable(app_editor);
    app_tile->init_sizes();
    app_tile->redraw();
}
```

1.7.11 Chapter 10: Syntax Highlighting

Chapter 10 adds a lot of code to implement "C" language syntax highlighting. Not all code is duplicated here in the documentation. Please check out `test/editor.cxx` for all the details.

The `Fl_Text_Editor` widget supports highlighting of text with different fonts, colors, and sizes. The implementation is based on the excellent `NEdit` text editor core, from <https://sourceforge.net/projects/nedit/>, which uses a parallel "style" buffer which tracks the font, color, and size of the text that is drawn.

Styles are defined using the `Fl_Text_Display::Style_Table_Entry` structure defined in `<FL/Fl_Text_Display.H>`:

```
struct Style_Table_Entry {
    Fl_Color color;
    Fl_Font font;
    int size;
    unsigned attr;
};
```

The `color` member sets the color for the text, the `font` member sets the FLTK font index to use, and the `size` member sets the pixel size of the text. The `attr` member is currently not used.

For our text editor we'll define 7 styles for plain code, comments, keywords, and preprocessor directives:

```
Fl_Text_Display::Style_Table_Entry styletable[] = {    // Style table
{ FL_BLACK,      FL_COURIER,      FL_NORMAL_SIZE }, // A - Plain
{ FL_DARK_GREEN, FL_COURIER_ITALIC, FL_NORMAL_SIZE }, // B - Line comments
{ FL_DARK_GREEN, FL_COURIER_ITALIC, FL_NORMAL_SIZE }, // C - Block comments
{ FL_BLUE,       FL_COURIER,      FL_NORMAL_SIZE },  // D - Strings
{ FL_DARK_RED,   FL_COURIER,      FL_NORMAL_SIZE },  // E - Directives
{ FL_DARK_RED,   FL_COURIER_BOLD, FL_NORMAL_SIZE },  // F - Types
{ FL_BLUE,       FL_COURIER_BOLD, FL_NORMAL_SIZE }   // G - Keywords
};
```

You'll notice that the comments show a letter next to each style - each style in the style buffer is referenced using a character starting with the letter 'A'.

You call the `highlight_data()` method to associate the style data and buffer with the text editor widget:

```
Fl_Text_Buffer *app_style_buffer;

app_editor->highlight_data(app_style_buffer, styletable,
                          sizeof(styletable) / sizeof(styletable[0]),
                          'A', style_unfinished_cb, 0);
```

Finally, you need to add a callback to the main text buffer so that changes to the text buffer are mirrored in the style buffer:

```
app_text_buffer->add_modify_callback(style_update, app_editor);
```

The `style_update()` function, like the `change_cb()` function described earlier, is called whenever text is added or removed from the text buffer. It mirrors the changes in the style buffer and then updates the style data as necessary:

```
//
// 'style_update()' - Update the style buffer...
//

void
style_update(int      pos,           // I - Position of update
             int      nInserted,    // I - Number of inserted chars
             int      nDeleted,     // I - Number of deleted chars
             int      nRestyled,    // I - Number of restyled chars
             const char *deletedText, // I - Text that was deleted
             void      *cbArg) {    // I - Callback data

    int start,                      // Start of text
        end;                       // End of text
    char last,                      // Last style on line
        *style,                    // Style data
        *text;                     // Text data

    // If this is just a selection change, just unselect the style buffer...
    if (nInserted == 0 && nDeleted == 0) {
        app_style_buffer->unselect();
        return;
    }

    // Track changes in the text buffer...
    if (nInserted > 0) {
        // Insert characters into the style buffer...
        style = new char[nInserted + 1];
        memset(style, 'A', nInserted);
        style[nInserted] = '\0';

        app_style_buffer->replace(pos, pos + nDeleted, style);
        delete[] style;
    } else {
        // Just delete characters in the style buffer...
        app_style_buffer->remove(pos, pos + nDeleted);
    }

    // Select the area that was just updated to avoid unnecessary
    // callbacks...
    app_style_buffer->select(pos, pos + nInserted - nDeleted);

    // Re-parse the changed region; we do this by parsing from the
    // beginning of the line of the changed region to the end of
    // the line of the changed region... Then we check the last
    // style character and keep updating if we have a multi-line
    // comment character...
    start = app_text_buffer->line_start(pos);
    end   = app_text_buffer->line_end(pos + nInserted - nDeleted);
    text  = app_text_buffer->text_range(start, end);
    style = app_style_buffer->text_range(start, end);
```

```

last = style[end - start - 1];

style_parse(text, style, end - start);

app_style_buffer->replace(start, end, style);
((Fl_Text_Editor *)cbArg)->redisplay_range(start, end);

if (last != style[end - start - 1]) {
    // The last character on the line changed styles, so reparse the
    // remainder of the buffer...
    free(text);
    free(style);

    end = app_text_buffer->length();
    text = app_text_buffer->text_range(start, end);
    style = app_style_buffer->text_range(start, end);

    style_parse(text, style, end - start);

    app_style_buffer->replace(start, end, style);
    ((Fl_Text_Editor *)cbArg)->redisplay_range(start, end);
}

free(text);
free(style);
}

```

The `style_parse()` function scans a copy of the text in the buffer and generates the necessary style characters for display. It assumes that parsing begins at the start of a line:

```

//
// 'style_parse()' - Parse text and produce style data.
//

void
style_parse(const char *text,
            char *style,
            int length) {
    char current;
    int col;
    int last;
    char buf[255],
        *bufptr;
    const char *temp;

    for (current = *style, col = 0, last = 0; length > 0; length --, text++) {
        if (current == 'A') {
            // Check for directives, comments, strings, and keywords...
            if (col == 0 && *text == '#') {
                // Set style to directive
                current = 'E';
            } else if (strncmp(text, "//", 2) == 0) {
                current = 'B';
            } else if (strncmp(text, "/*", 2) == 0) {
                current = 'C';
            } else if (strncmp(text, "\\\"", 2) == 0) {
                // Quoted quote...
                *style++ = current;
                *style++ = current;
                text++;
                length--;
                col += 2;
                continue;
            } else if (*text == '\"') {
                current = 'D';
            } else if (!last && islower(*text)) {
                // Might be a keyword...
                for (temp = text, bufptr = buf;
                     islower(*temp) && bufptr < (buf + sizeof(buf) - 1);
                     *bufptr++ = *temp++);

                if (!islower(*temp)) {
                    *bufptr = '\\0';

                    bufptr = buf;

                    if (bsearch(&bufptr, code_types,
                               sizeof(code_types) / sizeof(code_types[0]),
                               sizeof(code_types[0]), compare_keywords)) {
                        while (text < temp) {
                            *style++ = 'F';
                            text++;
                            length--;
                            col++;
                        }

                        text--;

```

```

        length ++;
        last = 1;
        continue;
    } else if (bsearch(&bufptr, code_keywords,
                     sizeof(code_keywords) / sizeof(code_keywords[0]),
                     sizeof(code_keywords[0]), compare_keywords)) {
        while (text < temp) {
            *style++ = 'G';
            text ++;
            length --;
            col ++;
        }

        text --;
        length ++;
        last = 1;
        continue;
    }
}

} else if (current == 'C' && strcmp(text, "*/", 2) == 0) {
    // Close a C comment...
    *style++ = current;
    *style++ = current;
    text ++;
    length --;
    current = 'A';
    col += 2;
    continue;
} else if (current == 'D') {
    // Continuing in string...
    if (strcmp(text, "\\\"", 2) == 0) {
        // Quoted end quote...
        *style++ = current;
        *style++ = current;
        text ++;
        length --;
        col += 2;
        continue;
    } else if (*text == '\\') {
        // End quote...
        *style++ = current;
        col ++;
        current = 'A';
        continue;
    }
}

// Copy style info...
if (current == 'A' && (*text == '{' || *text == '}')) *style++ = 'G';
else *style++ = current;
col ++;

last = isalnum(*text) || *text == '.';

if (*text == '\n') {
    // Reset column and possibly reset the style
    col = 0;
    if (current == 'B' || current == 'E') current = 'A';
}
}
}

```

1.8 Drawing Things in FLTK

This chapter covers the drawing functions that are provided with FLTK.

1.8.1 When Can You Draw Things in FLTK?

There are only certain places you can execute FLTK code that draws to the computer's display. Calling these functions at other places will result in undefined behavior!

- The most common place is inside the virtual `Fl_Widget::draw()` method. To write code here, you must subclass one of the existing `Fl_Widget` classes and implement your own version of `draw()`.

- You can also create custom `boxtypes` and `labeltypes`. These involve writing small procedures that can be called by existing `FL_Widget::draw()` methods. These "types" are identified by an 8-bit index that is stored in the widget's `box()`, `labeltype()`, and possibly other properties.
- You can call `FL_Window::make_current()` to do incremental update of a widget. Use `FL_Widget::window()` to find the window.

In contrast, code that draws to other drawing surfaces than the display (i.e., instances of derived classes of the `FL_Surface_Device` class, except `FL_Display_Device`, such as `FL_Printer` and `FL_Copy_Surface`) can be executed at any time as follows:

1. Make your surface the new current drawing surface calling the `FL_Surface_Device::push_current(FL_Surface_Device*)` function.
2. Make a series of calls to any of the drawing functions described below; these will operate on the new current drawing surface;
3. Set the current drawing surface back to its previous state calling `FL_Surface_Device::pop_current()`.

1.8.2 What Units Do FLTK Functions Use?

Before version 1.4 all graphical quantities used by FLTK were in pixel units: a window of width 500 units was 500 pixels wide, a line of length 10 units was 10 pixels long, lines of text written using a 14-point font were 14 pixels below each other. This organization is not sufficient to support GUI apps that can be drawn on screens of varying pixel density, especially on High-DPI screens, because widgets become very small and text becomes unreadable.

FLTK version 1.4 introduces a new feature, a screen-specific **scale factor** which is a float number with a typical value in the 1-2.5 range and is used as follows: any graphical element with an FLTK value of v units is drawn on the screen with $v * scale$ units. Thus, a window with width 500 units is $500 * scale$ pixels wide, a line of length 10 units is $10 * scale$ pixels long, lines of text written using a 14-point font are $14 * scale$ pixels below each other. Consider a system with two screens, one with regular DPI and one with a twice higher DPI. If the first screen's scale factor is set to 1 and that of the second screen to 2, the GUI of any FLTK app appears equally sized on the two screens.

FLTK uses several units to measure graphical elements:

- All quantities used by the public FLTK API to measure graphical elements (e.g., window widths, line lengths, font sizes, clipping regions, image widths and heights) are in **FLTK units** except if it's explicitly documented another unit is used. FLTK units are both platform- and DPI-independent. An example of FLTK API using another unit is `FL_Gl_Window::pixel_w()`.

- Just before drawing to a screen, the library internally multiplies all quantities expressed in FLTK units by the current value of the scale factor for the screen in use and obtains quantities in **drawing units**. The current scale factor value, for an `FL_Window` named *window*, is given by

```
int nscreen = window->screen_num(); // the screen where window is mapped
float s = FL::screen_scale(nscreen); // this screen's scale factor
```

One drawing unit generally corresponds to one screen pixel ...

- ... but not on macOS and for retina displays, where one drawing unit corresponds to two pixels.
- ... and not with the Wayland platform, where one drawing unit may correspond to 1, 2, or 3 pixels according to the current value of the Wayland-defined, integer-valued scale factor.

At application start time, FLTK attempts to detect the adequate scale factor value for each screen of the system. Here is how that's done under the [X11](#), [Windows](#), and [Wayland](#) platforms. If the resulting scale factor is not satisfactory, and also under the macOS platform, it's possible to set the `FLTK_SCALING_FACTOR` environmental variable to the desired numerical value (e.g., 1.75) and any FLTK app will start scaled with that value. Furthermore, it's possible to change the scale factor value of any screen at run time with `ctrl/+/-/0/` keystrokes which enlarge, shrink, and reset, respectively, all FLTK windows on a screen and their content. Under macOS, the corresponding GUI scaling shortcuts are `cmd/+/-/0/`.

GUI rescaling involves also image drawing: the screen area covered by the drawn image contains a number of pixels that grows with the scale factor. When FLTK draws images, it maps the image data (the size of these data is given by `Fl_Image::data_w()` and `Fl_Image::data_h()`) to the screen area whose size (in FLTK units) is given by `Fl_Image::w()` and `Fl_Image::h()`. How exactly such mapping is performed depends on the image type, the platform and some hardware features. The most common case for `Fl_RGB_Image`'s is that FLTK uses a scaled drawing system feature that directly maps image data to screen pixels. An important feature of FLTK for image drawing is the `Fl_Image::scale()` member function, new in FLTK version 1.4. This function controls the image drawing size (in FLTK units, given by `Fl_Image::w()` and `Fl_Image::h()`) independently from the size of the image data (given by `Fl_Image::data_w()` and `Fl_Image::data_h()`). An image with large enough data size can thus be drawn at the full resolution of the screen even when the screen area covered by the image grows following the GUI scale factor.

The `Fl_Image_Surface` class is intended to create an `Fl_RGB_Image` from a series of FLTK drawing operations. The `Fl_Image_Surface` constructor allows to control whether the size in pixels of the resulting image matches the FLTK units used when performing drawing operations, or matches the number of pixels corresponding to these FLTK units given the current value of the scale factor. The first result is obtained with `new Fl_Image_Surface(w, h)`, the second with `new Fl_Image_Surface(w, h, 1)`.

When drawing to `Fl_Printer` or `Fl_PostScript_File_Device`, the drawing unit is initially one point, that is, 1/72 of an inch. This unit is changed by calls to `Fl_Paged_Device::scale()`.

1.8.3 Drawing Functions

To use the drawing functions you must first include the `<FL/fl_draw.H>` header file. FLTK provides the following types of drawing functions:

- [Boxes](#)
- [Clipping](#)
- [Colors](#)
- [Color Contrast](#)
- [Line Dashes and Thickness](#)
- [Drawing Fast Shapes](#)
- [Drawing Complex Shapes](#)
- [Drawing Text](#)
- [Fonts](#)
- [Character Encoding](#)
- [Drawing Overlays](#)
- [Drawing Images](#)
- [Direct Image Drawing](#)
- [Direct Image Reading](#)
- [Image Classes](#)
- [Offscreen Drawing](#)

1.8.3.1 Boxes

FLTK provides three functions that can be used to draw boxes for buttons and other UI controls. Each function uses the supplied upper-lefthand corner and width and height to determine where to draw the box.

```
void fl_draw_box(FL_Boxtype b, int x, int y, int w, int h, FL_Color c)
```

The `fl_draw_box()` function draws a standard boxtype `b` in the specified color `c`.

```
void fl_frame(const char *s, int x, int y, int w, int h)
void fl_frame2(const char *s, int x, int y, int w, int h)
```

The `fl_frame()` and `fl_frame2()` functions draw a series of line segments around the given box. The string `s` must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The results of calling these functions with a string that is not a multiple of 4 characters in length are undefined.

The only difference between `fl_frame()` and `fl_frame2()` is the order of the line segments:

- For `fl_frame()` the order of each set of 4 characters is: top, left, bottom, right.
- For `fl_frame2()` the order of each set of 4 characters is: bottom, right, top, left.

Note that `fl_frame(FL_Boxtype b)` is described in the [Box Types](#) section.

1.8.3.2 Clipping

You can limit all your drawing to a rectangular region by calling `fl_push_clip()`, and put the drawings back by using `fl_pop_clip()`. This rectangle is measured in [FLTK units](#) and is unaffected by the current transformation matrix.

In addition, the system may provide clipping when updating windows which may be more complex than a simple rectangle.

```
void fl_push_clip(int x, int y, int w, int h)
void fl_clip(int x, int y, int w, int h)
```

Intersect the current clip region with a rectangle and push this new region onto the stack.

The `fl_clip()` version is deprecated and will be removed from future releases.

```
void fl_push_no_clip()
```

Pushes an empty clip region on the stack so nothing will be clipped.

```
void fl_pop_clip()
```

Restore the previous clip region.

Note: You must call `fl_pop_clip()` once for every time you call `fl_push_clip()`. If you return to FLTK with the clip stack not empty unpredictable results occur.

```
int fl_not_clipped(int x, int y, int w, int h)
```

Returns non-zero if any of the rectangle intersects the current clip region. If this returns 0 you don't have to draw the object.

Note: Under X this returns 2 if the rectangle is partially clipped, and 1 if it is entirely inside the clip region.

```
int fl_clip_box(int x, int y, int w, int h, int &X, int &Y, int &W, int &H)
```

Intersect the rectangle `x, y, w, h` with the current clip region and returns the bounding box of the result in `X, Y, W, H`. Returns non-zero if the resulting rectangle is different than the original. This can be used to limit the necessary drawing to a rectangle. `W` and `H` are set to zero if the rectangle is completely outside the region.

```
void fl_clip_region(Fl_Region r)  
Fl_Region fl_clip_region()
```

Replace the top of the clip stack with a clipping region of any shape. `Fl_Region` is an operating system specific type. The second form returns the current clipping region.

1.8.3.3 Colors

FLTK manages colors as 32-bit unsigned integers, encoded as RGBA. When the "RGB" bytes are non-zero, the value is treated as RGB. If these bytes are zero, the "I" byte will be used as an index into the colormap. Colors with both "RGB" set and an "I" > 0 are reserved for special use.

Values from 0 to 255, i.e. the "I" index value, represent colors from the FLTK standard colormap and are allocated as needed on screens without TrueColor support. The `Fl_Color` enumeration type defines the standard colors and color cube for the first 256 colors. All of these are named with symbols in [<FL/Enumerations.H>](#). Example:

Figure 1.25 FLTK default colormap (FI_Color 0x00 - 0xff)

Color values greater than 255 are treated as 24-bit RGB values. These are mapped to the closest color supported by the screen, either from one of the 256 colors in the FLTK colormap or a direct RGB value on TrueColor screens.

```
FI_Color fl_rgb_color(uchar r, uchar g, uchar b)
FI_Color fl_rgb_color(uchar grayscale)
```

Generate `FI_Color` out of specified 8-bit RGB values or one 8-bit grayscale value.

```
void fl_color(FI_Color c)
void fl_color(int c)
```

Sets the color for all subsequent drawing operations. Please use the first form: the second form is only provided for back compatibility.

For colormapped displays, a color cell will be allocated out of `fl_colormap` the first time you use a color. If the colormap fills up then a least-squares algorithm is used to find the closest color.

```
FI_Color fl_color()
```

Returns the last color that was set using `fl_color()`. This can be used for state save/restore.

```
void fl_color(uchar r, uchar g, uchar b)
```

Set the color for all subsequent drawing operations. The closest possible match to the RGB color is used. The RGB color is used directly on TrueColor displays. For colormap visuals the nearest index in the gray ramp or color cube is used.

```
unsigned Fl::get_color(Fl_Color i)
void Fl::get_color(Fl_Color i, uchar &red, uchar &green, uchar &blue)
```

Generate RGB values from a colormap index value *i*. The first returns the RGB as a 32-bit unsigned integer, and the second decomposes the RGB into three 8-bit values.

```
Fl::get_system_colors()
Fl::foreground()
Fl::background()
Fl::background2()
```

The first gets color values from the user preferences or the system, and the other routines are used to apply those values.

```
Fl::own_colormap()
Fl::free_color(Fl_Color i, int overlay)
Fl::set_color(Fl_Color i, unsigned c)
```

`Fl::own_colormap()` is used to install a local colormap [X11 only].

`Fl::free_color()` and `Fl::set_color()` are used to remove and replace entries from the colormap.

There are two predefined graphical interfaces for choosing colors. The function `fl_show_colormap()` shows a table of colors and returns an `Fl_Color` index value. The `Fl_Color_Chooser` widget provides a standard RGB color chooser.

As the `Fl_Color` encoding maps to a 32-bit unsigned integer representing RGBI, it is also possible to specify a color using a hex constant as a color map index:

```
// COLOR MAP INDEX
color(0x000000II)
    ----- |
    |       |
    |       |
    |       | Color map index (8 bits)
    |       | Must be zero

button->color(0x000000ff);           // colormap index #255 (FL_WHITE)
```

or specify a color using a hex constant for the RGB components:

```
// RGB COLOR ASSIGNMENTS
color(0xRRGGBB00)
    | | | |
    | | | Must be zero
    | | Blue (8 bits)
    | Green (8 bits)
    Red (8 bits)

button->color(0xff000000);           // RGB: red
button->color(0x00ff0000);           // RGB: green
button->color(0x0000ff00);           // RGB: blue
button->color(0xffffffff00);         // RGB: white
```

Note

If TrueColor is not available, any RGB colors will be set to the nearest entry in the colormap.

1.8.3.4 Color Contrast

Although these are not real "drawing" functions, creating readable contrast is essential in a good GUI design. FLTK tries to help with this by providing [fl_contrast\(\)](#) and related functions.

The basic function is [Fl_Color fl_contrast\(Fl_Color fg, Fl_Color bg, int context, int size\);](#)

The parameters `context` and `size` are optional and reserved for future use (since FLTK 1.4.0).

The return value can be used to substitute the foreground color `fg` used for drawing (usually the "text" or "label" color) on a particular background color `bg` with either black (FL_BLACK) or white (FL_WHITE). This is useful if the background color is not known or can be changed by the user or a system "theme".

FLTK calculates the contrast between `fg` and `bg` and returns the same color (`fg`) if the contrast is considered sufficient or one of FL_BLACK or FL_WHITE if the contrast of the given foreground color would be insufficient. Then either FL_BLACK or FL_WHITE is chosen, whichever has the higher contrast with the background color.

Example, may be used in a widget's `draw()` method:

```
Fl_Color bg = color();           // background color of the widget
Fl_Color fg = FL_BLUE;          // the chosen foreground (drawing) color
fl_color(fl_contrast(fg, bg));   // set the drawing color
fl_rect(..);                    // draw a rectangle with sufficient contrast
```

FLTK 1.4.0 introduced a new contrast algorithm which is superior to the one used up to FLTK 1.3.x. You can use

[fl_contrast_mode\(FL_CONTRAST_LEGACY\);](#)

early in your program to select the old behavior if you really need strict backwards compatibility. This is discouraged because the new algorithm is much better with regard to human contrast perception. The default mode since FLTK 1.4.0 is

[fl_contrast_mode\(FL_CONTRAST_CIELAB\);](#)

For more info please see the linked documentation of these functions.

Additionally the old and new contrast calculations can be fine tuned with the new function (since 1.4.0)

[fl_contrast_level\(int level\);](#)

This is not recommended but can be useful for some border cases. Please refer to the documentation of [fl_contrast_level\(\)](#).

Finally, developers can define their own contrast calculation function with

[void fl_contrast_function\(Fl_Contrast_Function *f\);](#)

Please see the documentation for details.

1.8.3.5 Line Dashes and Thickness

FLTK supports drawing of lines with different styles and widths.

```
void fl_line_style(int style, int width, char* dashes)
```

FL_SOLID		FL_CAP_FLAT	
FL_DASH		FL_CAP_ROUND	
FL_DOT		FL_CAP_SQUARE	
FL_DASHDOT		FL_JOIN_MITER	
FL_DASHDOTDOT		FL_JOIN_ROUND	
		FL_JOIN_BEVEL	

Figure 1.26 fl_line_style() styles

Set how to draw lines (the "pen"). If you change this it is your responsibility to set it back to the default with `fl_line_style(0)`.

`style` is a bitmask which is a bitwise-OR of the following values. If you don't specify a dash type you will get a solid line. If you don't specify a cap or join type you will get a system-defined default of whatever value is fastest.

- `FL_SOLID` solid line
- `FL_DASH` 75% dashed line
- `FL_DOT` 50% pixel dotted
- `FL_DASHDOT` dash / dot pattern
- `FL_DASHDOTDOT` dash / two dot pattern
- `FL_CAP_FLAT` end is flat
- `FL_CAP_ROUND` end is round
- `FL_CAP_SQUARE` extends past end point 1/2 line width
- `FL_JOIN_MITER` line join extends to a point
- `FL_JOIN_ROUND` line join is rounded
- `FL_JOIN_BEVEL` line join is flat (tidied)

`width` is the number of [FLTK units](#) thick to draw the lines. Zero results in the system-defined default, which on both X and Windows is somewhat different and nicer than 1.

`dashes` is a pointer to an array of dash lengths, measured in [FLTK units](#). The first location is how long to draw a solid portion, the next is how long to draw the gap, then the solid, etc. It is terminated with a zero-length entry. A `NULL` pointer or a zero-length array results in a solid line. Odd array sizes are not supported and result in undefined behavior.

Note

- Full functionality is not available under Windows 95, 98, and Me due to the reduced drawing functionality these operating systems provide.
- Because of how line styles are implemented on Windows systems, you *must* set the line style *after* setting the drawing color. If you set the color after the line style you will lose the line style settings!
- The dashes array does not work under Windows 95, 98, or Me, since those operating systems do not support complex line styles.

1.8.3.6 Drawing Fast Shapes

These functions are used to draw almost all the FLTK widgets. They draw on exact pixel boundaries and are as fast as possible. Their behavior is duplicated exactly on all platforms FLTK is ported. It is undefined whether these are affected by the [transformation matrix](#), so you should only call these while the matrix is set to the identity matrix (the default).

```
void fl_point(int x, int y)
```

Draw a single pixel at the given coordinates.

```
void fl_rectf(int x, int y, int w, int h)
void fl_rectf(int x, int y, int w, int h, FL_Color c)
```

Color a rectangle that exactly fills the given bounding box.

```
void fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)
```

Color a rectangle with "exactly" the passed `r, g, b` color. On screens with less than 24 bits of color this is done by drawing a solid-colored block using [fl_draw_image\(\)](#) so that the correct color shade is produced.

```
void fl_rect(int x, int y, int w, int h)
void fl_rect(int x, int y, int w, int h, FL_Color c)
```

Draw a 1-pixel border *inside* this bounding box.

```
void fl_rounded_rect(int x, int y, int w, int h, int radius) void fl_rounded_rectf(int x, int y, int w, int h, int radius)
```

Draw an outlined or filled rectangle with rounded corners.

```
void fl_line(int x, int y, int x1, int y1)
void fl_line(int x, int y, int x1, int y1, int x2, int y2)
```

Draw one or two lines between the given points.

```
void fl_loop(int x, int y, int x1, int y1, int x2, int y2)
void fl_loop(int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
```

Outline a 3 or 4-sided polygon with lines.

```
void fl_polygon(int x, int y, int x1, int y1, int x2, int y2)
void fl_polygon(int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
```

Fill a 3 or 4-sided polygon. The polygon must be convex.

```
void fl_xyline(int x, int y, int x1)
void fl_xyline(int x, int y, int x1, int y2)
void fl_xyline(int x, int y, int x1, int y2, int x3)
```

Draw horizontal and vertical lines. A horizontal line is drawn first, then a vertical, then a horizontal.

```
void fl_yxline(int x, int y, int y1)
void fl_yxline(int x, int y, int y1, int x2)
void fl_yxline(int x, int y, int y1, int x2, int y3)
```

Draw vertical and horizontal lines. A vertical line is drawn first, then a horizontal, then a vertical.

```
void fl_arc(int x, int y, int w, int h, double a1, double a2)
void fl_pie(int x, int y, int w, int h, double a1, double a2)
```

Draw ellipse sections using integer coordinates. These functions match the rather limited circle drawing code provided by X and Windows. The advantage over using `fl_arc()` with floating point coordinates is that they are faster because they often use the hardware, and they draw much nicer small circles, since the small sizes are often hard-coded bitmaps.

If a complete circle is drawn it will fit inside the passed bounding box. The two angles are measured in degrees counter-clockwise from 3'o'clock and are the starting and ending angle of the arc, `a2` must be greater or equal to `a1`.

Figure 1.27 `fl_pie()` and `fl_arc()`

`fl_arc()` draws a series of lines to approximate the arc. Notice that the integer version of `fl_arc()` has a different number of arguments to the other `fl_arc()` function described later in this chapter.

`fl_pie()` draws a filled-in pie slice. This slice may extend outside the line drawn by `fl_arc()`; to avoid this use `w-1` and `h-1`.

```
void fl_scroll(int X, int Y, int W, int H, int dx, int dy, void (draw_area)(void, int,int,int,int), void* data)
```

Scroll a rectangle and draw the newly exposed portions. The contents of the rectangular area is first shifted by `dx` and `dy` FLTK units. The callback is then called for every newly exposed rectangular area,

1.8.3.7 Drawing Complex Shapes

The complex drawing functions let you draw arbitrary shapes with 2-D linear transformations. The functionality matches that found in the Adobe® PostScript™ language. The exact pixels that are filled are less defined than for the fast drawing functions so that FLTK can take advantage of drawing hardware. On both X and Windows the transformed vertices are rounded to integers before drawing the line segments: this severely limits the accuracy of these functions for complex graphics, so use OpenGL when greater accuracy and/or performance is required.

```
void fl_load_matrix(double a,double b,double c,double d,double x,double y) void fl_load_identity()
```

Set the current transformation.

```
void fl_push_matrix()
void fl_pop_matrix()
```

Save and restore the current transformation. The maximum depth of the stack is 32 entries.

```
void fl_scale(double x,double y)
void fl_scale(double x)
void fl_translate(double x,double y)
void fl_rotate(double d)
void fl_mult_matrix(double a,double b,double c,double d,double x,double y)
```

Concatenate another transformation onto the current one. The rotation angle is in degrees (not radians) and is counter-clockwise.

```
double fl_transform_x(double x, double y)
double fl_transform_y(double x, double y)
double fl_transform_dx(double x, double y)
double fl_transform_dy(double x, double y)
void fl_transformed_vertex(double xf, double yf)
```

Transform a coordinate or a distance using the current transformation matrix. After transforming a coordinate pair, it can be added to the vertex list without any further translations using `fl_transformed_vertex()`.

```
void fl_begin_points()
void fl_end_points()
```

Start and end drawing a list of points. Points are added to the list with `fl_vertex()`.

```
void fl_begin_line()
void fl_end_line()
```

Start and end drawing lines.

```
void fl_begin_loop()
void fl_end_loop()
```

Start and end drawing a closed sequence of lines.

```
void fl_begin_polygon()
void fl_end_polygon()
```

Start and end drawing a convex filled polygon.

```
void fl_begin_complex_polygon()
void fl_gap()
void fl_end_complex_polygon()
```

Start and end drawing a complex filled polygon. This polygon may be concave, may have holes in it, or may be several disconnected pieces. Call `fl_gap()` to separate loops of the path. It is unnecessary but harmless to call `fl_gap()` before the first vertex, after the last one, or several times in a row.

`fl_gap()` should only be called between `fl_begin_complex_polygon()` and `fl_end_complex_polygon()`. To outline the polygon, use `fl_begin_loop()` and replace each `fl_gap()` with a `fl_end_loop();fl_begin_loop()` pair.

Note: For portability, you should only draw polygons that appear the same whether "even/odd" or "non-zero" winding rules are used to fill them. Holes should be drawn in the opposite direction of the outside loop.

void `fl_vertex(double x,double y)`

Add a single vertex to the current path.

void `fl_curve(double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)`

Add a series of points on a Bézier curve to the path. The curve ends (and two of the points are) at `X0, Y0` and `X3, Y3`.

void `fl_arc(double x, double y, double r, double start, double end)`

Add a series of points to the current path on the arc of a circle; you can get elliptical paths by using `scale` and `rotate` before calling `fl_arc()`. The center of the circle is given by `x` and `y`, and `r` is its radius. `fl_arc()` takes `start` and `end` angles that are measured in degrees counter-clockwise from 3 o'clock. If `end` is less than `start` then it draws the arc in a clockwise direction.

Figure 1.28 `fl_arc(x,y,r,a1,a2)`

void `fl_circle(double x, double y, double r)`

`fl_circle(x, y, r)` is equivalent to `fl_arc(x, y, r, 0, 360)` but may be faster. It must be the *only* thing in the path: if you want a circle as part of a complex polygon you must use `fl_arc()`.

Note: `fl_circle()` draws incorrectly if the transformation is both rotated and non-square scaled.

1.8.3.8 Drawing Text

All text is drawn in the [current font](#). It is undefined whether this location or the characters are modified by the current transformation.

```
void fl_draw(const char *, int x, int y)
void fl_draw(const char *, int n, int x, int y)
```

Draw a nul-terminated string or an array of `n` bytes starting at the given location. In both cases, the text must be UTF-8 encoded. Text is aligned to the left and to the baseline of the font. To align to the bottom, subtract `fl_descent()` from `y`. To align to the top, subtract `fl_descent()` and add `fl_height()`. This version of `fl_draw()` provides direct access to the text drawing function of the underlying OS. It does not apply any special handling to control characters.

```
void fl_rtl_draw(const char *str, int n, int x, int y)
```

Draw a UTF-8 string of length `n` bytes right to left starting at the given `x, y` location.

```
void fl_draw(const char* str, int x, int y, int w, int h, FL_Align align, FL_Image* img, int draw_symbols, int spacing)
```

Fancy string drawing function which is used to draw all the labels. The string is formatted and aligned inside the passed box. Handles `\t` and `\n`, expands all other control characters to `^X`, and aligns inside or against the edges of the box described by `x, y, w` and `h`. See [FL_Widget::align\(\)](#) for values for `align`. The value `FL_ALIGN_INSIDE` is ignored, as this function always prints inside the box. Parameter `spacing` controls the space between text and image.

If `img` is provided and is not `NULL`, the image is drawn above or below the text as specified by the `align` value.

The `draw_symbols` argument specifies whether or not to look for symbol names starting with the "@" character.

```
void fl_measure(const char *str, int& w, int& h, int draw_symbols)
```

Measure how wide and tall the string will be when printed by the `fl_draw(...align)` function. This includes leading/trailing white space in the string, kerning, etc.

If the incoming `w` is non-zero it will wrap to that width.

This will probably give unexpected values unless you have called `fl_font()` explicitly in your own code. Refer to the full documentation for `fl_measure()` for details on usage and how to avoid common pitfalls.

See also

`fl_text_extents()` – measure the 'inked' area of a string

`fl_width()` – measure the width of a string or single character

`fl_height()` – measure the height of the [current font](#)

`fl_descent()` – the height of the descender for the [current font](#)

int `fl_height()`

Recommended minimum line spacing for the [current font](#). You can also just use the value of `size` passed to `fl_font()`.

See also

`fl_text_extents()`, `fl_measure()`, `fl_width()`, `fl_descent()`

int `fl_descent()`

Recommended distance above the bottom of a `fl_height()` tall box to draw the text at so it looks centered vertically in that box.

double `fl_width(const char* txt)`

double `fl_width(const char* txt, int n)`

double `fl_width(unsigned int unicode_char)`

Return the width of a nul-terminated string, a sequence of `n` characters, or a single character in the [current font](#).

See also

`fl_measure()`, `fl_text_extents()`, `fl_height()`, `fl_descent()`

void `fl_text_extents(const char* txt, int& dx, int& dy, int& w, int& h)`

Determines the minimum dimensions of a nul-terminated string, ie. the 'inked area'.

Given a string "txt" drawn using `fl_draw(txt, x, y)` you would determine its extents in [FLTK units](#) on the display using `fl_text_extents(txt, dx, dy, wo, ho)` such that a bounding box that exactly fits around the inked area of the text could be drawn with `fl_rect(x+dx, y+dy, wo, ho)`.

Refer to the full documentation for [fl_text_extents\(\)](#) for details on usage.

See also

[fl_measure\(\)](#), [fl_width\(\)](#), [fl_height\(\)](#), [fl_descent\(\)](#)

```
const char* fl_shortcut_label(int shortcut)
```

Unparse a shortcut value as used by [Fl_Button](#) or [Fl_Menu_Item](#) into a human-readable string like "Alt+N". This only works if the shortcut is a character key or a numbered function key. If the shortcut is zero an empty string is returned. The return value points at a static buffer that is overwritten with each call.

1.8.3.9 Fonts

FLTK supports a set of standard fonts based on the Times, Helvetica/Arial, Courier, and Symbol typefaces, as well as custom fonts that your application may load. Each font is accessed by an index into a font table.

Initially only the first 16 faces are filled in. There are symbolic names for them: `FL_HELVETICA`, `FL_TIMES`, `FL_COURIER`, and modifier values `FL_BOLD` and `FL_ITALIC` which can be added to these, and `FL_SYMBOL` and `FL_ZAPF_DINGBATS`. Faces greater than 255 cannot be used in [Fl_Widget](#) labels, since [Fl_Widget](#) stores the index as a byte.

One important thing to note about 'current font' is that there are so many paths through the GUI event handling code as widgets are partially or completely hidden, exposed and then re-drawn and therefore you can not guarantee that 'current font' contains the same value that you set on the other side of the event loop. Your value may have been superseded when a widget was redrawn. You are strongly advised to set the font explicitly before you draw any text or query the width and height of text strings, etc.

```
void fl_font(int face, int size)
```

Set the current font, which is then used by the routines described above. You may call this outside a draw context if necessary to call [fl_width\(\)](#), but on X this will open the display.

The font is identified by a *face* and a *size*. The size of the font is measured in [FLTK units](#) and not "points". Lines should be spaced *size* FLTK units apart or more.

```
int fl_font()
int fl_size()
```

Returns the face and size set by the most recent call to `fl_font(a, b)`. This can be used to save/restore the font.

1.8.3.10 Character Encoding

FLTK 1.3 and later versions expect all text in Unicode UTF-8 encoding. UTF-8 is ASCII compatible for the first 128 characters. International characters are encoded in multibyte sequences.

FLTK expects individual characters, characters that are not part of a string, in UCS-4 encoding, which is also ASCII compatible, but requires 4 bytes to store a Unicode character.

FLTK can draw accurately any Unicode-supported script for which the system contains relevant fonts. Under X11 platforms, this requires to build the library with the `FLTK_USE_PANGO` CMake option turned On (or with `configure --enable-pango`).

Plain text drawing starting at a user-given coordinate is well supported by FLTK, including for right-to-left scripts. Further text-related operations (i.e., selection, formatting, input, and editing) are functional with left-to-right scripts only.

For more information about character encodings, see the chapter on [Unicode and UTF-8 Support](#).

1.8.3.11 Drawing Overlays

These functions allow you to draw interactive selection rectangles without using the overlay hardware. FLTK will XOR a single rectangle outline over a window.

```
void fl_overlay_rect(int x, int y, int w, int h)
void fl_overlay_clear()
```

`fl_overlay_rect()` draws a selection rectangle, erasing any previous rectangle by XOR'ing it first. `fl_overlay_clear()` will erase the rectangle without drawing a new one.

Using these functions is tricky. You should make a widget with both a `handle()` and `draw()` method. `draw()` should call `fl_overlay_clear()` before doing anything else. Your `handle()` method should call `window()->make_current()` and then `fl_overlay_rect()` after `FL_DRAG` events, and should call `fl_overlay_clear()` after a `FL_RELEASE` event.

1.8.4 Drawing Images

To draw images, you can either do it directly from data in your memory, or you can create a [Fl_Image](#) object. The advantage of drawing directly is that it is more intuitive, and it is faster if the image data changes more often than it is redrawn. The advantage of using the object is that FLTK will cache translated forms of the image (on X it uses a server pixmap) and thus redrawing is *much* faster.

1.8.4.1 Direct Image Drawing

The behavior when drawing images when the current transformation matrix is not the identity is not defined, so you should only draw images when the matrix is set to the identity.

```
void fl_draw_image(const uchar *buf,int X,int Y,int W,int H,int D,int L)
void fl_draw_image_mono(const uchar *buf,int X,int Y,int W,int H,int D,int L)
```

Draw an 8-bit per color RGB or luminance image. The pointer points at the "r" data of the top-left pixel. Color data must be in *r, g, b* order. The top left corner is given by *X* and *Y* and the size of the image is given by *W* and *H*. *D* is the delta to add to the pointer between pixels, it may be any value greater or equal to 3, or it can be negative to flip the image horizontally. *L* is the delta to add to the pointer between lines (if 0 is passed it uses *W*D*). and may be larger than *W*D* to crop data, or negative to flip the image vertically.

It is highly recommended that you put the following code before the first `show()` of *any* window in your program to get rid of the dithering if possible:

```
Fl::visual (FL_RGB);
```

Gray scale (1-channel) images may be drawn. This is done if `abs(D)` is less than 3, or by calling `fl_draw_image_mono()`. Only one 8-bit sample is used for each pixel, and on screens with different numbers of bits for red, green, and blue only gray colors are used. Setting *D* greater than 1 will let you display one channel of a color image.

Note: The X version does not support all possible visuals. If FLTK cannot draw the image in the current visual it will abort. FLTK supports any visual of 8 bits or less, and all common TrueColor visuals up to 32 bits.

```
typedef void (*Fl_Draw_Image_Cb)(void *data,int x,int y,int w,uchar *buf)
void fl_draw_image(Fl_Draw_Image_Cb cb,void *data,int X,int Y,int W,int H,int D)
void fl_draw_image_mono(Fl_Draw_Image_Cb cb,void *data,int X,int Y,int W,int H,int D)
```

Call the passed function to provide each scan line of the image. This lets you generate the image as it is being drawn, or do arbitrary decompression of stored data, provided it can be decompressed to individual scan lines easily.

The callback is called with the `void*` user data pointer which can be used to point at a structure of information about the image, and the *x*, *y*, and *w* of the scan line desired from the image. 0,0 is the upper-left corner of the image, *not* *X*, *Y*. A pointer to a buffer to put the data into is passed. You must copy *w* pixels from scanline *y*, starting at pixel *x*, to this buffer.

Due to cropping, less than the whole image may be requested. So *x* may be greater than zero, the first *y* may be greater than zero, and *w* may be less than *W*. The buffer is long enough to store the entire *W*D* pixels, this is for convenience with some decompression schemes where you must decompress the entire line at once: decompress it into the buffer, and then if *x* is not zero, copy the data over so the *x*'th pixel is at the start of the buffer.

You can assume the `y`'s will be consecutive, except the first one may be greater than zero.

If `D` is 4 or more, you must fill in the unused bytes with zero.

```
int fl_draw_pixmap(char* const* data, int x, int y, FL_Color bg)
int fl_draw_pixmap(const char* const* cdata, int x, int y, FL_Color bg)
```

Draws XPM image data, with the top-left corner at the given position. The image is dithered on 8-bit displays so you won't lose color space for programs displaying both images and pixmaps. This function returns zero if there was any error decoding the XPM data.

To use an XPM, do:

```
#include "foo.xpm"
...
fl_draw_pixmap(foo, X, Y);
```

Transparent colors are replaced by the optional `FL_Color` argument. To draw with true transparency you must use the `FL_Pixmap` class.

```
int fl_measure_pixmap(char* const* data, int &w, int &h)
int fl_measure_pixmap(const char* const* cdata, int &w, int &h)
```

An XPM image contains the dimensions in its data. This function finds and returns the width and height. The return value is non-zero if the dimensions were parsed ok and zero if there was any problem.

1.8.4.2 Direct Image Reading

FLTK provides a single function for reading from the current window or off-screen buffer into a RGB(A) image buffer.

```
uchar* fl_read_image(uchar *p, int X, int Y, int W, int H, int alpha)
```

Read a RGB(A) image from the current window or off-screen buffer. The `p` argument points to a buffer that can hold the image and must be at least `W*H*3` bytes when reading RGB images and `W*H*4` bytes when reading RGBA images. If `NULL`, `fl_read_image()` will create an array of the proper size which can be freed using `delete[]`.

The `alpha` parameter controls whether an alpha channel is created and the value that is placed in the alpha channel. If 0, no alpha channel is generated.

1.8.4.3 Image Classes

FLTK provides a base image class called `FL_Image` which supports creating, copying, and drawing images of various kinds, along with some basic color operations. Images can be used as labels for widgets using the `image()` and `deimage()` methods or drawn directly. Images can be drawn scaled to any size, independently from the size of the image's data (see `FL_Image::scale()`).

The `FL_Image` class does almost nothing by itself, but is instead supported by three basic image types:

- `FL_Bitmap`
- `FL_Pixmap`
- `FL_RGB_Image`

The `FL_Bitmap` class encapsulates a mono-color bitmap image. The `draw()` method draws the image using the current drawing color.

The `FL_Pixmap` class encapsulates a colormapped image. The `draw()` method draws the image using the colors in the file, and masks off any transparent colors automatically.

The `FL_RGB_Image` class encapsulates a full-color (or grayscale) image with 1 to 4 color components. Images with an even number of components are assumed to contain an alpha channel that is used for transparency. The transparency provided by the `draw()` method is either a 24-bit blend against the existing window contents or a "screen door" transparency mask, depending on the platform and screen color depth.

char `fl_can_do_alpha_blending()`

`fl_can_do_alpha_blending()` will return 1, if your platform supports true alpha blending for RGBA images, or 0, if FLTK will use screen door transparency.

FLTK also provides several image classes based on the three standard image types for common file formats:

- `FL_GIF_Image`
- `FL_Anim_GIF_Image`
- `FL_JPEG_Image`
- `FL_PNG_Image`
- `FL_PNM_Image`
- `FL_XBM_Image`
- `FL_XPM_Image`
- `FL_SVG_Image`
- `FL_BMP_Image`
- `FL_ICO_Image`

Each of these image classes loads a named file of the corresponding format. The `FL_Shared_Image` class can be used to load any type of image file - the class examines the file and constructs an image of the appropriate type.

Finally, FLTK provides a special image class called `FL_Tiled_Image` to tile another image object in the specified area. This class can be used to tile a background image in a `FL_Group` widget, for example.

```
virtual FL_Image* FL_Image::copy()
virtual FL_Image* FL_Image::copy(int W, int H) const
```

The `copy()` method creates a copy of the image. The second form specifies the new size of the image - the image is resized using the nearest-neighbor algorithm (this is the default).

Note

As of FLTK 1.3.3 the image resizing algorithm can be changed. See [Fl_Image::RGB_scaling\(Fl_RGB_Scaling method\)](#)

virtual void [Fl_Image::draw\(int x, int y, int w, int h, int ox, int oy\)](#)

The `draw()` method draws the image object. `x, y, w, h` indicates the destination rectangle. `ox, oy, w, h` is the source rectangle. This source rectangle is copied to the destination. The source rectangle may extend outside the image, i.e. `ox` and `oy` may be negative and `w` and `h` may be bigger than the image, and this area is left unchanged.

Note

See exceptions for [Fl_Tiled_Image::draw\(\)](#) regarding arguments `ox`, `oy`, `w`, and `h`.

virtual void [Fl_Image::draw\(int x, int y\)](#)

Draws the image with the upper-left corner at `x, y`. This is the same as doing `img->draw(x, y, img->w(), img->h(), 0, 0)` where `img` is a pointer to any [Fl_Image](#) type.

1.8.5 Offscreen Drawing

Sometimes it can be very useful to generate a complex drawing in memory first and copy it to the screen at a later point in time. This technique can significantly reduce the amount of repeated drawing. Offscreen drawing functions are declared in [<FL/fl_draw.H>](#).

[Fl_Double_Window](#) uses offscreen rendering to avoid flickering on systems that don't support double-buffering natively.

FLTK can draw into an offscreen buffer at any time. There is no need to wait for an [Fl_Widget::draw\(\)](#) to occur.

Note

In FLTK 1.3.x and earlier versions all offscreen drawing functions described below were implemented as macros and created certain temporary variables to save context information. You needed to create local scope blocks with curly braces `{ ... }` if you used offscreen functions more than once in a function or method. This is no longer necessary since offscreen drawing is now implemented in real functions (no macros).

Example:

```
Fl_Offscreen oscr = fl_create_offscreen(120, 120);
fl_begin_offscreen(oscr);
fl_color(FL_WHITE);
fl_rectf(0, 0, 120, 120);
fl_end_offscreen();
// other code here
fl_begin_offscreen(oscr);
fl_color(FL_BLACK);
fl_rectf(10, 10, 100, 100);
fl_end_offscreen();
// other code here
fl_delete_offscreen(oscr);
```

[Fl_Offscreen fl_create_offscreen\(int w, int h\)](#)

Create an RGB offscreen buffer containing as many pixels as in a screen area of size `w,h` [FLTK units](#).

```
void fl_delete_offscreen(FL_Offscreen)
```

Delete a previously created offscreen buffer. All drawings are lost.

```
void fl_begin_offscreen(FL_Offscreen)
```

Send all subsequent drawing commands to this offscreen buffer.

```
void fl_end_offscreen()
```

Quit sending drawing commands to this offscreen buffer.

```
void fl_copy_offscreen(int x, int y, int w, int h, FL_Offscreen osrc, int srcx, int srcy)
```

Copy a rectangular area of the size `w*h` from `srcx,srcy` in the offscreen buffer into the current drawing surface at `x,y`.

```
void fl_rescale_offscreen(FL_Offscreen &osrc)
```

Adapts the offscreen's size in pixels to a changed value of the scale factor while keeping the offscreen's graphical content.

1.9 Handling Events

This chapter discusses the FLTK event model and how to handle events in your program or widget.

1.9.1 The FLTK Event Model

Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application. Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to a `handle()` method that overrides the `FL_Widget::handle()` virtual method. Other information about the most recent event is stored in static locations and acquired by calling the [FL::event_*\(\) methods](#). This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the `handle()` method, for instance in a callback.

Event numbers can be converted to their actual names using the `fl_eventnames[]` array defined in `#include <FL/names.h>`; see next chapter for details.

In the next chapter, the `MyClass::handle()` example shows how to override the `FL_Widget::handle()` method to accept and process specific events.

1.9.2 Mouse Events

Classic mice provide two or three buttons:

- a primary (left) button, typically used to point and click on objects
- a secondary (right) button, typically used to open special menus etc.
- a middle button for other special events.

The primary and secondary mouse buttons can usually be inverted by system setup functions for left handed usage. FLTK always sends the mouse button number according to the "logical" mouse button, i.e. such a setup is transparent for application programmers.

The middle button was later replaced by a scroll wheel to allow scrolling text or other objects in a window or widget vertically. Pushing the scroll wheel down acts like pushing the middle mouse button.

If the scroll wheel is used to scroll while the Shift key is held, the scrolling direction is horizontal rather than vertical.

Some mice may even have a "scroll ball" or similar (touch) feature. These mice support horizontal and vertical scrolling simultaneously.

Newer mice add even more buttons, called "side buttons":

- a "back" button, typically used to "go back", e.g. in browsers
- a "forward" button, typically used to "go forward", e.g. in browsers

FLTK handles up to five buttons since version 1.3.10 across all supported platforms. Note that Windows doesn't support more than five buttons whereas other platforms may support more. FLTK ignores other buttons as long as they send "mouse button" events.

Some gaming mice with five or more buttons may send their button clicks as keyboard events which will be handled like normal text input by FLTK. This has not been tested though.

1.9.2.1 FL_PUSH

A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling `Fl::event_button()`. You find out the mouse position by calling `Fl::event_x()` and `Fl::event_y()`.

A widget indicates that it "wants" the mouse click by returning non-zero from its `handle()` method, as in the `MyClass::handle()` example. It will then become the `Fl::pushed()` widget and will get `FL_DRAG` and the matching `FL_RELEASE` events. If `handle()` returns zero then FLTK will try sending the `FL_PUSH` to another widget.

1.9.2.2 FL_DRAG

The mouse has moved with at least one button held down. The current button state is in `Fl::event_state()`. The mouse position is in `Fl::event_x()` and `Fl::event_y()`.

In order to receive `FL_DRAG` events, the widget must return non-zero when handling `FL_PUSH`.

Moving the mouse keeps sending `FL_DRAG` events as long as at least one button is held down. If any buttons are pushed and released during the drag operation FLTK sends `FL_PUSH` and `FL_RELEASE` events even while dragging. The current button status can be found in `Fl::event_state()` and in `Fl::event_buttons()`.

When the last button has been released FLTK sends `FL_MOVE` events again. Note: The button released last need not necessarily be the one that started the drag operation.

Since FLTK 1.4.0 dragging is supported for all five supported mouse buttons, for instance the user can drag the mouse while the "back" button is held down. Warning: This may or may not be compatible with other applications for drag-and-drop operations **between** applications and lead to unexpected behavior.

1.9.2.3 FL_RELEASE

A mouse button has been released. You can find out what button by calling `Fl::event_button()`.

In order to receive the `FL_RELEASE` event, the widget must return non-zero when handling `FL_PUSH`.

1.9.2.4 FL_MOVE

The mouse has moved without any mouse buttons held down. This event is sent to the `Fl::belowmouse()` widget.

In order to receive `FL_MOVE` events, the widget must return non-zero when handling `FL_ENTER`.

1.9.2.5 FL_MOUSEWHEEL

The user has moved the mouse wheel. The `Fl::event_dx()` and `Fl::event_dy()` methods can be used to find the amount to scroll horizontally (dx) and vertically (dy). On mice with a single scroll wheel holding the Shift key on the keyboard while scrolling sends horizontal scroll events.

1.9.3 Focus Events

1.9.3.1 FL_ENTER

The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its `handle()` method. It then becomes the `Fl::belowmouse()` widget and will receive `FL_MOVE` and `FL_LEAVE` events.

1.9.3.2 FL_LEAVE

The mouse has moved out of the widget.

In order to receive the `FL_LEAVE` event, the widget must return non-zero when handling `FL_ENTER`.

1.9.3.3 FL_FOCUS

This indicates an *attempt* to give a widget the keyboard focus.

If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its `handle()` method. It then becomes the `Fl::focus()` widget and gets `FL_KEYDOWN`, `FL_KEYUP`, and `FL_UNFOCUS` events.

The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check `Fl::event_key()` to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.

1.9.3.4 FL_UNFOCUS

This event is sent to the previous `Fl::focus()` widget when another widget gets the focus or the window loses focus.

1.9.4 Keyboard Events

1.9.4.1 FL_KEYBOARD, FL_KEYDOWN, FL_KEYUP

A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN, and both names are used interchangeably in this documentation.

The key can be found in `Fl::event_key()`. The text that the key should insert can be found with `Fl::event_text()` and its length is in `Fl::event_length()`.

If you use the key, then `handle()` should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event. FL_KEYBOARD events are also generated by the character palette/map.

To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events by returning 1. This way FLTK knows whether to bother sending your widget keyboard events. (Some widgets don't need them, e.g. `Fl_Box`.)

If you are writing a text-editing widget you may also want to call the `Fl::compose()` function to translate individual keystrokes into characters.

FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.

Todo Add details on how to detect repeating keys, since on some X servers a repeating key will generate both FL_KEYUP and FL_KEYDOWN, such that to tell if a key is held, you need `Fl::event_key(int)` to detect if the key is being held down during FL_KEYUP or not.

1.9.4.2 FL_SHORTCUT

If the `Fl::focus()` widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the `Fl::belowmouse()` widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes!

You can also make "global" shortcuts by using `Fl::add_handler()`. A global shortcut will work no matter what windows are displayed or which one has the focus.

Since version 1.4, FLTK has 3 default global shortcuts (`Ctrl+/-/0/` [`Cmd+/-/0/` under macOS]) that change the value of the GUI scaling factor. `Ctrl+` zooms-in all app windows of the focussed display (all displays under macOS); `Ctrl-` zooms-out these windows; `Ctrl 0` restores the initial value of the scaling factor. If any window of the display is fullscreen or maximized, scaling shortcuts have no effect. It's possible to deactivate FLTK's default scaling shortcuts with function `Fl::keyboard_screen_scaling()`.

Option `Fl::OPTION_SIMPLE_ZOOM_SHORTCUT` can facilitate the typing necessary to trigger the zoom-in operation with those keyboard layouts where character '+' is located in the shifted position of its key: when this option is On it's not necessary to press also the Shift key to zoom-in.

These scaling shortcuts are installed when the FLTK library opens the display. They have a lower priority than any shortcut defined in any menu and than any user-provided event handler (see `Fl::add_handler()`) installed after FLTK opened the display. Therefore, if a menu item of an FLTK app is given FL_COMMAND+'+' as shortcut, that item's callback rather than FLTK's default zooming-in routine is triggered when `Ctrl+` (`Cmd+` under macOS) is pressed.

FLTK sends the FL_ZOOM_EVENT when the scaling factor value changes, to which a callback can be associated with `Fl::add_handler()`. By default, FLTK displays the new scaling factor value in a yellow, transient window. This can be changed with option `Fl::OPTION_SHOW_SCALING`.

1.9.5 Widget Events

1.9.5.1 FL_DEACTIVATE

This widget is no longer active, due to `deactivate()` being called on it or one of its parents. Please note that although `active()` may still return true for this widget after receiving this event, it is only truly active if `active()` is true for both it and all of its parents. (You can use `active_r()` to check this).

1.9.5.2 FL_ACTIVATE

This widget is now active, due to `activate()` being called on it or one of its parents.

1.9.5.3 FL_HIDE

This widget is no longer visible, due to `hide()` being called on it or one of its parents, or due to a parent window being minimized. Please note that although `visible()` may still return true for this widget after receiving this event, it is only truly visible if `visible()` is true for both it and all of its parents. (You can use `visible_r()` to check this).

1.9.5.4 FL_SHOW

This widget is visible again, due to `show()` being called on it or one of its parents, or due to a parent window being restored. *A child `Fl_Window` will respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass `FL_SHOW` to the base class `handle()` method!*

Note

The events in this chapter ("Widget Events"), i.e. `FL_ACTIVATE`, `FL_DEACTIVATE`, `FL_SHOW`, and `FL_HIDE`, are the only events deactivated and invisible widgets can usually get, depending on their states. Under certain circumstances, there may also be `FL_LEAVE` or `FL_UNFOCUS` events delivered to deactivated or hidden widgets.

1.9.6 Clipboard Events

1.9.6.1 FL_PASTE

You should get this event some time after you call `Fl::paste()`. The contents of `Fl::event_text()` is the text to insert and the number of characters is in `Fl::event_length()`.

1.9.6.2 FL_SELECTIONCLEAR

The `Fl::selection_owner()` will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.

1.9.7 Drag and Drop Events

FLTK supports drag and drop of text and files from any application on the desktop to an FLTK widget. Text is transferred using UTF-8 encoding.

See [Fl::dnd\(\)](#) for drag and drop from an FLTK widget.

The drag and drop data is available in [Fl::event_text\(\)](#) at the concluding `FL_PASTE`. On some platforms, the event text is also available for the `FL_DND_*` events, however application must not depend on that behavior because it depends on the protocol used on each platform.

`FL_DND_*` events cannot be used in widgets derived from [Fl_Group](#) or [Fl_Window](#).

1.9.7.1 Dropped filenames

Files are received as a list of full path and file names.

- On some X11 platforms, files are received as a URL-encoded UTF-8 string, that is, non-ASCII bytes (and a few others such as space and %) are replaced by the 3 bytes "%XY" where XY are the byte's hexadecimal value. The [fl_decode_uri\(\)](#) function can be used to transform in-place the received string into a proper UTF-8 string. On these platforms, strings corresponding to dropped files are further prepended by `file://` (or other prefixes such as `computer://`).
- Other X11 situations put all dropped filenames in a single line, separated by spaces.
- On non-X11 platforms, including Wayland, files dropped are received one pathname per line, with no `'\n'` after the last pathname.

1.9.7.2 FL_DND_ENTER

The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive `FL_DND_DRAG`, `FL_DND_LEAVE` and `FL_DND_RELEASE` events.

1.9.7.3 FL_DND_DRAG

The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.

1.9.7.4 FL_DND_LEAVE

The mouse has moved out of the widget.

1.9.7.5 FL_DND_RELEASE

The user has released the mouse button dropping data into the widget. When the receiving widget's `handle()` method gets the `FL_DND_RELEASE` event, it should return 1 to accept the dragged data. Processing of this event must not use code that would make unrelated events be sent to the application (opening a dialog window for example) or that would communicate with the dragging process. The next event received by the `handle()` method will then be an `FL_PASTE` event. The `handle()` method should process this `FL_PASTE` event rapidly to prevent the dragging process from failing with a timeout error.

1.9.8 Other events

1.9.8.1 FL_SCREEN_CONFIGURATION_CHANGED

Sent whenever the screen configuration changes (a screen is added/removed, a screen resolution is changed, screens are moved). Use [Fl::add_handler\(\)](#) to be notified of this event.

1.9.8.2 FL_FULLSCREEN

The application window has been changed from normal to fullscreen, or from fullscreen to normal. If you are using a X window manager which supports Extended Window Manager Hints, this event will not be delivered until the change has actually happened.

1.9.9 Fl::event_*() methods

FLTK keeps the information about the most recent event in static storage. This information is good until the next event is processed. Thus it is valid inside `handle()` and `callback()` methods.

These are all trivial inline functions and thus very fast and small:

- [Fl::event_button\(\)](#)
- [Fl::event_clicks\(\)](#)
- [Fl::event_dx\(\)](#)
- [Fl::event_dy\(\)](#)
- [Fl::event_inside\(\)](#)
- [Fl::event_is_click\(\)](#)
- [Fl::event_key\(\)](#)
- [Fl::event_length\(\)](#)
- [Fl::event_state\(\)](#)
- [Fl::event_text\(\)](#)
- [Fl::event_x\(\)](#)
- [Fl::event_x_root\(\)](#)
- [Fl::event_y\(\)](#)
- [Fl::event_y_root\(\)](#)
- [Fl::get_key\(\)](#)
- [Fl::get_mouse\(\)](#)
- [Fl::test_shortcut\(\)](#)

1.9.10 Event Propagation

Widgets receive events via the virtual `handle()` function. The argument indicates the type of event that can be handled. The widget must indicate if it handled the event by returning 1. FLTK will then remove the event and wait for further events from the host. If the widget's handle function returns 0, FLTK may redistribute the event based on a few rules.

Most events are sent directly to the `handle()` method of the `Fl_Window` that the window system says they belong to. The window (actually the `Fl_Group` that `Fl_Window` is a subclass of) is responsible for sending the events on to any child widgets. To make the `Fl_Group` code somewhat easier, FLTK sends some events (`FL_DRAG`, `FL_RELEASE`, `FL_KEYBOARD`, `FL_SHORTCUT`, `FL_UNFOCUS`, and `FL_LEAVE`) directly to leaf widgets. These procedures control those leaf widgets:

- `Fl::add_handler()`
- `Fl::belowmouse()`
- `Fl::focus()`
- `Fl::grab()`
- `Fl::modal()`
- `Fl::pushed()`
- `Fl::release()` (deprecated, see `Fl::grab(0)`)
- `Fl_Widget::take_focus()`

FLTK propagates events along the widget hierarchy depending on the kind of event and the status of the UI. Some events are injected directly into the widgets, others may be resent as new events to a different group of receivers.

Mouse click events are first sent to the window that caused them. The window then forwards the event down the hierarchy until it reaches the widget that is below the click position. If that widget uses the given event, the widget is marked "pushed" and will receive all following mouse motion (`FL_DRAG`) events until the mouse button is released.

Mouse motion (`FL_MOVE`) events are sent to the `Fl::belowmouse()` widget, i.e. the widget that returned 1 on the last `FL_ENTER` event.

Mouse wheel events are sent to the window that caused the event. The window propagates the event down the tree, first to the widget that is below the mouse pointer, and if that does not succeed, to all other widgets in the group. This ensures that scroll widgets work as expected with the widget furthest down in the hierarchy getting the first opportunity to use the wheel event, but also giving scroll bars, that are not directly below the mouse a chance.

Keyboard events are sent directly to the widget that has keyboard focus. If the focused widget rejects the event, it is resent as a shortcut event, first to the top-most window, then to the widget below the mouse pointer, propagating up the hierarchy to all its parents. Those send the event also to all widgets that are not below the mouse pointer. Now if that did not work out, the shortcut is sent to all registered shortcut handlers.

If we are still unsuccessful, the event handler flips the case of the shortcut letter and starts over. Finally, if the key is "escape", FLTK sends a close event to the top-most window.

All other events are pretty much sent right away to the window that created the event.

Widgets can "grab" events. The grabbing window gets all events exclusively, but usually by the same rules as described above.

Windows can also request exclusivity in event handling by making the window modal.

1.9.11 FLTK Compose-Character Sequences

The character composition done by `Fl_Input` widget requires that you call the `Fl::compose()` function if you are writing your own text editor widget.

Currently, all characters made by single key strokes with or without modifier keys, or by system-defined character compose sequences (that can involve dead keys or a compose key) can be input. You should call `Fl::compose()` in case any enhancements to this processing are done in the future. The interface has been designed to handle arbitrary UTF-8 encoded text.

The following methods are provided for character composition:

- `Fl::compose()`
- `Fl::compose_reset()`

Under Mac OS X, FLTK "previews" partially composed sequences.

1.10 Adding and Extending Widgets

This chapter describes how to add your own widgets or extend existing widgets in FLTK.

1.10.1 Subclassing

New widgets are created by *subclassing* an existing FLTK widget, typically `Fl_Widget` for controls and `Fl_Group` for composite widgets.

A control widget typically interacts with the user to receive and/or display a value of some sort.

A composite widget holds a list of child widgets and handles moving, sizing, showing, or hiding them as needed. `Fl_Group` is the main composite widget class in FLTK, and all of the other composite widgets (`Fl_Pack`, `Fl_Scroll`, `Fl_Tabs`, `Fl_Tile`, `Fl_Window`, `Fl_Flex`, `Fl_Grid`, etc.) are subclasses of it.

You can also subclass other existing widgets to provide a different look or user-interface. For example, the button widgets are all subclasses of `Fl_Button` since they all interact with the user via a mouse button click. The only difference is the code that draws the face of the button.

1.10.2 Making a Subclass of `Fl_Widget`

Your subclasses can directly descend from `Fl_Widget` or any subclass of `Fl_Widget`. `Fl_Widget` has only four virtual methods, and overriding some or all of these may be necessary.

1.10.3 The Constructor

The constructor should have the following arguments:

```
MyClass(int x, int y, int w, int h, const char *label = 0);
```

This will allow the class to be used in FLUID without problems.

The constructor must call the constructor for the base class and pass the same arguments:

```
MyClass::MyClass(int x, int y, int w, int h, const char *label)
: Fl_Widget(x, y, w, h, label) {
    // do initialization stuff...
}
```

`Fl_Widget`'s protected constructor sets `x()`, `y()`, `w()`, `h()`, and `label()` to the passed values and initializes the other instance variables to:

```
type(0);
box(FL_NO_BOX);
color(FL_BACKGROUND_COLOR);
selection_color(FL_BACKGROUND_COLOR);
labeltype(FL_NORMAL_LABEL);
labelstyle(FL_NORMAL_STYLE);
labelsize(FL_NORMAL_SIZE);
labelcolor(FL_FOREGROUND_COLOR);
align(FL_ALIGN_CENTER);
callback(default_callback, 0);
flags(ACTIVE|VISIBLE);
image(0);
deimage(0);
```

1.10.4 Protected Methods of `Fl_Widget`

The following methods are provided for subclasses to use:

- `clear_visible()`
- `damage()`
- `draw_box()`
- `draw_focus()`
- `draw_label()`
- `set_flag()`
- `set_visible()`
- `test_shortcut()`
- `type()`

```
void Fl_Widget::damage(uchar mask)
```

```
void Fl_Widget::damage(uchar mask, int x, int y, int w, int h)
```

```
uchar Fl_Widget::damage()
```

The first form indicates that a partial update of the object is needed. The bits in mask are OR'd into `damage()`. Your `draw()` routine can examine these bits to limit what it is drawing. The public method `Fl_Widget::redraw()` simply does `Fl_Widget::damage(FL_DAMAGE_ALL)`, but the implementation of your widget can call the public `damage(n)`.

The second form indicates that a region is damaged. If only these calls are done in a window (no calls to `damage(n)`) then FLTK will clip to the union of all these calls before drawing anything. This can greatly speed up incremental displays. The mask bits are OR'd into `damage()` unless this is a [FL_Window](#) widget.

The third form returns the bitwise-OR of all `damage(n)` calls done since the last `draw()`.

When redrawing your widgets you should look at the damage bits to see what parts of your widget need redrawing. The `handle()` method can then set individual damage bits to limit the amount of drawing that needs to be done:

```
int MyClass::handle(int event) {
    // ...
    if (change_to_part1) damage(1);
    if (change_to_part2) damage(2);
    if (change_to_part3) damage(4);
}

void MyClass::draw() {
    if (damage() & FL_DAMAGE_ALL) {
        // ... draw frame/box and other static stuff ...
    }

    if (damage() & (FL_DAMAGE_ALL | 1)) draw_part1();
    if (damage() & (FL_DAMAGE_ALL | 2)) draw_part2();
    if (damage() & (FL_DAMAGE_ALL | 4)) draw_part3();
}
```

Todo Clarify [FL_Window::damage\(uchar\)](#) handling - seems confused/wrong? ORing value doesn't match setting behavior in [FL_Widget.H](#)!

void [FL_Widget::draw_box\(\)](#) const

void [FL_Widget::draw_box\(FL_Boxtype t, FL_Color c\)](#) const

The first form draws this widget's `box()`, using the dimensions of the widget. The second form uses `t` as the box type and `c` as the color for the box.

void [FL_Widget::draw_focus\(\)](#)

void [FL_Widget::draw_focus\(FL_Boxtype t, int x, int y, int w, int h\)](#) const

Draws a focus box inside the widget's bounding box. The second form allows you to specify a different bounding box.

void [FL_Widget::draw_label\(\)](#) const

void [FL_Widget::draw_label\(int x, int y, int w, int h\)](#) const

void [FL_Widget::draw_label\(int x, int y, int w, int h, FL_Align align\)](#) const

The first form is the usual function for a `draw()` method to call to draw the widget's label. It does not draw the label if it is supposed to be outside the box (on the assumption that the enclosing group will draw those labels).

The second form uses the passed bounding box instead of the widget's bounding box. This is useful so "centered" labels are aligned with some feature, like a moving slider.

The third form draws the label anywhere. It acts as though `FL_ALIGN_INSIDE` has been forced on so the label will appear inside the passed bounding box. This is designed for parent groups to draw labels with.

```
void Fl_Widget::set_flag(int c)
```

Calling `set_flag(SHORTCUT_LABEL)` modifies the behavior of `draw_label()` so that `'&'` characters cause an underscore to be printed under the next letter.

```
void Fl_Widget::set_visible()
void Fl_Widget::clear_visible()
```

Fast inline versions of `Fl_Widget::hide()` and `Fl_Widget::show()`. These do not send the `FL_HIDE` and `FL_SHOW` events to the widget.

```
int Fl_Widget::test_shortcut()
static int Fl_Widget::test_shortcut(const char *s)
```

The first version tests `Fl_Widget::label()` against the current event (which should be a `FL_SHORTCUT` event). If the label contains a `'&'` character and the character after it matches the keypress, this returns true. This returns false if the `SHORTCUT_LABEL` flag is off, if the label is `NULL`, or does not have a `'&'` character in it, or if the keypress does not match the character.

The second version lets you do this test against an arbitrary string.

```
uchar Fl_Widget::type() const
void Fl_Widget::type(uchar t)
```

The property `Fl_Widget::type()` can return an arbitrary 8-bit identifier, and can be set with the protected method `type(uchar t)`. This value had to be provided for Forms compatibility, but you can use it for any purpose you want. Try to keep the value less than 100 to not interfere with reserved values.

FLTK does not use RTTI (Run Time Typing Information) to enhance portability. But this may change in the near future if RTTI becomes standard everywhere.

If you don't have RTTI you can use the clumsy FLTK mechanism, by having `type()` use a unique value. These unique values must be greater than the symbol `FL_RESERVED_TYPE` (which is 100) and less than `FL_WINDOW` (unless you make a subclass of `Fl_Window`). Look through the header files for `FL_RESERVED_TYPE` to find an unused number. If you make a subclass of `Fl_Window` you must use `FL_WINDOW + n` (where `n` must be in the range 1 to 7).

1.10.5 Handling Events

The virtual method `Fl_Widget::handle(int event)` is called to handle each event passed to the widget. It can:

- Change the state of the widget.
- Call `Fl_Widget::redraw()` if the widget needs to be redisplayed.
- Call `Fl_Widget::damage(uchar c)` if the widget needs a partial-update (assuming you provide support for this in your `draw()` method).
- Call `Fl_Widget::do_callback()` if a callback should be generated.
- Call `Fl_Widget::handle()` on child widgets.

Events are identified by the integer argument. Other information about the most recent event is stored in static locations and acquired by calling the `Fl::event_*` methods. This information remains valid until another event is handled.

Here is a sample `handle()` method for a widget that acts as a pushbutton and also accepts the keystroke 'x' to cause the callback:

```
int MyClass::handle(int event) {
    switch (event) {
        case FL_PUSH:
            highlight = 1;
            redraw();
            return 1;
        case FL_DRAG: {
            int t = Fl::event_inside(this);
            if (t != highlight) {
                highlight = t;
                redraw();
            }
        }
        return 1;
        case FL_RELEASE:
            if (highlight) {
                highlight = 0;
                redraw();
                do_callback();
                // never do anything after a callback, as the callback
                // may delete the widget!
            }
            return 1;
        case FL_SHORTCUT:
            if (Fl::event_key() == 'x') {
                do_callback();
                return 1;
            }
            return 0;
        default:
            return Fl_Widget::handle(event);
    }
}
```

You must return non-zero if your `handle()` method uses the event. If you return zero, the parent widget will try sending the event to another widget.

For debugging purposes, event numbers can be printed as their actual event names using the `fl_eventnames[]` array, e.g.:

```
#include <FL/names.h> // defines fl_eventnames[]
[...
int MyClass::handle(int e) {
    printf("Event was %s (%d)\n", fl_eventnames[e], e); // e.g. "Event was FL_PUSH (1)"
    [...
}
```

1.10.6 Drawing the Widget

The `draw()` virtual method is called when FLTK wants you to redraw your widget. It will be called if and only if `damage()` is non-zero, and `damage()` will be cleared to zero after it returns. The `draw()` method should be declared protected so that it can't be called from non-drawing code.

The `damage()` value contains the bitwise-OR of all the `damage(n)` calls to this widget since it was last drawn. This can be used for minimal update, by only redrawing the parts whose bits are set. FLTK will turn on the `FL_DAMAGE_ALL` bit if it thinks the entire widget must be redrawn, e.g. for an expose event.

Expose events (and the `damage(mask,x,y,w,h)` function described above) will cause `draw()` to be called with FLTK's clipping turned on. You can greatly speed up redrawing in some cases by testing `fl_not_clipped(x,y,w,h)` or `fl_clip_box()` and skipping invisible parts.

Besides the protected methods described above, FLTK provides a large number of basic drawing functions, which are described in the chapter [Drawing Things in FLTK](#).

1.10.7 Resizing the Widget

The `resize(x,y,w,h)` method is called when the widget is being resized or moved. The arguments are the new position, width, and height. `x()`, `y()`, `w()`, and `h()` still remain the old size. You must call `resize()` on your base class with the same arguments to get the widget size to actually change.

This should *not* call `redraw()`, at least if only the `x()` and `y()` change. This is because composite widgets like [Fl_Scroll](#) may have a more efficient way of drawing the new position.

1.10.8 Making a Composite Widget

A "composite" widget contains one or more "child" widgets. To make a composite widget you should subclass [Fl_Group](#). It is possible to make a composite object that is not a subclass of [Fl_Group](#), but you'll have to duplicate the code in [Fl_Group](#) anyways.

Instances of the child widgets may be included in the parent:

```
class MyClass : public Fl_Group {
    Fl_Button the_button;
    Fl_Slider the_slider;
    ...
};
```

The constructor has to initialize these instances. They are automatically added to the group, since the [Fl_Group](#) constructor does `Fl_Group::begin()`. *Don't forget to call `Fl_Group::end()` or use the `Fl_End` pseudo-class:*

```
MyClass::MyClass(int x, int y, int w, int h) :
    Fl_Group(x, y, w, h),
    the_button(x + 5, y + 5, 100, 20),
    the_slider(x, y + 50, w, 20)
{
    ... (you could add dynamically created child widgets here) ...
    end(); // don't forget to do this!
}
```

The child widgets need callbacks. These will be called with a pointer to the children, but the widget itself may be found in the `parent()` pointer of the child. Usually these callbacks can be static private methods, with a matching private method:

```
void MyClass::static_slider_cb(Fl_Widget* v, void *) { // static method
    ((MyClass*) (v->parent()))->slider_cb();
}
void MyClass::slider_cb() { // normal method
    use(the_slider->value());
}
```

If you make the `handle()` method, you can quickly pass all the events to the children using the `Fl_Group::handle()` method. You don't need to override `handle()` if your composite widget does nothing other than pass events to the children:

```
int MyClass::handle(int event) {
    if (Fl_Group::handle(event)) return 1;
    ... handle events that children don't want ...
}
```

If you override `draw()` you need to draw all the children. If `redraw()` or `damage()` is called on a child, `damage(FL_DAMAGE_CHILD)` is done to the group, so this bit of `damage()` can be used to indicate that a child needs to be drawn. It is fastest if you avoid drawing anything else in this case:

```
void MyClass::draw() {
    Fl_Widget *const*a = array();
    if (damage() == FL_DAMAGE_CHILD) { // only redraw some children
        for (int i = children(); i--; a++) {
            update_child(**a);
        }
    } else { // total redraw
        // ... draw background graphics ...
        // now draw all the children atop the background:
        for (int i = children(); i--; a++) {
            draw_child(**a);
            draw_outside_label(**a); // you may not need to do this
        }
    }
}
```

`Fl_Group` provides some protected methods to make drawing easier:

- `draw_child()`
- `draw_children()`
- `draw_outside_label()`
- `update_child()`

void `Fl_Group::draw_child(Fl_Widget &widget) const`

This will force the child's `damage()` bits all to one and call `draw()` on it, then clear the `damage()`. You should call this on all children if a total redraw of your widget is requested, or if you draw something (like a background box) that damages the child. Nothing is done if the child is not `visible()` or if it is clipped.

void `Fl_Group::draw_children()`

A convenience function that draws all children of the group. This is useful if you derived a widget from `Fl_Group` and want to draw a special border or background. You can call `draw_children()` from the derived `draw()` method after drawing the box, border, or background.

void `Fl_Group::draw_outside_label(const Fl_Widget &widget) const`

Draw the labels that are *not* drawn by `draw_label()`. If you want more control over the label positions you might want to call `child->draw_label(x, y, w, h, a)`.

void `Fl_Group::update_child(Fl_Widget& widget) const`

Draws the child only if its `damage()` is non-zero. You should call this on all the children if your own `damage` is equal to `FL_DAMAGE_CHILD`. Nothing is done if the child is not `visible()` or if it is clipped.

1.10.9 Cut and Paste Support

FLTK provides routines to cut and paste UTF-8 encoded text between applications:

- [Fl::copy\(\)](#)
- [Fl::paste\(\)](#)
- [Fl::selection\(\)](#)
- [Fl::selection_owner\(\)](#)

It is also possible to copy and paste image data between applications:

- [Fl_Copy_Surface](#)
- [Fl::clipboard_contains\(\)](#)
- [Fl::paste\(\)](#)

It may be possible to cut/paste other kinds of data by using [Fl::add_handler\(\)](#). Note that handling events beyond those provided by FLTK may be operating system specific. See [Operating System Issues](#) for more details.

1.10.10 Drag And Drop Support

FLTK provides routines to drag and drop UTF-8 encoded text between applications:

Drag'n'drop operations are initiated by copying data to the clipboard and calling the function [Fl::dnd\(\)](#).

Drop attempts are handled via the following events, already described under [Drag and Drop Events](#) in a previous chapter:

- `FL_DND_ENTER`
- `FL_DND_DRAG`
- `FL_DND_LEAVE`
- `FL_DND_RELEASE`
- `FL_PASTE`

1.10.11 Making a subclass of `Fl_Window`

You may want your widget to be a subclass of [Fl_Window](#), [Fl_Double_Window](#), or [Fl_Gl_Window](#). This can be useful if your widget wants to occupy an entire window, and can also be used to take advantage of system-provided clipping, or to work with a library that expects a system window ID to indicate where to draw.

Subclassing [Fl_Window](#) is almost exactly like subclassing [Fl_Group](#), and in fact you can easily switch a subclass back and forth. Watch out for the following differences:

1. [Fl_Window](#) is a subclass of [Fl_Group](#) so *make sure your constructor calls* `end()` unless you actually want children added to your window.
2. When handling events and drawing, the upper-left corner is at 0,0, not `x()`, `y()` as in other [Fl_Widget](#)'s. For instance, to draw a box around the widget, call `draw_box(0, 0, w(), h())`, rather than `draw_box(x(), y(), w(), h())`.

You may also want to subclass [Fl_Window](#) in order to get access to different visuals or to change other attributes of the windows. See the [Operating System Issues](#) chapter for more information.

1.11 Using OpenGL

This chapter discusses using FLTK for your OpenGL applications.

1.11.1 Using OpenGL in FLTK

The easiest way to make an OpenGL display is to subclass [Fl_Gl_Window](#). Your subclass must implement a `draw()` method which uses OpenGL calls to draw the display. Your main program should call `redraw()` when the display needs to change, and (somewhat later) FLTK will call `draw()`.

With a bit of care you can also use OpenGL to draw into normal FLTK windows (see [Using OpenGL in Normal FLTK Windows](#) below). This allows you to use Gouraud shading for drawing your widgets. To do this you use the `gl_start()` and `gl_finish()` functions around your OpenGL code.

You must include FLTK's `<FL/gl.h>` header file. It will include the file `<GL/gl.h>` (on macOS: `<OpenGL/gl.h>`), define some extra drawing functions provided by FLTK, and include the `<windows.h>` header file needed by Windows applications.

Some simple coding rules (see [OpenGL and support of HighDPI displays](#)) allow to write cross-platform code that will support OpenGL run on HighDPI displays (including the 'retina' displays of Apple hardware).

1.11.2 Making a Subclass of Fl_Gl_Window

To make a subclass of [Fl_Gl_Window](#), you must provide:

- A class definition.
- A `draw()` method.
- A `handle()` method if you need to receive input from the user.

If your subclass provides static controls in the window, they must be redrawn whenever the `FL_DAMAGE_ALL` bit is set in the value returned by `damage()`.

1.11.2.1 Defining the Subclass

To define the subclass you just subclass the [Fl_Gl_Window](#) class:

```
class MyWindow : public Fl_Gl_Window {
    void draw();
    int handle(int);

public:
    MyWindow(int X, int Y, int W, int H, const char *L)
        : Fl_Gl_Window(X, Y, W, H, L) {}
};
```

The `draw()` and `handle()` methods are described below. Like any widget, you can include additional private and public data in your class (such as scene graph information, etc.)

1.11.2.2 The draw() Method

The `draw()` method is where you actually do your OpenGL drawing:

```
void MyWindow::draw() {
    if (!valid()) {
        ... set up projection, viewport, etc ...
        ... window size is in w() and h().
        ... valid() is turned on by FLTK after draw() returns
    }
    ... draw ...
}
```

1.11.2.3 The handle() Method

The `handle()` method handles mouse and keyboard events for the window:

```
int MyWindow::handle(int event) {
    switch(event) {
        case FL_PUSH:
            ... mouse down event ...
            ... position in Fl::event_x() and Fl::event_y()
            return 1;
        case FL_DRAG:
            ... mouse moved while down event ...
            return 1;
        case FL_RELEASE:
            ... mouse up event ...
            return 1;
        case FL_FOCUS :
        case FL_UNFOCUS :
            ... Return 1 if you want keyboard events, 0 otherwise
            return 1;
        case FL_KEYBOARD:
            ... keypress, key is in Fl::event_key(), ascii in Fl::event_text()
            ... Return 1 if you understand/use the keyboard event, 0 otherwise...
            return 1;
        case FL_SHORTCUT:
            ... shortcut, key is in Fl::event_key(), ascii in Fl::event_text()
            ... Return 1 if you understand/use the shortcut event, 0 otherwise...
            return 1;
        default:
            // pass other events to the base class...
            return Fl_Gl_Window::handle(event);
    }
}
```

When `handle()` is called, the OpenGL context is not set up! If your display changes, you should call `redraw()` and let `draw()` do the work. Don't call any OpenGL drawing functions from inside `handle()`!

You can call *some* OpenGL stuff like hit detection and texture loading functions by doing:

```
case FL_PUSH:
    make_current();           // make OpenGL context current
    if (!valid()) {

        ... set up projection exactly the same as draw ...

        valid(1);           // stop it from doing this next time
    }
    ... ok to call NON-DRAWING OpenGL code here, such as hit
    detection, loading textures, etc...
```

Your main program can now create one of your windows by doing `new MyWindow(...)`.

You can also use your new window class in FLUID by:

1. Putting your class definition in a `MyWindow.H` file.
2. Creating a `Fl_Box` widget in FLUID.
3. In the widget panel fill in the "class" field with `MyWindow`. This will make FLUID produce constructors for your new class.
4. In the "Extra Code" field put `#include "MyWindow.H"`, so that the FLUID output file will compile.

You must put `glwindow->show()` in your main code after calling `show()` on the window containing the Open↔GL window.

1.11.3 OpenGL and support of HighDPI displays

HighDPI displays (including the so-called 'retina' displays of Apple hardware) are supported by FLTK in such a way that 1 unit of an FLTK quantity (say, the value given by `Fl_Gl_Window::w()`) corresponds to more than 1 pixel on the display. Conversely, when a program specifies the width and height of the OpenGL viewport, it is necessary to use an API that returns quantities expressed in pixels. That can be done as follows:

```
Fl_Gl_Window *glw = ...;
glViewport(0, 0, glw->pixel_w(), glw->pixel_h());
```

which makes use of the `Fl_Gl_Window::pixel_w()` and `Fl_Gl_Window::pixel_h()` methods giving the size in pixels of an `Fl_Gl_Window` that is potentially mapped to a HighDPI display. Method `Fl_Gl_Window::pixels_per_unit()` can also be useful in this context.

Note

A further coding rule is necessary to properly support retina displays and OpenGL under macOS (see [OpenGL and 'retina' displays](#))

1.11.4 Using OpenGL in Normal FLTK Windows

Note

Drawing both with OpenGL and Quartz in a normal FLTK window is not possible with the macOS platform. This technique is therefore not useful under macOS because it permits nothing more than what is possible with class `Fl_Gl_Window`.

You can put OpenGL code into the `draw()` method, as described in [Drawing the Widget](#) in the previous chapter, or into the code for a `boxtype` or other places with some care.

Most importantly, before you show *any* windows, including those that don't have OpenGL drawing, you **must** initialize FLTK so that it knows it is going to use OpenGL. You may use any of the symbols described for `Fl_Gl_Window` ← `::mode()` to describe how you intend to use OpenGL:

```
Fl::gl_visual(FL_RGB);
```

You can then put OpenGL drawing code anywhere you can draw normally by surrounding it with `gl_start()` and `gl_finish()` to set up, and later release, an OpenGL context with an orthographic projection so that 0,0 is the lower-left corner of the window and each pixel is one unit. The current clipping is reproduced with OpenGL `glScissor()` commands. These functions also synchronize the OpenGL graphics stream with the drawing done by other X, Windows, or FLTK functions.

```
gl_start();
... put your OpenGL code here ...
gl_finish();
```

The same context is reused each time. If your code changes the projection transformation or anything else you should use `glPushMatrix()` and `glPopMatrix()` functions to put the state back before calling `gl_finish()`.

You may want to use `Fl_Window::current()->h()` to get the drawable height so that you can flip the Y coordinates.

Unfortunately, there are a bunch of limitations you must adhere to for maximum portability:

- You must choose a default visual with `Fl::gl_visual()`.
- You cannot pass `FL_DOUBLE` to `Fl::gl_visual()`.
- You cannot use `Fl_Double_Window` or `Fl_Overlay_Window`.

Do *not* call `gl_start()` or `gl_finish()` when drawing into an `Fl_Gl_Window` !

1.11.5 Using FLTK widgets in OpenGL Windows

FLTK widgets can be added to `Fl_Gl_Window`s just as they would be added to `Fl_Window`s. They are rendered as an overlay over the user defined OpenGL graphics using 'fl_.' graphics calls that are implemented in GL.

`Fl_Gl_Window` does not add subsequent widgets as children by default as `Fl_Window` does. Call `myGlWindow->begin()` after creating the GL window to automatically add following widgets. Remember to call `myGlWindow->end()`.

```
class My_Gl_Window : public Fl_Gl_Window {
...
    void draw();
...
};

...
myGlWindow = new My_Gl_Window(0, 0, 500, 500);
myGlWindow->begin();
myButton = new Fl_Button(10, 10, 120, 24, "Hello!");
myGlWindow->end();
...

void My_Gl_Window::draw() {
    // ... user GL drawing code
    Fl_Gl_Window::draw(); // Draw FLTK child widgets.
}
```

Users can draw into the overlay by using GL graphics calls as well as all `fl_.` graphics calls from the "Drawing Fast Shapes" section.

```
void My_Gl_Window::draw() {
    // ... user GL drawing code
    Fl_Gl_Window::draw_begin(); // Set up 1:1 projection
    Fl_Window::draw();          // Draw FLTK children
    fl_color(FL_RED);
    fl_rect(10, 10, 100, 100);
    Fl_Gl_Window::draw_end();   // Restore GL state
}
```

Widgets can be drawn with transparencies by assigning an alpha value to a colormap entry and using that color in the widget.

```
Fl::set_color(FL_FREE_COLOR, 255, 255, 0, 127); // 50% transparent yellow
myGlWindow = new My_Gl_Window(0, 0, 500, 500);
myGlWindow->begin();
myButton = new Fl_Button(10, 10, 120, 24, "Hello!");
myButton->box(FL_BORDER_BOX);
myButton->color(FL_FREE_COLOR);
myGlWindow->end();
```

Transparencies can also be set directly when drawing. This can be used to create custom box types and RGB overlay drawings with an alpha channel.

```
fl_color(0, 255, 0, 127); // 50% transparent green
fl_rectf(10, 10, 100, 100);
fl_color(FL_RED); // back to opaque red
fl_rect(20, 20, 80, 80);
```

1.11.6 OpenGL Drawing Functions

FLTK provides some useful OpenGL drawing functions. They can be freely mixed with any OpenGL calls, and are defined by including `<FL/gl.h>` which you should include instead of the OpenGL header `<GL/gl.h>`.

void `gl_color(Fl_Color)`

Sets the current OpenGL color to a FLTK color. *For color-index modes it will use `fl_xpixel(c)`, which is only right if this window uses the default colormap!*

void `gl_rect(int x, int y, int w, int h)`
 void `gl_rectf(int x, int y, int w, int h)`

Outlines or fills a rectangle with the current color. If `Fl_Gl_Window::ortho()` has been called, then the rectangle will exactly fill the pixel rectangle passed.

void `gl_font(Fl_Font fontid, int size)`

Sets the current OpenGL font to the same font you get by calling `fl_font()`.

int `gl_height()`
 int `gl_descent()`
 float `gl_width(const char *s)`
 float `gl_width(const char *s, int n)`
 float `gl_width(uchar c)`

Returns information about the current OpenGL font.

void `gl_draw(const char *s)`
 void `gl_draw(const char *s, int n)`

Draws a nul-terminated string or an array of `n` characters in the current OpenGL font at the current raster position.

void `gl_draw(const char *s, int x, int y)`
 void `gl_draw(const char *s, int n, int x, int y)`
 void `gl_draw(const char *s, float x, float y)`
 void `gl_draw(const char *s, int n, float x, float y)`

Draws a nul-terminated string or an array of `n` characters in the current OpenGL font at the given position.

void `gl_draw(const char *s, int x, int y, int w, int h, Fl_Align)`

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to `^X`, and aligned with the edges or center. Exactly the same output as `fl_draw()`.

1.11.7 Speeding up OpenGL

Performance of `Fl_Gl_Window` may be improved on some types of OpenGL implementations, in particular MESA and other software emulators, by setting the `GL_SWAP_TYPE` environment variable. This variable declares what is in the backbuffer after you do a `swapbuffers`.

- `setenv GL_SWAP_TYPE COPY`

This indicates that the back buffer is copied to the front buffer, and still contains its old data. This is true of many hardware implementations. Setting this will speed up emulation of overlays, and widgets that can do partial update can take advantage of this as `damage()` will not be cleared to -1.

- `setenv GL_SWAP_TYPE NODAMAGE`

This indicates that nothing changes the back buffer except drawing into it. This is true of MESA and Win32 software emulation and perhaps some hardware emulation on systems with lots of memory.

- All other values for `GL_SWAP_TYPE`, and not setting the variable, cause FLTK to assume that the back buffer must be completely redrawn after a swap.

This is easily tested by running the `gl_overlay` demo program and seeing if the display is correct when you drag another window over it or if you drag the window off the screen and back on. You have to exit and run the program again for it to see any changes to the environment variable.

1.11.8 Using OpenGL Optimizer with FLTK

OpenGL Optimizer is a scene graph toolkit for OpenGL available from Silicon Graphics for IRIX and Microsoft Windows. It allows you to view large scenes without writing a lot of OpenGL code.

OptimizerWindow Class Definition

To use **OpenGL Optimizer** with FLTK you'll need to create a subclass of `Fl_Gl_Window` that includes several state variables:

```
class OptimizerWindow : public Fl_Gl_Window {
    csContext *context_; // Initialized to 0 and set by draw()...
    csDrawAction *draw_action_; // Draw action...
    csGroup *scene_; // Scene to draw...
    csCamera *camera_; // Viewport for scene...

    void draw();

public:
    OptimizerWindow(int X, int Y, int W, int H, const char *L)
        : Fl_Gl_Window(X, Y, W, H, L) {
        context_ = (csContext *)0;
        draw_action_ = (csDrawAction *)0;
        scene_ = (csGroup *)0;
        camera_ = (csCamera *)0;
    }

    void scene(csGroup *g) { scene_ = g; redraw(); }

    void camera(csCamera *c) {
        camera_ = c;
        if (context_) {
            draw_action_>setCamera(camera_);
            camera_>draw(draw_action_);
            redraw();
        }
    }
};
```

The camera() Method

The `camera()` method sets the camera (projection and viewpoint) to use when drawing the scene. The scene is redrawn after this call.

The draw() Method

The `draw()` method performs the needed initialization and does the actual drawing:

```
void OptimizerWindow::draw() {
    if (!context_) {
        // This is the first time we've been asked to draw; create the
        // Optimizer context for the scene...

#ifdef _WIN32
        context_ = new csContext((HDC)fl_getHDC());
        context_>ref();
        context_>makeCurrent((HDC)fl_getHDC());
#else
        context_ = new csContext(fl_display, fl_visual);
        context_>ref();
        context_>makeCurrent(fl_display, fl_window);
#endif // _WIN32

        ... perform other context setup as desired ...

        // Then create the draw action to handle drawing things...

        draw_action_ = new csDrawAction;
        if (camera_) {
            draw_action_>setCamera(camera_);
            camera_>draw(draw_action_);
        }
    } else {
#ifdef _WIN32
        context_>makeCurrent((HDC)fl_getHDC());
#else
        context_>makeCurrent(fl_display, fl_window);
#endif // _WIN32
    }

    if (!valid()) {
        // Update the viewport for this context...
        context_>setViewport(0, 0, w(), h());
    }

    // Clear the window...
    context_>clear(csContext::COLOR_CLEAR | csContext::DEPTH_CLEAR,
        0.0f,          // Red
        0.0f,          // Green
        0.0f,          // Blue
        1.0f);         // Alpha

    // Then draw the scene (if any)...
    if (scene_)
        draw_action_>apply(scene_);
}
```

The scene() Method

The `scene()` method sets the scene to be drawn. The scene is a collection of 3D objects in a `csGroup`. The scene is redrawn after this call.

1.11.9 Using OpenGL 3.0 (or higher versions)

The examples subdirectory contains `OpenGL3test.cxx`, a toy program showing how to use OpenGL 3.0 (or higher versions) with FLTK in a cross-platform fashion. It contains also `OpenGL3-glut-test.cxx` which shows how to use FLTK's GLUT compatibility and OpenGL 3.

To access OpenGL 3.0 (or higher versions), use the `FL_OPENGL3` flag when calling `Fl_Gl_Window::mode(int a)` or `glutInitDisplayMode()`.

On the Windows and Linux platforms, FLTK creates contexts implementing the highest OpenGL version supported by the hardware. Such contexts may also be compatible with lower OpenGL versions. Access to functions from OpenGL versions above 1.1 requires to load function pointers at runtime on these platforms. FLTK recommends to use the GLEW library to perform this. It is therefore necessary to install the GLEW library (see below).

On the macOS platform, MacOS 10.7 or above is required; GLEW is possible but not necessary. FLTK creates contexts for OpenGL versions 1 and 2 without the `FL_OPENGL3` flag and for OpenGL versions 3.2 and above (**but not below**) with it.

GLEW installation (Linux and Windows platforms)

FLTK needs a header file, `GL/glew.h`, and a library, `libGLEW.*` or equivalent, to support OpenGL 3 and above.

These can be obtained for most Linux distributions by installing package `libglew-dev`.

For the Windows platform :

- the header and a Visual Studio static library (`glew32.lib`) can be downloaded from <http://glew.sourceforge.net/> ;
- a MinGW-style static library (`libglew32.a`) can be built from source (same web site) with the make command. Alternatively, pre-built files are available for these architectures :
 - x86: download files `glew.h` and `libglew32.a`;
 - x86_64: install GLEW as an MSYS2 package with command :

```
pacman -S mingw-w64-x86_64-glew
```

Source-level changes for OpenGL 3:

- Put this in all OpenGL-using source files (instead of, or before if needed, `#include <FL/gl.h>`, and before `#include <FL/glut.h>` if you use GLUT):

```
#if defined(__APPLE__)
#   include <OpenGL/gl3.h> // defines OpenGL 3.0+ functions
#else
#   if defined(_WIN32)
#       define GLEW_STATIC 1
#   endif
#   include <GL/glew.h>
#endif
```

- Add the `FL_OPENGL3` flag when calling `FL_Gl_Window::mode(int a)` or `glutInitDisplayMode()`.
- Put this in the `handle(int event)` member function of the first to be created among your `FL_Gl_`→`_Window`-derived classes:

```
#ifndef __APPLE__
static int first = 1;
if (first && event == FL_SHOW && shown()) {
    first = 0;
    make_current();
    glewInit(); // defines pters to functions of OpenGL V 1.2 and above
}
#endif
```

- Alternatively, if you use GLUT, put

```
#ifndef __APPLE__
    glewInit(); // defines pters to functions of OpenGL V 1.2 and above
#endif
```

after the first `glutCreateWindow()` call.

If GLEW is installed on the Mac OS development platform, it is possible to use the same code for all platforms, with one exception: put

```
#ifdef __APPLE__
    glewExperimental = GL_TRUE;
#endif
```

before the `glewInit()` call.

Testing for success of the `glewInit()` call

Testing whether the `glewInit()` call is successful is to be done as follows:

```
#include <FL/platform.H> // defines FLTK_USE_WAYLAND under the Wayland platform
#include <FL/Fl.H> // for Fl::warning()
#ifdef __APPLE__
#   if defined(_WIN32)
#       define GLEW_STATIC 1
#   endif
#   include <GL/glew.h>

    GGLenum err = glewInit(); // defines pters to functions of OpenGL V 1.2 and above
#   ifdef FLTK_USE_WAYLAND
        // glewInit returns GLEW_ERROR_NO_GLX_DISPLAY with Wayland
        if (fl_wl_display() && err == GLEW_ERROR_NO_GLX_DISPLAY) err = GLEW_OK;
#   endif
    if (err != GLEW_OK) Fl::warning("glewInit() failed returning %u", err);
#endif // ! __APPLE__
```

Changes in the build process

Link with `libGLEW.so` (with X11 or Wayland), `libglew32.a` (with MinGW) or `glew32.lib` (with MS Visual Studio); no change is needed on the Mac OS platform.

1.12 FLTK Runtime Options

In this chapter, we will cover how to access and alter settings for applications created using FLTK, both as an administrator and as a regular user.

Subchapters:

- [Runtime Options](#)
- [Obtaining Current Settings](#)
- [Administrative Tool](#)
- [List of Options](#)

1.12.1 Runtime Options

FLTK keeps track of various aspects of the user interface in a system-wide database. Users have the ability to set their own preferences and override default or system settings. For instance, FLTK will display a dotted rectangle around the widget with current focus. This might not be desirable for users who do not use keyboard navigation and do not need the rectangle. This can be turned off by setting the `OPTION_VISIBLE_FOCUS` option to 'off' for that user, which will disable the focus rectangle in all FLTK-based applications.

1.12.2 Obtaining Current Settings

Options are kept in preference files using the signature `Fl_Preferences::CORE_SYSTEM`, `"fltk.org"`, `"fltk"` for system-wide settings and `Fl_Preferences::CORE_USER`, `"fltk.org"`, `"fltk"` for individual users. They can be accessed by using the function `bool Fl::option(Fl_Option opt)`. If an application needs to temporarily override user or system settings, it can use the function `void option(Fl_Option opt, bool val)`.

To make changes to options permanently, FLTK provides an administrative tool called `fltk-options`.

1.12.3 Administrative Tool

`fltk-options` is a hybrid app that is part of FLTK and can be installed on the target system. It includes an up-to-date man page.

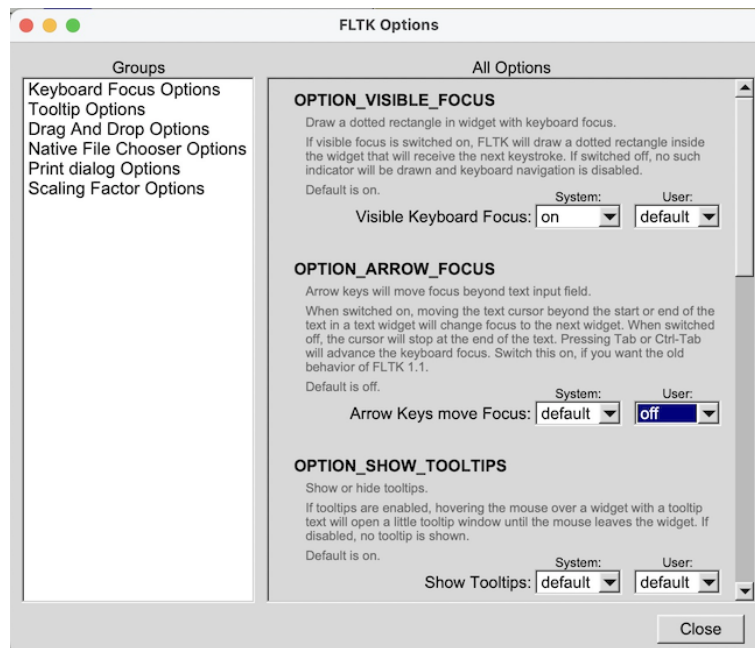

Figure 1.29 fltk-options Application

When `fltk-options` is called without any command-line arguments, it opens in interactive mode and provides a user interface to view and alter all system and current user options.

Starting the tool from a shell, the command-line options `-S` and `-U` can be used to display or change system or user options. On MS-Windows, `fltk-options` is also available as `fltk-options-cmd.exe`.

1.12.4 List of Options

Calling `fltk-options --help` gives a list of all available commands, and options and their values. `fltk-options --help OPTION` prints more detailed information for `OPTION` if available. In interactive mode, tooltips provide this additional information.

A full list of options can be found in the manual at [Fl::Fl_Option](#).

1.13 Advanced FLTK

This chapter explains advanced programming and design topics that will help you to get the most out of FLTK.

1.13.1 Multithreading

FLTK can be used to implement a GUI for a multithreaded application but, as with multithreaded programming generally, there are some concepts and caveats that must be kept in mind.

Key amongst these is that, for many of the target platforms on which FLTK is supported, only the `main()` thread of the process is permitted to handle system events, create or destroy windows and open or close windows. Further, only the `main()` thread of the process can safely write to the display.

To support this in a portable way, all FLTK `draw()` methods are executed in the `main()` thread. A worker thread may update the state of an existing widget, but it may not do any rendering directly, nor create or destroy a window. (**NOTE:** A special case exists for [Fl_Gl_Window](#) where it can, with suitable precautions, be possible to safely render to an existing GL context from a worker thread.)

Creating portable threads

We do not provide a threading interface as part of the library. A simple example showing how threads can be implemented, for all supported platforms, can be found in `test/threads.h` and `test/threads.cxx`.

FLTK has been used with a variety of thread interfaces, so if the simple example shown in `test/threads.cxx` does not cover your needs, you might want to select a third-party library that provides the features you require.

1.13.2 FLTK multithread locking - `Fl::lock()` and `Fl::unlock()`

In a multithreaded program, drawing of widgets (in the `main()` thread) happens asynchronously to widgets being updated by worker threads, so no drawing can occur safely whilst a widget is being modified (and no widget should be modified whilst drawing is in progress).

FLTK supports multithreaded applications using a locking mechanism internally. This allows a worker thread to lock the rendering context, preventing any drawing from taking place, whilst it changes the value of its widget.

Note

The converse is also true; whilst a worker thread holds the lock, the `main()` thread may not be able to process any drawing requests, nor service any events. So a worker thread that holds the FLTK lock **must** contrive to do so for the shortest time possible or it could impair operation of the application.

The lock operates broadly as follows.

Using the FLTK library, the `main()` thread holds the lock whenever it is processing events or redrawing the display. It acquires (locks) and releases (unlocks) the FLTK lock automatically and no "user intervention" is required. Indeed, a function that runs in the context of the `main()` thread ideally should **not** acquire / release the FLTK lock explicitly. (Though note that the lock calls are recursive, so calling `Fl::lock()` from a thread that already holds the lock, including the `main()` thread, is benign. The only constraint is that every call to `Fl::lock()` **must** be balanced by a corresponding call to `Fl::unlock()` to ensure the lock count is preserved.)

The `main()` thread **must** call `Fl::lock()` **once** before any windows are shown, to enable the internal lock (it is "off" by default since it is not useful in single-threaded applications) but thereafter the `main()` thread lock is managed by the library internally.

A worker thread, when it wants to alter the value of a widget, can acquire the lock using `Fl::lock()`, update the widget, then release the lock using `Fl::unlock()`. Acquiring the lock ensures that the worker thread can update the widget, without any risk that the `main()` thread will attempt to redraw the widget whilst it is being updated.

Note that acquiring the lock is a blocking action; the worker thread will stall for as long as it takes to acquire the lock. If the `main()` thread is engaged in some complex drawing operation this may block the worker thread for a long time, effectively serializing what ought to be parallel operations. (This frequently comes as a surprise to coders less familiar with multithreaded programming issues; see the discussion of "lockless programming" later for strategies for managing this.)

To incorporate the locking mechanism in the library, FLTK must be compiled with `--enable-threads` set during the `configure` process. IDE-based versions of FLTK are automatically compiled with the locking mechanism incorporated if possible. Since version 1.3, the `configure` script that builds the FLTK library also sets `--enable-threads` by default.

1.13.3 Simple multithreaded examples using Fl::lock

In `main()`, call `Fl::lock()` once before `Fl::run()` or `Fl::wait()` to enable the lock and start the runtime multithreading support for your program. All callbacks and derived functions like `handle()` and `draw()` will now be properly locked.

This might look something like this:

```
int main(int argc, char **argv) {
    /* Create your windows and widgets here */

    Fl::lock(); /* "start" the FLTK lock mechanism */

    /* show your window */
    main_win->show(argc, argv);

    /* start your worker threads */
    ... start threads ...

    /* Run the FLTK main loop */
    int result = Fl::run();

    /* terminate any pending worker threads */
    ... stop threads ...

    return result;
}
```

You can start as many threads as you like. From within a thread (other than the `main()` thread) FLTK calls must be wrapped with calls to `Fl::lock()` and `Fl::unlock()`:

```
void my_thread(void) {
    while (thread_still_running) {
        /* do thread work */
        ...
        /* compute new values for widgets */
        ...

        Fl::lock();      // acquire the lock
        my_widget->update(values);
        Fl::unlock();    // release the lock; allow other threads to access FLTK again
        Fl::awake();     // use Fl::awake() to signal main thread to refresh the GUI
    }
}
```

Note

To trigger a refresh of the GUI from a worker thread, the worker code should call `Fl::awake()`

Using Fl::awake thread messages

You can send messages from worker threads to the `main()` thread using `Fl::awake(void* message)`. If using this thread message interface, your `main()` might look like this:

```
int main(int argc, char **argv) {
    /* Create your windows and widgets here */

    Fl::lock(); /* "start" the FLTK lock mechanism */

    /* show your window */
    main_win->show(argc, argv);

    /* start your worker threads */
    ... start threads ...

    /* Run the FLTK loop and process thread messages */
    while (Fl::wait() > 0) {
        if ((next_message = Fl::thread_message()) != NULL) {
            /* process your data, update widgets, etc. */
            ...
        }
    }

    /* terminate any pending worker threads */
    ... stop threads ...

    return 0;
}
```

```
}

```

Your worker threads can send messages to the `main()` thread using `Fl::awake(void* message)`:

```
void *msg;           // "msg" is a pointer to your message
Fl::awake(msg);      // send "msg" to main thread

```

A message can be anything you like. The `main()` thread can retrieve the message by calling `Fl::thread_message()`.

Using `Fl::awake` callback messages

You can also request that the `main()` thread call a function on behalf of the worker thread by using `Fl::awake(Fl_Awake_Handler cb, void* userdata)`.

The `main()` thread will execute the callback "as soon as possible" when next processing the pending events. This can be used by a worker thread to perform operations (for example showing or hiding windows) that are prohibited in a worker thread.

```
void do_something_cb(void *userdata) {
    // Will run in the context of the main thread
    ... do_stuff ...
}

// running in worker thread
void *data;           // "data" is a pointer to your user data
Fl::awake(do_something_cb, data); // call to execute cb in main thread

```

Note

The `main()` thread will execute the `Fl_Awake_Handler` callback `do_something_cb` asynchronously to the worker thread, at some short but indeterminate time after the worker thread registers the request. When it executes the `Fl_Awake_Handler` callback, the `main()` thread will use the contents of `*userdata` **at the time of execution**, not necessarily the contents that `*userdata` had at the time that the worker thread posted the callback request. The worker thread should therefore contrive **not** to alter the contents of `*userdata` once it posts the callback, since the worker thread does not know when the `main()` thread will consume that data. It is often useful that `userdata` point to a struct, one member of which the `main()` thread can modify to indicate that it has consumed the data, thereby allowing the worker thread to re-use or update `userdata`.

Warning

The mechanisms used to deliver `Fl::awake(void* message)` and `Fl::awake(Fl_Awake_Handler cb, void* userdata)` events to the `main()` thread can interact in unexpected ways on some platforms. Therefore, for reliable operation, it is advised that a program use either `Fl::awake(Fl_Awake_Handler cb, void* userdata)` or `Fl::awake(void* message)`, but that they never be intermixed. Calling `Fl::awake()` with no parameters should be safe in either case.

If you have to choose between using the `Fl::awake(void* message)` and `Fl::awake(Fl_Awake_Handler cb, void* userdata)` mechanisms and don't know which to choose, then try the `Fl::awake(Fl_Awake_Handler cb, void* userdata)` method first as it tends to be more powerful in general.

1.13.4 FLTK multithreaded "lockless programming"

The simple multithreaded examples shown above, using the FLTK lock, work well for many cases where multiple threads are required. However, when that model is extended to more complex programs, it often produces results that the developer did not anticipate.

A typical case might go something like this. A developer creates a program to process a huge data set. The program has a `main()` thread and 7 worker threads and is targeted to run on an 8-core computer. When it runs, the program divides the data between the 7 worker threads, and as they process their share of the data, each thread updates its portion of the GUI with the results, locking and unlocking as they do so.

But when this program runs, it is much slower than expected and the developer finds that only one of the eight CPU cores seems to be utilised, despite there being 8 threads in the program. What happened?

The threads in the program all run as expected, but they end up being serialized (that is, not able to run in parallel) because they all depend on the single FLTK lock. Acquiring (and releasing) that lock has an associated cost, and is a **blocking** action if the lock is already held by any other worker thread or by the `main()` thread.

If the worker threads are acquiring the lock "too often", then the lock will **always** be held **somewhere** and every attempt by any other thread (even `main()`) to lock will cause that other thread (including `main()`) to block. And blocking `main()` also blocks event handling, display refresh...

As a result, only one thread will be running at any given time, and the multithreaded program is effectively reduced to being a (complicated and somewhat less efficient) single thread program.

A "solution" is for the worker threads to lock "less often", such that they do not block each other or the `main()` thread. But judging what constitutes locking "too often" for any given configuration, and hence will block, is a very tricky question. What works well on one machine, with a given graphics card and CPU configuration may behave very differently on another target machine.

There are "interesting" variations on this theme, too: for example it is possible that a "faulty" multithreaded program such as described above will work adequately on a single-core machine (where all threads are inherently serialized anyway and so are less likely to block each other) but then stall or even deadlock in unexpected ways on a multicore machine when the threads do interfere with each other. (I have seen this - it really happens.)

The "better" solution is to avoid using the FLTK lock so far as possible. Instead, the code should be designed so that the worker threads do not update the GUI themselves and therefore never need to acquire the FLTK lock. This would be FLTK multithreaded "lockless programming".

There are a number of ways this can be achieved (or at least approximated) in practice but the most direct approach is for the worker threads to make use of the `Fl::awake(Fl_Awake_Handler cb, void* userdata)` method so that GUI updates can all run in the context of the `main()` thread, alleviating the need for the worker thread to ever lock. The onus is then on the worker threads to manage the `userdata` so that it is delivered safely to the `main()` thread, but there are many ways that can be done.

Note

Using `Fl::awake` is not, strictly speaking, entirely "lockless" since the awake handler mechanism incorporates resource locking internally to protect the queue of pending awake messages. These resource locks are held transiently and generally do not trigger the pathological blocking issues described here.

However, aside from using `Fl::awake`, there are many other ways that a "lockless" design can be implemented, including message passing, various forms of IPC, etc.

If you need high performing multithreaded programming, then take some time to study the options and understand the advantages and disadvantages of each; we can't even begin to scratch the surface of this huge topic here!

And of course occasional, sparse, use of the FLTK lock from worker threads will do no harm; it is "excessive" locking (whatever that might be) that triggers the failing behaviour.

It is always a Good Idea to update the GUI at the lowest rate that is acceptable when processing bulk data (or indeed, in all cases!) Updating at a few frames per second is probably adequate for providing feedback during a long calculation. At the upper limit, anything faster than the frame rate of your monitor and the updates will never even be displayed; why waste CPU computing pixels that you will never show?

1.13.5 FLTK multithreaded Constraints

FLTK supports multiple platforms, some of which allow only the `main()` thread to handle system events and open or close windows. The safe thing to do is to adhere to the following rules for threads on all operating systems:

- Don't `show()` or `hide()` anything that contains `Fl_Window` based widgets from a worker thread. This includes any windows, dialogs, file choosers, subwindows or widgets using `Fl_Gl_Window`. Note that this constraint also applies to non-window widgets that have tooltips, since the tooltip will contain a `Fl_Window` object. The safe and portable approach is **never** to call `show()` or `hide()` on any widget from the context of a worker thread. Instead you can use the `Fl_Awake_Handler` variant of `Fl::awake()` to request the `main()` thread to create, destroy, show or hide the widget on behalf of the worker thread.
- Don't call `Fl::run()`, `Fl::wait()`, `Fl::flush()`, `Fl::check()` or any related methods that will handle system messages from a worker thread
- Don't intermix use of `Fl::awake(Fl_Awake_Handler cb, void* userdata)` and `Fl::awake(void* message)` calls in the same program as they may interact unpredictably on some platforms; choose one or other style of `Fl::awake(<thing>)` mechanism and use that. (Intermixing calls to `Fl::awake()` should be safe with either however.)
- Starting with FLTK 1.4, it's possible to start (or cancel) a timer from a worker thread under the condition that the call to `Fl::add_timeout` (or `Fl::remove_timeout`) is wrapped in `Fl::lock()` and `Fl::unlock()`.
- Don't change window decorations or titles from a worker thread
- The `make_current()` method will probably not work well for regular windows, but should always work for a `Fl_Gl_Window` to allow for high speed rendering on graphics cards with multiple pipelines. Managing thread-safe access to the GL pipelines is left as an exercise for the reader! (And may be target specific...)

See also: `Fl::lock()`, `Fl::unlock()`, `Fl::awake()`, `Fl::awake(Fl_Awake_Handler cb, void* userdata)`, `Fl::awake(void* message)`, `Fl::thread_message()`.

1.14 Unicode and UTF-8 Support

This chapter explains how FLTK handles international text via Unicode and UTF-8.

Unicode support was added to FLTK starting with version 1.3.0 and is still incomplete but mostly functional. This chapter is Work in Progress, reflecting the current state of Unicode support.

1.14.1 About Unicode, ISO 10646 and UTF-8

The summary of Unicode, ISO 10646 and UTF-8 given below is deliberately brief and provides just enough information for the rest of this chapter.

For further information, please see:

- <https://unicode.org>
- <https://iso.org>
- <https://en.wikipedia.org/wiki/Unicode>
- <https://www.cl.cam.ac.uk/~mgk25/unicode.html>
- <https://tools.ietf.org/html/rfc3629>

The Unicode Standard

The Unicode Standard was originally developed by a consortium of mainly US computer manufacturers and developers of multi-lingual software. It has now become a defacto standard for character encoding and is supported by most of the major computing companies in the world.

Before Unicode, many different systems, on different platforms, had been developed for encoding characters for different languages, but no single encoding could satisfy all languages. Unicode provides access to over 130,000 characters used in all the major languages written today, and is independent of platform and language.

Unicode also provides higher-level concepts needed for text processing and typographic publishing systems, such as algorithms for sorting and comparing text, composite character and text rendering, right-to-left and bi-directional text handling.

Note

There are currently no plans to add this extra functionality to FLTK.

ISO 10646

The International Organisation for Standardization (ISO) had also been trying to develop a single unified character set. Although both ISO and the Unicode Consortium continue to publish their own standards, they have agreed to coordinate their work so that specific versions of the Unicode and ISO 10646 standards are compatible with each other.

The international standard ISO 10646 defines the **Universal Character Set** (UCS) which contains the characters required for almost all known languages. The standard also defines three different implementation levels specifying how these characters can be combined.

Note

There are currently no plans for handling the different implementation levels or the combining characters in FLTK.

In UCS, characters have a unique numerical code and an official name, and are usually shown using 'U+' and the code in hexadecimal, e.g. U+0041 is the "Latin capital letter A". The UCS characters U+0000 to U+007F correspond to US-ASCII, and U+0000 to U+00FF correspond to ISO 8859-1 (Latin1).

ISO 10646 was originally designed to handle a 31-bit character set from U+00000000 to U+7FFFFFFF, but the current idea is that 21 bits will be sufficient for all future needs, giving characters up to U+10FFFF. The complete character set is sub-divided into *planes*. *Plane 0*, also known as the **Basic Multilingual Plane** (BMP), ranges from U+0000 to U+FFFF and consists of the most commonly used characters from previous encoding standards. Other planes contain characters for specialist applications.

Todo FLTK 1.3 and later supports the full Unicode range (21 bits), but there are a few exceptions, for instance binary shortcut values in menus ([Fl_Shortcut](#)) can only be used with characters from the BMP (16 bits). This may be extended in a future FLTK version.

The UCS also defines various methods of encoding characters as a sequence of bytes. UCS-2 encodes Unicode characters into two bytes, which is wasteful if you are only dealing with ASCII or Latin1 text, and insufficient if you need characters above U+00FFFF. UCS-4 uses four bytes, which lets it handle higher characters, but this is even more wasteful for ASCII or Latin1.

UTF-8

The Unicode standard defines various UCS Transformation Formats (UTF). UTF-16 and UTF-32 are based on units of two and four bytes. UCS characters requiring more than 16 bits are encoded using "surrogate pairs" in UTF-16.

UTF-8 encodes all Unicode characters into variable length sequences of bytes. Unicode characters in the 7-bit ASCII range map to the same value and are represented as a single byte, making the transformation to Unicode quick and easy.

All UCS characters above U+007F are encoded as a sequence of several bytes. The top bits of the first byte are set to show the length of the byte sequence, and subsequent bytes are always in the range 0x80 to 0xBF. This combination provides some level of synchronisation and error detection.

Unicode range	Byte sequences
U+00000000 - U+0000007F	0xxxxxxx
U+00000080 - U+000007FF	110xxxxx 10xxxxxx
U+00000800 - U+0000FFFF	1110xxxx 10xxxxxx 10xxxxxx
U+00010000 - U+001FFFFF	11110xxx 10xxxxxx 10xxxxxx 10xxxxxx
U+00200000 - U+03FFFFFF	111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx
U+04000000 - U+7FFFFFFF	1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx

Note

This table contains theoretical values outside the valid Unicode range (U+000000 - U+10FFFF). Such values can only be returned by conversion functions for illegal input values (see [Illegal Unicode and UTF-8 Sequences](#)).

Moving from ASCII encoding to Unicode will allow all new FLTK applications to be easily internationalized and used all over the world. By choosing UTF-8 encoding, FLTK remains largely source-code compatible to previous iterations of the library.

1.14.2 Unicode in FLTK

Todo Work through the code and this documentation to harmonize the `[OksiD]` and `[fltk2]` functions.

FLTK will be entirely converted to Unicode using UTF-8 encoding. If a different encoding is required by the underlying operating system, FLTK will convert the string as needed.

It is important to note that the initial implementation of Unicode and UTF-8 in FLTK involves three important areas:

- provision of Unicode character tables and some simple related functions;
- conversion of `char*` variables and function parameters from single byte per character representation to UTF-8 variable length sequences;
- modifications to the display font interface to accept general Unicode character or UCS code numbers instead of just ASCII or Latin1 characters.

The current implementation of Unicode / UTF-8 in FLTK will impose the following limitations:

- An implementation note in the `[OksiD]` code says that all functions are LIMITED to 24 bit Unicode values, but also says that only 16 bits are really used under linux and win32. **[Can we verify this?]**
- The `[fltk2]` `fl_utf8encode()` and `fl_utf8decode()` functions are designed to handle Unicode characters in the range U+000000 to U+10FFFF inclusive, which covers all UTF-16 characters, as specified in RFC 3629. *Note that the user must first convert UTF-16 surrogate pairs to UCS.*
- FLTK will only handle single characters, so composed characters consisting of a base character and floating accent characters will be treated as multiple characters.
- FLTK will only compare or sort strings on a byte by byte basis and not on a general Unicode character basis.
- FLTK will not handle right-to-left or bi-directional text.

Todo Verify 16/24 bit Unicode limit for different character sets? OksiD's code appears limited to 16-bit whereas the FLTK2 code appears to handle a wider set. What about illegal characters? See comments in `fl_utf8fromwc()` and `fl_utf8toUtf16()`.

1.14.3 Illegal Unicode and UTF-8 Sequences

Three pre-processor variables are defined in the source code [1] that determine how `fl_utf8decode()` handles illegal UTF-8 sequences:

- if `ERRORS_TO_CP1252` is set to 1 (the default), `fl_utf8decode()` will assume that a byte sequence starting with a byte in the range 0x80 to 0x9f represents a Microsoft CP1252 character, and will return the value of an equivalent UCS character. Otherwise, it will be processed as an illegal byte value as described below.
- if `STRICT_RFC3629` is set to 1 (not the default!) then UTF-8 sequences that correspond to illegal UCS values are treated as errors. Illegal UCS values include those above U+10FFFF, or corresponding to UTF-16 surrogate pairs. Illegal byte values are handled as described below.
- if `ERRORS_TO_ISO8859_1` is set to 1 (the default), the illegal byte value is returned unchanged, otherwise 0xFFFD, the Unicode REPLACEMENT CHARACTER, is returned instead.

[1] Since FLTK 1.3.4 you may set these three pre-processor variables on your compile command line with -D"variable=value" (value: 0 or 1) to avoid editing the source code.

fl_utf8encode() is less strict, and only generates the UTF-8 sequence for 0xFFFD, the Unicode REPLACEMENT CHARACTER, if it is asked to encode a UCS value above U+10FFFF.

Many of the [fltk2] functions below use fl_utf8decode() and fl_utf8encode() in their own implementation, and are therefore somewhat protected from bad UTF-8 sequences.

The [OksiD] fl_utf8len() function assumes that the byte it is passed is the first byte in a UTF-8 sequence, and returns the length of the sequence. Trailing bytes in a UTF-8 sequence will return -1.

- **WARNING:** fl_utf8len() can not distinguish between single bytes representing Microsoft CP1252 characters 0x80-0x9f and those forming part of a valid UTF-8 sequence. You are strongly advised not to use fl_utf8len() in your own code unless you know that the byte sequence contains only valid UTF-8 sequences.
- **WARNING:** Some of the [OksiD] functions below still use fl_utf8len() in their implementations. These may need further validation.

Please see the individual function description for further details about error handling and return values.

1.14.4 FLTK Unicode and UTF-8 Functions

This section provides a brief overview of the functions. For more details, consult the main text for each function via its link.

int [fl_utf8locale\(\)](#) **FLTK2**

fl_utf8locale() returns true if the "locale" seems to indicate that UTF-8 encoding is used.

It is highly recommended that you change your system so this does return true!

int [fl_utf8test\(const char *src, unsigned len\)](#) **FLTK2**

fl_utf8test() examines the first len bytes of src. It returns 0 if there are any illegal UTF-8 sequences; 1 if src contains plain ASCII or if len is zero; or 2, 3 or 4 to indicate the range of Unicode characters found.

int [fl_utf_nb_char\(const unsigned char *buf, int len\)](#) **OksiD**

Returns the number of UTF-8 characters in the first len bytes of buf.

int [fl_unichar_to_utf8_size\(Fl_Unichar\)](#)

int [fl_utf8bytes\(unsigned ucs\)](#)

Returns the number of bytes needed to encode `ucs` in UTF-8.

`int fl_utf8len(char c)` **OksID**

If `c` is a valid first byte of a UTF-8 encoded character sequence, `fl_utf8len()` will return the number of bytes in that sequence. It returns -1 if `c` is not a valid first byte.

`unsigned int fl_nonspacing(unsigned int ucs)` **OksID**

Returns true if `ucs` is a non-spacing character.

`const char* fl_utf8back(const char *p, const char *start, const char *end)` **FLTK2**

`const char* fl_utf8fwd(const char *p, const char *start, const char *end)` **FLTK2**

If `p` already points to the start of a UTF-8 character sequence, these functions will return `p`. Otherwise `fl_utf8back()` searches backwards from `p` and `fl_utf8fwd()` searches forwards from `p`, within the `start` and `end` limits, looking for the start of a UTF-8 character.

`unsigned int fl_utf8decode(const char *p, const char *end, int *len)` **FLTK2**

`int fl_utf8encode(unsigned ucs, char *buf)` **FLTK2**

`fl_utf8decode()` attempts to decode the UTF-8 character that starts at `p` and may not extend past `end`. It returns the Unicode value, and the length of the UTF-8 character sequence is returned via the `len` argument. `fl_utf8encode()` writes the UTF-8 encoding of `ucs` into `buf` and returns the number of bytes in the sequence. See the main documentation for the treatment of illegal Unicode and UTF-8 sequences.

`unsigned int fl_utf8froma(char *dst, unsigned dstlen, const char *src, unsigned srclen)` **FLTK2**

`unsigned int fl_utf8toa(const char *src, unsigned srclen, char *dst, unsigned dstlen)` **FLTK2**

`fl_utf8froma()` converts a character string containing single bytes per character (i.e. ASCII or ISO-8859-1) into UTF-8. If the `src` string contains only ASCII characters, the return value will be the same as `srclen`.

`fl_utf8toa()` converts a string containing UTF-8 characters into single byte characters. UTF-8 characters that do not correspond to ASCII or ISO-8859-1 characters below 0xFF are replaced with '?'.

Both functions return the number of bytes that would be written, not counting the null terminator. `dstlen` provides a means of limiting the number of bytes written, so setting `dstlen` to zero is a means of measuring how much storage would be needed before doing the real conversion.

`char* fl_utf2mbcs(const char *src)` **Oksid**

converts a UTF-8 string to a local multi-byte character string. **[More info required here!]**

`unsigned int fl_utf8fromwc(char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)` **FLTK2**

`unsigned int fl_utf8towc(const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)` **FLTK2**

`unsigned int fl_utf8toUtf16(const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)` **FLTK2**

These routines convert between UTF-8 and `wchar_t` or "wide character" strings. The difficulty lies in the fact that `sizeof(wchar_t)` is 2 on Windows and 4 on Linux and most other systems. Therefore some "wide characters" on Windows may be represented as "surrogate pairs" of more than one `wchar_t`.

`fl_utf8fromwc()` converts from a "wide character" string to UTF-8. Note that `srclen` is the number of `wchar_t` elements in the source string and on Windows this might be larger than the number of characters. `dstlen` specifies the maximum number of **bytes** to copy, including the null terminator.

`fl_utf8towc()` converts a UTF-8 string into a "wide character" string. Note that on Windows, some "wide characters" might result in "surrogate pairs" and therefore the return value might be more than the number of characters. `dstlen` specifies the maximum number of `wchar_t` elements to copy, including a zero terminating element. **[Is this all worded correctly?]**

`fl_utf8toUtf16()` converts a UTF-8 string into a "wide character" string using UTF-16 encoding to handle the "surrogate pairs" on Windows. `dstlen` specifies the maximum number of `wchar_t` elements to copy, including a zero terminating element. **[Is this all worded correctly?]**

These routines all return the number of elements that would be required for a full conversion of the `src` string, including the zero terminator. Therefore setting `dstlen` to zero is a way of measuring how much storage would be needed before doing the real conversion.

`unsigned int fl_utf8from_mb(char *dst, unsigned dstlen, const char *src, unsigned srclen)` **FLTK2**

`unsigned int fl_utf8to_mb(const char *src, unsigned srclen, char *dst, unsigned dstlen)` **FLTK2**

These functions convert between UTF-8 and the locale-specific multi-byte encodings used on some systems for filenames, etc. If `fl_utf8locale()` returns true, these functions don't do anything useful. **[Is this all worded correctly?]**

```
int fl_tolower(unsigned int ucs) OksiD
int fl_toupper(unsigned int ucs) OksiD
int fl_utf_tolower(const unsigned char *str, int len, char *buf) OksiD
int fl_utf_toupper(const unsigned char *str, int len, char *buf) OksiD
```

`fl_tolower()` and `fl_toupper()` convert a single Unicode character from upper to lower case, and vice versa. `fl_utf_tolower()` and `fl_utf_toupper()` convert a string of bytes, some of which may be multi-byte UTF-8 encodings of Unicode characters, from upper to lower case, and vice versa.

Warning: to be safe, `buf` length must be at least `3*len` [for 16-bit Unicode]

```
int fl_utf_strcasecmp(const char *s1, const char *s2) OksiD
int fl_utf_strncasecmp(const char *s1, const char *s2, int n) OksiD
```

`fl_utf_strcasecmp()` is a UTF-8 aware string comparison function that converts the strings to lower case Unicode as part of the comparison. `fl_utf_strncasecmp()` only compares the first `n` characters [bytes?]

1.14.5 FLTK Unicode Versions of System Calls

- `int fl_access(const char* f, int mode) OksiD`
- `int fl_chmod(const char* f, int mode) OksiD`
- `int fl_execvp(const char* file, char* const* argv) OksiD`
- `FILE* fl_fopen(const char* f, const char* mode) OksiD`
- `char* fl_getcwd(char* buf, int maxlen) OksiD`
- `char* fl_getenv(const char* name) OksiD`
- `char fl_make_path(const char* path) - returns char ? OksiD`
- `void fl_make_path_for_file(const char* path) OksiD`
- `int fl_mkdir(const char* f, int mode) OksiD`
- `int fl_open(const char* f, int o, ...) OksiD`
- `int fl_rename(const char* f, const char* t) OksiD`
- `int fl_rmdir(const char* f) OksiD`
- `int fl_stat(const char* path, struct stat* buffer) OksiD`
- `int fl_system(const char* f) OksiD`
- `int fl_unlink(const char* f) OksiD`

TODO:

- more doc on unicode, add links
- write something about filename encoding on OS X...
- explain the `fl_utf8_...` commands
- explain issues with [FL_Preferences](#)

1.15 Constants and Enumerations

Note

This file is not actively maintained any more, but is left here as a reference, until the doxygen documentation is completed.

See also

[FL/Enumerations.H](#).

This appendix lists the enumerations provided in the `<FL/Enumerations.H>` header file, organized by section. Constants whose value are zero are marked with "(0)", this is often useful to know when programming.

1.15.1 Version Numbers

The FLTK version number is stored in a number of compile-time constants:

- `FL_MAJOR_VERSION` - The major release number, currently 1
- `FL_MINOR_VERSION` - The minor release number, currently 4
- `FL_PATCH_VERSION` - The patch release number, currently 1
- `FL_VERSION` - [Deprecated] A combined floating-point version number for the major, minor, and patch release numbers, currently 1.0400
- `FL_API_VERSION` - A combined integer version number for the major, minor, and patch release numbers, currently 10400 (use this instead of `FL_VERSION`, if possible)
- `FL_ABI_VERSION` - A combined integer version number for the application binary interface (ABI) major, minor, and patch release numbers, currently 10400 (default)

Note

The ABI version (`FL_ABI_VERSION`) is usually constant throughout one major/minor release version, for instance 10300 if `FL_API_VERSION` is 10304. Hence the ABI is constant if only the patch version is changed. You can change this with `configure` or `CMake` though if you want the latest enhancements (called "ABI features", see `CHANGES`).

1.15.2 Events

Events are identified by an [FL_Event](#) enumeration value. The following events are currently defined:

- FL_NO_EVENT - No event (or an event fltk does not understand) occurred (0).
- FL_PUSH - A mouse button was pushed.
- FL_RELEASE - A mouse button was released.
- FL_ENTER - The mouse pointer entered a widget.
- FL_LEAVE - The mouse pointer left a widget.
- FL_DRAG - The mouse pointer was moved with a button pressed.
- FL_FOCUS - A widget should receive keyboard focus.
- FL_UNFOCUS - A widget loses keyboard focus.
- FL_KEYBOARD - A key was pressed.
- FL_CLOSE - A window was closed.
- FL_MOVE - The mouse pointer was moved with no buttons pressed.
- FL_SHORTCUT - The user pressed a shortcut key.
- FL_DEACTIVATE - The widget has been deactivated.
- FL_ACTIVATE - The widget has been activated.
- FL_HIDE - The widget has been hidden.
- FL_SHOW - The widget has been shown.
- FL_PASTE - The widget should paste the contents of the clipboard.
- FL_SELECTIONCLEAR - The widget should clear any selections made for the clipboard.
- FL_MOUSEWHEEL - The horizontal or vertical mousewheel was turned.
- FL_DND_ENTER - The mouse pointer entered a widget dragging data.
- FL_DND_DRAG - The mouse pointer was moved dragging data.
- FL_DND_LEAVE - The mouse pointer left a widget still dragging data.
- FL_DND_RELEASE - Dragged data is about to be dropped.
- FL_SCREEN_CONFIGURATION_CHANGED - The screen configuration (number, positions) was changed.
- FL_FULLSCREEN - The fullscreen state of the window has changed.

1.15.3 Callback "When" Conditions

The following constants determine when a callback is performed:

- FL_WHEN_NEVER - Never call the callback (0).
- FL_WHEN_CHANGED - Do the callback only when the widget value changes.
- FL_WHEN_NOT_CHANGED - Do the callback whenever the user interacts with the widget.
- FL_WHEN_RELEASE - Do the callback when the button or key is released and the value changes.
- FL_WHEN_ENTER_KEY - Do the callback when the user presses the ENTER key and the value changes.
- FL_WHEN_RELEASE_ALWAYS - Do the callback when the button or key is released, even if the value doesn't change.
- FL_WHEN_ENTER_KEY_ALWAYS - Do the callback when the user presses the ENTER key, even if the value doesn't change.

1.15.4 Fl::event_button() Values

The following constants define the button numbers for FL_PUSH and FL_RELEASE events:

- FL_LEFT_MOUSE - the left mouse button
- FL_MIDDLE_MOUSE - the middle mouse button
- FL_RIGHT_MOUSE - the right mouse button
- FL_BACK_MOUSE - the back mouse button (side button 1)
- FL_FORWARD_MOUSE - the forward mouse button (side button 2)

1.15.5 Fl::event_key() Values

The following constants define the non-ASCII keys on the keyboard for FL_KEYBOARD and FL_SHORTCUT events:

- FL_Button - A mouse button; use `Fl_Button + n` for mouse button `n`.
- FL_BackSpace - The backspace key.
- FL_Tab - The tab key.
- FL_Enter - The enter key.
- FL_Pause - The pause key.
- FL_Scroll_Lock - The scroll lock key.
- FL_Escape - The escape key.
- FL_Home - The home key.
- FL_Left - The left arrow key.
- FL_Up - The up arrow key.
- FL_Right - The right arrow key.
- FL_Down - The down arrow key.
- FL_Page_Up - The page-up key.
- FL_Page_Down - The page-down key.
- FL_End - The end key.
- FL_Print - The print (or print-screen) key.
- FL_Insert - The insert key.
- FL_Menu - The menu key.
- FL_Num_Lock - The num lock key.
- FL_KP - One of the keypad numbers or keys; use `FL_KP + 'n'` for number `n` and, say, `FL_KP + '*'`.
- FL_KP_Enter - The enter key on the keypad.
- FL_F - One of the function keys; use `FL_F + n` for function key `n`.
- FL_Shift_L - The lefthand shift key.

- `FL_Shift_R` - The righthand shift key.
- `FL_Control_L` - The lefthand control key.
- `FL_Control_R` - The righthand control key.
- `FL_Caps_Lock` - The caps lock key.
- `FL_Meta_L` - The left meta/Windows key.
- `FL_Meta_R` - The right meta/Windows key.
- `FL_Alt_L` - The left alt key.
- `FL_Alt_R` - The right alt key.
- `FL_Delete` - The delete key.
- `FL_Alt_Gr` - The AltGr key on some international keyboards.

1.15.6 `Fl::event_state()` Values

The following constants define bits in the `Fl::event_state()` value:

- `FL_SHIFT` - One of the shift keys is down.
- `FL_CAPS_LOCK` - The caps lock is on.
- `FL_CTRL` - One of the ctrl keys is down.
- `FL_ALT` - One of the alt keys is down.
- `FL_NUM_LOCK` - The num lock is on.
- `FL_META` - One of the meta/Windows keys is down.
- `FL_COMMAND` - An alias for `FL_CTRL` on Windows, X11 and Wayland, or `FL_META` on MacOS X.
- `FL_CONTROL` - An alias for `FL_META` on Windows, X11 and Wayland, or `FL_CTRL` on MacOS X.
- `FL_SCROLL_LOCK` - The scroll lock is on.
- `FL_BUTTON1` - Mouse button 1 is pushed.
- `FL_BUTTON2` - Mouse button 2 is pushed.
- `FL_BUTTON3` - Mouse button 3 is pushed.
- `FL_BUTTON4` - Mouse button 4 (back) is pushed.
- `FL_BUTTON5` - Mouse button 5 (forward) is pushed.
- `FL_BUTTONS` - Any mouse button (1..5) is pushed.
- `FL_BUTTON(n)` - Mouse button `n` (where `n > 0`) is pushed.

1.15.7 Alignment Values

The following constants define bits that can be used with `FL_Widget::align()` to control the positioning of the label:

- `FL_ALIGN_CENTER` - The label is centered (0).
- `FL_ALIGN_TOP` - The label is top-aligned.
- `FL_ALIGN_BOTTOM` - The label is bottom-aligned.
- `FL_ALIGN_LEFT` - The label is left-aligned.
- `FL_ALIGN_RIGHT` - The label is right-aligned.
- `FL_ALIGN_CLIP` - The label is clipped to the widget.
- `FL_ALIGN_WRAP` - The label text is wrapped as needed.
- `FL_ALIGN_TOP_LEFT` - The label appears at the top of the widget, aligned to the left.
- `FL_ALIGN_TOP_RIGHT` - The label appears at the top of the widget, aligned to the right.
- `FL_ALIGN_BOTTOM_LEFT` - The label appears at the bottom of the widget, aligned to the left.
- `FL_ALIGN_BOTTOM_RIGHT` - The label appears at the bottom of the widget, aligned to the right.
- `FL_ALIGN_LEFT_TOP` - The label appears to the left of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_RIGHT_TOP` - The label appears to the right of the widget, aligned at the top. Outside labels only.
- `FL_ALIGN_LEFT_BOTTOM` - The label appears to the left of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_RIGHT_BOTTOM` - The label appears to the right of the widget, aligned at the bottom. Outside labels only.
- `FL_ALIGN_INSIDE` - 'or' this with other values to put label inside the widget.
- `FL_ALIGN_TEXT_OVER_IMAGE` - Label text will appear above the image.
- `FL_ALIGN_IMAGE_OVER_TEXT` - Label text will be below the image.
- `FL_ALIGN_IMAGE_NEXT_TO_TEXT` - The image will appear to the left of the text.
- `FL_ALIGN_TEXT_NEXT_TO_IMAGE` - The image will appear to the right of the text.
- `FL_ALIGN_IMAGE_BACKDROP` - The image will be used as a background for the widget.

1.15.8 Fonts

The following constants define the standard FLTK fonts:

- `FL_HELVETICA` - Helvetica (or Arial) normal (0).
- `FL_HELVETICA_BOLD` - Helvetica (or Arial) bold.
- `FL_HELVETICA_ITALIC` - Helvetica (or Arial) oblique.
- `FL_HELVETICA_BOLD_ITALIC` - Helvetica (or Arial) bold-oblique.
- `FL_COURIER` - Courier normal.
- `FL_COURIER_BOLD` - Courier bold.

- FL_COURIER_ITALIC - Courier italic.
- FL_COURIER_BOLD_ITALIC - Courier bold-italic.
- FL_TIMES - Times roman.
- FL_TIMES_BOLD - Times bold.
- FL_TIMES_ITALIC - Times italic.
- FL_TIMES_BOLD_ITALIC - Times bold-italic.
- FL_SYMBOL - Standard symbol font.
- FL_SCREEN - Default monospaced screen font.
- FL_SCREEN_BOLD - Default monospaced bold screen font.
- FL_ZAPF_DINGBATS - Zapf-dingbats font.

1.15.9 Colors

The `Fl_Color` enumeration type holds a FLTK color value. Colors are either 8-bit indexes into a `virtual colormap` or 24-bit RGB color values. Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

1.15.9.1 Color Constants

Constants are defined for the user-defined foreground and background colors, as well as specific colors and the start of the grayscale ramp and color cube in the `virtual colormap`. Inline functions are provided to retrieve specific grayscale, color cube, or RGB color values.

The following color constants can be used to access the user-defined colors:

- FL_BACKGROUND_COLOR - the default background color
- FL_BACKGROUND2_COLOR - the default background color for text, list, and valuator widgets
- FL_FOREGROUND_COLOR - the default foreground color (0) used for labels and text
- FL_INACTIVE_COLOR - the inactive foreground color
- FL_SELECTION_COLOR - the default selection/highlight color

The following color constants can be used to access the colors from the FLTK standard color cube:

- FL_BLACK
- FL_BLUE
- FL_CYAN
- FL_DARK_BLUE
- FL_DARK_CYAN
- FL_DARK_GREEN
- FL_DARK_MAGENTA

- FL_DARK_RED
- FL_DARK_YELLOW
- FL_GREEN
- FL_MAGENTA
- FL_RED
- FL_WHITE
- FL_YELLOW

The following are named values within the standard grayscale:

- FL_GRAY0
- FL_DARK3
- FL_DARK2
- FL_DARK1
- FL_LIGHT1
- FL_LIGHT2
- FL_LIGHT3

The inline methods for getting a grayscale, color cube, or RGB color value are described in the [Colors](#) section of the [Drawing Things in FLTK](#) chapter.

1.15.10 Cursors

The following constants define the mouse cursors that are available in FLTK. The double-headed arrows are bitmaps provided by FLTK on X, the others are provided by system-defined cursors.

- FL_CURSOR_DEFAULT - the default cursor, usually an arrow (0)
- FL_CURSOR_ARROW - an arrow pointer
- FL_CURSOR_CROSS - crosshair
- FL_CURSOR_WAIT - watch or hourglass
- FL_CURSOR_INSERT - I-beam
- FL_CURSOR_HAND - hand (uparrow on Windows)
- FL_CURSOR_HELP - question mark
- FL_CURSOR_MOVE - 4-pointed arrow
- FL_CURSOR_NS - up/down arrow
- FL_CURSOR_WE - left/right arrow
- FL_CURSOR_NWSE - diagonal arrow
- FL_CURSOR_NESW - diagonal arrow
- FL_CURSOR_NONE - invisible

1.15.11 FD "When" Conditions

- `FL_READ` - Call the callback when there is data to be read.
- `FL_WRITE` - Call the callback when data can be written without blocking.
- `FL_EXCEPT` - Call the callback if an exception occurs on the file.

1.15.12 Damage Masks

The following damage mask bits are used by the standard FLTK widgets:

- `FL_DAMAGE_CHILD` - A child needs to be redrawn.
- `FL_DAMAGE_EXPOSE` - The window was exposed.
- `FL_DAMAGE_SCROLL` - The [Fl_Scroll](#) widget was scrolled.
- `FL_DAMAGE_OVERLAY` - The overlay planes need to be redrawn.
- `FL_DAMAGE_USER1` - First user-defined damage bit.
- `FL_DAMAGE_USER2` - Second user-defined damage bit.
- `FL_DAMAGE_ALL` - Everything needs to be redrawn.

1.16 GLUT Compatibility

This appendix describes the GLUT compatibility header file supplied with FLTK. FLTK's GLUT compatibility is based on the original GLUT 3.7 and the follow-on FreeGLUT 2.4.0 libraries.

1.16.1 Using the GLUT Compatibility Header File

You should be able to compile existing GLUT source code by including `<FL/glut.H>` instead of `<GL/glut.h>`. This can be done by editing the source, by changing the `-I` switches to the compiler, or by providing a symbolic link from `GL/glut.h` to `FL/glut.H`.

All files calling GLUT procedures must be compiled with C++. You may have to alter them slightly to get them to compile without warnings, and you may have to rename them to get make to use the C++ compiler.

You must link with the FLTK library. Most of `FL/glut.H` is inline functions. You should take a look at it (and maybe at `test/glpuzzle.cxx` in the FLTK source) if you are having trouble porting your GLUT program.

This has been tested with most of the demo programs that come with the GLUT and FreeGLUT distributions.

1.16.2 Known Problems

The following functions and/or arguments to functions are missing, and you will have to replace them or comment them out for your code to compile:

- `glutGet (GLUT_ELAPSED_TIME)`
- `glutGet (GLUT_SCREEN_HEIGHT_MM)`
- `glutGet (GLUT_SCREEN_WIDTH_MM)`
- `glutGet (GLUT_WINDOW_NUM_CHILDREN)`
- `glutInitDisplayMode (GLUT_LUMINANCE)`
- `glutKeyboardUpFunc(void(*callback)(unsigned char key, int x, int y))`
- `glutLayerGet (GLUT_HAS_OVERLAY)`
- `glutLayerGet (GLUT_LAYER_IN_USE)`
- `glutPushWindow ()`
- `glutSetColor (), glutGetColor (), glutCopyColormap ()`
- `glutVideoResize ()` missing.
- `glutWarpPointer ()`
- `glutWindowStatusFunc ()`
- Spaceball, buttonbox, dials, and tablet functions

Most of the symbols/enumerations have different values than GLUT uses. This will break code that relies on the actual values. The only symbols guaranteed to have the same values are true/false pairs like `GLUT_DOWN` and `GLUT_UP`, mouse buttons `GLUT_LEFT_BUTTON`, `GLUT_MIDDLE_BUTTON`, `GLUT_RIGHT_BUTTON`, and `GLUT_KEY_F1` thru `GLUT_KEY_F12`.

The strings passed as menu labels are not copied.

`glutPostRedisplay ()` does not work if called from inside a display function. You must use `glutIdleFunc ()` if you want your display to update continuously.

`glutSwapBuffers ()` does not work from inside a display function. This is on purpose, because FLTK swaps the buffers for you.

`glutUseLayer ()` does not work well, and should only be used to initialize transformations inside a resize callback. You should redraw overlays by using `glutOverlayDisplayFunc ()`.

Overlays are cleared before the overlay display function is called. `glutLayerGet (GLUT_OVERLAY_DAMAGED)` always returns true for compatibility with some GLUT overlay programs. You must rewrite your code so that `gl_color ()` is used to choose colors in an overlay, or you will get random overlay colors.

`glutSetCursor (GLUT_CURSOR_FULL_CROSSHAIR)` just results in a small crosshair.

The fonts used by `glutBitmapCharacter ()` and `glutBitmapWidth ()` may be different.

`glutInit (argc, argv)` will consume different switches than GLUT does. It accepts the switches recognized by `Fl::args()`, and will accept any abbreviation of these switches (such as `"-di"` for `"-display"`).

1.16.3 Mixing GLUT and FLTK Code

You can make your GLUT window a child of a [Fl_Window](#) with the following scheme. The biggest trick is that GLUT insists on a call to `show()` the window at the point it is created, which means the [Fl_Window](#) parent window must already be shown.

- Don't call `glutInit()`.
- Create your [Fl_Window](#), and any FLTK widgets. Leave a blank area in the window for your GLUT window.
- `show()` the [Fl_Window](#). Perhaps call `show(argc, argv)`.
- Call `window->begin()` so that the GLUT window will be automatically added to it.
- Use `glutInitWindowSize()` and `glutInitWindowPosition()` to set the location in the parent window to put the GLUT window.
- Put your GLUT code next. It probably does not need many changes. Call `window->end()` immediately after the `glutCreateWindow()` !
- You can call either `glutMainLoop()`, [Fl::run\(\)](#), or loop calling [Fl::wait\(\)](#) to run the program.

1.16.4 class Fl_Glut_Window

1.16.4.1 Class Hierarchy

```
Fl_Gl_Window
|
+----Fl_Glut_Window
```

1.16.4.2 Include Files

```
#include <FL/glut.H>
```

1.16.4.3 Description

Each GLUT window is an instance of this class. You may find it useful to manipulate instances directly rather than use GLUT window id's. These may be created without opening the display, and thus can fit better into FLTK's method of creating windows.

The current GLUT window is available in the global variable `glut_window`.

`new Fl_Glut_Window(...)` is the same as `glutCreateWindow()` except it does not `show()` the window or make the window current.

`window->make_current()` is the same as `glutSetWindow(number)`. If the window has not had `show()` called on it yet, some functions that assume an OpenGL context will not work. If you do `show()` the window, call `make_current()` again to set the context.

`~Fl_Glut_Window()` is the same as `glutDestroyWindow()`.

1.16.4.4 Members

The [Fl_Glut_Window](#) class contains several public members that can be altered directly:

member	description
display	A pointer to the function to call to draw the normal planes.
entry	A pointer to the function to call when the mouse moves into or out of the window.
keyboard	A pointer to the function to call when a regular key is pressed.
menu[3]	The menu to post when one of the mouse buttons is pressed.
mouse	A pointer to the function to call when a button is pressed or released.
motion	A pointer to the function to call when the mouse is moved with a button down.
overlaydisplay	A pointer to the function to call to draw the overlay planes.
passivemotion	A pointer to the function to call when the mouse is moved with no buttons down.
reshape	A pointer to the function to call when the window is resized.
special	A pointer to the function to call when a special key is pressed.
visibility	A pointer to the function to call when the window is iconified or restored (made visible.)

1.16.4.5 Methods

`Fl_Glut_Window::Fl_Glut_Window(int x, int y, int w, int h, const char *title = 0)`

`Fl_Glut_Window::Fl_Glut_Window(int w, int h, const char *title = 0)`

The first constructor takes 4 int arguments to create the window with a preset position and size. The second constructor with 2 arguments will create the window with a preset size, but the window manager will choose the position according to its own whims.

`virtual Fl_Glut_Window::~~Fl_Glut_Window()`

Destroys the GLUT window.

`void Fl_Glut_Window::make_current()`

Switches all drawing functions to the GLUT window.

1.17 Forms Compatibility

This appendix describes the Forms compatibility included with FLTK.

Note

The Forms compatibility library is deprecated, no longer actively maintained since FLTK 1.3.0, and likely to be removed completely in FLTK 1.5.

Since FLTK 1.4 building the Forms compatibility library `fltk_forms` (configure/Makefiles) or `fltk::forms` (CMake) can be disabled with one of these commands:

```
- ./configure --disable-forms ...
- cmake -D FLTK_BUILD_FORMS:BOOL=OFF ...
- cmake-gui ...
```

Fluid can still import Forms and XForms designer (.fd) files but w/o any guarantees for working results. Manual fixes may be necessary.

In the next minor or major release (1.5 or higher) the Forms compatibility library will not be built by default or will be removed entirely.

1.17.1 Importing Forms Layout Files

FLUID can read the `.fd` files put out by all versions of Forms and XForms `fdesign`. However, it will mangle them a bit, but it prints a warning message about anything it does not understand. FLUID cannot write `fdesign` files, so you should save to a new name so you don't write over the old one.

You will need to edit your main code considerably to get it to link with the output from FLUID. If you are not interested in this you may have more immediate luck with the forms compatibility header, `<FL/forms.H>`.

1.17.2 Using the Compatibility Header File

You should be able to compile existing Forms or XForms source code by changing the include directory switch to your compiler so that the `forms.h` file supplied with FLTK is included. The `forms.h` file simply pulls in `<FL/forms.H>` so you don't need to change your source code. Take a look at `<FL/forms.H>` to see how it works, but the basic trick is lots of inline functions. Most of the XForms demo programs work without changes.

You will also have to compile your Forms or XForms program using a C++ compiler. The FLTK library does not provide C bindings or header files.

Although FLTK was designed to be compatible with the GL Forms library (version 0.3 or so), XForms has bloated severely and its interface is X-specific. Therefore, XForms compatibility is no longer a goal of FLTK. Compatibility was limited to things that were free, or that would add code that would not be linked in if the feature is unused, or that was not X-specific.

To use any new features of FLTK, you should rewrite your code to not use the inline functions and instead use "pure" FLTK. This will make it a lot cleaner and make it easier to figure out how to call the FLTK functions. Unfortunately this conversion is harder than expected and even Digital Domain's inhouse code still uses `forms.H` a lot.

1.17.3 Problems You Will Encounter

Many parts of XForms use X-specific structures like `XEvent` in their interface. I did not emulate these! Unfortunately these features (such as the "canvas" widget) are needed by most large programs. You will need to rewrite these to use FLTK subclasses.

`Fl_Free` widgets emulate the *old* Forms "free" widget. It may be useful for porting programs that change the `handle()` function on widgets, but you will still need to rewrite things.

`Fl_Timer` widgets are provided to emulate the XForms timer. These work, but are quite inefficient and inaccurate compared to using `Fl::add_timeout()`.

All instance variables are hidden. If you directly refer to the `x`, `y`, `w`, `h`, `label`, or other fields of your Forms widgets you will have to add empty parenthesis after each reference. The easiest way to do this is to globally replace `"->x"` with `"->x()"`, etc. Replace `"boxtype"` with `"box()"`.

`const char *` arguments to most FLTK methods are simply stored, while Forms would `strdup()` the passed string. This is most noticeable with the label of widgets. Your program must always pass static data such as a string constant or malloc'd buffer to `label()`. If you are using labels to display program output you may want to try the `Fl_Output` widget.

The default fonts and sizes are matched to the older GL version of Forms, so all labels will draw somewhat larger than an XForms program does.

`fdesign` outputs a setting of a `"fdui"` instance variable to the main window. I did not emulate this because I wanted all instance variables to be hidden. You can store the same information in the `user_data()` field of a window. To do this, search through the `fdesign` output for all occurrences of `"->fdui"` and edit to use `"->user_data()"` instead. This will require casts and is not trivial.

The prototype for the functions passed to `fl_add_timeout()` and `fl_set_idle_callback()` callback are different.

All the following XForms calls are missing:

- FL_REVISION, fl_library_version()
- FL_RETURN_DBLCLICK (use [Fl::event_clicks\(\)](#))
- fl_add_signal_callback()
- fl_set_form_atactivate() fl_set_form_atdeactivate()
- fl_set_form_property()
- fl_set_app_mainform(), fl_get_app_mainform()
- fl_set_form_minsize(), fl_set_form_maxsize()
- fl_set_form_event_cmask(), fl_get_form_event_cmask()
- fl_set_form_dblbuffer(), fl_set_object_dblbuffer() (use an [Fl_Double_Window](#) instead)
- fl_adjust_form_size()
- fl_register_raw_callback()
- fl_set_object_bw(), fl_set_border_width()
- fl_set_object_resize(), fl_set_object_gravity()
- fl_set_object_shortcutkey()
- fl_set_object_automatic()
- fl_get_object_bbox() (maybe FLTK should do this)
- fl_set_object_prehandler(), fl_set_object_posthandler()
- fl_enumerate_fonts()
- **Most drawing functions**
- fl_set_coordunit() (FLTK uses pixels all the time)
- fl_ringbell()
- fl_gettime()
- fl_win*() (all these functions)
- fl_initialize(argc, argv, x, y, z) ignores last 3 arguments
- fl_read_bitmapfile(), fl_read_pixmapfile()
- fl_addto_browser_chars()
- FL_MENU_BUTTON just draws normally
- fl_set_bitmapbutton_file(), fl_set_pixmapbutton_file()
- FL_CANVAS objects
- FL_DIGITAL_CLOCK (comes out analog)
- fl_create_bitmap_cursor(), fl_set_cursor_color()
- fl_set_dial_angles()
- fl_show_oneliner()
- fl_set_choice_shortcut(a, b, c)
- command log

- Only some of file selector is emulated
- `FL_DATE_INPUT`
- `fl_pup*()` (all these functions)
- `textbox` object (should be easy but I had no sample programs)
- `xyplot` object

1.17.4 Additional Notes

These notes were written for porting programs written with the older IRISGL version of Forms. Most of these problems are the same ones encountered when going from old Forms to XForms:

Does Not Run In Background

The IRISGL library always forked when you created the first window, unless `"foreground()"` was called. FLTK acts like `"foreground()"` is called all the time. If you really want the fork behavior do `"if (fork()) exit(0)"` right at the start of your program.

You Cannot Use IRISGL Windows or `fl_queue`

If a Forms (not XForms) program if you wanted your own window for displaying things you would create a IRISGL window and draw in it, periodically calling Forms to check if the user hit buttons on the panels. If the user did things to the IRISGL window, you would find this out by having the value `FL_EVENT` returned from the call to Forms.

None of this works with FLTK. Nor will it compile, the necessary calls are not in the interface.

You have to make a subclass of `FL_Gl_Window` and write a `draw()` method and `handle()` method. This may require anywhere from a trivial to a major rewrite.

If you draw into the overlay planes you will have to also write a `draw_overlay()` method and call `redraw_overlay()` on the OpenGL window.

One easy way to hack your program so it works is to make the `draw()` and `handle()` methods on your window set some static variables, storing what event happened. Then in the main loop of your program, call `FL::wait()` and then check these variables, acting on them as though they are events read from `fl_queue`.

You Must Use OpenGL to Draw Everything

The file `<FL/gl.h>` defines replacements for a lot of IRISGL calls, translating them to OpenGL. There are much better translators available that you might want to investigate.

You Cannot Make Forms Subclasses

Programs that call `fl_make_object` or directly setting the handle routine will not compile. You have to rewrite them to use a subclass of `Fl_Widget`. It is important to note that the `handle()` method is not exactly the same as the `handle()` function of Forms. Where a Forms `handle()` returned non-zero, your `handle()` must call `do_callback()`. And your `handle()` must return non-zero if it "understood" the event.

An attempt has been made to emulate the "free" widget. This appears to work quite well. It may be quicker to modify your subclass into a "free" widget, since the "handle" functions match.

If your subclass draws into the overlay you are in trouble and will have to rewrite things a lot.

You Cannot Use <device.h>

If you have written your own "free" widgets you will probably get a lot of errors about "getvaluator". You should substitute:

Forms	FLTK
MOUSE_X	Fl::event_x_root()
MOUSE_Y	Fl::event_y_root()
LEFTSHIFTKEY,RIGHTSHIFTKEY	Fl::event_shift()
CAPSLOCKKEY	Fl::event_capslock()
LEFTCTRLKEY,RIGHTCTRLKEY	Fl::event_ctrl()
LEFTALTKEY,RIGHTALTKEY	Fl::event_alt()
MOUSE1,RIGHTMOUSE	Fl::event_state()
MOUSE2,MIDDLEMOUSE	Fl::event_state()
MOUSE3,LEFTMOUSE	Fl::event_state()

Anything else in `getvaluator` and you are on your own...

Font Numbers Are Different

The "style" numbers have been changed because I wanted to insert bold-italic versions of the normal fonts. If you use Times, Courier, or Bookman to display any text you will get a different font out of FLTK. If you are really desperate to fix this use the following code:

```
fl_font_name(3, "courier-medium-r-no");
fl_font_name(4, "courier-bold-r-no");
fl_font_name(5, "courier-medium-o-no");
fl_font_name(6, "times-medium-r-no");
fl_font_name(7, "times-bold-r-no");
fl_font_name(8, "times-medium-i-no");
fl_font_name(9, "bookman-light-r-no");
fl_font_name(10, "bookman-demi-r-no");
fl_font_name(11, "bookman-light-i-no");
```

1.18 Operating System Issues

This appendix describes the operating system specific interfaces in FLTK:

- [Accessing the OS Interfaces](#)
- [The Wayland/X11 hybrid library](#)
- [The UNIX \(X11\) Interface](#)
- [The Windows Interface](#)
- [The Apple OS X Interface](#)
- [The Wayland Interface](#)

1.18.1 Accessing the OS Interfaces

All programs that need to access the operating system specific interfaces must include the following header file:

```
#include <FL/platform.H>
```

This header file will define the appropriate interface for your environment. The pages that follow describe the functionality that is provided for each operating system.

Note

These definitions used to be in [FL/x.H](#) up to FLTK 1.3.x. Usage of [FL/x.H](#) is deprecated since FLTK 1.4.0. You should replace all references of [FL/x.H](#) with [FL/platform.H](#) if your target is FLTK 1.4 or later. [FL/x.H](#) will be retained for backwards compatibility for some releases but will be removed in a later (not yet specified) FLTK release.

WARNING:

The interfaces provided by this header file may change radically in new FLTK releases. Use them only when an existing generic FLTK interface is not sufficient.

1.18.2 The Wayland/X11 hybrid library

By default, the FLTK library is, under Linux and Unix, a Wayland/X11 hybrid which can run FLTK-based apps as Wayland clients or as X11 clients. The choice between running an app as a Wayland or an X11 client is done as follows, when the app runs function [fl_open_display\(\)](#) (that function can be called explicitly by the app or implicitly by FLTK, for example the first time an [Fl_Window](#) is shown):

- if the app contains a global boolean variable named [fl_disable_wayland](#) and this variable is true, X11 is used;
- if environment variable `FLTK_BACKEND` is not defined, Wayland is used if a Wayland compositor is available, otherwise X11 is used;
- if `$FLTK_BACKEND` equals "wayland", the library makes the app a Wayland client, and stops with error if no Wayland compositor is available;

- if `$FLTK_BACKEND` equals "x11", the library makes the app an X11 client even if a Wayland compositor is available.

The first condition listed above is meant to facilitate conversion of code written for FLTK 1.3.x and containing X11-specific code; add this single statement anywhere in the app's source code:

```
FL_EXPORT bool fl_disable_wayland = true;
```

and the app will always run as an X11 client.

After function `fl_open_display()` has been called, exactly one of the functions `fl_wl_display()` and `fl_x11_display()` returns a non-NULL value. When the former function does, the app runs as a Wayland client, and Wayland-specific functions and symbols described below ([The Wayland Interface](#)) can be used, whereas X11-specific functions and symbols cannot. Otherwise, the app runs as an X11 client, and only X11-specific functions and symbols below ([The UNIX \(X11\) Interface](#)) can be used.

Because a single app can be expected to run either Wayland or X11, it's necessary to use distinct names for global variables and functions in the X11- and the Wayland-specific source code.

Non-default configurations of the FLTK library under Linux/Unix are described in file `README.Wayland.txt`.

1.18.3 The UNIX (X11) Interface

Cross-platform applications should bracket X11-specific source code between `#if defined(FLTK_USE_X11)` / `#endif` and should ensure function `fl_x11_display()` returns non-NULL before calling X11-specific functions and using X11-specific symbols.

The UNIX interface provides access to the X Window System state information and data structures.

1.18.3.1 Handling Other X Events

```
void Fl::add_handler(int (*f)(int))
```

Installs a function to parse unrecognized events. If FLTK cannot figure out what to do with an event, it calls each of these functions (most recent first) until one of them returns non-zero. If none of them returns non-zero then the event is ignored.

FLTK calls this for any X events it does not recognize, or X events with a window ID that FLTK does not recognize. You can look at the X event in the `fl_xevent` variable.

The argument is the FLTK event type that was not handled, or zero for unrecognized X events. These handlers are also called for global shortcuts and some other events that the widget they were passed to did not handle, for example `FL_SHORTCUT`.

```
extern XEvent *fl_xevent
```

This variable contains the most recent X event.

extern `ulong fl_event_time`

This variable contains the time stamp from the most recent X event that reported it; not all events do. Many X calls like cut and paste need this value.

Window `fl_xid(const FL_Window *)`

Returns the XID for a window, or zero if not `shown()`.

Deprecated Kept for compatibility with FLTK versions before 1.4. Use preferentially `fl_x11_xid(const FL_Window *)` with versions 1.4 and above.

`FL_Window *fl_find(ulong xid)`

Returns the `FL_Window` that corresponds to the given XID, or `NULL` if not found. This function uses a cache so it is slightly faster than iterating through the windows yourself.

Deprecated Kept for compatibility with FLTK versions before 1.4. Use preferentially `fl_x11_find(Window)` with versions 1.4 and above.

`int fl_handle(const XEvent &)`

This call allows you to supply the X events to FLTK, which may allow FLTK to cooperate with another toolkit or library. The return value is non-zero if FLTK understood the event. If the window does not belong to FLTK and the `add_handler()` functions all return 0, this function will return false.

Besides feeding events your code should call `Fl::flush()` periodically so that FLTK redraws its windows.

This function will call the callback functions. It will not return until they complete. In particular, if a callback pops up a modal window by calling `fl_ask()`, for instance, it will not return until the modal function returns.

1.18.3.2 Drawing using Xlib

The following global variables are set before `Fl_Widget::draw()` is called, or by `Fl_Window::make_current()`:

```
extern Display *fl_display; // for compatibility with previous FLTK versions
extern Display *fl_x11_display(); // preferred access starting with FLTK 1.4
extern Window fl_window;
extern GC fl_gc; // for compatibility with previous FLTK versions
extern GC fl_x11_gc(); // preferred access starting with FLTK 1.4
extern int fl_screen;
extern XVisualInfo *fl_visual;
extern Colormap fl_colormap;
```

You must use them to produce Xlib calls. Don't attempt to change them. A typical X drawing call is written like this:

```
XDrawSomething(fl_display, fl_window, fl_gc, ...);
```

Other information such as the position or size of the X window can be found by looking at `Fl_Window::current()`, which returns a pointer to the `Fl_Window` being drawn.

```
unsigned long fl_xpixel(Fl_Color i)
unsigned long fl_xpixel(uchar r, uchar g, uchar b)
```

Returns the X pixel number used to draw the given FLTK color index or RGB color. This is the X pixel that `fl_color()` would use.

```
int fl_parse_color(const char* p, uchar& r, uchar& g, uchar& b)
```

Convert a name into the red, green, and blue values of a color by parsing the X11 color names. On other systems, `fl_parse_color()` can only convert names in hexadecimal encoding, for example `#ff8083`.

```
extern XFontStruct *fl_xfont
```

Points to the font selected by the most recent `fl_font()`. This is not necessarily the current font of `fl_gc`, which is not set until `fl_draw()` is called. If FLTK was compiled with Xft support, `fl_xfont` will usually be 0 and `fl_xftfont` will contain a pointer to the `XftFont` structure instead.

```
extern void *fl_xftfont
```

If FLTK was compiled with Xft support enabled, `fl_xftfont` points to the xft font selected by the most recent `fl_font()`. Otherwise it will be 0. `fl_xftfont` should be cast to `XftFont*`.

1.18.3.3 Changing the Display, Screen, or X Visual

FLTK uses only a single display, screen, X visual, and X colormap. This greatly simplifies its internal structure and makes it much smaller and faster. You can change which it uses by setting global variables *before the first `Fl_Window::show()` is called*. You may also want to call `Fl::visual()`, which is a portable interface to get a full color and/or double buffered visual.

```
int Fl::display(const char *)
```

Set which X display to use. This actually does `putenv("DISPLAY=...")` so that child programs will display on the same screen if called with `exec()`. This must be done before the display is opened. This call is provided under MacOS and Windows but it has no effect.

```
extern Display *fl_display
```

The open X display. This is needed as an argument to most Xlib calls. Don't attempt to change it! This is `NULL` before the display is opened.

```
void fl_open_display()
```

Opens the display. Does nothing if it is already open. This will make sure `fl_display` is non-zero. You should call this if you wish to do X calls and there is a chance that your code will be called before the first `show()` of a window.

This may call `Fl::abort()` if there is an error opening the display.

```
void fl_x11_use_display(Display *d)
```

Directs FLTK to use a pre-established X11 connection.

```
void fl_close_display()
```

This closes the X connection. You do *not* need to call this to exit, and in fact it is faster to not do so! It may be useful to call this if you want your program to continue without the X connection. You cannot open the display again, and probably cannot call any FLTK functions.

```
extern int fl_screen
```

Which screen number to use. This is set by `fl_open_display()` to the default screen. You can change it by setting this to a different value immediately afterwards. It can also be set by changing the last number in the `Fl::display()` string to "host:0.#".

```
extern XVisualInfo *fl_visual
extern Colormap fl_colormap
```

The visual and colormap that FLTK will use for all windows. These are set by `fl_open_display()` to the default visual and colormap. You can change them before calling `show()` on the first window. Typical code for changing the default visual is:

```
Fl::args(argc, argv); // do this first so $DISPLAY is set
fl_open_display();
fl_visual = find_a_good_visual(fl_display, fl_screen);
if (!fl_visual) Fl::abort("No good visual");
fl_colormap = make_a_colormap(fl_display, fl_visual->visual, fl_visual->depth);
// it is now ok to show() windows:
window->show(argc, argv);
```

1.18.3.4 Using a Subclass of `Fl_Window` for Special X Stuff

FLTK can manage an X window on a different screen, visual and/or colormap, you just can't use FLTK's drawing routines to draw into it. But you can write your own `draw()` method that uses Xlib (and/or OpenGL) calls only.

FLTK can also manage XID's provided by other libraries or programs, and call those libraries when the window needs to be redrawn.

To do this, you need to make a subclass of `Fl_Window` and override some of these virtual functions:

virtual void `Fl_Window::show()`

If the window is already `shown()` this must cause it to be raised, this can usually be done by calling `Fl_Window::show()`. If not `shown()` your implementation must call either `Fl_X::set_xid()` or `Fl_X::make_xid()`.

An example:

```
void MyWindow::show() {
    if (shown()) {Fl_Window::show(); return;} // you must do this!
    fl_open_display(); // necessary if this is first window
    // we only calculate the necessary visual colormap once:
    static XVisualInfo *visual;
    static Colormap colormap;
    if (!visual) {
        visual = figure_out_visual();
        colormap = XCreateColormap(fl_display, RootWindow(fl_display, fl_screen),
                                   vis->visual, AllocNone);
    }
    Fl_X::make_xid(this, visual, colormap);
}
```

```
Fl_X *Fl_X::set_xid(Fl_Window*, Window xid)
```

Allocate a hidden class called an `Fl_X`, put the XID into it, and set a pointer to it from the `Fl_Window`. This causes `Fl_Window::shown()` to return true.

```
void Fl_X::make_xid(Fl_Window*, XVisualInfo* = fl_visual, Colormap = fl_colormap)
```

This static method does the most onerous parts of creating an X window, including setting the label, resize limitations, etc. It then does `Fl_X::set_xid()` with this new window and maps the window.

virtual void `Fl_Window::flush()`

This virtual function is called by `Fl::flush()` to update the window. For FLTK's own windows it does this by setting the global variables `fl_window` and `fl_gc` and then calling the `draw()` method. For your own windows you might just want to put all the drawing code in here.

The X region that is a combination of all `damage()` calls done so far is in `Fl_X::flx(this)->region`. If `NULL` then you should redraw the entire window. The undocumented function `fl_clip_region()` (`XRegion`) will initialize the FLTK clip stack with a region or `NULL` for no clipping. You must set region to `NULL` afterwards as `fl_clip_region()` will own and delete it when done.

If `damage()` & `FL_DAMAGE_EXPOSE` then only X expose events have happened. This may be useful if you have an undamaged image (such as a backing buffer) around.

Here is a sample where an undamaged image is kept somewhere:

```
void MyWindow::flush() {
    fl_clip_region(Fl_X::flx(this)->region);
    Fl_X::flx(this)->region = 0;
    if (damage() != 2) {... draw things into backing store ...}
    ... copy backing store to window ...
}
```

Note

For compatibility with FLTK versions before 1.4, member function `Fl_X::flx(Fl_Window*)` can also be written `Fl_X::i(Fl_Window*)`.

virtual void `Fl_Window::hide()`

Destroy the window server copy of the window. Usually you will destroy contexts, pixmaps, or other resources used by the window, and then call `Fl_Window::hide()` to get rid of the main window identified by `xid()`. If you override this, you must also override the destructor as shown:

```
void MyWindow::hide() {
    if (mypixmap) {
        XFreePixmap(fl_display, mypixmap);
        mypixmap = 0;
    }
    Fl_Window::hide(); // you must call this
}
```

virtual void `Fl_Window::~~Fl_Window()`

Because of the way C++ works, if you override `hide()` you *must* override the destructor as well (otherwise only the base class `hide()` is called):

```
MyWindow::~~MyWindow() {
    hide();
}
```

Note

Access to the `Fl_X` hidden class requires to `#define FL_INTERNALS` before compilation.

1.18.3.5 Setting the Icon of a Window

FLTK recommends to set window icons using these platform-independent methods: `FL_Window::icon(const FL_RGB_Image *)` and `FL_Window::icons(const FL_RGB_Image *[], int)`. See also methods setting default window icons `FL_Window::default_icon(const FL_RGB_Image *)` and `FL_Window::default_icons(const FL_RGB_Image *[], int)`.

FLTK on X11 also supports, for backward compatibility, use of the deprecated method `FL_Window::icon(const void *)` as follows :

Sets the icon for the window to the passed pointer. You will need to cast the icon `Pixmap` to a `char*` when calling this method. To set a monochrome icon using a bitmap compiled with your application use:

```
#include "icon.xbm"

fl_open_display(); // needed if display has not been previously opened

Pixmap p = XCreateBitmapFromData(fl_display, DefaultRootWindow(fl_display),
                                icon_bits, icon_width, icon_height);

window->icon((const void*)p);
```

To use a multi-colored icon, the XPM format and library should be used as follows:

```
#include <X11/xpm.h>
#include "icon.xpm"

fl_open_display(); // needed if display has not been previously opened

Pixmap p, mask;

XpmCreatePixmapFromData(fl_display, DefaultRootWindow(fl_display),
                        icon_xpm, &p, &mask, NULL);

window->icon((const void *)p);
```

When using the Xpm library, be sure to include it in the list of libraries that are used to link the application (usually `-lXpm`).

NOTE:

You must call `FL_Window::show(int argc, char** argv)` for the icon to be used. The `FL_Window::show()` method does not bind the icon to the window.

Any window icon must be set with the above methods before the window is shown.

1.18.3.6 X Resources

When the `FL_Window::show(int argc, char** argv)` method is called, FLTK looks for the following X resources:

- `background` - The default background color for widgets (color).
- `dndTextOps` - The default setting for drag and drop text operations (boolean).
- `foreground` - The default foreground (label) color for widgets (color).
- `scheme` - The default scheme to use (string).
- `selectBackground` - The default selection color for menus, etc. (color).
- `Text.background` - The default background color for text fields (color).
- `tooltips` - The default setting for tooltips (boolean).
- `visibleFocus` - The default setting for visible keyboard focus on non-text widgets (boolean).

Resources associated with the first window's `FL_Window::xclass()` string are queried first, or if no class has been specified then the class `"fltk"` is used (e.g. `fltk.background`). If no match is found, a global search is done (e.g. `*background`).

1.18.3.7 Display Scaling Factor

FLTK uses the value of the `Xft.dpi` resource divided by 96. to initialize the display scaling factor. That is also what is done by the gnome and KDE desktops.

1.18.4 The Windows Interface

Cross-platform applications should bracket Windows-specific source code between `#ifdef _WIN32 / #endif`.

The Windows interface provides access to the Windows GDI state information and data structures.

1.18.4.1 Using filenames with non-ASCII characters

In FLTK, all strings, including filenames, are UTF-8 encoded. The utility functions `fl_fopen()` and `fl_open()` allow to open files potentially having non-ASCII names in a cross-platform fashion, whereas the standard `fopen()/open()` functions fail to do so.

1.18.4.2 Responding to WM_QUIT

FLTK will intercept `WM_QUIT` messages that are directed towards the thread that runs the main loop. These are converted to `SIGTERM` signals via `raise()`. This allows you to deal with outside termination requests with the same code on both Windows and UNIX systems. Other processes can send this message via `PostThreadMessage()` in order to request, rather than force your application to terminate.

1.18.4.3 Handling Other Windows API Messages

By default a single `WNDCLASSEX` called "FLTK" is created. All `Fl_Window`'s are of this class unless you use `Fl_Window::xclass()`. The window class is created the first time `Fl_Window::show()` is called.

You can probably combine FLTK with other libraries that make their own window classes. The easiest way is to call `Fl::wait()`, as it will call `DispatchMessage()` for all messages to the other windows. If necessary you can let the other library take over as long as it calls `DispatchMessage()`, but you will have to arrange for the function `Fl::flush()` to be called regularly so that widgets are updated, timeouts are handled, and the idle functions are called.

```
extern MSG fl_msg
```

This variable contains the most recent message read by `GetMessage()`, which is called by `Fl::wait()`. This may not be the most recent message sent to an FLTK window, because silly Windows calls the handle procedures directly for some events (sigh).

```
void Fl::add_handler(int (*f)(int))
```

Installs a function to parse unrecognized messages sent to FLTK windows. If FLTK cannot figure out what to do with a message, it calls each of these functions (most recent first) until one of them returns non-zero. The argument passed to the functions is the FLTK event that was not handled or zero for unknown messages. If all the handlers return zero then FLTK calls `DefWindowProc()`.

```
HWND fl_xid(const Fl_Window *)
```

Returns the window handle for a `Fl_Window`, or zero if not `shown()`.

```
Fl_Window *fl_find(HWND xid)
```

Returns the `Fl_Window` that corresponds to the given window handle, or `NULL` if not found. This function uses a cache so it is slightly faster than iterating through the windows yourself.

1.18.4.4 Drawing Things Using the Windows GDI

When the virtual function `Fl_Widget::draw()` is called, FLTK stores all the extra arguments you need to make a proper GDI call in some global variables:

```
extern HINSTANCE fl_display; // for compatibility with previous FLTK versions
extern HINSTANCE fl_win32_display(); // preferred access starting with FLTK 1.4
extern HWND fl_window;
extern HDC fl_gc; // for compatibility with previous FLTK versions
extern HDC fl_win32_gc(); // preferred access starting with FLTK 1.4
COLORREF fl_rgb();
HPEN fl_pen();
HBRUSH fl_brush();
```

These global variables are set before `Fl_Widget::draw()` is called, or by `Fl_Window::make_current()`. You can refer to them when needed to produce GDI calls, but don't attempt to change them. The functions return GDI objects for the current color set by `fl_color()` and are created as needed and cached. A typical GDI drawing call is written like this:

```
DrawSomething(fl_gc, ..., fl_brush());
```

It may also be useful to refer to `Fl_Window::current()` to get the window's size or position.

1.18.4.5 HighDPI support

FLTK apps for the Windows platform are by default "Per-monitor DPI-aware V2". This means that any window automatically adjusts its physical size in relation to the scaling factor of the display where it maps. This also means that all drawings (e.g., text, lines, images) take advantage of the full resolution of the display in use. FLTK apps may also use the manifest mechanism to declare their level of DPI awareness. The FLTK library adapts to the DPI awareness level set in the app's manifest, which can be lower than the default level if the manifest sets it so.

1.18.4.6 Display Scaling Factor

FLTK uses the value given by function `GetDpiForMonitor()` divided by 96. to initialize the scaling factor of each display in the system. This matches the value of "Change the size of text, apps and other items" found in section "System" subsection "Display" of Windows settings.

1.18.4.7 Setting the Icon of a Window

FLTK recommends to set window icons using these platform-independent methods: `Fl_Window::icon(const Fl_RGB_Image *)` and `Fl_Window::icons(const Fl_RGB_Image *[], int)`. See also methods setting default window icons `Fl_Window::default_icon(const Fl_RGB_Image *)` and `Fl_Window::default_icons(const Fl_RGB_Image *[], int)`.

FLTK on Windows also supports, for backward compatibility, use of the deprecated method `Fl_Window::icon(const void *)` as follows :

Set the icon for the window to the passed pointer. You will need to cast the `HICON` handle to a `char*` when calling this method. To set the icon using an icon resource compiled with your application use:

```
window->icon((const void *)LoadIcon(fl_display, MAKEINTRESOURCE(IDI_ICON)));
```

You can also use the `LoadImage()` and related functions to load specific resolutions or create the icon from bitmap data.

NOTE:

You must call `Fl_Window::show(int argc, char** argv)` for the icon to be used. The `Fl_Window::show()` method does not bind the icon to the window.

Any window icon must be set with the above methods before the window is shown.

1.18.4.8 How to Not Get a MSDOS Console Window

Windows has a really stupid mode switch stored in the executables that controls whether or not to make a console window.

To always get a console window you simply create a console application (the `"/SUBSYSTEM:CONSOLE"` option for the linker). For a GUI-only application create a Windows application (the `"/SUBSYSTEM:WINDOWS"` option for the linker).

FLTK includes a `WinMain()` function that calls the ANSI standard `main()` entry point for you. *This function creates a console window when you use the debug version of the library.*

Windows applications without a console cannot write to `stdout` or `stderr`, even if they are run from a console window. Any output is silently thrown away. Additionally, Windows applications are run in the background by the console, although you can use `"start /wait program"` to run them in the foreground.

1.18.4.9 Known Windows Bugs and Problems

The following is a list of known bugs and problems in the Windows version of FLTK:

- If a program is deactivated, `Fl::wait()` does not return until it is activated again, even though many events are delivered to the program. This can cause idle background processes to stop unexpectedly. This also happens while the user is dragging or resizing windows or otherwise holding the mouse down. We were forced to remove most of the efficiency FLTK uses for redrawing in order to get windows to update while being moved. This is a design error in Windows and probably impossible to get around.
- `Fl_Gl_Window::can_do_overlay()` returns true until the first time it attempts to draw an overlay, and then correctly returns whether or not there is overlay hardware.
- `SetCapture` (used by `Fl::grab()`) doesn't work, and the main window title bar turns gray while menus are popped up.
- Compilation with `gcc 3.4.4` and `-Os` exposes an optimisation bug in `gcc`. The symptom is that when drawing filled circles only the perimeter is drawn. This can for instance be seen in the symbols demo. Other optimisation options such as `-O2` and `-O3` seem to work OK. More details can be found in STR#1656

1.18.5 The Apple OS X Interface

Cross-platform applications should bracket macOS-specific source code between `#if defined(__APPLE__)` and `!defined(FLTK_USE_X11) / #endif`.

FLTK supports Apple OS X using the Apple Cocoa library. Older versions of MacOS are no longer supported.

Control, Option, and Command Modifier Keys

FLTK maps the Mac 'control' key to `FL_CTRL`, the 'option' key to `FL_ALT` and the 'Apple' key to `FL_META`. Furthermore, `FL_COMMAND` designates the 'Apple' key on Mac OS X and the 'control' key on other platforms. Keyboard events return the key name in `Fl::event_key()` and the keystroke translation in `Fl::event_text()`. For example, typing Option-Y on a Mac US keyboard will set `FL_ALT` in `Fl::event_state()`, set `Fl::event_key()` to 'y' and return the Yen symbol in `Fl::event_text()`.

Right Click simulation with Ctrl Click

The Apple HIG guidelines indicate applications should support 'Ctrl Click' to simulate 'Right Click' for e.g. context menus, so users with one-button mice and one-click trackpads can still access right-click features. However, paraphrasing [Manolo's comment on the fltk.coredev newsgroup](#):

- *FLTK does /not/ support Ctrl-Click == Right Click itself because Mac OS X event processing doesn't support this at the system level: the system reports left-clicks with the ctrl modifier when the user ctrl-clicks, and OS X system preferences don't allow changing this behavior. Therefore, applications must handle simulation of Right Click with Ctrl Click in the application code.*

Ian MacArthur provided the following handle() method code snippet showing an example of how to do this:

```
case FL_PUSH:
{
    int btn = Fl::event_button();
#ifdef __APPLE__
    int ev_state = Fl::event_state();
#endif
    //
    // Context menu can be called up in one of two ways: -
    // 1 - right click, as normally used on Windows and Linux
    // 2 - Ctrl + left click, as sometimes used on Mac
    //
#ifdef __APPLE__
    // On apple, check right click, and ctrl+left click
    if ((btn == FL_RIGHT_MOUSE) || (ev_state == (FL_CTRL | FL_BUTTON1)))
#else
    // On other platforms, only check right click as ctrl+left is used for selections
    if (btn == FL_RIGHT_MOUSE)
#endif
    {
        // Did we right click on the object?..
    }
}
```

There is a thread about this subject on fltk.coredev (Aug 1-14, 2014) entitled "[RFC] Right click emulation for one button mouse on Mac".

Apple "Quit" Event

When the user presses Cmd-Q or requests a termination of the application, FLTK sends an FL_CLOSE event to all open windows. If any window remains open, the termination request aborts. If all windows close, the application's event loop terminates, that is, `Fl::run()` returns. The application can then follow FLTK's normal termination path executing cleanup code that may be programmed after termination of the event loop, and returning from `main()`. Function `Fl::program_should_quit()` allows to detect whether the event loop terminated because of a program termination request.

Apple "Open" Event

Whenever the user drops a file onto an application icon, OS X generates an Apple Event of the type "Open". You can have FLTK notify you of an Open event by calling the `fl_open_callback()` function.

void `fl_open_display()`

Opens the display. Does nothing if it is already open. You should call this if you wish to do Cocoa or Quartz calls and there is a chance that your code will be called before the first `show()` of a window.

Window `fl_xid(const FL_Window *)`

Returns the window reference for an `FL_Window`, or `NULL` if the window has not been shown. This reference is a pointer to an instance of the subclass `FLWindow` of Cocoa's `NSWindow` class.

`FL_Window *fl_find(Window xid)`

Returns the `FL_Window` that corresponds to the given window reference, or `NULL` if not found.

void `fl_mac_set_about(FL_Callback *cb, void *user_data, int shortcut)`

Attaches the callback `cb` to the "About myprog" item of the system application menu. `cb` will be called with `NULL` first argument and `user_data` second argument. This MacOS-specific function is deprecated in FLTK 1.4 and replaced by `FL_Sys_Menu_Bar::about(FL_Callback *cb, void *data)` which is cross-platform.

`FL_Sys_Menu_Bar` class

The `FL_Sys_Menu_Bar` class allows to build menu bars that, on Mac OS X, are placed in the system menu bar (at top-left of display), and, on other platforms, at a user-chosen location of a user-chosen window.

1.18.5.1 Setting the icon of an application

- First, create a `.icns` file containing several copies of your icon of decreasing sizes. This can be done using the Preview application or the Icon Composer application available in "Graphics Tools for Xcode". To create a high resolution icon file, it is necessary to use the `iconutil` command-line utility.
- Put your `.icns` file in the Resources subdirectory of your application bundle.
- Add these two lines to the `Info.plist` file of your application bundle

```
<key>CFBundleIconFile</key>
<string>foo.icns</string>
```

replacing `foo` by your application name. If you use Xcode, just add your `.icns` file to your application target.

1.18.5.2 Drawing Things Using Quartz

All code inside `FL_Widget::draw()` is expected to call Quartz drawing functions. The Quartz coordinate system is flipped to match FLTK's coordinate system. The origin for all drawing is in the top left corner of the enclosing `FL_Window`. The function `fl_mac_gc()` returns the appropriate Quartz 2D drawing environment (of type `CGContextRef`). For compatibility with previous FLTK versions, deprecated global variable `fl_gc` gives the same value.

Include `FL/platform.H` to declare the `fl_mac_gc()` function (or the `fl_gc` variable).

1.18.5.3 Internationalization

All FLTK programs contain an application menu with, e.g., the About xxx, Hide xxx, and Quit xxx items. This menu can be internationalized/localized by any of two means.

- using the [Fl_Mac_App_Menu](#) class.
- using the standard Mac OS X localization procedure. Create a language-specific .lproj directory (e.g., German.lproj) in the Resources subdirectory of the application bundle. Create therein a Localizable.strings file that translates all menu items to this language. The German Localizable.strings file, for example, contains:

```
"About %@", "Über %@";
"Print Front Window"="Frontfenster drucken";
"Services" = "Dienste";
"Hide %@", "%@" ausblenden";
"Hide Others"="Andere ausblenden";
"Show All"="Alle einblenden";
"Quit %@", "%@" beenden";
```

Set "Print Front Window" = ""; therein so the application menu doesn't show a "Print Front Window" item. To localize the application name itself, create a file InfoPlist.strings in each .lproj directory and put CFBundleName = "localized name"; in each such file.

1.18.5.4 OpenGL and 'retina' displays

It is possible to have OpenGL produce graphics at the high pixel resolution allowed by the so-called 'retina' displays present on recent Apple hardware. For this, call

```
Fl::use_high_res_GL(1);
```

before any [Fl_Gl_Window](#) is shown. Also, adapt your [Fl_Gl_Window::draw\(\)](#) and [Fl_Gl_Window::draw_overlay\(\)](#) methods replacing

```
glViewport(0, 0, w(), h());
```

by

```
glViewport(0, 0, pixel_w(), pixel_h());
```

making use of the [Fl_Gl_Window::pixel_w\(\)](#) and [Fl_Gl_Window::pixel_h\(\)](#) methods that return the width and height of the GL scene in pixels: if the [Fl_Gl_Window](#) is mapped on a retina display, these methods return twice as much as reported by [Fl_Widget::w\(\)](#) and [Fl_Widget::h\(\)](#); if it's mapped on a regular display, they return the same values as [w\(\)](#) and [h\(\)](#). These methods dynamically change their values if the window is moved into/out from a retina display. If [Fl::use_high_res_GL\(1\)](#) is not called, all [Fl_Gl_Window](#)'s are drawn at low resolution. These methods are useful on all platforms because [Fl_Gl_Window::w\(\)](#) and [Fl_Gl_Window::h\(\)](#) don't return, on HighDPI displays, the quantities in pixels necessary to OpenGL functions .

The [Fl_Gl_Window::pixels_per_unit\(\)](#) method is useful when the OpenGL code depends on the pixel dimension of the GL scene. This occurs, e.g., if a window's [handle\(\)](#) method uses [Fl::event_x\(\)](#) and [Fl::event_y\(\)](#) whose returned values should be multiplied by [Fl_Gl_Window::pixels_per_unit\(\)](#) to obtain the adequate pixel units. This method may also be useful, for example, to adjust the width of a line in a high resolution GL scene.

1.18.5.5 FI_Double_Window

OS X double-buffers all windows automatically. On OS X, [FI_Window](#) and [FI_Double_Window](#) are handled internally in the same way.

1.18.5.6 Mac File System Specifics

Resource Forks (OS X pre 10.6)

FLTK does not access the resource fork of an application. However, a minimal resource fork must be created for OS X applications. Starting with OS X 10.6, resource forks are no longer needed.

Caution (OS X 10.2 and older):

When using UNIX commands to copy or move executables, OS X will NOT copy any resource forks! For copying and moving use CpMac and MvMac respectively. For creating a tar archive, all executables need to be stripped from their Resource Fork before packing, e.g. "DeRez fluid > fluid.r". After unpacking the Resource Fork needs to be reattached, e.g. "Rez fluid.r -o fluid".

It is advisable to use the Finder for moving and copying and Mac archiving tools like Sit for distribution as they will handle the Resource Fork correctly.

Mac File Paths

FLTK uses UTF-8-encoded UNIX-style filenames and paths.

[Mac OS X-specific symbols](#)

1.18.6 The Wayland Interface

Cross-platform applications should bracket Wayland-specific source code between `#ifdef FLTK_USE_WAYLAND` / `#endif` and should ensure function `fl_wl_display()` returns non-NULL before calling Wayland-specific functions and using Wayland-specific symbols.

```
extern struct wl_display *fl_wl_display();
```

After `fl_open_display()` has run, function `fl_wl_display()` returns a pointer to the struct `wl_display` representing the connection between the application and Wayland. For example, `wl_display_get_fd(fl_wl_display())` gives the file descriptor one can use to communicate with the Wayland compositor according to the Wayland protocol.

```
struct wld_window *fl_wl_xid(const FI_Window *)
```

Returns a pointer to an [FLTK-defined](#) structure holding Wayland-related data created when a window gets `show()`, or NULL if not `show()`.

[Fl_Window](#) *fl_wl_find(struct wld_window * wld_win)

Returns the [Fl_Window](#) that corresponds to the given Window, or NULL if not found.

struct wl_surface *fl_wl_surface(struct wld_window *wld_win)

Returns a pointer to the struct wl_surface corresponding to a `show()` top-level window or subwindow.

cairo_t *fl_wl_gc()

Drawing natively to a Wayland window : Within an overridden [Fl_Widget::draw\(\)](#) method, or after a call to [Fl_Window::make_current\(\)](#), it's possible to draw using the Cairo library. Function [fl_wl_gc\(\)](#) returns the adequate `cairo_t*` value. Regular FLTK coordinates, with top-left origin, are to be used. All FLTK-defined drawing functions (e.g., [fl_rect\(\)](#), [fl_draw\(\)](#)) can be used too.

void [fl_close_display\(\)](#)

This closes the Wayland connection. You do not need to call this to exit. It may be useful to call this if you want your program to continue without the Wayland connection. You cannot open the display again, and cannot call any FLTK functions.

See also

[wayland.H](#) for all functions specific of the Wayland platform.

1.18.6.1 HiDPI display support

FLTK Wayland apps automatically scale according to the Wayland-defined, integer-valued scale factor. On a HiDPI display, it's enough to set this factor to 2 for any FLTK app to be drawn using twice as many pixels and thus to be as readable as it is on a regular display. With the gnome and KDE-plasma desktops, that is achieved in the "Displays" section of the "Settings" application, selecting 200 % for the "Scale" parameter. In addition to this, FLTK apps can also be scaled up or down typing `ctrl+/-/0/` and with the `FLTK_SCALING_FACTOR` environment variable.

1.18.6.2 Window icons

Standard FLTK functions `FL_Window::icon(const FL_RGB_Image*)`, `FL_Window::icons(const FL_RGB_Image*[], int)`, `FL_Window::default_icon(const FL_RGB_Image*)` and `FL_Window::default_icons(const FL_RGB_Image*[], int)` have no effect on the Wayland platform. The equivalent of a call to `FL_Window::default_icon(const FL_RGB_Image*)` to set the application-specific window icon can be obtained as follows, using FLTK's editor app as an example:

- create a text file named `editor.desktop` containing :

```
[Desktop Entry]
Version=1.0
Type=Application
Name=Editor
Name[fr]=Editeur
Comment=FLTK editor
Exec=editor %F
Icon=/path/to/icon/file/editor.svg
MimeType=text/plain
```

- The `Name=` line therein determines the string displayed when the app runs.
- Optionally, one or more `Name[locale]=` lines can be used to set locale-specific app names.
- The `Icon=` line accepts also `.png` files.
- Put this file in `/usr/local/share/applications/` so it's available to all system users or in `$HOME/.local/share/applications/` so it's available to a single user.

1.18.6.3 Window titlebars

Wayland supports both client-side window decoration (CSD), where client applications are responsible for drawing window titlebars, and server-side window decoration (SSD), where the Wayland compositor itself draws window titlebars. Among 4 tested Wayland compositors, Mutter (gnome's compositor) and Weston use CSD mode whereas the KWin and Sway compositors use SSD mode. When running in CSD mode, FLTK uses a library called `libdecor` to draw titlebars. The `libdecor` library has been conceived to use various plug-in's to draw titlebars in various fashions intended to match any desktop's preferred titlebar style. FLTK supports drawing titlebars with any `libdecor` plug-in via an environment variable called `LIBDECOR_PLUGIN_DIR` which can be given the name of a directory containing the desired plug-in. When `LIBDECOR_PLUGIN_DIR` is not defined, or points to a directory that doesn't contain a `libdecor` plug-in, FLTK uses its built-in plug-in to draw titlebars. That is the most common situation, until `libdecor` plug-in's become available for popular UNIX desktops.

1.19 Migrating Code from FLTK 1.3 to 1.4

This appendix describes the differences between FLTK 1.3.x and FLTK 1.4.x functions and classes and potential requirements to change source code. We also explain how code can be made compatible so it can be compiled by both FLTK 1.3.x and 1.4.x.

If you need to migrate your code from prior FLTK versions to FLTK 1.4, please consult the relevant appendices in the FLTK 1.3 online documentation or by downloading the FLTK 1.3 documentation. See https://www.fltk.org/doc-1.3/migration_1_3.html and/or <https://www.fltk.org/software.php>, respectively.

1.19.1 Changes in Header Files

We strive to include only necessary header files in the public headers of the FLTK library to reduce dependencies and hence compile times.

We try to avoid including system header files as far as possible. Known exceptions are `<stdio.h>` where file system structures and functions are visible in the public API, for instance `FILE*`, and sometimes essential header files like `<stdlib.h>` and/or `<stddef.h>`. Some required system headers **may** be included in platform specific header files like `<FL/platform.H>` or `<FL/platform_types.h>`.

In earlier versions (1.3.x) some of the public FLTK headers included some not strictly required system headers by accident.

The consequence for building user programs with FLTK 1.4 is: if you require a system or FLTK header in your user program that you don't `#include` explicitly but which has been included by FLTK 1.3.x your FLTK 1.3 program may issue compiler errors or warnings about missing header files or missing declarations when compiled with FLTK 1.4.

This is not a fault of FLTK 1.4 but a fault of the source code that did not include all required headers.

In FLTK 1.4 inclusion of `<FL/Fl.H>` is no longer a strict requirement as it was required and documented in FLTK 1.3.x. In FLTK 1.4 you may still need to `'#include <FL/Fl.H>'` if you are using enumerations or methods of class `Fl` like `Fl::run()` but there are exceptions where this header is included by other FLTK headers, like `Fl_Window.H` and other subclasses.

Suggested solution: include all FLTK and system header files your source code requires explicitly and don't rely on FLTK headers to include a particular header file. If you want your code to be as much as possible compatible with FLTK 1.3.x, then you should `'#include <FL/Fl.H>'` as required by 1.3.x.

You don't need to include headers of base classes - this is done by all FLTK headers as required. Besides that you need to include some support headers if you use FLTK functions like `fl_choice()` and others. This is described in the function's documentation (if a required header is missing in the docs this is a bug).

If you follow these rules your program will be compatible with both FLTK 1.3.x and FLTK 1.4.x as long as you use only functions and classes defined in FLTK 1.3.

1.19.2 Fl_Preferences

Starting with FLTK 1.3, preference databases are expected to be in UTF-8 encoding. Previous databases were stored in the current character set or code page which renders them incompatible for text entries using international characters.

Starting with FLTK 1.4, searching a valid path to store the preference files has changed slightly. Please see `Fl_Preferences::Fl_Preferences(Root, const char*, const char*)` for details.

On Unix/Linux platforms new FLTK preference files are stored using the [XDG Base Directory Specification](#) which means in essence that user preference files are stored in the user's home directory under the subdirectory `.config`, i.e. in `$HOME/.config/fltk.org/` rather than `$HOME/.fltk/fltk.org/`. Existing preference files are still found and used, hence this new location is optional.

You may want to move the preference files from their old locations to their new locations as documented in `Fl_Preferences::Fl_Preferences(Root, const char*, const char*)`.

New `Fl_Preferences` types `Fl_Preferences::USER_L`, `Fl_Preferences::SYSTEM_L` and some more combinations with `"_L"` suffix have been defined to make preference files independent of the current locale. This is particularly important for floating point data which is stored in text form with varying decimal separator depending on the locale (either `'.'` or `','`). You may want to change your program to use these new constants instead of those without the `"_L"` suffix. For more information see the documentation of [Fl_Preferences](#).

1.19.3 Fl::add_timeout and friends

Since FLTK 1.4.0 internal timeout handling has been unified across platforms. This ensures equal timeout handling, improved accuracy of `Fl::repeat_timeout()`, and easier maintenance (less potential for errors).

This will very likely not affect user code, however there is one subtle exception on macOS and Windows: in FLTK 1.3.x these platforms used system timers to schedule timeouts. Since FLTK 1.4.0 all platforms use the same internal timer management that was previously only used on Unix/Linux/X11. The consequence of this change is that the FLTK event loop needs to be executed to trigger timeout events, i.e. you must either call `Fl::wait()` repeatedly or start the event loop with `Fl::run()`.

Code that did not execute the event loop and relied on the system timers has never been cross platform compatible, i.e. it wouldn't work on Unix/Linux. An example would be code that opened a splash window, scheduled a timeout with `Fl::add_timeout()`, and waited for the timer event w/o running the FLTK event loop. Such code must be modified to execute `Fl::run()` and/or use `Fl::wait()`.

1.19.4 New FL_OVERRIDE Macro

FLTK 1.4 defines a new macro `FL_OVERRIDE` as "override" if a recent C++ standard (C++11 or higher) is used to compile your code.

This macro is currently defined in `FL/fl_attr.h` but this may change in a future release. It is enough to `#include <FL/Fl.H>` to enable this macro.

Unfortunately Visual Studio does not define a meaningful value of `__cplusplus` to detect the C++ standard. Hence we use the Visual Studio version (2015 or higher) to decide whether we can define `FL_OVERRIDE` or not.

The `FL_OVERRIDE` macro is used to decorate declarations of overridden virtual methods in subclasses. Example code from `FL/Fl_Window.H`:

```
int handle(int) FL_OVERRIDE;
void resize(int X, int Y, int W, int H) FL_OVERRIDE;
Fl_Window * as_window() FL_OVERRIDE { return this; }
```

The `FL_OVERRIDE` macro translates to `'override'` on newer compilers and to an empty string for older compilers.

We recommend to add this to your overridden virtual methods in subclasses derived from FLTK base classes (widgets) and to compile with C++ standard C++11 or higher to enable the compiler to detect some errors if methods are not overridden correctly.

You don't need to declare the overridden methods `'virtual'` if you use `FL_OVERRIDE` or the keyword `override`.

Hint: For the GCC and clang compilers you can enable the warning `'-Wsuggest-override'` to detect where you may (want to) add the `FL_OVERRIDE` macro.

1.19.5 Fl_Image::copy() 'const'

Since FLTK 1.4.0 the virtual method `Fl_Image::copy()` has been declared `'const'` so read-only (`'const'`) images can be copied w/o casts.

This will very likely not affect user code. However, if you derived your own class from any of the `Fl_*_Image` variants **and** you overrode `Your_Image::copy()` then you **must** declare this `'const'` as well, i.e. you must add the keyword `'const'` to the declaration of `copy()` in your header file and in the implementation.

We suggest to add the new `FL_OVERRIDE` macro or the keyword `'override'` (see above) to your own overridden method declarations to enable the compiler to detect such incompatibilities.

Code example in header file:

```
class Your_Image {
    // ...
    Fl_Image *copy() const FL_OVERRIDE;
    Fl_Image *copy(int w, int h) const FL_OVERRIDE;
};
```

Note the `'const'` attribute **and** the `FL_OVERRIDE` macro.

1.19.6 Using X11 specific code with a "hybrid" FLTK library

Read this section if your FLTK 1.3 program uses X11 specific code with platform specific guards like

```
#if defined(WIN32)
    // Windows specific code here
#elif defined(__APPLE__)
    // macOS specific code here
#else
    // X11 specific code here
#endif
```

or similar.

You may skip this section if you don't use platform (X11) specific code.

FLTK 1.4 introduced Wayland support on Unix-like systems that support Wayland at runtime. The default build selects the Wayland runtime if it exists at program startup and falls back to using X11 if Wayland is not supported. On all currently known Wayland-enabled systems X11 programs are still supported by using "XWayland" which must be installed and enabled on the system. This is usually the case (as of this writing in November 2024).

Since using the Wayland runtime is the default you may get runtime errors if your program uses X11 specific code with the Wayland runtime.

There are two solutions:

1. Change the conditional code shown above everywhere in your program. This is the best and recommended long-term solution but may require some work.
2. Disable the Wayland backend (runtime) for your program. This can be a short-term solution for quick "porting" success.

Details about solution 1 are beyond the scope of this documentation but here's an example how such code can be rewritten in FLTK 1.4 for all platforms. This code is now in `test/fltk-versions.cxx` but may be changed in the future. Change this as you need.

```
static const char *get_platform() {
    #if defined(_WIN32)
        return "Windows";
    #elif defined(FLTK_USE_X11) || defined(FLTK_USE_WAYLAND)
        #if defined(FLTK_USE_X11)
            if (fl_x11_display())
                return "Unix/Linux (X11)";
        #endif
        #if defined(FLTK_USE_WAYLAND)
            if (fl_wl_display())
                return "Unix/Linux (Wayland)";
        #endif
        return "X11 or Wayland (backend unknown or display not opened)";
    #elif defined(__APPLE__)
        return "macOS (native)";
    #endif
    return "platform unknown, unsupported, or display not opened";
}
```

Solution 2 is described in chapter 2.1 of `README.Wayland.txt`. Please read this chapter if you need to support X11 specific code w/o the Wayland runtime.

Excerpt from `README.Wayland.txt`:

It is possible to force a program linked to a Wayland-enabled FLTK library to use X11 in all situations by putting this declaration somewhere in the source code:

```
FL_EXPORT bool fl_disable_wayland = true;
```

Please note that you may need to do more to link and run your program successfully, depending on the build system.

Additional info can be found in chapter [The Wayland/X11 hybrid library](#).

1.19.7 Modern CMake

FLTK 1.4.0 supports "modern" CMake rather than old or "classic" CMake which was used in FLTK 1.3.x. Modern CMake was introduced in CMake 3.0 (~ 2014) and further developed in later CMake versions. FLTK 1.4.0 requires at least CMake 3.15 (~ 2019) as of February 2024.

There are a lot of advantages that motivated this transition (mentioning only some):

- easier to use for projects using FLTK
- better structure
- uses CMake targets rather than variables
- embeddable in user projects via `FetchContent()` etc.
- embeddable in user projects via `add_subdirectory()`
- better coexistence with main projects if built as a subproject

Note that CMake targets can provide all required build flags and build dependencies which is the main advantage for user projects. For instance, instead of linking both `fltk` and `fltk_images` you need only `fltk_images` and `fltk` is linked in automatically.

Unfortunately there is one drawback you may encounter: Several CMake build option names have been changed, compared to FLTK 1.3.x. This is due to the fact that CMake cache variables are shared between the main (aka superbuild) project and all subprojects. Therefore all FLTK options are now prefixed with `FLTK_`.

This feature is now CMake standard and very common in newer projects. The CMake developers recommend strongly to use modern CMake.

We took the opportunity to redesign all CMake related options and target names for FLTK 1.4.0 to avoid changing these names later. Note that CMake support in 1.3.x was only experimental and the one in FLTK 1.4 (Git) up to the official release was beta state by definition. We apologize for all inconveniencies, hope that this is one of the rare exceptions in FLTK development, and that the new names are now stable as usual.

Changes in Detail:

Since FLTK 1.4.0 CMake target names are "namespaced", i.e. they are created with the prefix `'fltk::'` and the old prefix `'fltk_'` has been stripped off as far as the `CMakeLists.txt` file of user projects is concerned. The known filenames on disk did not change though.

The shared library target names use the common suffix `"-shared"` rather than `"_SHARED"`.

The library `'fltk_cairo'` is no longer used. Its functionality has been included in `libfltk`. FLTK 1.4.0 creates a dummy (empty) `libfltk_cairo` for backwards compatibility only. Please remove `fltk_cairo` from your projects and use only `'fltk::fltk'` and/or the other libraries instead.

For more information and documentation of all options please refer to the file `README.CMake.txt` in the FLTK root directory.

Old and New Library Targets:

Library	Old Target	New Target	Shared Library Target
<code>fltk</code>	<code>fltk</code>	<code>fltk::fltk</code>	<code>fltk::fltk-shared</code>
<code>fltk_forms</code>	<code>fltk_forms</code>	<code>fltk::forms</code>	<code>fltk::forms-shared</code>
<code>fltk_gl</code>	<code>fltk_gl</code>	<code>fltk::gl</code>	<code>fltk::gl-shared</code>
<code>fltk_images</code>	<code>fltk_images</code>	<code>fltk::images</code>	<code>fltk::images-shared</code>
<code>fltk_jpeg</code>	<code>fltk_jpeg</code>	<code>fltk::jpeg</code>	<code>fltk::jpeg-shared</code>
<code>fltk_png</code>	<code>fltk_png</code>	<code>fltk::png</code>	<code>fltk::png-shared</code>
<code>fltk_z</code>	<code>fltk_z</code>	<code>fltk::z</code>	<code>fltk::z-shared</code>
<code>fluid</code>	<code>fluid</code>	<code>fltk::fluid</code>	n/a

For project developers used to the old (1.3.x) names the following table can assist to find the new option names. This table is ordered alphabetically by the old option name. Note that some option names did not change and some of the "old" names have been introduced in early 1.4.0 development.

Old Option Name (FLTK 1.3.x)	New Option Name (FLTK 1.4.x)

OPTION_WAYLAND_ONLY	FLTK_BACKEND_X11=OFF

1.19.8 New FL_HELVETICA Font on Windows

In FLTK releases before 1.4.2 the Windows font name used for the FLTK font 'FL_HELVETICA' and its variants was named 'Arial'. It turned out that this was a very old font used in early Windows versions and had been replaced with the newer font name 'Microsoft Sans Serif'. This font has many more UTF-8 capable glyphs (characters) and

is almost 100% compatible with the previously used font 'Arial'. It is supported by Microsoft since Windows XP, our oldest currently (partially) supported Windows platform.

This new font is used since FLTK 1.4.2.

We don't expect any issues with this much better font but if you really want strict backwards compatibility with FLTK 1.3.x or early 1.4.0/1.4.1 versions you can apply a tiny patch at the beginning of your program.

This code will load the old font 'Arial' on Windows:

```
#ifdef _WIN32
// reset Windows fonts to pre-1.4.2 state
Fl::set_font(FL_HELVETICA, "Arial");
Fl::set_font(FL_HELVETICA + 1, "BArial");
Fl::set_font(FL_HELVETICA + 2, "IArial");
Fl::set_font(FL_HELVETICA + 3, "PArial");
#endif
```

1.20 Software License

December 11, 2001

The FLTK library and included programs are provided under the terms of the GNU Library General Public License (LGPL) with the following exceptions:

1. Modifications to the FLTK configure script, config header file, and makefiles by themselves to support a specific platform do not constitute a modified or derivative work.

The authors do request that such modifications be contributed to the FLTK project - send all contributions through the "Software Trouble Report" on the following page: <https://www.fltk.org/bugs.php>

2. Widgets that are subclassed from FLTK widgets do not constitute a derivative work.
3. Static linking of applications and widgets to the FLTK library does not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared FLTK libraries, or link their applications or widgets against a user-supplied version of FLTK.

If you link the application or widget to a modified version of FLTK, then the changes to FLTK must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the FLTK license with programs that are linked to the FLTK library, nor do you have to identify the FLTK license in your program or documentation as required by section 6 of the LGPL.

However, programs must still identify their use of FLTK. The following example statement can be included in user documentation to satisfy this requirement:

[program/widget] is based in part on the work of the FLTK project (<https://www.fltk.org>).

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc.

59 Temple Place - Suite 330, Boston, MA 02111-1307, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.
[This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software—to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given

copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy. For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE

COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

1.21 Example Source Code

The FLTK distribution contains over 60 sample applications written in, or ported to, FLTK. If the FLTK archive you received does not contain either an 'examples' or 'test' directory, you can download the complete FLTK distribution from <https://www.fltk.org/software.php>.

Most of the example programs were created while testing a group of widgets. They are not meant to be great achievements in clean C++ programming, but merely a test platform to verify the functionality of the FLTK library.

Note that extra example programs are also available in an additional 'examples' directory, but these are **NOT** built automatically when you build FLTK, unlike those in the 'test' directory shown below.

1.21.1 Example Applications: Overview

adjuster	animated	arc	ask	bitmap	blocks
boxtype	browser	button	buttons	cairo_test	checkers
clipboard	clock	colbrowser	color_chooser	cube	CubeView
cursor	curve	demo	device	doublebuffer	editor
fast_slow	file_chooser	FLUID	fonts	forms	fractals
fullscreen	gl_overlay	glpuzzle	hello	help_dialog	icon
iconize	image	inactive	input	input_choice	keyboard
label	line_style	list_visuals	mandelbrot	menubar	message
minimum	native-filechooser	navigation	offscreen	output	overlay
pack	pixmap	pixmap_browser	preferences	radio	resize
resizebox	rotated_text	scroll	shape	subwindow	sudoku
symbols	table	tabs	threads	tile	tiled_image
tree	twowin	unittests	utf8	valuators	windowfocus

1.21.1.1 adjuster

`adjuster` shows a nifty little widget for quickly setting values in a great range.

1.21.1.2 animated

`animated` shows a window with an animated square that shows drawing with transparency (alpha channel).

1.21.1.3 arc

The `arc` demo explains how to derive your own widget to generate some custom drawings. The sample drawings use the matrix based arc drawing for some fun effects.

1.21.1.4 `ask`

`ask` shows some of FLTK's standard dialog boxes. Click the correct answers or you may end up in a loop, or you may end up in a loop, or you... .

1.21.1.5 `bitmap`

This simple test shows the use of a single color bitmap as a label for a box widget. Bitmaps are stored in the X11 '.bmp' file format and can be part of the source code.

1.21.1.6 `blocks`

A wonderful and addictive game that shows the usage of FLTK timers, graphics, and how to implement sound on all platforms. `blocks` is also a good example for the Mac OS X specific bundle format.

1.21.1.7 `boxtype`

`boxtype` gives an overview of readily available boxes and frames in FLTK. More types can be added by the application programmer. When using themes, FLTK shuffles boxtypes around to give your program a new look.

1.21.1.8 `browser`

`browser` shows the capabilities of the [Fl_Browser](#) widget. Important features tested are loading of files, line formatting, and correct positioning of the browser data window.

1.21.1.9 `button`

The `button` test is a simple demo of push-buttons and callbacks.

1.21.1.10 `buttons`

`buttons` shows a sample of FLTK button types.

1.21.1.11 `cairo_test`

`cairo_test` shows a sample of drawing with Cairo in an [Fl_Cairo_Window](#). This program can only be built completely if FLTK was configured with Cairo support. It displays a message box if Cairo support was not included.

1.21.1.12 `checkers`

Written by Steve Poulsen in early 1979, `checkers` shows how to convert a VT100 text-terminal based program into a neat application with a graphical UI. Check out the code that drags the pieces, and how the pieces are drawn by layering. Then tell me how to beat the computer at Checkers.

1.21.1.13 `clipboard`

The `clipboard` demo can be used to view the contents of the system clipboard, either text or image contents. Currently an image is preferred if the clipboard contains both formats. Images can be stored as PNG files so screenshots can be stored on disk with this little FLTK demo program.

1.21.1.14 clock

The `clock` demo shows two analog clocks. The innards of the `FL_Clock` widget are pretty interesting, explaining the use of timeouts and matrix based drawing.

1.21.1.15 colbrowser

`colbrowser` runs only on X11 systems. It reads `/usr/lib/X11/rgb.txt` to show the color representation of every text entry in the file. This is beautiful, but only moderately useful unless your UI is written in *Motif*.

1.21.1.16 color_chooser

The `color_chooser` gives a short demo of FLTK's palette based color chooser and of the RGB based color wheel.

1.21.1.17 cube

The `cube` demo shows the speed of OpenGL. It also tests the ability to render two OpenGL buffers into a single window, and shows OpenGL text.

1.21.1.18 CubeView

`CubeView` shows how to create a UI containing OpenGL with FLUID.

1.21.1.19 cursor

The `cursor` demo shows all mouse cursor shapes that come standard with FLTK. The *fgcolor* and *bicolor* sliders work only on few systems (some version of Irix for example).

1.21.1.20 curve

`curve` draws a nice Bézier curve into a custom widget. The *points* option for splines is not supported on all platforms.

1.21.1.21 demo

This tool allows quick access to most programs in the `test` directory. The menu tree can be changed by editing `test/demo.menu`.

1.21.1.22 device

Exercises the `FL_Image_Surface`, `FL_Copy_Surface`, and `FL_Printer` classes to draw to an `FL_Image` object, copy graphical data to the clipboard, and for print support.

Note

The `clipboard.cxx` program of the 'test' directory is a clipboard watching application that continuously displays the textual or graphical content of the system clipboard (a.k.a pasteboard on macOS) exercising `FL::paste()`.

1.21.1.23 doublebuffer

The `doublebuffer` demo shows the difference between a single buffered window, which may flicker during a slow redraw, and a double buffered window, which never flickers, but uses twice the amount of RAM. Some modern OS's double buffer all windows automatically to allow transparency and shadows on the desktop. FLTK is smart enough to not tripple buffer a window in that case.

1.21.1.24 editor

FLTK has two very different text input widgets. `Fl_Input` and derived classes are rather light weight, however `Fl_Text_Editor` is a complete port of *nedit* (with permission). The `editor` test is almost a full application, showing custom syntax highlighting and dialog creation. See chapter [Designing a Simple Text Editor](#) for a tutorial about creating this program.

1.21.1.25 fast_slow

`fast_slow` shows how an application can use the `Fl_Widget::when()` setting to receive different kinds of callbacks.

1.21.1.26 file_chooser

The standard FLTK `file_chooser` is the result of many iterations, trying to find a middle ground between a complex browser and a fast light implementation.

1.21.1.27 fonts

`fonts` shows all available text fonts on the host system. If your machine still has some pixmap based fonts, the supported sizes will be shown in bold face. Only the first 256 fonts will be listed.

1.21.1.28 forms

`forms` is an XForms program with very few changes. Search for "fltk" to find all changes necessary to port to fltk. This demo shows the different boxtypes. Note that some boxtypes are not appropriate for some objects.

1.21.1.29 fractals

`fractals` shows how to mix OpenGL, Glut and FLTK code. FLTK supports a rather large subset of Glut, so that many Glut applications compile just fine.

1.21.1.30 fullscreen

This demo shows how to do many of the window manipulations that are popular for games. You can toggle the border on/off, switch between single- and double-buffered rendering, and take over the entire screen. More information in the source code.

1.21.1.31 gl_overlay

`gl_overlay` shows OpenGL overlay plane rendering. If no hardware overlay plane is available, FLTK will simulate it for you.

1.21.1.32 glpuzzle

The `glpuzzle` test shows how most Glut source code compiles easily under FLTK.

1.21.1.33 `hello`

`hello`: Hello, World. Need I say more? Well, maybe. This tiny demo shows how little is needed to get a functioning application running with FLTK. Quite impressive, I'd say.

1.21.1.34 `help_dialog`

`help_dialog` displays the built-in FLTK help browser. The [FL_Help_Dialog](#) understands a subset of html and renders various image formats. This widget makes it easy to provide help pages to the user without depending on the operating system's html browser.

1.21.1.35 `icon`

`icon` demonstrates how an application icon can be set from an image. This icon should be displayed in the window bar (label), in the task bar, and in the task switcher (Windows: Alt-Tab). This feature is platform specific, hence it is possible that you can't see the icon. On Unix/Linux (X11) this can even depend on the Window Manager (WM).

1.21.1.36 `iconize`

`iconize` demonstrates the effect of the window functions `hide()`, `iconize()`, and `show()`.

1.21.1.37 `image`

The `image` demo shows how an image can be created on the fly. This generated image contains an alpha (transparency) channel which lets previous renderings 'shine through', either via true transparency or by using screen door transparency (pixelation).

1.21.1.38 `inactive`

`inactive` tests the correct rendering of inactive widgets. To see the inactive version of images, you can check out the `pixmap` or `image` test.

1.21.1.39 `input`

This tool shows and tests different types of text input fields based on [FL_Input_](#). The `input` program also tests various settings of [FL_Input::when\(\)](#).

1.21.1.40 `input_choice`

`input_choice` tests the latest addition to FLTK1, a text input field with an attached pulldown menu. Windows users will recognize similarities to the 'ComboBox'. `input_choice` starts up in 'plastic' scheme, but the traditional scheme is also supported.

1.21.1.41 `keyboard`

FLTK unifies keyboard events for all platforms. The `keyboard` test can be used to check the return values of [FL::event_key\(\)](#) and [FL::event_text\(\)](#). It is also great to see the modifier buttons and the scroll wheel at work. Quit this application by closing the window. The ESC key will not work.

1.21.1.42 label

Every FLTK widget can have a label attached to it. The `label` demo shows alignment, clipping, and wrapping of text labels. Labels can contain symbols at the start and end of the text, like `@FLTK` or `@circle uh-huh @square`.

1.21.1.43 line_style

Advanced line drawing can be tested with `line_style`. Not all platforms support all line styles.

1.21.1.44 list_visuals

This little app finds all available pixel formats for the current X11 screen. But since you are now an FLTK user, you don't have to worry about any of this.

1.21.1.45 mandelbrot

`mandelbrot` shows two advanced topics in one test. It creates grayscale images on the fly, updating them via the `idle` callback system. This is one of the few occasions where the `idle` callback is very useful by giving all available processor time to the application without blocking the UI or other apps.

1.21.1.46 menubar

The `menubar` tests many aspects of FLTK's popup menu system. Among the features are radio buttons, menus taller than the screen, arbitrary sub menu depth, and global shortcuts.

1.21.1.47 message

`message` pops up a few of FLTK's standard message boxes.

1.21.1.48 minimum

The `minimum` test program verifies that the update regions are set correctly. In a real life application, the trail would be avoided by choosing a smaller label or by setting label clipping differently.

1.21.1.49 native-filechooser

The `native-filechooser` program invokes the platform specific file chooser, if available (see [FI_Native_File_Chooser](#) widget).

1.21.1.50 navigation

`navigation` demonstrates how the text cursor moves from text field to text field when using the arrow keys, tab, and shift-tab.

1.21.1.51 offscreen

`offscreen` shows how to draw into an offscreen image and display the offscreen image in the program window.

1.21.1.52 output

`output` shows the difference between the single line and multi line mode of the [FL_Output](#) widget. Fonts can be selected from the FLTK standard list of fonts.

1.21.1.53 overlay

The `overlay` test app shows how easy an FLTK window can be layered to display cursor and manipulator style elements. This example derives a new class from [FL_Overlay_Window](#) and provides a new function to draw custom overlays.

1.21.1.54 pack

The `pack` test program demonstrates the resizing and repositioning of children of the [FL_Pack](#) group. Putting an [FL_Pack](#) into an [FL_Scroll](#) is a useful way to create a browser for large sets of data.

1.21.1.55 pixmap

This simple test shows the use of a LUT based pixmap as a label for a box widget. Pixmapes are stored in the X11 '.xpm' file format and can be part of the source code. Pixmapes support one transparent color.

1.21.1.56 pixmap_browser

`pixmap_browser` tests the shared-image interface. When using the same image multiple times, [FL_Shared_Image](#) will keep it only once in memory.

1.21.1.57 preferences

I do have my `preferences` in the morning, but sometimes I just can't remember a thing. This is where the [FL_Preferences](#) come in handy. They remember any kind of data between program launches.

1.21.1.58 radio

The `radio` tool was created entirely with *FLUID*. It shows some of the available button types and tests radio button behavior.

1.21.1.59 resizebox

`resizebox` shows some possible ways of FLTK's automatic resize behavior.

1.21.1.60 rotated_text

`rotated_text` shows how text can be rotated, i.e. drawn in any given angle. This demo is device specific, for instance it works under X11 only if configured with Xft.

1.21.1.61 resize

The `resize` demo tests size and position functions with the given window manager.

1.21.1.62 scroll

`scroll` shows how to scroll an area of widgets, one of them being a slow custom drawing. [Fl_Scroll](#) uses clipping and smart window area copying to improve redraw speed. The buttons at the bottom of the window control decoration rendering and updates.

1.21.1.63 `shape`

`shape` is a very minimal demo that shows how to create your own OpenGL rendering widget. Now that you know that, go ahead and write that flight simulator you always dreamt of.

1.21.1.64 `subwindow`

The `subwindow` demo tests messaging and drawing between the main window and 'true' sub windows. A sub window is different to a group by resetting the FLTK coordinate system to 0, 0 in the top left corner. On Win32 and X11, subwindows have their own operating system specific handle.

1.21.1.65 `sudoku`

Another highly addictive game - don't play it, I warned you. The implementation shows how to create application icons, how to deal with OS specifics, and how to generate sound.

1.21.1.66 `symbols`

`symbols` are a speciality of FLTK. These little vector drawings can be integrated into labels. They scale and rotate, and with a little patience, you can define your own. The rotation number refers to 45 degree rotations if you were looking at a numeric keypad (2 is down, 6 is right, etc.).

1.21.1.67 `table`

The `table` demo shows the features of the [Fl_Table](#) widget.

1.21.1.68 `tabs`

The `tabs` tool was created with *FLUID*. It tests correct hiding and redisplaying of tabs, navigation across tabs, resize behavior, and no unneeded redrawing of invisible widgets.

The `tabs` application shows the [Fl_Tabs](#) widget on the left and the [Fl_Wizard](#) widget on the right side for direct comparison of these two panel management widgets.

1.21.1.69 `threads`

FLTK can be used in a multithreading environment. There are some limitations, mostly due to the underlying operating system. `threads` shows how to use [Fl::lock\(\)](#), [Fl::unlock\(\)](#), and [Fl::awake\(\)](#) in secondary threads to keep FLTK happy. Although locking works on all platforms, this demo is not available on every machine.

1.21.1.70 `tile`

The `tile` tool shows a nice way of using [Fl_Tile](#). To test correct resizing of subwindows, the widget for region 1 is created from an [Fl_Window](#) class.

1.21.1.71 tiled_image

The `tiled_image` demo uses a small image as the background for a window by repeating it over the full size of the widget. The window is resizable and shows how the image gets repeated.

1.21.1.72 tree

The `tree` demo shows the features of the `Fl_Tree` widget.

1.21.1.73 twowin

The `twowin` program tests focus transfer from one window to another window.

1.21.1.74 unittests

`unittests` exercises all of FLTK's drawing features (e.g., text, lines, circles, images), as well as scrollbars and schemes.

1.21.1.75 utf8

`utf8` shows all fonts available to the platform that runs it, and how each font draws each of the Unicode code points ranging between U+0020 and U+FFFF.

1.21.1.76 valuator

`valuator` shows all of FLTK's nifty widgets to change numeric values.

1.21.1.77 windowfocus

`windowfocus` shows a very special case when a new window is shown while the focus stays in the original window.

1.21.1.78 FLUID

FLUID is not only a big test program, but also a very useful visual UI designer. Many parts of FLUID were created using FLUID. Check out the FLUID User Manual and the tutorials that come with it at <https://www.fltk.org/documentation.php>.

1.21.2 Example Applications: Images

This chapter contains a few selected images of the test and example applications listed above. It is not meant to be complete or a full reference. The reason some images are included here is to show how the display **should** look when running the example programs.

1.21.2.1 cairo_test

The `cairo_test` demo program shows three shiny buttons drawn with Cairo in an `Fl_Cairo_Window`.

Figure 1.30 Buttons drawn with Cairo

1.21.2.2 icon

The `icon` program lets you set the program icon from an image (here an `Fl_RGB_Image`).

Figure 1.31 Green icon (Windows 10)

1.21.2.3 unittests

Select "drawing images" in the browser at the left side to see the image drawing example:

1.22 FAQ (Frequently Asked Questions)

A list of frequently asked questions about FLTK.

This appendix describes various frequently asked questions regarding FLTK.

- [Where do I start learning FLTK?](#)
- [How do I make a box with text?](#)
- [Can I use FLTK to make closed-source commercial applications?](#)
- [Hitting the 'Escape' key closes windows - how do I prevent this?](#)

1.22.1 Where do I start learning FLTK?

It is assumed you know C++, which is the language all FLTK programs are written in, including FLTK itself.

If you like reading manuals to work your way into things, a good start is the FLTK documentation's [Introduction to FLTK](#). Under the [FLTK Basics](#) section there's an example 'hello world' program that includes a line-by-line description.

If you like looking at simple code first to pique your interest, and then read up from there, start with the example programs in the test/ and examples/ directory that is included with the source code. A good place to start is the 'hello world' program in test/hello.cxx. Also do a google search for "FLTK example programs". "Erco's Cheat Page" is one that shows many simple examples of how to do specific things.

If you like to run example programs and look for ones that are like yours and then read them, download and build FLTK from the source, then run the test/demo program. Also, go into the 'examples/' directory and run 'make', then run some of those programs.

If you prefer watching TV to reading books and code, google search for "FLTK video tutorials" which has some introductory examples of how to write FLTK programs in C++ and build them.

1.22.2 How do I make a box with text?

The 'hello world' program shows how to make a box with text. All widgets have labels, so picking a simple widget like [Fl_Box](#) and setting its label() and using align() to align the label and labelfont() to set the font, and labelsize() to set the size, you can get text just how you want.

Labels are not selectable though; if you want selectable text, you can use [Fl_Output](#) or [Fl_Multiline_Output](#) for simple text that doesn't include scrollbars. For more complex text that might want scrollbars and multiple colors/fonts, use either [Fl_Text_Display](#) which handles plain text, or [Fl_Help_View](#) which handles simple HTML formatted text.

1.22.3 Can I use FLTK to make closed-source commercial applications?

Yes. The FLTK [Software License](#) is standard LGPL, but also includes a special clause ("exception") to allow for static linking. Specifically:

[from the top of the FLTK LGPL License section on exceptions]

3. Static linking of applications and widgets to the FLTK library does not constitute a derivative work and does not require the author to provide source code for the application or widget, use the shared FLTK libraries, or link their applications or widgets against a user-supplied version of FLTK.

If you link the application or widget to a modified version of FLTK, then the changes to FLTK must be provided under the terms of the LGPL in sections 1, 2, and 4.

4. You do not have to provide a copy of the FLTK license with programs that are linked to the FLTK library, nor do you have to identify the FLTK license in your program or documentation as required by section 6 of the LGPL.

However, programs must still identify their use of FLTK. The following example statement can be included in user documentation to satisfy this requirement:

[program/widget] is based in part on the work of the
FLTK project (<https://www.fltk.org>).

1.22.4 Hitting the 'Escape' key closes windows - how do I prevent this?

[From FLTK article #378]

1. FLTK has a "global event handler" that makes Escape try to close the window, the same as clicking the close box. To disable this everywhere you can install your own that pretends it wants the escape key and thus stops the default one from seeing it (this may not be what you want, see below about the callbacks):

```
static int my_handler(int event) {
    if (event == FL_SHORTCUT) return 1; // eat all shortcut keys
    return 0;
}
...in main():
    Fl::add_handler(my_handler);
...
```

1. Attempts to close a window (both clicking the close box or typing Escape) call that window's callback. The default version of the callback does `hide()`. To make the window not close or otherwise do something different you replace the callback. To make the main window exit the program:

```
void my_callback(Fl_Widget*, void*) {
    exit(0);
}
...
main_window->callback(my_callback);
...
```

If you don't want Escape to close the main window and exit you can check for and ignore it. This is better than replacing the global handler because Escape will still close pop-up windows:

```
void my_callback(Fl_Widget*, void*) {
    if (Fl::event() == FL_SHORTCUT && Fl::event_key() == FL_Escape)
        return; // ignore Escape
    exit(0);
}
```

The reason for calling a window callback can also be found using the `Fl::callback_reason()` method:

```
void my_callback(Fl_Widget*, void*) {
    if (Fl::callback_reason() == FL_REASON_CANCELLED)
```

```
    return; // ignore that the user pressed the Escape key
    if (Fl::callback_reason() == FL_REASON_CLOSED)
        save_and_exit(); // user clicked the Close button in the window decoration
    exit(0); // fallback for other callback reasons
}
```

It is very common to ask for confirmation before exiting, this can be done with:

```
void my_callback(Fl_Widget*, void*) {
    if (fl_choice("Are you sure you want to quit?",
                  "continue", "quit", NULL))
        exit(0);
}
```

Chapter 2

FI_Terminal Technical Documentation

This chapter covers the vt100/xterm style "escape codes" used by [FI_Terminal](#) for cursor positioning, text colors, and other display screen control features such as full or partial screen clearing, up/down scrolling, character insert/delete, etc.

2.1 The Escape Codes FI_Terminal Supports

These are the escape codes [FI_Terminal](#) actually supports, and is not the 'complete' list that e.g. xterm supports. Most of the important stuff has been implemented, but esoteric features (such as scroll regions) has not. Features will be added as the widget matures.

```
-----
--- The CSI (Control Sequence Introducer, or "ESC[") ---
-----

ESC[#@ - (ICH) Insert blank Chars (default=1)
ESC[#A - (CUU) Cursor Up, no scroll/wrap
ESC[#B - (CUD) Cursor Down, no scroll/wrap
ESC[#C - (CUF) Cursor Forward, no wrap
ESC[#D - (CUB) Cursor Back, no wrap
ESC[#E - (CNL) Cursor Next Line (crlf) xterm, !gnome
ESC[#F - (CPL) Cursor Preceding Line: move to sol and up # lines
ESC[#G - (CHA) Cursor Horizontal Absolute positioning

    ESC[G - move to column 1 (start of line, sol)
    ESC[#G - move to column #
ESC[#H - (CUP) Cursor Position (#'s are 1 based)

    ESC[H - go to row #1
    ESC[#H - go to (row #) (default=1)
    ESC[#;#H - go to (row# ; col#)
ESC[#I - (CHT) Cursor Horizontal Tab: tab forward

    ESC[#I - tab # times (default 1)
ESC[#J - (ED) Erase in Display

    ESC[0J - clear to end of display (default)
    ESC[1J - clear to start of display
    ESC[2J - clear all lines
    ESC[3J - clear screen history
ESC[#K - (EL) Erase in line

    ESC[0K - clear to end of line (default)
    ESC[1K - clear to start of line
    ESC[2K - clear current line
ESC[#L - (IL) Insert # Lines (default=1)
ESC[#M - (DL) Delete # Lines (default=1)
ESC[#P - (DCH) Delete # Chars (default=1)
ESC[#S - (SU) Scroll Up # lines (default=1)
ESC[#T - (SD) Scroll Down # lines (default=1)
ESC[#X - (ECH) Erase Characters (default=1)
ESC[#Z - (CBT) Cursor Backwards Tab

    ESC[#Z - backwards tab # times (default=1)
ESC[#a - (HPR) move cursor relative [columns] (default=[row,col+1]) (NOT IMPLEMENTED)
ESC[#b - (REP) repeat prev graphics char # times (NOT IMPLEMENTED)
ESC[#d - (VPA) Line Position Absolute [row] (NOT IMPLEMENTED)
ESC[#e - (LPA) Line Position Relative [row] (NOT IMPLEMENTED)
ESC[#f - (CUP) cursor position (#'s 1 based), same as ESC[H
ESC[#g - (TBC) Tabulation Clear

    ESC[0g - Clear tabstop at cursor
```

```

ESC[3g - Clear all tabstops
ESC[#m - (SGR) Set Graphic Rendition

*** Attribute Enable ***

ESC[0m - reset: normal attribs/default fg/bg color (VT100)
ESC[1m - bold (VT100)
ESC[2m - dim
ESC[3m - italic
ESC[4m - underline (VT100)
ESC[5m - blink (NOT IMPLEMENTED) (VT100)
ESC[6m - (unused)
ESC[7m - inverse (VT100)
ESC[8m - (unused)
ESC[9m - strikeout
ESC[21m - doubly underline (Currently this just does single underline)

*** Attribute Disable ***

ESC[22m - disable bold/dim
ESC[23m - disable italic
ESC[24m - disable underline
ESC[25m - disable blink (NOT IMPLEMENTED)
ESC[26m - (unused)
ESC[27m - disable inverse
ESC[28m - disable hidden
ESC[29m - disable strikeout

*** Foreground Text "8 Color" ***

ESC[30m - fg Black
ESC[31m - fg Red
ESC[32m - fg Green
ESC[33m - fg Yellow
ESC[34m - fg Blue
ESC[35m - fg Magenta
ESC[36m - fg Cyan
ESC[37m - fg White
ESC[39m - fg default

*** Background Text "8 Color" ***

ESC[40m - bg Black
ESC[41m - bg Red
ESC[42m - bg Green
ESC[43m - bg Yellow
ESC[44m - bg Blue
ESC[45m - bg Magenta
ESC[46m - bg Cyan
ESC[47m - bg White
ESC[49m - bg default

*** Special RGB Color ***

ESC [ 38 ; Red ; Grn ; Blue m - where Red,Grn,Blu are decimal (0-255)
ESC[s - save cursor pos (ansi.sys+xterm+gnome, but NOT vt100)
ESC[u - rest cursor pos (ansi.sys+xterm+gnome, but NOT vt100)
ESC[>#q - (DECSCA) Set Cursor style (block/line/blink..) (NOT IMPLEMENTED)
ESC[##;#r - (DECSTBM) Set scroll Region top;bot (NOT IMPLEMENTED)
ESC[##..$t - (DECRARA) (NOT IMPLEMENTED)
-----
--- C1 Control Codes ---
-----
<ESC>c - (RIS) Reset term to Initial State
<ESC>D - (IND) Index: move cursor down a line, scroll if at bottom
<ESC>E - (NEL) Next Line: basically do a crlf, scroll if at bottom
<ESC>H - (HTS) Horizontal Tab Set: set a tabstop
<ESC>M - (RI) Reverse Index (up w/scroll)

```

NOTE: Acronyms in parens are Digital Equipment Corporation's names these VT features.

2.2 Useful Terminal Escape Code Documentation

2.3 FI_Terminal Design Document

When I started this project, I identified the key concepts needed to implement `FI_Terminal`:

- Draw and manage multiline Unicode text in FLTK
- Allow per-character colors and attributes
- Efficient screen buffer to handle "scrollback history"
- Efficient scrolling with vertical scrollbar for even large screen history
- Mouse selection for copy/paste
- Escape code management to implement VT100 style / ANSI escape codes.

A class was created for each character, since characters can be either ASCII or Utf8 encoded byte sequences. This class is called `Utf8Char`, and handles the character, its fg and bg color, and any attributes like dim, bold, italic, etc. For managing the screen, after various experiments, I decided a ring buffer was the best way to manage things, the ring split in two:

- 'screen history' which is where lines scrolled off the top are saved
- 'display screen' displayed to the user at all times, and where the cursor lives

Scrolling the display, either by scrollbar or by new text causing the display to scroll up one line, would simply change an 'offset' index# of where in the ring buffer the top of the screen is, automatically moving the top line into the history, all without moving memory around.

In fact the only time screen memory is moved around is during these infrequent operations:

- during "scroll down" escape sequences, e.g. `ESC[#T`
- character insert/delete operations within a line, e.g. `ESC[#@`, `ESC[#P`
- changing the display size e.g. `FI_Terminal::resize()`
- changing the history size e.g. `FI_Terminal::history_lines()`

So a class "RingBuffer" is defined to manage the ring, and accessing its various parts, either as the entire entity ring, just the history, or just the display.

These three concepts, "ring", "history" and "display" are given abbreviated names in the RingBuffer class's API:

NOTE: Abbreviations "hist" and "disp"

"history" may be abbreviated as "hist", and "display" as "disp" in both this text and the source code. 4 character names are used so they line up cleanly in the source, e.g.

```
ring_rows()    ring_cols()
hist_rows()    hist_cols()
disp_rows()    disp_cols()

4 characters
```

These concepts were able to fit into C++ classes:

Utf8Char

Each character on the screen is a "Utf8Char" which can manage the UTF-8 encoding of any character as one or more bytes. Also in that class is a byte for an attribute (underline, bold, etc), and two integers for fg/bg color.

RingBuffer

The RingBuffer class keeps track of the buffer itself, a single array of Utf8Chars called "ring_chars" whose width is ring_cols() and whose height is ring_rows().

The "top" part of the ring is the history, whose width is hist_cols() and whose height is hist_rows(). hist_use_rows() is used to define what part of the history is currently in use.

The "bottom" part of the ring is the display, whose width is disp_cols() and whose height is disp_rows().

An index number called "offset" points to where in the ring buffer the top of the ring currently is. This index changes each time the screen is scrolled, and affects both where the top of the display is, and where the top of the history is. The memory layout of the Utf8Char character array is:

So it's basically a single continuous array of Utf8Char instances where any character can generally be accessed by index# using the formula:

```
ring_chars[ (row*ring_cols)+col ]
```

..where 'row' is the desired row, 'col' is the desired column, and 'ring_cols' is how many columns "wide" the buffer is. The "offset" index affects that formula as an extra row offset, and the resulting index is then clamped within the range of the ring buffer using modulus.

Methods are used to allow direct access to the characters in the buffer that automatically handle the offset and modulus formulas, namely:

```

u8c_ring_row(row,col)  // access the entire ring by row/col
u8c_hist_row(row,col)  // access just the history buffer
u8c_disp_row(row,col)  // access just the display buffer

```

A key concept is the use of the simple 'offset' index integer to allow the starting point of the history and display to be moved around to implement 'text scrolling', such as when crlf at the screen bottom causes a 'scroll up'.

This is simply an "index offset" integer applied to the hist and disp indexes when drawing the display. So after scrolling two lines up, the offset is just increased by 2, redefining where the top of the history and display are, e.g.

```

Offset is 0:      2      Offset now 2:
                  D i s p l a y
                  >
H i s t o r y      H i s t o r y
                  2
                  >
D i s p l a y      D i s p l a y

```

This 'offset' trivially implements "text scrolling", avoiding having to physically move memory around. Just the 'offset' changes, the text remains where it is in memory.

This also makes it appear the top line in the display is 'scrolled up' into the bottom of the scrollbar 'history'. If the offset exceeds the size of the ring buffer, it simply wraps around back to the beginning of the buffer with a modulo.

Indexes into the display and history are also modulo their respective rows, e.g.

```
act_ring_index = (hist_rows + disp_row + offset - scrollbar_pos) % ring_rows;
```

This way indexes for ranges can run beyond the bottom of the ring, and automatically wrap around the ring, e.g.

```
> 2
  3   D i s p l a y
  4
    <-- offset points here

disp
index      H i s t o r y
wraps

      0   D i s p l a y
      1   <- ring_rows points to end of ring
      2 :
      3 :
disp_row(5) -> 4 :.....:
```

The dotted lines show where the display would be if not for the fact it extends beyond the bottom of the ring buffer (due to the current offset), and therefore wraps up to the top of the ring.

So to find a particular row in the display, in this case a 5 line display whose lines lie between 0 and 4, some simple math calculates the row position into the ring:

```
act_ring_index = (histrows      // the display exists AFTER the history, so offset the hist_rows
                  + offset      // include the scroll 'offset'
                  + disp_row     // add the desired row relative to the top of the display (0..disp_rows)
                  ) % ring_rows; // make sure the resulting index is within the ring buffer (0..ring_rows)
```

An additional bit of math makes sure if a negative result occurs, that negative value works relative to the end of the ring, e.g.

```
if (act_ring_index < 0) act_ring_index = ring_rows + act_ring_index;
```

This guarantees the `act_ring_index` is within the ring buffer's address space, with all offsets applied.

The math that implements this can be found in the `u8c_xxxx_row()` methods, where "xxxx" is one of the concept regions "ring", "hist" or "disp":

```
Utf8Char *u8c;
u8c = u8c_ring_row(rrow);    // address within ring, rrow can be 0..(ring_rows-1)
u8c = u8c_hist_row(hrow);    // address within hist, hrow can be 0..(hist_rows-1)
u8c = u8c_disp_row(drow);    // address within disp, drow can be 0..(disp_rows-1)
```

The small bit of math is only involved whenever a new row address is needed, so in a display that's 80x25, to walk all the characters in the screen, the math above would only be called 25 times, once for each row, and each column in the row is just a simple integer offset:

```
for ( int row=0; row<disp_rows(); row++ ) {    // walk rows: disp_rows = 25
    Utf8Char *u8c = u8c_disp_row(row);          // get first char in display 'row'
    for ( int col=0; col<disp_cols(); col++ ) { // walk cols: disp_cols = 80
        u8c[col].do_something();                // work with the char at row/col
    }
}
```

So to recap, the concepts here are:

- The ring buffer itself, a linear array that is conceptually split into a 2 dimensional array of rows and columns whose height and width are:

```
ring_rows -- how many rows in the entire ring buffer
ring_cols -- how many columns in the ring buffer
nchars    -- total chars in ring, e.g. (ring_rows * ring_cols)
```

- The "history" within the ring. For simplicity this is thought of as starting relative to the top of the ring buffer, occupying ring buffer rows:

```
0 .. hist_rows()-1
```

- The "display", or "disp", within the ring, just after the "history". It occupies the ring buffer rows:

```
hist_rows() .. hist_rows()+disp_rows()-1
```

..or similarly:

```
(hist_rows)..(ring_rows-1)
```

The following convenience methods provide access to the start and end indexes within the ring buffer for each entity:

Entire ring ring_srow() – start row index of the ring buffer (always 0) ring_erow() – end row index of the ring buffer
 "history" part of ring hist_srow() – start row index of the screen history hist_erow() – end row index of the screen history

"display" part of ring disp_srow() – start row index of the display disp_erow() – end row index of the display

The values returned by these are as described above. For the hist_xxx() and disp_xxx() methods the 'offset' included into the formula. (For this reason hist_srow() won't always be zero the way ring_srow() is, due to the 'offset')

The values returned by these methods can all be passed to the u8c_ring_row() function to access the actual character buffer's contents.

- An "offset" used to move the "history" and "display" around within the ring buffer to implement the "text scrolling" concept. The offset is applied when new characters are added to the buffer, and during drawing to find where the display actually is within the ring.
- The "scrollbar", which only is used when redrawing the screen the user sees, and is simply an additional offset to all the above, where a scrollbar value of zero (the scrollbar tab at the bottom) shows the display rows, and as the scrollbar values increase as the user moves the scrollbar tab upwards, +1 per line, this is subtracted from the normal starting index to let the user work their way backwards into the scrollbar history. Again, negative numbers wrap around within the ring buffer automatically.

The ring buffer allows new content to simply be appended to the ring buffer, and the index# for the start of the display and start of scrollbar history are simply incremented. So the next time the display is "drawn", it starts at a different position in the ring.

This makes scrolling content at high speed trivial, without memory moves. It also makes the concept of "scrolling" with the scrollbar simple as well, simply being an extra index offset applied during drawing.

Mouse Selection

Dragging the mouse across the screen should highlight the text, allowing the user to extend the selection either beyond or before the point started. Extending the drag to the top of the screen should automatically 'scroll up' to select more lines in the scrollbar history, or below the bottom to do the opposite.

The mouse selection is implemented as a class to keep track of the start/end row/col positions of the selection, and other details such as a flag indicating if a selection has been made, what color the fg/bg text should appear when text is selected, and methods that allow setting and extending the selection, clearing the selection, and "scrolling" the selection, to ensure the row/col indexes adjust correctly to track when the screen or scrollbar is scrolled.

Redraw Timer

Knowing when to redraw is tricky with a terminal, because sometimes high volumes of input will come in asynchronously, so in that case we need to determine when to redraw the screen to show the new content; too quickly will cause the screen to spend more time redrawing itself, preventing new input from being added. Too slowly, the user won't see new information appear in a timely manner.

To solve this, a rate timer is used to prevent too many redraws:

- When new data comes in, a 1/10 sec timer is started and a modify flag is set.
- redraw() is NOT called yet, allowing more data to continue to arrive quickly

- When the 1/10th second timer fires, the callback checks the modify flag:
 - if set, calls `redraw()`, resets the modify to 0, and calls `FI::repeat_timeout()` to repeat the callback in another 1/10th sec.
 - if clear, no new data came in, so DISABLE the timer, done.

In this way, redraws don't happen more than 10x per second, and `redraw()` is called only when there's new content to see.

The redraw rate can be set by the user application using the `FI_Terminal::redraw_rate()`, 0.10 being the default. Some terminal operations necessarily call `redraw()` directly, such as interactive mouse selection, or during user scrolling the terminal's scrollbar, where it's important there's no delay in what the user sees while interacting directly with the widget.

Chapter 3

Development of the FLTK library

- [The Wayland backend for its developer](#)
- [Developer info for bundled libs](#)
- [Developer Information](#)

3.1 The Wayland backend for its developer

This chapter describes how the Wayland backend of FLTK works from a developer's viewpoint.

3.1.1 Introduction to Wayland

Wayland usage involves communication via a Unix domain socket between a client application and another process called the Wayland compositor which creates, moves, resizes and draws windows on the display. Diverse Wayland compositors exist. They can follow rather diverse logics. For example, FreeBSD offers Sway which is a tiling compositor where the display is always entirely filled with whatever resizable windows are mapped at any given time. Compositors follow either the client-side decoration (CSD) rule where client apps draw window titlebars, or the server-side decoration (SSD) rule where the compositor draws titlebars. FLTK supports both CSD and SSD compositors. It uses a library called `libdecor` charged of determining whether a CSD or a SSD compositor is active, and of drawing titlebars in the first case.

Wayland is divided in various protocols that a given compositor may or may not support, although they all support the `core` protocol. Each protocol adds functionality not available in the core protocol. [Wayland Explorer](#) lists all protocols. The core protocol allows a client app to discover what protocols the connected compositor supports. Protocols can be stable, which means they have a defined API that will not change but can be expanded, or unstable. For example, mapping a window on a display is not done by the core protocol but by the `xdg_shell` protocol which is stable. The names of symbols used by unstable protocols always begin with letter 'z'. For example, FLTK uses unstable protocol `Text input` to support CJK input methods; its symbol names begin with `zwp_↔text_input_v3`.

Wayland makes intensive use of the *listener* mechanism. A listener is a small array of pointers to FLTK-defined callback functions associated to a Wayland-defined object; Wayland calls these functions when defined events occur (more at [Listeners](#) below).

Wayland differs noticeably from X11 in that rendering is left to clients: Wayland provides no drawing API. Instead, Wayland provides objects of type `struct wl_buffer` which encapsulate a memory array of pixel values shared between the client and the compositor. The client app is expected to draw to that memory buffer with whatever means it chooses, and to instruct the compositor to map those pixels to the display when the drawing is complete. The Wayland platform of FLTK draws with the Cairo library to `Fl_Window`'s and `Fl_Image_Surface`'s, and with OpenGL to `Fl_Gl_Window`'s.

Wayland differs also from X11 in that the position of a window in the display is completely hidden to the client app. This prevents function `Fl_Window::position()` from having any effect on a top-level window. Wayland also prevents a client app from knowing whether a window is minimized: `Fl_Window::show()` has no effect on a minimized window. Subwindows can be positioned as usual relatively to their parent window. Wayland allows to create popup windows positioned relatively to a previously mapped other window. This allows FLTK to position adequately menu and tooltip windows (see [Menu windows and other popups](#)). FLTK uses also popups for the small,

yellow windows that display the new scale factor value when it's changed: these are created as short-lived popups centered above `Fl::first_window()`.

Wayland uses a trick of its own to handle lists of linked records. It defines type `struct wl_list` and a few macros (`wl_list_init()`, `wl_list_for_each()`, `wl_list_insert()`, `wl_list_for_each_safe()`, `wl_list_remove()`) to manage linked lists. Records put in these lists must contain a member variable of type `struct wl_list` used to link records together and often named 'link'. Access to such a list is possible memorizing a value of type `struct wl_list` computed by macro `wl_list_init()`. Macro `wl_list_for_each(arg1, arg2, arg3)` allows to run through all list elements with:

- `arg1` is a pointer variable of the type of elements of the linked list;
- `arg2` is the address of a variable of type `struct wl_list` identifying the targeted list;
- `arg3` is the name of the member variable of these elements used to link them together.

For example, `wl_list_for_each()` can be used as follows to scan the linked list of all displays of the system (see [Fl_Wayland_Screen_Driver::output](#)):

```
Fl_Wayland_Screen_Driver::output *output;
Fl_Wayland_Screen_Driver *scr_driver = (Fl_Wayland_Screen_Driver*)Fl::screen_driver();
wl_list_for_each(output, &(scr_driver->outputs), link) {
    // ... work with output, an item of the linked list of all displays in the system ...
}
```

Overall, and ignoring for now OpenGL usage, FLTK interacts with Wayland as follows :

- When opening the display: FLTK calls `Fl::add_fd()` in `FL_READ` mode to associate a callback function called `wayland_socket_callback` to the socket connecting the client and the compositor.
- Client to compositor: FLTK calls C functions of the `libwayland-client.so`, `libwayland-cursor.so` and `libxkbcommon.so` shared libraries and of the `libdecor` library. These send suitable messages to the compositor writing to the socket. The names of these functions begin with `wl_`, `xkb_` or `libdecor_`.
- Compositor to client: the callback function `wayland_socket_callback` runs when there are data to read in the socket; it calls `wl_display_dispatch()` which interprets the read data and calls corresponding listeners.

The core protocol defines also a number of mostly opaque structures whose names begin with `wl_`. The names of symbols and types defined by the other protocols FLTK uses begin with `xdg_`, `zwp_text_input_v3`, `zxdg_toplevel_decoration`, `gtk_shell1` and `gtk_surface1`. FLTK defines a few structures holding Wayland-related data. The names of FLTK-defined structures don't begin with `wl_`. For example, `struct wld_window` (see [wld_window](#)) is used to store all Wayland-specific data associated to a mapped [Fl_Window](#).

3.1.2 Building libfltk as a Wayland client

Classes `Fl_Wayland_Window_Driver`, `Fl_Wayland_Screen_Driver`, `Fl_Wayland_Graphics_Driver`, `Fl_Wayland_Copy_Surface_Driver`, `Fl_Wayland_Image_Surface_Driver` and `Fl_Wayland_Gl_Window_Driver` and file `fl_wayland_platform_init.cxx` contain all the Wayland-specific code of the FLTK library. This code is located at `src/drivers/Wayland/` in the FLTK source tree. A single C++ source file generally contains all the code of a given class. The code related to copy, paste and drag-and-drop operations, however, is gathered in file `fl_wayland_clipboard_dnd.cxx` and contains a few member functions of class `Fl_Wayland_Screen_Driver`. Furthermore, class `Fl_UNIX_System_Driver` is used by both the Wayland and the X11 FLTK platforms. File `FL/fl_config.h` defines preprocessor variables `FLTK_USE_WAYLAND` and `FLTK_USE_CAIRO`.

The public C API to Wayland, xkb, EGL and libdecor libraries are obtained with

```
#include <wayland-client.h>
#include <wayland-cursor.h>
#include <xkbcommon/xkbcommon.h>
#include <xkbcommon/xkbcommon-compose.h>
#include <linux/input.h> // for BTN_LEFT, BTN_RIGHT, BTN_MIDDLE
#include "../../libdecor/src/libdecor.h"
#include "../../libdecor/src/libdecor-plugin.h"
#ifdef HAVE_GL
#   include <wayland-egl.h>
#   include <EGL/egl.h>
#endif // HAVE_GL
```

as necessary.

File `README.Wayland.txt` details what software packages are needed on Debian-based, Fedora and FreeBSD systems for FLTK to use Wayland. Wayland protocols are packaged as XML files accompanied by a utility program, `wayland-scanner`, able to generate a header file and a necessary glue C source file from a given XML file. For example, for FLTK to use the `xdg-shell` protocol, these commands are run at build time to generate a `.c` file (`xdg-shell-protocol.c`) that will be compiled into `libfltk` and a header file (`xdg-shell-client-protocol.h`) that the FLTK code will include:

```
PROTOCOLS=`pkg-config --variable=pkgdatadir wayland-protocols`
wayland-scanner private-code $PROTOCOLS/stable/xdg-shell/xdg-shell.xml xdg-shell-protocol.c
wayland-scanner client-header $PROTOCOLS/stable/xdg-shell/xdg-shell.xml xdg-shell-client-protocol.h
```

Similar operations are performed for FLTK to use protocols `xdg-decoration`, `Text input` and `GTK Shell`.

3.1.3 The hybrid Wayland/X11 platform

The Wayland platform of FLTK is normally a two-legged hybrid able to use either Wayland or X11 and to choose between these possibilities at run-time, without any change to the client application. The Wayland/X11 hybrid is essentially a version of the FLTK library containing both all Wayland-specific and all X11-specific code. That's reflected in file `FL/fl_config.h` which defines both `FLTK_USE_WAYLAND` and `FLTK_USE_X11`. This creates the constraint that Wayland and X11 cannot use the same type name for different purposes or the same symbol name. That is why function `fl_xid(const Fl_Window*)` is deprecated in FLTK 1.4 and replaced by `fl_wl_xid()` for Wayland and `fl_x11_xid()` for X11. Also, global variable `Window fl_window` is not used by the Wayland platform which instead uses `static struct wld_window *Fl_Wayland_Window_Driver:: wld_window`. The FLTK library contains also a short source file, `fl_wayland_platform_init.cxx`, that determines, at startup time, whether the app will run as a Wayland or as an X11 client. Function `attempt_wayland()` therein performs this choice as follows :

- if the app defines a global bool variable called `fl_disable_wayland` and this variable is true, the X11 leg is chosen;
- if environment variable `FLTK_BACKEND` is defined to string "wayland", the Wayland leg is chosen;
- if environment variable `FLTK_BACKEND` is defined to string "x11", the X11 leg is chosen;
- otherwise, a connection to a Wayland compositor is attempted; if it's successful, the Wayland leg is chosen; if it's not, the X11 leg is chosen.

The first condition listed above is meant to facilitate transition to FLTK 1.4 of source code written for FLTK 1.3 and containing X11-specific code : it's enough to put

```
FL_EXPORT bool fl_disable_wayland = true;
```

anywhere in the source code, for the app to run with 1.4, using the x11 leg of the hybrid platform, without any other change in the source code nor to the application's environment.

Function `attempt_wayland()` must be called before the very first platform-dependent operation FLTK performs so that operation is done the Wayland or the X11 way, as appropriate. That's why 4 locations of the FLTK source code call `attempt_wayland()`: `Fl_Graphics_Driver::newMainGraphicsDriver()`, `Fl_Screen_Driver::newScreenDriver()`, `Fl_Window_Driver::newWindowDriver(Fl_Window*)`, and `Fl_Image_Surface_Driver::newImageSurfaceDriver()`.

In special situations, such as with embedded systems equipped with the Wayland software but lacking the X11 library, it's possible to build the FLTK library such as it contains only the Wayland backend. This is achieved building FLTK with `cmake -DFLTK_BACKEND_X11=OFF` or with `configure -disable-x11`. In that case, `FL/fl_config.h` does not define `FLTK_USE_X11`.

The rest of this chapter describes what happens when the Wayland leg has been chosen.

3.1.4 Listeners

A Wayland 'listener' is a small array of pointers to FLTK-defined callback functions associated to a Wayland-defined object, usually right after creation of this object, by a call to a specific Wayland function named following the form `wl_XXX_add_listener()`. After defined events have occurred, the Wayland compositor sends appropriate commands to the client through the socket; the event loop detects the availability of data in the socket and calls function `wayland_socket_callback()`; this function calls the appropriate member of the listener and transmits relevant information to the client app as parameters of this call. For example, this code:

```
static void surface_enter(.....) { ..... } // called when a surface enters a display
```

```
static void surface_leave(.....) { ..... } // called when a surface leaves a display

static struct wl_surface_listener surface_listener = {
    surface_enter,
    surface_leave,
};
```

```
some_pointer_type pter_to_data;
struct wl_surface *my_wl_surface;
my_wl_surface = wl_compositor_create_surface(scr_driver->wl_compositor);
wl_surface_add_listener(my_wl_surface, &surface_listener, pter_to_data);
```

creates a Wayland object of type `struct wl_surface` (roughly, a window), and associates it with a 2-member listener called `surface_listener`. After this, Wayland is expected to call the 2 listener members, `surface_↵_enter` or `surface_leave`, each time `my_wl_surface` will enter or leave, respectively, a display. The arguments of these calls, not detailed here, allow the member functions to identify which surface enters or leaves which display. The `wl_surface_add_listener()` call above also associates `pter_to_data` to `my_↵wl_surface` as *user data*. The `wl_surface` object's "user data" can be obtained later calling function `wl_↵surface_get_user_data()`.

Wayland function `wl_proxy_get_listener()` returns a pointer to a Wayland object's listener provided that object is transmitted cast to type `struct wl_proxy *`. This gives a handy way to distinguish FLTK-created Wayland objects from objects of other origin: the listener of an FLTK-created object is a known FLTK listener. For example, function `Fl_Wayland_Window_Driver::surface_to_window()` uses this possibility calling `wl_proxy_get_listener((struct wl_proxy *)wl_surface)` for any object of type `struct wl_surface`: if that object was created as in the example above, this call returns a pointer to FLTK's `surface_↵_listener` static variable.

3.1.5 Opening a Wayland connection

Establishing a Wayland connection requires environment variable `XDG_RUNTIME_DIR` to be defined and to point to a directory containing a socket connected to a Wayland compositor. This variable is usually set by the login procedure of Wayland-friendly desktops. Which socket-file to use within that directory is determined as follows:

- the client may call `Fl::display(const char *display_name)` before `fl_open_display()` runs or use the `-display` command line argument and transmit there the socket name;
- environment variable `WAYLAND_DISPLAY` can be defined to the socket name;
- otherwise, "wayland-0" is used.

Which socket is selected determines the compositor used by the client application: that at the other end of the socket.

Establishing the connection begins with a call to `wl_display_connect(const char *display_name)`. That call is done inside function `attempt_wayland()` mentioned before with a `NULL` argument, or when a non default Wayland display name is specified as explained above. That call returns a `struct wl_display` pointer or `NULL` in case of failure. Such `NULL` return is the hint that allows the FLTK display opening procedure of the Wayland/X11 hybrid to recognize when Wayland access is not possible and to fallback to X11. If the call is successful, its non-`NULL` return is assigned to class variable `Fl_Wayland_Screen_Driver::wl_display`.

The rest of the work is done in function `Fl_Wayland_Screen_Driver::open_display_platform()`. A call to `wl_registry_add_listener()` associates a 2-member listener, whose 1st member, `registry_↵_handle_global()`, will be called by Wayland a number of times to indicate each time a protocol supported by the compositor or a system feature such as displays and keyboards.

FLTK runs this code to receive calls to `registry_handle_global()`:

```
static void sync_done(void *data, struct wl_callback *cb, uint32_t time) {
    *(struct wl_callback **)data = NULL;
    wl_callback_destroy(cb);
}

static const struct wl_callback_listener sync_listener = {
    sync_done
};
```

```
struct wl_callback *registry_cb = wl_display_sync(wl_display);
wl_callback_add_listener(registry_cb, &sync_listener, &registry_cb);
while (registry_cb) wl_display_dispatch(wl_display);
```

A pointer to an object of type `struct wl_callback` created by function `wl_display_sync()` is assigned to variable `registry_cb`. Then a 1-member listener is attached to this object. Wayland will run this listener's member function, `sync_done()`, after all calls to `registry_handle_global()` have occurred. Function

`sync_done()` sets to null variable `registry_cb` and destroys the `wl_callback`. Finally, function `wl_display_dispatch()` is called as long as variable `registry_cb` is not null. Thus, when `sync_done()` runs, FLTK has received all due calls to `registry_handle_global()`.

The prototype of function `registry_handle_global` is:

```
static void registry_handle_global(void *user_data, struct wl_registry *wl_registry,
    uint32_t id, const char *interface, uint32_t version)
```

Each time Wayland calls `registry_handle_global()`, `interface` and `version` give the name and version of a component or feature of the Wayland system. Here is the list of the `interface` value for all protocols and system features FLTK uses:

interface	use
<code>wl_compositor</code>	create <code>wl_surface</code> objects
<code>wl_subcompositor</code>	create subwindows
<code>wl_shm</code>	create buffers and buffer factories
<code>wl_seat</code>	create the unique "seat"
<code>wl_data_device</code>	support of copy/paste/drag-n-drop
<code>wl_output</code>	received once for each display
<code>xdg_wm_base</code>	create mapped windows
<code>gtk_shell1</code>	signals Mutter is in use + titlebar gestures
<code>weston_desktop_shell</code>	signals Weston is in use
<code>org_kde_plasma_shell</code>	signals KDE/Plasma is in use
<code>zwp_text_input_manager_v3</code>	interface with Text Input Methods
<code>zxdg_decoration_manager_v1</code>	select between CSD and SSD modes

Wayland compositors typically support several other protocols (e.g., `zxdg_output_manager_v1`) that FLTK does not use.

Each time `registry_handle_global` runs with an `interface` from the table above, FLTK calls `wl_registry_bind()` which returns a pointer to a Wayland structure that will be the client's access point to the corresponding Wayland protocol or system feature. This pointer is stored in a dedicated member variable of the unique `Fl_Wayland_Screen_Driver` object of an FLTK app, or of another object accessible from this object. For example, when `interface` equals "`wl_compositor`", the value returned by `wl_registry_bind()` is stored as member `wl_compositor` of the `Fl_Wayland_Screen_Driver` object. `registry_handle_global()` also identifies whether the Mutter, Weston, or KWin compositor is connected and stores this information in static member variable `Fl_Wayland_Screen_Driver::compositor`.

Wayland calls `registry_handle_global()` with its parameter `interface` equals to "`wl_output`" once for each screen connected to the system. Each time, an object of type `struct wl_output` is created, to which a 4-member listener is associated by function `wl_output_add_listener()`. The 3rd member of this 4-function listener, `output_done()`, runs after all initialization steps of the screen have completed and turns to `true` member `done` of a record of type `struct Fl_Wayland_Screen_Driver::output` associated to the screen. Function `sync_done()` mentioned above therefore also calls `wl_display_dispatch()` until the `done` member of all `Fl_Wayland_Screen_Driver::output` records are `true`. Overall, after return from function `sync_done()`, FLTK has been made aware of all optional protocols and features of its connected Wayland compositor, and has initialized all screens of the system.

Finally, function `wl_display_get_fd()` is called to obtain the file descriptor of the Wayland socket and a call to `Fl::add_fd()` makes FLTK listen to this descriptor in `FL_READ` mode and associates function `wayland_socket_callback()` from file `Fl_Wayland_Screen_Driver.cxx` with it. This function calls `wl_display_dispatch()` which reads and interprets data available from the file descriptor, and calls corresponding listeners. The `wl_display_dispatch()` call is repeated as long as data are available for reading.

The event loop is run by function `Fl_Unix_System_Driver::wait()` which is used by both the Wayland and X11 FLTK backends. Among various tasks, this function waits for data arriving on the file descriptors FLTK is listening. Overall, the event loop of the Wayland backend is nearly exactly the same as that used by the X11 backend. The Wayland backend differs only in the callback function handling data read from the Wayland connection socket, and in overridden functions `Fl_Wayland_Screen_Driver::poll_or_select_with_delay()` and `Fl_Wayland_Screen_Driver::poll_or_select()`.

3.1.6 Wayland windows and surfaces

Wayland defines objects called surfaces of type `struct wl_surface`. A Wayland surface "has a rectangular area which may be displayed on zero or more displays, present buffers, receive user input, and define a local coordinate system". In short, surface is the name Wayland uses for a window. Buffers allow the client app to define the graphical content of surfaces (see [Wayland buffers](#)). FLTK creates a surface each time an `Fl_Window` is shown by calling function `wl_compositor_create_surface()`. Static member function `Fl_Wayland_Window_Driver::surface_to_window(struct wl_surface *)` gives the `Fl_Window*` corresponding to the surface given in argument.

FLTK recognizes 4 mutually exclusive kinds of surfaces :

- DECORATED are toplevel windows with a titlebar;
- UNFRAMED are toplevel windows without titlebar;
- POPUP correspond to menus and tooltips;
- SUBWINDOW correspond to an `Fl_Window` embedded in another `Fl_Window`.

Function `Fl_Wayland_Window_Driver::makeWindow()` creates all these surfaces, creates for each a record of type `struct wld_window` (see [wld_window](#)), and stores the window kind in member variable `kind` of this record. Member variable `xid` of the window's `Fl_X` record stores the address of this record.

Except for SUBWINDOW's, each surface needs a Wayland object of type `struct xdg_surface` used to make it become a mapped window and stored in member `xdg_surface` of the window's `wld_window` record. For DECORATED windows, this object is created inside `libdecor` and transmitted to FLTK by function `libdecor_frame_get_xdg_surface()`. For UNFRAMED and POPUP windows, it's created by function `xdg_wm_base_get_xdg_surface()`. Finally, each surface is also associated to one more Wayland object whose type varies with the window's kind. These explain this part of the `wld_window` record:

```
union {
    struct libdecor_frame *frame; // created for DECORATED by libdecor_decorate()
    struct wl_subsurface *subsurface; // created for SUBWINDOW by wl_subcompositor_get_subsurface()
    struct xdg_popup *xdg_popup; // created for POPUP by xdg_surface_get_popup()
    struct xdg_toplevel *xdg_toplevel; // created for UNFRAMED by xdg_surface_get_toplevel()
};
```

Except for SUBWINDOW's, each surface is associated to a 'configure' function that Wayland calls one or more times when the window is going to be mapped on the display. The 'configure' function of DECORATED surfaces is `handle_configure()` which is the 1st member of a 4-member listener named `libdecor_frame_iface` associated to a decorated window when it's created calling `libdecor_decorate()`. Finally, a call to `libdecor_frame_map()` triggers the process of mapping the newly created DECORATED surface on a display. Wayland calls `handle_configure()` twice during this process. The first `handle_configure()` run allows to set the window's `xdg_surface` object which is returned by function `libdecor_frame_get_xdg_surface()`. FLTK distinguishes the first from the second run of `handle_configure()` by looking at the `xdg_surface` member variable that's NULL at the beginning of the 1st run and not NULL later. Wayland calls `handle_configure()` also during operations such as resizing, minimizing (see below). With the help of a few calls to `libdecor` functions, FLTK obtains in this function all needed information about the size and state of the mapped window. The 'configure' functions of UNFRAMED and POPUP surfaces are `xdg_surface_configure()`, `xdg_toplevel_configure()` and `popup_configure()`. The mapping process of these surfaces is triggered by a call to `wl_surface_commit()`. These 'configure' functions transmit effective window size information to FLTK. Also, they are where the window's `Fl_Window_Driver::wait_for_expose_value` member variable is set to 0 to indicate that the window has been mapped to display. **Caution**: there are some small differences between how and when the various Wayland compositors call `handle_configure()`.

When a decorated window changes size, whatever the cause of it, Wayland calls `handle_configure()` which sets member variable `Fl_Wayland_Window_Driver::in_handle_configure` to true and calls the window's virtual `resize()` function which ultimately runs `Fl_Wayland_Window_Driver::resize()` which calls `Fl_Group::resize()` to perform FLTK's resize operations and `Fl_Wayland_Graphics_Driver::buffer_release()` to delete the existing window buffer that's not adequate for the new window size. At the end of the run of `handle_configure()`, `in_handle_configure` is set back to false. When the window size change is caused by the app itself calling the window's `resize()` function, `Fl_Wayland_Window_Driver::in_handle_configure` is false. This allows `Fl_Wayland_Window_Driver::resize()` to detect that Wayland needs be informed of the desired size change, which gets done by a call to `libdecor_frame_commit()`. Wayland later calls `handle_configure()` and events described above unfold.

Wayland generally does not provide a way to control where the compositor should map a window in the system displays. Nevertheless, for multi-display systems, Wayland allows to control on what display should the compositor map a fullscreen window. That is done inside function `handle_configure()` which calls `libdecor_frame_set_fullscreen()` for DECORATED windows and inside function `xdg_toplevel_configure()` which calls `xdg_toplevel_set_fullscreen()` for UNFRAMED. The struct `wl_output` pointer for the targeted display is transmitted as 2nd argument of these calls.

3.1.7 Menu windows and other popups

Menu windows, tiny menu title windows, and tooltip windows are implemented using Wayland's popup mechanism which allows to position a popup window relatively to a previously mapped window, itself a popup or another kind of window, with the restriction that any popup must overlap or at least touch that other window. Member function `Fl_Wayland_Window_Driver::makeWindow` calls member function `Fl_Wayland_Window_Driver::process_menu_or_tooltip` to create all popups.

This function gets called after FLTK has computed using a given algorithm the desired (x,y) position of the popup window's top-left corner, using coordinates centered on the top-left corner of the toplevel window from which the popup originates. This algorithm is able to prevent popups from being positioned beyond the screen borders under the assumption that the position of a toplevel window inside a screen is known. While this assumption holds for other platforms, it does not for the Wayland platform. The FLTK code for the Wayland platform therefore modifies the algorithm that FLTK uses to compute the position of menu windows. The key information used by this algorithm is obtained by member function `Fl_Window_Driver::menu_window_area` which computes the coordinates of the rectangle where menu windows are allowed to be positioned. Under other platforms, this function just returns the origin and size of the work area of the screen in use. In contrast, the Wayland platform handles two situations differently :

- For menu windows that are not taller than the display in use, the Wayland-overridden member function `Fl_Wayland_Window_Driver::menu_window_area` returns large negative origin and large width and height values. This lets the standard FLTK algorithm position the menu relatively to its window of origin without concern about screen limits, and relies on Wayland's constraint mechanism described below to prevent the menu from going beyond these limits, without FLTK having to know where they are.
- Menu windows taller than the screen where they are mapped need special handling described in detail in a comment above the source code of function `Fl_Wayland_Window_Driver::process_menu_or_tooltip`.

Function `Fl_Wayland_Window_Driver::process_menu_or_tooltip` first computes `origin_win`, pointer to the `Fl_Window` relatively to which the popup is to be positioned. Window `origin_win` is the parent menu window when the popup is a sub-menu; it's the tiny windowtitle when the popup is a menu with a title; otherwise, it's the window containing the point of origin of the popup. An object of type `struct xdg_positioner` created by function `xdg_wm_base_create_positioner()` is used to express the rules that will determine the popup position relatively to `origin_win` as follows:

- Function `xdg_positioner_set_anchor_rect()` determines a rectangle in `origin_win` relatively to which the popup is to be positioned. When the popup to be created is a menu window spawned by an `Fl_Menu_Bar`, that rectangle is the full area of the menu title window. Otherwise, that rectangle is an adequately located point.
- Function `xdg_positioner_set_size()` sets the popup size.
- The `xdg_positioner_set_anchor(positioner, XDG_POSITIONER_ANCHOR_BOTTOM_LEFT);` and `xdg_positioner_set_gravity(positioner, XDG_POSITIONER_GRAVITY_BOTTOM_RIGHT);` calls position the popup so that its top-left corner is initially below and at right of the bottom-left corner of the `origin_win`'s anchor rectangle.
- The call to `xdg_positioner_set_offset()` further changes the popup vertical position.
- The call to `xdg_positioner_set_constraint_adjustment()` uses constraint flags `XDG_POSITIONER_CONSTRAINT_ADJUSTMENT_SLIDE_X` and `XDG_POSITIONER_CONSTRAINT_ADJUSTMENT_SLIDE_Y` which mean that the compositor will move the popup horizontally and vertically if its initial position would make it expand beyond the edges of the screen. Furthermore, flag `XDG_POSITIONER_CONSTRAINT_ADJUSTMENT_FLIP_Y` is added when the popup is a menu window spawned

by an `Fl_Menu_Bar`; this has the popup flipped above the `Fl_Menu_Bar` if there's not enough screen room below it for the popup.

- Finally, a call to function `xdg_surface_get_popup()` creates the popup accounting for position rules listed above. The positioner is then deleted by `xdg_positioner_destroy()`, a listener is associated to the popup surface with `xdg_popup_add_listener()`, and a call to `wl_surface_commit()` triggers the mapping of the popup on the display.

Overall, the expected coordinates of the top-left corner of the popup relatively to `origin_win` are `popup_x`, `popup_y`. They are memorized in a record of FLTK-defined type `struct win_positioner` that's associated to the popup listener. When the compositor maps the popup, function `popup_configure`, the first element of the popup listener, runs and receives as arguments the coordinates of the popup top left and its size. These values account for the positioning constraints of the popup which may have moved it to avoid screen borders. This function can therefore detect whether constraints applied have modified the effective popup location in comparison to the expected coordinates which are available as member variables of the `struct win_positioner` record mentioned above. That's key to the handling by FLTK of tall menu windows.

Groups of popups containing a menutitle, the associated menuwindow, and optionally a submenu window and that don't belong to an `Fl_Menu_Bar` are mapped in a different order: the menuwindow is mapped first, and the menutitle is mapped second above it as a child popup. Function `Fl_Window_Driver::is_floating_title()` detects when such a menutitle is created, static member variable `previous_floatingtitle` is assigned the value of this menutitle, and the menutitle is mapped only after the menuwindow has been mapped, as a child of it. This positions better the popup group in the display relatively to where the popup was created.

3.1.8 Fl_Wayland_Graphics_Driver and Fl_Cairo_Graphics_Driver

The Wayland platform of FLTK uses an `Fl_Wayland_Graphics_Driver` object for all its on-screen drawing operations. This object is created by function `Fl_Graphics_Driver::newMainGraphicsDriver()` called by `Fl_Display_Device::display_device()` when the library opens the display. New `Fl_Wayland_Graphics_Driver` objects are also created for each `Fl_Image_Surface` and each `Fl_Copy_Surface` used, and deleted when these objects are deleted.

Class `Fl_Wayland_Graphics_Driver` derives from class `Fl_Cairo_Graphics_Driver` which implements all the FLTK drawing API for a Cairo surface. Function `Fl_Wayland_Graphics_Driver::cairo_init()` creates the Cairo surface used by each `Fl_Wayland_Graphics_Driver` object by calling `cairo_image_surface_create_for_data()` for the window's or offscreen's `draw_buffer` (see below).

Class `Fl_Cairo_Graphics_Driver` is also used by the X11 leg of the hybrid Wayland-X11 platform because this leg draws to the display with an `Fl_X11_Cairo_Graphics_Driver` object which derives from class `Fl_Cairo_Graphics_Driver`. Finally, `Fl_Cairo_Graphics_Driver` is also used, in the form of an object from its derived class `Fl_PostScript_Graphics_Driver`, when the hybrid Wayland-X11 platform draws PDF or PostScript, or when the classic X11 platform uses Pango and draws PDF or PostScript. This happens when classes `Fl_PDF_File_Surface`, `Fl_PostScript_File_Device` and `Fl_Printer` are used.

3.1.9 Wayland buffers

Wayland uses buffers, objects of type `struct wl_buffer`, to draw to surfaces. In principle, one or more buffers can be associated to a surface, and functions `wl_surface_attach()` and `wl_surface_commit()` are called to first attach one such buffer to the surface and then inform the compositor to map this buffer's graphics content on the display. Wayland buffers can use various memory layouts. FLTK uses `WL_SHM_FORMAT_ARGB8888`, which is the same layout as what Cairo calls `CAIRO_FORMAT_ARGB32`.

FLTK calls function `Fl_Wayland_Window_Driver::make_current()` before drawing to any `Fl_Window`. Member `buffer` of this `Fl_Window`'s `struct wld_window` (see [wld_window](#)) is NULL when the window has just been created or resized. In that case, FLTK calls `Fl_Wayland_Graphics_Driver::create_wld_buffer()` which returns a pointer to a `struct wld_buffer` containing

- a Wayland buffer, member `wl_buffer`;
- a Cairo image surface, created by a call to `Fl_Wayland_Graphics_Driver::cairo_init()`.

Each of these two objects encapsulates a byte array of the same size and the same memory layout destined to contain the `Fl_Window`'s graphics. The Cairo image surface object is where FLTK draws. The Wayland buffer is what Wayland maps on the display. FLTK copies the Cairo surface's byte array to the Wayland buffer's byte array before beginning the mapping operation. If `width` and `height` are a window's dimensions in pixels,

```
int stride = cairo_format_stride_for_width(CAIRO_FORMAT_ARGB32, width);
int size = stride * height;
```

give size, the common size of both byte arrays.

The effective creation of the `wl_buffer` object is delayed until function `Fl_Wayland_Graphics_Driver::buffer_commit()` gets called. Section [Buffer factories](#) below details how FLTK creates `wl_buffer` objects.

The struct `Fl_Wayland_Graphics_Driver::wld_buffer` (see [wld_buffer](#)) contains a pointer to the byte array of the Cairo image surface (member `draw_buffer.buffer`), information about the Wayland buffer (members `wl_buffer` and `data`), the common size of the Cairo surface's and Wayland buffer's byte arrays (member `draw_buffer.data_size`), and other information. A pointer to this struct `Fl_Wayland_Graphics_Driver::wld_buffer` is memorized as member `buffer` of the [FL_Window](#)'s `wld_window`. All drawing operations to the [FL_Window](#) then modify the content of the Cairo image surface.

Function `Fl_Wayland_Window_Driver::flush()` is in charge of sending FLTK graphics data to the display. That is done by calling function `Fl_Wayland_Graphics_Driver::buffer_commit()` which creates the struct `wl_buffer` object calling `create_shm_buffer()` if that was not done before, copies the byte array of the Cairo surface to the Wayland buffer's starting memory address, and calls functions `wl_surface_attach()` and `wl_surface_commit()`. Before calling [FL_Window::flush\(\)](#), FLTK has computed a damaged region. If that region is not null, `Fl_Wayland_Graphics_Driver::buffer_commit()` copies only the damaged parts of the Cairo surface to the Wayland buffer and calls function `wl_surface_damage_buffer()` for these parts to inform the compositor of what parts of the surface need its attention.

Wayland buffer deletion

Each [wld_buffer](#) record contains boolean member `in_use` which is set to `true` just before the buffer gets committed, and boolean member `released` which is set to `true` when FLTK no longer needs the buffer and calls `Fl_Wayland_Graphics_Driver::buffer_release()`. FLTK's buffer-creating function, `Fl_Wayland_Graphics_Driver::create_shm_buffer()`, attaches a 1-member listener to each buffer which Wayland calls after a commit operation to indicate the client is allowed to re-use the buffer. This listener's member function, `buffer_release_listener()`, turns to false member `in_use` of the buffer's [wld_buffer](#) record. Since the two events 'FLTK no longer needs the buffer' and 'the client is allowed to re-use the buffer' can arrive in any order, FLTK deletes the struct `wl_buffer` object by running `do_buffer_release()` only after both events happened, that is, when `in_use` is false and `released` is true. That's why function `do_buffer_release()` is called by both functions `Fl_Wayland_Graphics_Driver::buffer_release()` and `buffer_release_listener()`.

3.1.10 Throttling window redraws

FLTK uses Wayland's synchronization mechanism to make sure any committed `wl_buffer` is not changed while the compositor is using it and to refrain from calling `wl_surface_commit()` more frequently than the system can process it. Firstly, as seen above, Wayland calls function `buffer_release_listener()` when the client is free to reuse or destroy a given `wl_buffer`. FLTK won't change or destroy a committed `wl_buffer` before that call. Second, this 2-step mechanism prevents Wayland clients from committing new buffer states too frequently:

- `Fl_Wayland_Graphics_Driver::buffer_commit()` first calls function `wl_surface_frame()` to obtain a pointer to a struct `wl_callback` object and stores it as member `frame_cb` of the surface's [wld_window](#). Then it calls `wl_callback_add_listener()` to associate this object to the FLTK-defined, callback function `surface_frame_done()`. It next calls `wl_surface_commit()`. Together, these 3 calls instruct Wayland to start mapping the buffer content to the display and to call `surface_frame_done()` later, when it will have become ready for another mapping operation.
- Later, `surface_frame_done()` runs and destroys the `wl_callback` object by function `wl_callback_destroy()` and sets member `frame_cb` to NULL.

Member variable `draw_buffer_needs_commit` of the [wld_buffer](#) is also important in this mechanism : it informs FLTK that the graphics buffer has changed and needs being committed. This variable is turned `true` every time a graphics operation changes the buffer content and turned `false` when the buffer gets committed.

This procedure ensures that FLTK never calls `wl_surface_commit()` before the compositor becomes ready for a new commit because `Fl_Wayland_Window_Driver::flush()` calls `Fl_Wayland_Graphics_Driver::buffer_commit()` only if `frame_cb` is NULL. If it's not NULL, the exact content of function `surface_frame_done()` :

```
static void surface_frame_done(void *data, struct wl_callback *cb, uint32_t time) {
    struct wld_window *window = (struct wld_window *)data;
    wl_callback_destroy(cb);
    window->frame_cb = NULL;
    if (window->buffer && window->buffer->draw_buffer_needs_commit) {
        Fl_Wayland_Graphics_Driver::buffer_commit(window);
    }
}
```

has the effect that when the mapping operation eventually completes, Wayland runs `surface_frame_done()`, which, if the buffer's `draw_buffer_needs_commit` member is true, calls `Fl_Wayland_Graphics_Driver::buffer_commit()` anew. The net result is that the screen shows the most recent surface content. This synchronization mechanism is also used when performing an interactive window resize operation. During such operation, the compositor informs the client an interactive resize is being performed and sends window resize commands at high rate (~60 Hz) to the client via the socket. Libdecor turns on flag `LIBDECOR_WINDOW_STATE_RESIZING` to inform the client, and runs function `handle_configure()` for each received resize command. Before calling `Fl_Group::resize()` and later `Fl_Window::draw()`, `handle_configure()` tests whether `window->frame_cb` is NULL. When it's not because a previous resize operation is being performed, the current resize command is skipped. At the end of the interactive resize, flag `LIBDECOR_WINDOW_STATE_RESIZING` is off and Wayland sends a final resize command which is not skipped. Overall, this ensures the client program resizes its window as frequently as it can without falling behind resize commands sent by the compositor. To account for a bug in Mutter (issue #878), the `window->frame_cb` object is not created when a toplevel window is being resized and is entirely covered by one subwindow.

Progressive window drawing

FLTK supports progressive drawing when an app calls function `Fl_Window::make_current()` at any time and then calls the FLTK drawing API. This is made possible in function `Fl_Wayland_Window_Driver::make_current()` with

```
// to support progressive drawing
if ( (!Fl_Wayland_Window_Driver::in_flush_) && window->buffer && (!window->frame_cb)
    && window->buffer->draw_buffer_needs_commit && (!wait_for_expose_value) ) {
    Fl_Wayland_Graphics_Driver::buffer_commit(window);
}
```

Thus, `buffer_commit()` runs only when `frame_cb` is NULL. If an app rapidly performs calls to `Fl_Window::make_current()` and to drawing functions, FLTK will copy `draw_buffer` to the Wayland buffer and instruct Wayland to map it to the display when `frame_cb` is NULL which means that the compositor is ready to start performing a mapping operation. This occurs when the progressive drawing operation begins. Later, `frame_cb` is generally found non NULL when `Fl_Wayland_Window_Driver::make_current()` runs because the compositor is busy processing the previous Wayland buffer. When the compositor has completed this processing, the client app runs `surface_frame_done()` which, provided member variable `draw_buffer_needs_commit` is true, calls `Fl_Wayland_Graphics_Driver::buffer_commit()`. This makes the compositor map the Wayland buffer in its new, more advanced, state.

An example of progressive drawing is given by FLTK's mandelbrot test app. When set to fullscreen, this app can be seen to progressively fill its window from top to bottom by blocks of lines, each block appearing when the compositor is ready to map a new buffer. When the compositor is not ready, the app does not block but continues computing and drawing in memory but not on display more lines of the desired Mandelbrot graph.

3.1.11 Buffer factories

Wayland names *buffer factory* a software procedure that constructs objects of type `struct wl_buffer` for use by a client application. FLTK creates a `wl_buffer` object each time an `Fl_Window` is mapped on a display or resized. That's done by member function `Fl_Wayland_Graphics_Driver::create_shm_buffer()` which follows this 3-step procedure to create a "buffer factory" for FLTK and to construct Wayland buffers from it:

- Libdecor function `libdecor_os_create_anonymous_file(off_t size)` creates an adequate file and mmap's it. This file lives in RAM because it is created by function `memfd_create()`. FLTK sets this file size to 10 MB unless the size of the buffer to be created is larger; in that case the anonymous file is sized to twice the buffer size.
- Wayland function `wl_shm_create_pool()` shares this mmap'ed memory with the Wayland compositor and returns an object of type `struct wl_shm_pool` which encapsulates this memory. A record of type `struct Fl_Wayland_Graphics_Driver::wld_shm_pool_data` is created and associated to

the newly created `wl_shm_pool` by `wl_shm_pool_set_user_data()`. This record stores the starting address (`pool_memory`) and size (`pool_size`) of the pool's encapsulated memory. The record also contains member buffers of type `struct wl_list` which stores the access point to the linked list of `wl_buffer` objects that will be created from the `wl_shm_pool`.

- A variable named `chunk_offset` represents the offset within the pool's shared memory available for the buffer being constructed. It equals 0 when the pool has just been created and is updated as detailed below each time a buffer is created from the pool. A record of type `struct Fl_Wayland_Graphics_Driver::wld_buffer` is created. This record will contain (member `wl_buffer`) the address of a `wl_buffer` object that's created by function `wl_shm_pool_create_buffer()`. This `wl_buffer` object encapsulates a section of a given size of the pool's shared memory beginning at offset `chunk_offset` in it. Quantity `pool_memory + chunk_offset` is therefore the address of the beginning of the mmap'ed memory section encapsulated by this `wl_buffer`. Member `shm_pool` of the newly constructed `Fl_Wayland_Graphics_Driver::wld_buffer` object is set to the address of the current `wl_shm_pool` object. This record is added to the head of the linked list of current pool's buffers by a call to `wl_list_insert()`. At that point, a `struct Fl_Wayland_Graphics_Driver::wld_buffer` record is part of the linked list of all such records corresponding to `wl_buffer` objects created from the same `wl_shm_pool` object, and member `shm_pool` of this record gives the address of this `wl_shm_pool`. When a new `struct Fl_Wayland_Graphics_Driver::wld_buffer` record is to be created,

```
struct wld_shm_pool_data *pool_data =
    (struct wld_shm_pool_data *)wl_shm_pool_get_user_data(pool);
struct Fl_Wayland_Graphics_Driver::wld_buffer *record = wl_container_of(pool_data->buffers.next,
record, link);
int chunk_offset = ((char*)record->data - pool_data->pool_memory) + record->data_size;
```

gives the offset within the current pool's mmap'ed memory available for a new `wl_buffer`. Macro `wl_container_of()` gives the address of a record belonging to a linked list of records of the same type.

A window's `wl_buffer` is re-filled by graphics data and committed each time the window gets redrawn, and is set to be destroyed by function `Fl_Wayland_Graphics_Driver::buffer_release()` when `Fl_Window::hide()` runs or the window is resized. When the `wl_buffer` is no longer in use, function `do_buffer_release()` gets called as explained above. It destroys the `wl_buffer` with `wl_buffer->destroy()`, and removes the corresponding `Fl_Wayland_Graphics_Driver::wld_buffer` record from the linked list of buffers from the same `wl_shm_pool`. Since new `Fl_Wayland_Graphics_Driver::wld_buffer` records are added at the head of the linked list, and since the record at the head of this list is used to compute the offset within the pool's mmap'ed memory available for a new `wl_buffer`, destruction of the last created `wl_buffer` allows to re-use the destroyed buffer's pool's memory for a new `wl_buffer`.

When function `do_buffer_release()` finds the list of buffers from a given pool empty, two situations can occur. 1) This pool is the current pool. Its mmap'ed memory will be re-used from offset 0 to create future `wl_buffer` objects. 2) This pool is not current. It gets destroyed with `wl_shm_pool_destroy()`, the pool's mmap'ed memory is munmap'ed, and the pool's associated `struct wld_shm_pool_data` is freed. In situation 1) above, the next `wl_buffer` to be created can need more memory than the current pool's memory size. If so, the current pool gets destroyed and replaced by a new, larger pool.

If the sum of `chunk_offset` plus the buffer size is larger than the current pool's size when function `create_shm_buffer()` is called, `chunk_offset` is reset to 0, and a new `wl_shm_pool` object is created and used by FLTK's "buffer factory". This mechanism allows to access new mmap'ed memory when `chunk_offset` reaches the end of the previous mmap'ed section.

Wayland uses also `wl_buffer` objects to support cursors. FLTK uses the "buffer factory" described here when creating custom cursors (see [custom-cursor](#)) with function `Fl_Wayland_Window_Driver::set_cursor(const Fl_RGB_Image *, ...)` which calls `create_shm_buffer()` via `set_cursor_4args()`, `custom_offscreen()` and `create_wld_buffer()`. In contrast, standard shaped-cursors (e.g., `FL_CURSOR_INSERT`) use their own "buffer factory" inside Wayland functions such as `wl_cursor_theme_get_cursor()`. Therefore, the fact that the `wl_buffer` objects behind standard cursors are never destroyed doesn't prevent disused `struct wl_shm_pool` objects from being freed because those buffers come from a distinct "buffer factory". The "buffer factory" described here is also used by function `offscreen_from_text()` when displaying dragged text in a DnD operation.

3.1.12 Displays and HighDPI support

Wayland uses the concept of *seat* of type `struct wl_seat` which encompasses displays, a keyboard, a mouse, and a trackpad. Although Wayland may be in principle able to deal with several seats, FLTK's Wayland platform

is conceived for one seat only. That seat may contain one or more displays, which Wayland calls *outputs*, of type `struct wl_output`.

As written above, function `registry_handle_global()` discovers the available seat at start-up time. This function also associates a listener to each display connected to the system by calling function `wl_output_add_listener()`. This listener's member functions run at program startup when Wayland discovers its displays (see [Opening a Wayland connection](#)). Member `output_mode` runs also when the display is resized and member `output_scale` also when the Wayland scale factor (see below) is changed. FLTK defines type `struct Fl_Wayland_Screen_Driver::output` to store display size and scaling information. One such record is created for each display. These records are put in a `struct wl_list` accessible from member `outputs` of the single `Fl_Wayland_Screen_Driver` object.

FLTK uses 2 distinct scaling parameters for each display:

- `int wld_scale;` This member variable of the `struct Fl_Wayland_Screen_Driver::output` record typically equals 1 for standard, and 2 for HighDPI displays. The effect of value `n` of variable `wld_scale` is that 1 Wayland graphics unit represents a block of $n \times n$ pixels. Another effect is that a drawing buffer for a surface of size $W \times H$ units contains $W * n * H * n * 4$ bytes. Member function `output_scale()` mentioned above sets this value for each system's display at startup time. Member function `Fl_Wayland_Graphics_Driver::buffer_commit()` informs the Wayland compositor of the value of `wld_scale` calling `wl_surface_set_buffer_scale()` which is enough to make FLTK apps HighDPI-aware. Under the gnome and KDE desktops, this parameter is visible in the "Settings" app, "Displays" section, "Scale" parameter which is 200% on HighDPI displays.
- `float gui_scale;` This other member variable is where FLTK's own GUI scaling mechanism with `ctrl+/-/0/` keystrokes and with environment variable `FLTK_SCALING_FACTOR` operates: when FLTK is scaled at 150%, `gui_scale` is assigned value 1.5. Function `Fl_Wayland_Screen_Driver::scale(int n, float f)` assigns value `f` to the `gui_scale` member variable of display # `n`. This variable is used by function `Fl_Wayland_Window_Driver::make_current()` when it calls `Fl_Wayland_Graphics_Driver::set_buffer()` that scales the graphics driver by this factor with `cairo_scale()`.

Overall, an FLTK object, say an `Fl_Window`, of size $W \times H$ FLTK units occupies `int(W * gui_scale) * wld_scale x int(H * gui_scale) * wld_scale` pixels on the display.

When an `Fl_Window` is to be shown, `Fl_Wayland_Window_Driver::makeWindow()` creates a `struct wl_surface` with `wl_compositor_create_surface()` and associates it calling `wl_surface_add_listener()` with a 2-member listener called `surface_listener` encharged of managing as follows the list of displays where this `wl_surface` will map. The `Fl_Window` possesses an initially empty linked list of displays accessible at member `outputs` of the window's `wld_window` record. When the `Fl_Window`, or more exactly its associated `struct wl_surface` is mapped on a display, member `surface_enter()` of `surface_listener` runs. This function adds the display where the surface belongs to the end of the linked list of displays for this surface. When a surface is dragged or enlarged across the edge of a display in a multi-display system and expands on a second display, `surface_enter()` runs again, and this surface's list of displays contains 2 items. When a surface leaves a display, member `surface_leave()` of `surface_listener` runs. It removes that display from the surface's list of displays. Each time the first item of a surface's list of displays changes, function `change_scale()` is called and applies that display's `gui_scale` value to that surface calling `Fl_Window_Driver::screen_num(int)`. When a window is unmapped by function `Fl_Wayland_Window_Driver::hide()`, the surface's list of displays is emptied.

Fractional scaling

The KWin and gnome compositors allow to use *fractional scaling* that can take values between 100% and 400% that are not a multiple of 100%. Wayland implements this rendering all `wl_surface`'s as if the scaling had the next value above that is a multiple of 100% (e.g., 175% --> 200%), and downsizing them to the desired fractional scale value at the compositing stage. Seen from FLTK, everything runs with `wld_scale` having an integer value (1, 2, 3 or 4).

Some gnome versions may natively support fractional scaling. Others require to use these commands to make them accept/refuse fractional scaling:

```
gsettings set org.gnome.mutter experimental-features "['scale-monitor-framebuffer']"
gsettings reset org.gnome.mutter experimental-features
```

3.1.13 Mouse and trackpad handling

FLTK receives information about mouse and pointer events via a 'listener' made up of 5 pointers to functions which Wayland calls when events listed in table below occur. These functions receive from Wayland enough information in their parameters to generate corresponding FLTK events, that is, calls to `Fl::handle(int event_type, Fl_Window *)`.

listener function	called by Wayland when	resulting FLTK events
<code>pointer_enter</code>	pointer enters a window	<code>FL_ENTER</code>
<code>pointer_leave</code>	pointer leaves a window	<code>FL_LEAVE</code>
<code>pointer_motion</code>	pointer moves inside a window	<code>FL_MOVE</code>
<code>pointer_button</code>	state of mouse buttons changes	<code>FL_PUSH</code> , <code>FL_RELEASE</code>
<code>pointer_axis</code>	trackpad is moved vertically or horizontally	<code>FL_MOUSEWHEEL</code>

`pointer_listener` is installed by a call to function `wl_pointer_add_listener()` made by function `seat_capabilities()` which is itself another 'listener' made up of 2 function pointers

```
static struct wl_seat_listener seat_listener = {
    seat_capabilities,
    seat_name
};
```

installed by a call to function `wl_seat_add_listener()` made by function `registry_handle_global()` when it receives a "wl_seat" interface.

Handling middle mouse button clicks on window titlebars

The gnome desktop, via its `gnome-tweaks` application, allows to determine what happens when a middle mouse button click occurs on a window titlebar. To obey this setting, FLTK implements part of the `GTK Shell` protocol as follows. Mutter, gnome's Wayland compositor, declares its support of the `GTK Shell` protocol calling `registry_handle_global()` with its interface argument equal to "gtk_shell". FLTK initializes then member variable `seat->gtk_shell` of type `struct gtk_shell*`.

Member functions of `pointer_listener` mentioned above run for all mouse events on all `wl_surface` objects. The table above describes what these functions do for mouse events on FLTK-created `wl_surface` objects. But they also run for the `libdecor`-created `wl_surface` objects corresponding to window titlebars. Thus, member function `pointer_enter()` runs when the mouse enters a titlebar. It calls `Fl_Wayland_Screen_Driver::event_coords_from_surface()` which calls `Fl_Wayland_Window_Driver::surface_to_window()` which, as mentioned above, can distinguish FLTK-created from non FLTK-created `wl_surface` objects. This allows `pointer_enter()` to identify the entered surface as a titlebar and to assign static global variable `gtk_shell_surface` with the titlebar's `wl_surface` when the mouse enters a titlebar. Similarly, member function `pointer_leave()` sets `gtk_shell_surface` to `NULL` when the mouse leaves this titlebar. When there's a click on a titlebar, member function `pointer_button()` runs this code

```
if (gtk_shell_surface && state == WL_POINTER_BUTTON_STATE_PRESSED && button == BTN_MIDDLE) {
    struct gtk_surface1 *gtk_surface = gtk_shell1_get_gtk_surface(seat->gtk_shell, gtk_shell_surface);
    gtk_surface1_titlebar_gesture(gtk_surface, serial, seat->wl_seat, GTK_SURFACE1_GESTURE_MIDDLE_CLICK);
    gtk_surface1_release(gtk_surface);
    return;
}
```

which ensures that what `gnome-tweaks` has assigned to middle-click events is executed. At this point, FLTK obeys what `libdecor` decides for right-click (display the window menu) and double-click (maximize the window) events on titlebars which may diverge from `gnome-tweaks` settings.

3.1.14 Wayland cursors

Wayland defines types `struct wl_cursor` and `struct wl_cursor_theme` to hold cursor-related data. FLTK uses function `init_cursors()` from file `Fl_Wayland_Screen_Driver.cxx` to obtain the 'cursor theme' name using function `libdecor_get_cursor_settings()` of library `libdecor`. Function `wl_cursor_theme_load()` then returns a pointer to an object of type `struct wl_cursor_theme` stored in member variable `cursor_theme` of the `Fl_Wayland_Screen_Driver::seat` record. Function `init_cursors()` is itself called by a 'listener' called `seat_capabilities()` installed when function `registry_handle_global()` receives a "wl_seat" interface, at program startup. It is also called when the value of the Wayland scaling factor changes: `output_done()` calls `try_update_cursor()` calls `init_cursors()`. Function

`output_done()` belongs to a 'listener' installed when function `registry_handle_global()` receives a "wl_output" interface.

Each time `Fl_Window::cursor(Fl_Cursor)` runs, FLTK calls `Fl_Wayland_Window_Driver::set_cursor(Fl_Cursor)` which calls `wl_cursor_theme_get_cursor()` to set the current cursor shape to one of the standard shapes from the `Fl_Cursor` enumeration. This Wayland function selects a cursor shape based on the current `wl_cursor_theme` object and a cursor name and returns a pointer to a struct `wl_cursor`. Under the gnome desktop, cursor names are the files of directory `/usr/share/icons/XXXX/cursors/` where XXXX is the 'gnome cursor theme' (default= Adwaita). For example, what FLTK calls `FL_CURSOR_INSERT` corresponds to file `xterm` therein. The full correspondance between `Fl_Cursor` values and names of files therein is found in function `Fl_Wayland_Window_Driver::set_cursor(Fl_Cursor)`. FLTK stores in member variable `default_cursor` of the `Fl_Wayland_Screen_Driver::seat` record a pointer to the currently used `wl_cursor` object, and the current `Fl_Cursor` value in member `standard_cursor` of the `Fl_Wayland_Window_Driver` object.

Finally, function `do_set_cursor()` of file `Fl_Wayland_Screen_Driver.cxx` makes the system pointer use the current `wl_cursor` object to draw its shape on screen. That's done with a call to `wl_pointer_set_cursor()` and a few other functions.

Custom cursor shapes

To support custom cursors, FLTK presently uses a non-public type, struct `cursor_image`, defined in file `Fl_Wayland_Window_Driver.cxx` as follows:

```
struct cursor_image {
    struct wl_cursor_image image;
    struct wl_cursor_theme *theme;
    struct wl_buffer *buffer;
    int offset;
};
```

This definition has been copied to the FLTK source code from file `wayland-cursor.c` of the Wayland project source code because it's not accessible via Wayland header files. It shows that a pointer to a `cursor_image` object can also be viewed as a pointer to the embedded struct `wl_cursor_image` object, this one being part of the public Wayland API. It also shows that a struct `cursor_image` object has an associated struct `wl_buffer` object used to contain the cursor's graphics.

Function `Fl_Wayland_Window_Driver::set_cursor(const Fl_RGB_Image *rgb, int hotx, int hoty)` gives FLTK support of custom cursor shapes. It calls `Fl_Wayland_Window_Driver::set_cursor_4args()` that creates a `cursor_image` object, allocates the corresponding `wl_buffer` by a call to `Fl_Wayland_Graphics_Driver::create_shm_buffer()` via `custom_offscreen()` and `create_wld_buffer()` and draws the cursor shape into that buffer using the offscreen-drawing method of FLTK.

The public type struct `wl_cursor` is essentially an array of `wl_cursor_image` objects and a name:

```
struct wl_cursor {
    unsigned int image_count;
    struct wl_cursor_image **images;
    char *name;
};
```

Function `Fl_Wayland_Window_Driver::set_cursor_4args()` also creates a struct `wl_cursor` object containing a single `wl_cursor_image`, which is in fact the `cursor_image`. Finally, a struct `Fl_Wayland_Window_Driver::custom_cursor` (see [wld_window](#)) is allocated and used to memorize the struct `wl_cursor` and the cursor's image and hotspot. A pointer to this struct `Fl_Wayland_Window_Driver::custom_cursor` object is stored in member `custom_cursor` of the window's [wld_window](#).

Function `Fl_Wayland_Window_Driver::set_cursor_4args()` is also called when a window with a custom cursor is moved between distinct displays or when a display is rescaled to adapt the cursor size to the new display's scale factor.

Static member function `Fl_Wayland_Window_Driver::delete_cursor()` is used to delete any custom cursor shape. This occurs when a window associated to a custom cursor is un-mapped and when such a window gets associated to a standard cursor or to a new custom cursor.

3.1.15 Keyboard support

The "Mouse handling" section above mentioned function `seat_capabilities()` that Wayland calls when the app discovers its "seat". Presence of flag `WL_SEAT_CAPABILITY_KEYBOARD` in argument `capabilities`

of this function indicates that a keyboard is available. In that case, a call to `wl_seat_get_keyboard()` returns a pointer stored in member `wl_keyboard` of the `Fl_Wayland_Screen_Driver::seat` object, and a call to `wl_keyboard_add_listener()` installs a 6-member listener of type `struct wl_keyboard_listener`. These 6 FLTK-defined, callback functions are used as follows.

1) Function `wl_keyboard_keymap()` runs when the app starts and also if the keyboard layout is changed during run-time. It allows initialization of access to this keyboard. Noticeably, member `xkb_state` of type `struct xkb_state*` of the current `Fl_Wayland_Screen_Driver::seat` record is adequately initialized.

2-3) Functions `wl_keyboard_enter()` and `wl_keyboard_leave()`, called when focus enters and leaves a surface, send `FL_FOCUS` and `FL_UNFOCUS` events to the `Fl_Window` object corresponding to this surface.

4) Function `wl_keyboard_key()` runs each time a keyboard key is pressed or released. Its argument `key`, to which 8 must be added, provides the keycode via function `xkb_state_key_get_one_sym()` and then the corresponding text via function `xkb_state_key_get_utf8()` which is put in `Fl::e_text`. Then, a few calls to functions whose name begin with `xkb_compose_` are necessary to support dead and compose keys. Finally a call to `Fl::handle()` sends an `FL_KEYDOWN` or `FL_KEYUP` event to the appropriate `Fl_Window`. Also, function `wl_keyboard_key()` uses global variable `Fl_Int_Vector key_vector` to record all currently pressed keys. This is the base of the implementation of `Fl_Wayland_Screen_Driver::event_key(int)`.

5) Function `wl_keyboard_modifiers()` runs when a modifier key (e.g., shift, control) is pressed or released. Calls to functions `xkb_state_update_mask()` and `xkb_state_mod_name_is_active()` allow FLTK to set `Fl::e_state` adequately.

6) Function `wl_keyboard_repeat_info()` does not run, for now, because this would require version 4 of the `wl_keyboard` object which is at version 2 in all tested Wayland compositors.

3.1.16 Support of text input methods

When the connected Wayland compositor supports text input methods, function `registry_handle_global()` gets called with its interface argument equal to `zwp_text_input_manager_v3` interface.name. The following call to `wl_registry_bind()` returns a pointer to type `struct zwp_text_input_manager_v3` that is stored as member `text_input_base` of the `Fl_Wayland_Screen_Driver` object.

Later, when function `seat_capabilities()` runs, `text_input_base` is found not NULL, which triggers a call to function `zwp_text_input_manager_v3_get_text_input()` returning a value of type `struct zwp_text_input_v3 *` and stored as member `text_input` of the `Fl_Wayland_Screen_Driver::seat` object. Next, a call to `zwp_text_input_v3_add_listener()` associates this `text_input` with a 6-member listener of type `struct zwp_text_input_v3_listener`. These 6 FLTK-defined, callback functions are used as follows.

1-2) Functions `text_input_enter()` and `text_input_leave()` run when text input enters or leaves a surface.

3-4) Functions `text_input_preedit_string()` and `text_input_commit_string()` are called when the text input method prepares the client app to later insert 'marked' text or regular text, respectively. Complex text input often begins by inserting temporary text which is said to be 'marked' before replacing it with the text that will stay in the document. FLTK underlines marked text to distinguish it from regular text.

5) Function `text_input_done()` runs when it's time to send either regular or marked text to the client app. This is done by function `send_text_to_fltk()` which uses static variables `current_pre_edit`, `pending_pre_edit` and `pending_commit` to determine the sent text.

6) Function `text_input_delete_surrounding_text()` has no effect at present, without this preventing input methods that have been tested with FLTK from working satisfactorily.

It's necessary to inform the running text input method of the current location of the insertion point in the active surface. This information allows the input method to map its auxiliary window close to the insertion point. The flow of information on this topic is as follows:

- The two FLTK widgets supporting text input, `Fl_Input` and `Fl_Text_Display`, transmit to FLTK the window coordinates of the bottom of the current insertion point and the line height each time they change calling function `fl_set_spot()`.
- `fl_set_spot()` calls the platform override of virtual member function `Fl_Screen_Driver::set_spot()`. Under Wayland, this just calls `Fl_Wayland_Screen_Driver::insertion_point_location(int x, int y, int height)` which calls `zwp_text_input_v3_set_cursor_rectangle()` to inform the text input method about the surface position and size of the insertion point

and also memorizes this information in static member variables of class `Fl_Wayland_Screen_Driver`.

- Callback function `text_input_enter()` calls `Fl_Wayland_Screen_Driver::insertion_point_location(int *x, int *y, int *height)` which gives it the stored position information, and then calls `zwp_text_input_v3_set_cursor_rectangle()` to inform the text input method about the position of the insertion point.

3.1.17 Interface with libdecor

FLTK uses a library called `libdecor` to determine whether the Wayland compositor uses CSD or SSD mode, and also to draw window titlebars when in CSD mode (see [libdecor](#)). `Libdecor` is conceived to be present in a shared library linked to the Wayland client application which itself, and if the running Wayland compositor uses CSD mode, loads another shared library intended to draw titlebars in a way that best matches the Desktop. As of late 2023, `libdecor` contains two titlebar-drawing plugins:

- `libdecor-gtk` intended for the Gnome desktop;
- `libdecor-cairo` for other situations.

On recent Linux distributions, FLTK uses the system `libdecor` shared library available via packages `libdecor-0-dev` and `libdecor-0-plugin-1-gtk`. On earlier Linux versions, or if CMake option `FLTK_USE_SYSTEM_LIBDECOR` is set to OFF, FLTK bundles the most recent source code of `libdecor` and its plugins. The `libdecor` code bundled inside FLTK is compiled and put in `libfltk`. FLTK uses `libdecor-gtk` when software package `libgtk-3-dev` is present in the build system, and `libdecor-cairo` otherwise. FLTK prefixes all symbols of its bundled `libdecor` with "fl_". This allows an FLTK client app to link to other libraries which may use the system version of `libdecor`.

`Libdecor` uses the Wayland protocol `XDG decoration` to request being decorated by a supporting compositor. If the running compositor supports SSD, `libdecor` doesn't draw window titlebars because the compositor does it. That is what happens with the `KWin` and `Sway` compositors. However, if environment variable `LIBDECOR_FORCE_CSD` is defined to value 1 when an FLTK app runs, `libdecor` instructs an SSD-able compositor to refrain from decorating its windows and decorates windows itself.

Whatever the value of `FLTK_USE_SYSTEM_LIBDECOR`, FLTK and `libdecor` use environment variable `LIBDECOR_PLUGIN_DIR` as follows: if this variable is defined and points to the name of a directory, this directory is searched for a potential `libdecor` plugin in the form of a shared library; if one is found, FLTK and `libdecor` load it and use it.

The `libdecor` source code bundled in FLTK is identical to that of the `libdecor` repository. Nevertheless, FLTK uses this code with some minor changes. For example, except if `FLTK_USE_SYSTEM_LIBDECOR` is 1, FLTK needs to modify function `libdecor_new()` charged of loading the plugin, to make it use the plugin code that is included in `libfltk` if none is found as a dynamic library. This is done as follows in file `libdecor/build/fl_`

`libdecor.c`:

```
#define libdecor_new libdecor_new_orig
#include "../src/libdecor.c"
#undef libdecor_new

void libdecor_new() { // FLTK rewrite of this function
    .....
}
```

FLTK compiles file `fl_libdecor.c` which includes `libdecor.c` to the effect that all of the `libdecor` code becomes part of `libfltk` except that function `libdecor_new()` is substituted by its FLTK rewrite, without file `libdecor.c` being modified at all. This trick is also used to modify function `libdecor_frame_set_minimized()` to bypass a bug in the Weston compositor before version 10. Similarly, FLTK compiles file `fl_`

`libdecor-plugins.c` which includes either `libdecor-gtk.c` or `libdecor-cairo.c` to the effect that the desired plugin becomes part of `libfltk`.

To support function `Fl_Widget_Surface::draw_decorated_window()` that draws a mapped window and its titlebar, FLTK needs to perform two operations: 1) identify what plugin is operating, and 2) call a function that is specific of that plugin and that returns the pixels of the drawn titlebar.

FLTK performs operation 1) above using its function `get_libdecor_plugin_description()` of file `fl_`

`_libdecor-plugins.c` that returns a human readable string describing the running plugin. Each plugin puts its own string in member description of a record of type `struct libdecor_plugin_description`. Although this type is public in header file `libdecor-plugin.h`, accessing the symbol defined by the plugin to store a pointer to a value of this type is complicated for a reason and solved by a method detailed in a comment before function `get_libdecor_plugin_description()`.

Operation 2) above is done by FLTK-defined function `fl_libdecor_titlebar_buffer()` from file `fl_libdecor-plugins.c`. This function calls `get_libdecor_plugin_description()` seen above to get the running plugin's descriptive string. That is "GTK3 plugin" with `libdecor-gtk`. FLTK function `gtk_titlebar_buffer()` is then called, and returns a pointer to the start of a byte buffer containing the titlebar graphics. That is, again, not possible with the public `libdecor` API. Therefore, FLTK copies to `fl_libdecor-plugins.c` the definitions of several types given in `libdecor-gtk.c` or `libdecor-cairo.c` such as type `struct border_component`.

3.1.18 Copy/Paste/Drag-n-Drop

FLTK follows the procedure that is very well described in item "Wayland clipboard and drag & drop" of the [Documentation resources](#). All corresponding source code is in file `src/drivers/Wayland/fl_wayland_clipboard_dnd.cxx`.

This part of the `Fl_Wayland_Screen_Driver::seat` record stores pointers to Wayland objects used for clipboard and D-n-D operations:

```
struct wl_data_device_manager *data_device_manager;
struct wl_data_device *data_device;
struct wl_data_source *data_source;
```

FLTK can copy or paste plain UTF-8 text or image data to/from the clipboard. Images are copied to the clipboard as image/bmp mime type. Images in image/bmp or image/png mime types from the clipboard can be pasted to FLTK apps.

Files dropped are received one pathname per line, with no '\n' after the last pathname.

3.1.19 EGL as support for OpenGL

Wayland uses [EGL™](#) to interface OpenGL with the underlying native platform window system. OpenGL-using FLTK apps are therefore linked to `libwayland-egl.so` and `libEGL.so` in addition to `libGL.so` and `libGLU.so`.

EGL completely hides the `wl_buffer` objects it uses to draw to GL windows. The `wld_buffer` structure and the 'buffer factory' described previously are not used for `Fl_Gl_Window`'s: the `buffer` member of an `Fl_Gl_Window`'s `wld_window` structure is always NULL.

EGL is initialized calling member function `Fl_Wayland_Gl_Window_Driver::init()` once, the first time the `Fl_Wayland_Gl_Window_Driver` c'tor runs. That is done with calls to `eglGetDisplay()`, `eglInitialize()`, and `eglBindAPI()`.

Member function `Fl_Wayland_Gl_Window_Driver::find()` calls `eglChooseConfig()` to filter the set of GL configurations that match the `Fl_Gl_Window`'s `mode()`, and puts in the returned `Fl_Gl_Choice` object the first matching configuration. The filtering gets done with bits `EGL_WINDOW_BIT`, to support the creation of window surfaces, and `EGL_OPENGL_BIT`, to support the creation of OpenGL contexts.

EGL needs 2 more objects created for each `Fl_Gl_Window`. They have types `struct wl_egl_window` and `EGLSurface`, and are created by member function `Fl_Wayland_Gl_Window_Driver::make_current_before()` which runs at the beginning of `Fl_Gl_Window::make_current()`. The first argument of the call to `wl_egl_window_create()` therein has type `struct wl_surface *` and is what connects EGL with the targeted Wayland window.

EGL creates with `eglCreateContext()` an object of type `EGLContext` via member function `Fl_Wayland_Gl_Window_Driver::create_gl_context()` called by `Fl_Gl_Window::make_current()`.

Types `EGLContext` and `GLContext` are 2 names for the same object. The call to `eglCreateContext()` is made asking for a GL context of version at least 2. This does not prevent from obtaining contexts of higher versions, namely above 3.2, which are compatible with version 2 (the so-called compatibility profile) under all tested Linux systems.

FLTK function `Fl_Gl_Window::make_current()` calls overridden function `Fl_Wayland_Gl_Window_Driver::set_gl_context()` which calls EGL function `eglMakeCurrent()` when the cached context changes.

FLTK calls function `Fl_Wayland_Gl_Window_Driver::swap_buffers()` each time it wants a GL context to be sent to the display. This function contains some pure GL code to emulate an overlay buffer to support `Fl_Gl_Window` objects overriding their `draw_overlay()` member function. Then, it calls function `eglSwapBuffers()`.

The overridden `Fl_Wayland_Gl_Window_Driver::resize()` function is implemented with calls to `wl_egl_window_get_attached_size()` and `wl_egl_window_resize()`.

Class `Fl_Wayland_Gl_Plugin` exists to allow `libfltk` to call functions from `libfltk_gl`,

libwayland-egl.so or libEGL.so and without having libfltk force linking any FLTK app with these GL-related libraries. For example, `Fl_Wayland_Window_Driver::flush()` needs to call `Fl_Gl_Window::valid(0)`.

Throttling GL window redraws

Although no documentation covering this subject was found, the EGL library internally uses `wl_callback` objects to throttle GL window redraws, and FLTK needs not interfere with these operations. Nevertheless FLTK creates and uses `wl_callback` objects for GL windows in 2 cases:

- when a decorated GL window is being interactively resized. Function `Fl_Wayland_Gl_Window_Driver::resize()` creates a `wl_callback` object, assigns it to `xid->frame_cb` and calls `wl_callback_add_listener()` before calling `wl_egl_window_resize()`. This allows the mechanism described above that prevents surfaces from being resized too frequently to operate with decorated `Fl_Gl_Window`'s too.
- when a GL subwindow is being refreshed by `Fl_Wayland_Gl_Window_Driver::swap_buffers()`. FLTK checks that `xid->frame_cb` is NULL and if so creates a `wl_callback` calling `wl_surface_frame()` before calling `eglSwapBuffers()`. This is useful if the GL subwindow becomes entirely out from the screen area. In that case, the Mutter compositor stops signaling that the subwindow is ready for new commits which FLTK detects because `xid->frame_cb` remains non-NULL. If the subwindow eventually re-appears partially on-screen, `xid->frame_cb` becomes NULL and FLTK calls `eglSwapBuffers()` to redraw the GL scene.

3.1.20 FLTK-defined, Wayland-specific types

struct `wld_window`

Defined in `Fl_Wayland_Window_Driver.H`. One such record is created for each shown() `Fl_Window` by `Fl_Wayland_Window_Driver::makeWindow()`. Function `fl_wl_xid(Fl_Window*)` returns a pointer to the struct `wld_window` of its argument.

```
struct wld_window {
    Fl_Window *fl_win;
    struct wl_list outputs; // linked list of displays where part or whole of window maps
    struct wl_surface *wl_surface; // the window's surface
    struct wl_callback *frame_cb; // non-NULL until Wayland can process new surface commit
    struct Fl_Wayland_Graphics_Driver::wld_buffer *buffer; // see \ref wld_buffer
    struct xdg_surface *xdg_surface;
    enum Fl_Wayland_Window_Driver::kind kind; // DECORATED or POPUP or SUBWINDOW or UNFRAMED
    union {
        struct libdecor_frame *frame; // for DECORATED windows
        struct wl_subsurface *subsurface; // for SUBWINDOW windows
        struct xdg_popup *xdg_popup; // for POPUP windows
        struct xdg_toplevel *xdg_toplevel; // for UNFRAMED windows
    };
    struct Fl_Wayland_Window_Driver::custom_cursor {
        struct wl_cursor *wl_cursor;
        const Fl_RGB_Image *rgb;
        int hotx, hoty;
    } *custom_cursor; // non-null when using custom cursor
    int configured_width; // used when negotiating window size with the compositor
    int configured_height;
    int floating_width; // helps restoring size after un-maximizing
    int floating_height;
    int state; // indicates whether window is fullscreen, maximized. Used otherwise for POPUPS
    bool covered; // specially for Mutter and issue #878
}
```

struct `Fl_Wayland_Graphics_Driver::draw_buffer`

Defined in file `Fl_Wayland_Graphics_Driver.H`. One such record is created when an `Fl_Image_Surface` object is created. One such record is also embedded inside each struct `Fl_Wayland_Graphics_Driver::wld_buffer` record (see [wld_buffer](#)).

```
struct Fl_Wayland_Graphics_Driver::draw_buffer {
    unsigned char *buffer; // address of the beginning of the Cairo image surface's byte array
    cairo_t *cairo; // used when drawing to the Cairo image surface
    size_t data_size; // of buffer and wl_buffer, in bytes
    int stride; // bytes per line
    int width; // in pixels
};
```

FLTK gives offscreen buffers the platform-dependent type `Fl_Offscreen` which is in fact member `cairo_` of struct `Fl_Wayland_Graphics_Driver::draw_buffer`. Thus, a variable with type `Fl_Offscreen` needs be cast to type `cairo_t*`. Static member function `struct draw_buffer *offscreen_↵buffer(Fl_Offscreen)` of class `Fl_Wayland_Graphics_Driver` returns the `draw_buffer` record corresponding to an `Fl_Offscreen` value.

struct `Fl_Wayland_Graphics_Driver::wld_buffer`

Defined in file `Fl_Wayland_Graphics_Driver.H`. One such record is created by `Fl_Wayland_↵Graphics_Driver::create_wld_buffer()` when an `Fl_Window` is `show()`'n or resized, when a custom cursor shape is created, or when text is dragged.

```
struct Fl_Wayland_Graphics_Driver::wld_buffer {
    struct draw_buffer draw_buffer; // see draw_buffer
    struct wl_list link; // links all buffers from the same wl_shm_pool
    struct wl_buffer *wl_buffer; // the Wayland buffer
    void *data; // address of the beginning of the Wayland buffer's byte array
    struct wl_shm_pool *shm_pool; // pter to wl_shm_pool from which this wl_buffer comes
    bool draw_buffer_needs_commit; // true when draw_buffer has been modified but not yet committed
    bool in_use; // true while being committed
    bool released; // true after buffer_release() was called
};
```

struct `Fl_Wayland_Screen_Driver::output`

Defined in `Fl_Wayland_Screen_Driver.H`. One such record is created for each display of the system by function `registry_handle_global()` when it receives a "wl_output" interface. These records are kept in a linked list of them all, and an identifier of this linked list is stored in member `outputs` of the unique `Fl_↵Wayland_Screen_Driver` object FLTK uses. Thus,

```
Fl_Wayland_Screen_Driver *scr_driver = (Fl_Wayland_Screen_Driver*)Fl::screen_driver();
struct wl_list list_of_all_displays = scr_driver->outputs;
```

gives access, the Wayland way, to the linked list of displays in the system.

```
struct Fl_Wayland_Screen_Driver::output { // one record for each display
    uint32_t id; // an identifier of the display
    int x, y; // logical position of the top-left of display
    int width; // nber of horizontal pixels
    int height; // nber of vertical pixels
    float dpi; // at this point, always 96.
    struct wl_output *wl_output; // the Wayland object for this display
    int wld_scale; // Wayland scale factor
    float gui_scale; // FLTK scale factor
    bool done; // true means record members have been initialized
    struct wl_list link; // links these records together
};
```

It's possible to get the FLTK-defined record associated to a display from the Wayland-associated object for the same display, say `struct wl_output *wl_output`, by this call: `(struct Fl_Wayland_Screen_↵Driver::output *)wl_output_get_user_data(wl_output)`.

struct `Fl_Wayland_Screen_Driver::seat`

Defined in file `Fl_Wayland_Screen_Driver.H`. One record is created by function `registry_handle_↵global()` when it receives a "wl_seat" or `wl_data_device_manager_interface.name` interface. A pointer to this struct is stored in member `seat` of the client's unique `Fl_Wayland_Screen_Driver` object.

```
struct Fl_Wayland_Screen_Driver::seat {
    struct wl_seat *wl_seat;
    struct wl_pointer *wl_pointer;
    struct wl_keyboard *wl_keyboard;
    uint32_t keyboard_enter_serial;
    struct wl_surface *keyboard_surface;
    struct wl_list pointer_outputs;
    struct wl_cursor_theme *cursor_theme;
    struct wl_cursor *default_cursor;
    struct wl_surface *cursor_surface;
    struct wl_surface *pointer_focus;
    int pointer_scale;
    uint32_t serial;
    uint32_t pointer_enter_serial;
    struct wl_data_device_manager *data_device_manager;
    struct wl_data_device *data_device;
    struct wl_data_source *data_source;
    struct xkb_state *xkb_state;
    struct xkb_context *xkb_context;
    struct xkb_keymap *xkb_keymap;
};
```

```

struct xkb_compose_state *xkb_compose_state;
char *name;
struct zwf_text_input_v3 *text_input;
};

```

3.1.21 Documentation resources

The Wayland book	Extensive introduction to Wayland programming written by the author of the <i>sway</i> compositor, unfortunately unachieved.
Wayland Explorer	Documentation of all Wayland protocols, both stable and unstable. A language-independent syntax is used which makes function names usable from C or C++ not always obvious. Some useful functions seem undocumented here for an unclear reason.
Wayland Protocol Specification	Documentation for all functions of the Wayland core protocol.
Wayland clipboard and drag & drop	Detailed explanation of how clipboard and drag-and-drop work under Wayland.
Wayland and input methods	Blog article introducing to the issue of text input methods under Wayland.
Input Method Hub	Entry page for input method support giving newcomers a first understanding of what input methods are and how they are implemented in Wayland.

3.2 Developer info for bundled libs

This chapter details the procedure to update the libraries which are bundled inside FLTK.

3.2.1 Introduction

This file is mainly intended for FLTK developers and contains information about the current versions of all bundled libraries and about how to upgrade these bundled libraries.

Starting with FLTK 1.4.0 the bundled libraries jpeg, png, and zlib use "symbol prefixing" with the prefix 'fltk_' for all external symbols to distinguish the bundled libraries from existing system libraries and to avoid runtime errors.

User code compiled correctly with the header files provided by the bundled image libraries need not be changed.

The nanosvg library is not affected.

3.2.2 Current status

Current versions of bundled libraries (as of February 14, 2025):

Library	Version/git commit	Release date	FLTK Version
jpeg	jpeg-9f	2024-01-14	1.4.0
nanosvg	7aeda550a8 [1]	2023-12-02	1.4.0
png	libpng-1.6.44	2024-09-12	1.4.1
zlib	zlib-1.3.1	2024-01-22	1.4.0
libdecor	f7cd7ffd [2]	2025-01-21	1.4.2

Previous versions of bundled libraries (FLTK 1.3.x):

Library	Version	Release date	FLTK Version
jpeg	jpeg-9e	2022-01-16	1.3.9
png	libpng-1.6.40	2023-06-21	1.3.9
zlib	zlib-1.3	2023-08-18	1.3.9
jpeg	jpeg-9d	2020-01-12	1.3.6 - 1.3.8
png	libpng-1.6.37	2019-04-14	1.3.6 - 1.3.8
zlib	zlib-1.2.11	2017-01-15	1.3.6 - 1.3.8

[1] Git commit in branch 'fltk' of <https://github.com/fltk/nanosvg>

```
See also git tag 'fltk_yyyy-mm-dd' where yyyy-mm-dd == "Release date"
and file nanosvg/README.txt.
[2] Git commit in https://gitlab.freedesktop.org/libdecor/libdecor
```

General information:

FLTK does not include the entire library distributions. We only provide the source files necessary to build the FLTK library and some README and/or CHANGELOG files. There are no test programs or other contributed files.

We use our own build files, hence a few files MUST NOT be upgraded when the library source files are upgraded. We strive to keep changes to the library source files as small as possible. Patching library code to work with FLTK should be a rare exception. Symbol prefixing with prefix 'fltk_' is one such exception to the rule.

If patches are necessary all changes in the library files should be marked with "FLTK" in a comment so a developer who upgrades the library later is aware of changes in the source code for FLTK. Look for 'FLTK' and/or 'fltk_' to find the differences.

Additional comments should be added to show the rationale, i.e. why a particular change was necessary. If applicable, add a reference to a Software Trouble Report, GitHub Issue or Pull Request (PR) like "STR 3456", "Issue #123", or "PR #234".

3.2.3 How to update the bundled libraries

It is generally advisable to use a graphical merge program. I'm using 'meld' under Linux, but YMMV.

Do not add any source files unless they are required to build the library.

Some config header files may be pre-generated in the FLTK sources. These header files should be left untouched, but it may be necessary to update these files if new items were added to the new library version. In this case the new header should be pre-generated on a Linux system with default options unless otherwise mentioned below for a specific library. Currently there are no known exceptions.

Merging source files:

Please check if some source and header files contain "FLTK" comments and/or 'fltk_' symbol prefixing to be aware of necessary merges. It is also good to download the distribution tar ball or Git source files of the previous version and to run a (graphical) diff or merge tool on the previous version and the bundled version of FLTK to see the "previous" differences.

Files that were not patched in previous versions should be copied to the new version w/o changes. Files that had FLTK specific patches must be merged manually. FLTK patches should be verified (if still necessary) and should be kept in the new source files.

Source and header files that have been added in the new library version should be added in FLTK as well if they are necessary to build the library. A simple "trial and error" should be sufficient to find files that need to be added. Added files must be added to FLTK's build files as well, usually to both 'Makefile' and 'CMakeLists.txt' to be used in configure/make and in CMake based builds, respectively.

Upgrade order:

There is only one dependency between all bundled libraries: libpng depends on zlib. Hence zlib should be upgraded first, then all other libs can be upgraded in arbitrary order.

Tests after merge:

Tests should be done on as many platforms as possible, both with autotools (configure/make) and CMake. Windows (Visual Studio) and macOS (Xcode) builds need CMake to generate the IDE files.

Upgrade notes for specific libraries:

The following chapters contain informations about specific files and how they are upgraded. Since the changes in all bundled libraries are not known in advance this information may change in the future. Please verify that no other changes are necessary.

3.2.4 zlib:

Website: <https://zlib.net/>

Download: See website and follow links.

Repository: git clone <https://github.com/madler/zlib.git>

zlib should be upgraded first because libpng depends on zlib.

Download the latest zlib sources, 'cd' to /path-to/zlib and run

```
$ ./configure --zprefix
```

This creates the header file 'zconf.h' with definitions to enable the standard 'z_' symbol prefix.

Unfortunately zlib requires patching some source and header files to convert this 'z_' prefix to 'ftk_z_' to be more specific. As of this writing (Nov. 2021) three files need symbol prefix patches:

- gzread.c
- zconf.h
- zlib.h

You may want to compare these files and/or the previous version to find out which changes are required. The general rule is to change all occurrences of 'z_' to 'ftk_z_' but there are exceptions.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- gzread.c: Merge changes (see above, manual merge recommended).
- zconf.h: Merge changes (see above, manual merge recommended).
- zlib.h: Merge changes (see above, manual merge recommended).
- makedepend: Keep this file.

Run 'make depend' in the zlib folder on a Linux system after the upgrade to update this file.

3.2.5 png:

Website: <http://libpng.org/pub/png/libpng.html>

Download: See website and follow links.

Repository: git clone <https://git.code.sf.net/p/libpng/code> libpng

libpng should be upgraded after zlib because it depends on zlib.

Download the latest libpng sources, 'cd' to /path-to/libpng and run

```
$ ./configure --with-libpng-prefix=ftk_
$ make
```

This creates the header files 'pnglibconf.h' and 'pngprefix.h' with the 'ftk_' symbol prefix.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- pnglibconf.h: Generate on a Linux system and merge (see above).
- pngprefix.h: Generate on a Linux system and merge (see above).
- makedepend: Keep this file.

Run 'make depend' in the png folder on a Linux system after the upgrade to update this file.

3.2.6 jpeg:

Website: <https://ijg.org/>

Download: See website and follow links.

Repository: N/A

Download the latest jpeg-xy sources on a Linux (or Unix) system, 'cd' to /path-to/jpeg-xy and run

```
$ ./configure
$ make [-jN]
```

This builds the library and should create the static library file '.libs/libjpeg.a'.

Execute the following command to extract the libjpeg symbol names used to build the 'prefixed' libfltk_jpeg library:

```
$ nm --extern-only --defined-only .libs/libjpeg.a | awk '{print $3}' \
| sed '/^$/d' | sort -u | awk '{print "#define \"$1\" fltk_\"$1\"}' \
> fltk_jpeg_prefix.h
```

This creates the header file 'fltk_jpeg_prefix.h' with the '# define' statements using the 'fltk_' symbol prefix.

The following files need special handling:

- CMakeLists.txt: Keep FLTK version, update manually if necessary.
- Makefile: Same as CMakeLists.txt.
- fltk_jpeg_prefix.h: Generate on a Linux system and merge (see above).
- jconfig.h: keep changes flagged with

```
/* FLTK */
```

Note: more to come...

- makedepend: Keep this file.

Run 'make depend' in the jpeg folder on a Linux system after the upgrade to update this file.

3.2.7 nanosvg:

Website: <https://github.com/memononen/nanosvg>

Download: See website and follow links.

Repository: git clone <https://github.com/memononen/nanosvg.git>

FLTK Fork: git clone <https://github.com/fltk/nanosvg.git>

FLTK has its own GitHub fork of the original repository (see above).

The intention is to update this fork from time to time so the FLTK specific patches are up-to-date with the original library. Hopefully the FLTK patches will be accepted upstream at some time in the future so we no longer need our own patches. AlbrechtS, 04 Feb 2018.

Update (Feb 22, 2021): The upstream library is officially no longer maintained (see README.md) although updates appear from time to time.

Use this fork (branch 'fltk') to get the nanosvg library with FLTK specific patches:

```
$ git clone https://github.com/fltk/nanosvg.git nanosvg-fltk
$ cd nanosvg-fltk
$ git checkout fltk
$ cd src
$ cp nanosvg.h nanosvgrast.h /path/to/fltk-1.4/nanosvg/
```

This library does not have its own build files since it is a header-only library. The headers are included in FLTK where necessary.

The following files need special handling:

nanosvg.h: Merge or download from FLTK's fork (see above).

nanosvgrast.h: Merge or download from FLTK's fork (see above).

Maintaining branch 'fltk' in FLTK's fork of nanosvg (fltk/nanosvg):

Only maintainers with write access on fltk/nanosvg can do this. Others can fork our fltk/nanosvg fork in their own GitHub account and either open a PR on fltk/nanosvg or tell us about their changes in fltk.development.

Use something similar to the following commands to update FLTK's fork of nanosvg to the latest version. Commands are only examples, you may need to change more or less, depending on the outstanding updates.

Step 1: clone the fltk/nanosvg fork, set the remote 'upstream', and update the 'master' branch:

```
$ cd /to/your/dev/dir
$ git clone https://github.com/fltk/nanosvg.git nanosvg-fltk
$ cd nanosvg-fltk
$ git remote add upstream https://github.com/memononen/nanosvg
```

```
$ git checkout master
$ git pull upstream master
```

Note: the 'master' branch must never be changed, i.e. it must always be the same as 'upstream/master'. Never commit your own (FLTK specific) changes to branch 'master'.

Step 2: rebase branch 'fltk' on the new master (upstream/master), fix potential conflicts, and tag the new branch. It is important to keep the individual FLTK specific patches intact (one commit per patch) because this will preserve the history and the committer and make it easier to skip single patches when they are accepted upstream.

```
$ git checkout fltk
$ git rebase upstream/master
```

At this point you may need to fix conflicts! Do whatever is necessary to update the branch 'fltk'.

Now 'git tag' the 'fltk' branch for later reference.

Hint: use 'git show <any-older-tag-name>' to see its contents. I like to write a summary of commits in the tag comment.

```
$ git tag -a fltk_yyyy-mm-dd fltk
```

Replace 'yyyy-mm-dd' with the current date and add a comment when asked for it (your editor will open an empty file).

Step 3: at this point it is recommended to copy the changed header files to your working copy of the FLTK library and test the changes. If anything is wrong, go back, fix the bugs and change the git tag (delete and create a new one).

Step 4: push the new branch 'fltk' and the tag to the fltk/nanosvg repository:

```
$ git push -f origin fltk
$ git push origin fltk_yyyy-mm-dd
```

Step 5: copy the changed files to your working copy of the FLTK repository (if not done already), update this file accordingly, and commit/push the update to the fltk/fltk repository.

3.2.8 libdecor:

Website: <https://gitlab.freedesktop.org/libdecor/libdecor>

Download: See website and follow links.

Repository: git clone <https://gitlab.freedesktop.org/libdecor/libdecor.git>

libdecor is used by the Wayland/X11 hybrid platform to draw window titlebars when FLTK apps run as Wayland clients and the running Wayland compositor uses client-side decoration. In the future, when libdecor will have made its way into Linux packages, FLTK will use the system version of libdecor. libdecor will remain as an FLTK bundle to support Linux configurations where the libdecor package is not available or not installed.

FLTK uses libdecor source files without any modification. This part of the libdecor source tree is copied to directory libdecor/ of the FLTK source tree:

```
LICENSE
README.md
src/      ... and files below except meson.build files
```

Furthermore, directory libdecor/build/ of the FLTK source tree does not originate from the libdecor source tree but contains 3 FLTK-created files. File build/Makefile may need changes if a libdecor update adds or renames source files.

3.3 Developer Information

This chapter describes FLTK development and documentation.

Example

```
/** \file
    Fl_Clock, Fl_Clock_Output widgets. */

/**
    \class Fl_Clock_Output
    \brief This widget can be used to display a program-supplied time.

    The time shown on the clock is not updated. To display the current time,
    use Fl_Clock instead.
```

```

\image html clock.png
\image latex clock.png "" width=10cm
\image html round_clock.png
\image latex clock.png "" width=10cm
\image html round_clock.png "" width=10cm */

/**
 Returns the displayed time.
 Returns the time in seconds since the UNIX epoch (January 1, 1970).
 \see value(ulong)
 */
ulong value() const {return value_;}

/**
 Set the displayed time.
 Set the time in seconds since the UNIX epoch (January 1, 1970).
 \param[in] v seconds since epoch
 \see value()
 */
void Fl_Clock_Output::value(ulong v) {
 [...]
}

/**
 Create an Fl_Clock widget using the given position, size, and label string.
 The default boxttype is \c FL_NO_BOX.
 \param[in] X, Y, W, H position and size of the widget
 \param[in] L widget label, default is no label
 */
Fl_Clock::Fl_Clock(int X, int Y, int W, int H, const char *L)
 : Fl_Clock_Output(X, Y, W, H, L) {}

/**
 Create an Fl_Clock widget using the given boxttype, position, size, and
 label string.
 \param[in] t boxttype
 \param[in] X, Y, W, H position and size of the widget
 \param[in] L widget label, default is no label
 */
Fl_Clock::Fl_Clock(uchar t, int X, int Y, int W, int H, const char *L)
 : Fl_Clock_Output(X, Y, W, H, L) {
 type(t);
 box(t==FL_ROUND_CLOCK ? FL_NO_BOX : FL_UP_BOX);
}

```

Note

From Duncan: (will be removed later, just for now as a reminder)

I've just added comments for the `fl_color_chooser()` functions, and in order to keep them and the general Function Reference information for them together, I created a new doxygen group, and used `\ingroup` in the three comment blocks. This creates a new Modules page (which may not be what we want) with links to it from the File Members and [Fl_Color_Chooser.H](#) pages. It needs a bit more experimentation on my part unless someone already knows how this should be handled. (Maybe we can add it to a `functions.dox` file that defines a functions group and do that for all of the function documentation?)

Update: the trick is not to create duplicate entries in a new group, but to move the function information into the doxygen comments for the class, and use the navigation links provided. Simply using `\relatesalso` as the first doxygen command in the function's comment puts it in the appropriate place. There is no need to have `\defgroup` and `\ingroup` as well, and indeed they don't work. So, to summarize:

```

Gizmo.H
/** \class Gizmo
 A gizmo that does everything
 */
class Gizmo {
 etc
};
extern int popup_gizmo(...);

```

```
Gizmo.cxx:
/** \relatesalso Gizmo
    Pops up a gizmo dialog with a Gizmo in it
 */
int popup_gizmo(...);
```

Comments Within Doxygen Comment Blocks

You can use HTML comment statements to embed comments in doxygen comment blocks. These comments will not be visible in the generated document.

```
The following text is a developer comment.
<!-- *** This *** is *** invisible *** -->
This will be visible again.
```

will be shown as:

The following text is a developer comment.

This will be visible again.

Note

Since an unknown Doxygen version indentation by four or more bytes is automatically displayed as if it was framed by `\code` and `\endcode`. You need to take care that "normal" text is not indented that much to avoid mis-interpretation and formatting as code.

Different Headlines

You can use HTML tags `<H1>` ... `<H4>` for headlines with different sizes. As of doxygen 1.8.x there must not be more than three spaces at the beginning of the line for this to work. Currently (doxygen 1.8.6) there seems to be no difference in the font sizes of `<H3>` and `<H4>` in the pdf output, whereas the html output uses different font sizes.

```
<H1>Headline in big text (H1)</H1>
<H2>Headline in big text (H2)</H2>
<H3>Headline in big text (H3)</H3>
<H4>Headline in big text (H4)</H4>
```

Headline in big text (H1)

Headline in big text (H2)

Headline in big text (H3)

Headline in big text (H4)

3.3.1 Non-ASCII Characters

Doxygen understands many HTML quoting characters like `"`, `ü`, `ç`, `Ç`, but not all HTML quoting characters.

This will appear in the document:

Doxygen understands many HTML quoting characters like ", ü, ç, Ç, but not all HTML quoting characters.

For further informations about HTML quoting characters see

<http://www.doxygen.org/manual/htmlcmds.html>

Alternatively you can use **UTF-8** encoding within Doxygen comments.

3.3.2 Document Structure

- `\page` creates a named page
- `\section` creates a named section within that page
- `\subsection` creates a named subsection within the current section
- `\subsubsection` creates a named subsubsection within the current subsection

All these statements take a "name" as their first argument, and a title as their second argument. The title can contain spaces.

The page, section, and subsection titles are formatted in blue color and a size like "`<H1>`", "`<H2>`", and "`<H3>`", and "`<H4>`", respectively.

By **FLTK documentation convention**, a file like this one with a doxygen documentation chapter has the name "`<chapter>.dox`". The `\page` statement at the top of the page is "`\page <chapter> This is the title`". Sections within a documentation page must be called "`<chapter>_<section>`", where "`<chapter>`" is the name part of the file, and "`<section>`" is a unique section name within the page that can be referenced in links. The same for subsections and subsubsections.

These doxygen page and section commands work only in special documentation chapters, not within normal source or header documentation blocks. However, links **from** normal (e.g. class) documentation **to** documentation sections **do work**.

This page has

```
\page development Developer Information
```

at its top.

This section is

```
\section development_structure Document Structure
```

The following section is

```
\section development_links Creating Links
```

3.3.3 Creating Links

Links to other documents and external links can be embedded with

- doxygen `\ref` links to other doxygen `\page`, `\section`, `\subsection` and `\anchor` locations
- HTML links without markup - doxygen creates "`http://...`" links automatically
- standard, non-Doxygen, HTML links

- see chapter `\ref unicode` creates a link to the named chapter `unicode` that has been created with a `\page` statement.
- For further informations about quoting see <http://www.doxygen.org/manual/htmlcmds.html>
- see `FLTK Library` creates a standard HTML link

appears as:

- see chapter [Unicode and UTF-8 Support](#) creates a link to the named chapter `unicode` that has been created with a `\page` statement.
- For further informations about quoting see <http://www.doxygen.org/manual/htmlcmds.html>
- see [FLTK Library](#) creates a standard HTML link

3.3.4 Paragraph Layout

There is no real need to use HTML `<P>` and `</P>` tags within the text to tell doxygen to start or stop a paragraph. In most cases, when doxygen encounters a blank line or some, but not all, **commands** in the text it knows that it has reached the start or end of a paragraph. Doxygen also offers the `\par` command for special paragraph handling. It can be used to provide a paragraph title and also to indent a paragraph. Unfortunately `\par` won't do what you expect if you want to have doxygen links and sometimes html tags don't work either.

```
\par Normal Paragraph with title
```

This paragraph will have a title, but because there is a blank line between the `\par` and the text, it will have the normal layout.

```
\par Indented Paragraph with title
```

This paragraph will also have a title, but because there is no blank line between the `\par` and the text, it will be indented.

```
\par
```

It is also possible to have an indented paragraph without title. This is how you indent subsequent paragraphs.

```
\par No link to Fl_Widget::draw()
```

Note that the paragraph title is treated as plain text.
 Doxygen type links will not work.
 HTML characters and tags may or may not work.

```
Fl_Widget::draw() links and &quot;html&quot; tags work<br>
\par
Use a single line ending with <br> for complicated paragraph titles.
```

The above code produces the following paragraphs:

Normal Paragraph with title

This paragraph will have a title, but because there is a blank line between the `\par` and the text, it will have the normal layout.

Indented Paragraph with title

This paragraph will also have a title, but because there is no blank line between the `\par` and the text, it will be indented.

It is also possible to have an indented paragraph without title. This is how you indent subsequent paragraphs.

No link to `Fl_Widget::draw()`

Note that the paragraph title is treated as plain text. Doxygen type links will not work. HTML characters and tags may or may not work.

[Fl_Widget::draw\(\)](#) links and "html" tags work

Use a single line ending with `
` for complicated paragraph titles.

3.3.5 Navigation Elements

Each introduction (tutorial) page ends with navigation elements. These elements must only be included in the html documentation, therefore they must be separated with `\htmlonly` and `\endhtmlonly`.

The following code creates the navigation bar at the bottom of the [FLTK Basics](#) HTML page as an example of all pages in the "FLTK Programming Manual" section. Note that **this page** is one of the appendices w/o navigation bar.

```
\htmlonly
<hr>
<table summary="navigation bar" width="100%" border="0">
<tr>
  <td width="45%" align="LEFT">
    <a class="el" href="intro.html">
      [Prev]
      Introduction to FLTK
    </a>
  </td>
  <td width="10%" align="CENTER">
    <a class="el" href="index.html">[Index]</a>
  </td>
  <td width="45%" align="RIGHT">
    <a class="el" href="common.html">
      Common Widgets and Attributes
      [Next]
    </a>
  </td>
</tr>
</table>
\endhtmlonly
```

Chapter 4

Todo List

Page [Adding and Extending Widgets](#)

Clarify [Fl_Window::damage\(uchar\)](#) handling - seems confused/wrong? ORing value doesn't match setting behavior in [Fl_Widget.H](#)!

Member [Fl::now](#) (double offset=0)

[Fl::system_driver\(\)](#)->gettime() was implemented for the Forms library and has a limited resolution (on Windows: milliseconds). On POSIX platforms it uses gettimeofday() with microsecond resolution. A new function could use a better resolution on Windows with its multimedia timers which requires a new dependency: winmm.lib (dll). This could be a future improvement, maybe set as a build option or generally (requires Win95 or 98?).

Member [Fl_Browser::scrollbar_width](#) () const

This method should eventually be removed in 1.4+

Member [Fl_Browser::scrollbar_width](#) (int width)

This method should eventually be removed in 1.4+

Class [Fl_Chart](#)

Refactor [Fl_Chart::type\(\)](#) information.

Member [Fl_File_Input::errorcolor](#) () const

Remove [Fl_File_Input::errorcolor\(\)](#) in FLTK 1.5.0 or higher.

Member [Fl_File_Input::errorcolor](#) ([Fl_Color](#) c)

Remove [Fl_File_Input::errorcolor\(Fl_Color\)](#) in FLTK 1.5.0 or higher.

Member [fl_filename_list](#) (const char *d, struct dirent ***l, [Fl_File_Sort_F](#) *s=fl_numericsort)

should support returning OS error messages

Class [Fl_Grid](#)

This (relative group coordinates of nested groups of [Fl_Grid](#)) needs explanation and maybe an example.

Member [Fl_Grid::Cell::~~Cell](#) ()

[Fl_Grid](#)'s cell destructor should remove the cell from the grid. Currently it does nothing!

Member [Fl_Grid::clear_layout](#) ()

[Fl_Grid::clear\(\)](#) needs to be implemented as documented above!

Member `FI_Grid::debug` (int level=127)

Add more information about cells and children.

Control output by using `level`.

Member `FI_Grid::FI_Grid` (int X, int Y, int W, int H, const char *L=0)

More documentation of `FI_Grid` constructor?

Member `FI_Grid::layout` (int rows, int cols, int margin=-1, int gap=-1)

Document when and why to call `layout()` w/o args. See `FI_Flex::layout()`

Member `FI_Grid::layout` ()

Document when and why to call `layout()` w/o args. See `FI_Flex::layout()`

Member `FI_Group::delete_child` (int n)

Reimplementation of `FI_Group::delete_child(int)` in more FLTK subclasses. This is not yet complete.

Member `fl_height` (int font, int size)

In the future, when the XFT issues are resolved, this function should simply return the 'size' value.

Member `FI_Input::handle_mouse` (int, int, int, int, int keepmark=0)

Add comment and parameters

Member `FI_Input::handletext` (int e, int, int, int, int)

Add comment and parameters

Struct `FI_Label`

There is an aspiration that the `FI_Label` type will become a widget by itself. That way we will be avoiding a lot of code duplication by handling labels in a similar fashion to widgets containing text. We also provide an easy interface for very complex labels, containing html or vector graphics. However, this re-factoring is not in place in this release.

Member `FI_Menu::add` (const char *, int shortcut, `FI_Callback` *, void *=0, int=0)

Raw integer shortcut needs examples. Dependent on responses to <https://www.fltk.org/newsgroups.php?gfltk.coredev+v:10086> and results of STR#2344

Member `FI_Shortcut`

Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 . . . U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on **all** programs being coded with symbolic names and not hard coded bit values.

Member `FI_Terminal::scrollbar`

Support scrollbar_left/right() - See `FI_Browser::scrollbar` docs

Support new `ScrollbarStyle`

Member `FI_Text_Display::extend_range_for_styles` (int *start, int *end)

Unicode?

Member [FI_Text_Display::handle_vline](#) (int mode, int lineStart, int lineLen, int leftChar, int rightChar, int topClip, int bottomClip, int leftClip, int rightClip) const

we need to handle hidden hyphens and tabs here!

we handle all styles and selections

we must provide code to get pixel positions of the middle of a character as well

Member [FI_Text_Display::overstrike](#) (const char *text)

Unicode? Find out exactly what we do here and simplify.

Member [FI_Text_Display::position_to_linecol](#) (int pos, int *lineNum, int *column) const

a column number makes little sense in the UTF-8/variable font width environment. We will have to further define what exactly we want to return. Please check the functions that call this particular function.

Member [FI_Text_Display::scroll](#) (int topLineNum, int horizOffset)

Column numbers make little sense here.

Member [FI_Text_Display::scrollbar_width](#) () const

This method should eventually be removed.

Member [FI_Text_Display::scrollbar_width](#) (int width)

This method should eventually be removed

Member [FI_Text_Display::shortcut](#) () const

FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Member [FI_Text_Display::shortcut](#) (int s)

FIXME : get set methods pointing on shortcut_ have no effects as shortcut_ is unused in this class and derived!

Member [FI_Text_Display::wrapped_column](#) (int row, int column) const

What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

Unicode?

Member [FI_Text_Display::wrapped_row](#) (int row) const

What does this do and how is it useful? Column numbers mean little in this context. Which functions depend on this one? Function TextDXYToUnconstrainedPosition does not exist (nedit port?)

Member [FI_Tiled_Image::FI_Tiled_Image](#) (FI_Image *i, int W=0, int H=0)

Fix [FI_Tiled_Image](#) as background image for widgets and windows and fix the implementation of [FI::scheme\(const char *\)](#).

Member [FI_Tree::handle](#) (int e) FL_OVERRIDE

add [FI_Widget_Tracker](#) (see [FI_Browser_.cxx::handle\(\)](#))

Member [FI_Tree::is_scrollbar](#) (FI_Widget *w)

should be const

Member [Fl_Tree::show_self\(\)](#)

should be const

Member [Fl_Window::show\(\)](#) `FL_OVERRIDE`

Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

Page [FLTK Basics](#)

This section needs a major rework. Add a chapter "Building FLTK with CMake".

Page [Handling Events](#)

Add details on how to detect repeating keys, since on some X servers a repeating key will generate both `FL_KEYUP` and `FL_KEYDOWN`, such that to tell if a key is held, you need [Fl::event_key\(int\)](#) to detect if the key is being held down during `FL_KEYUP` or not.

Page [Unicode and UTF-8 Support](#)

FLTK 1.3 and later supports the full Unicode range (21 bits), but there are a few exceptions, for instance binary shortcut values in menus ([Fl_Shortcut](#)) can only be used with characters from the BMP (16 bits). This may be extended in a future FLTK version.

Work through the code and this documentation to harmonize the `[OksiD]` and `[fltk2]` functions.

Verify 16/24 bit Unicode limit for different character sets? OksiD's code appears limited to 16-bit whereas the FLTK2 code appears to handle a wider set. What about illegal characters? See comments in `fl_utf8fromwc()` and `fl_utf8toUtf16()`.

Chapter 5

Deprecated List

Member `Fl::release ()`

Use `Fl::grab(0)` instead.

Member `Fl::set_idle (Fl_Old_Idle_Handler cb)`

This method is obsolete - use the `add_idle()` method instead.

Member `Fl::version ()`

Use `int Fl::api_version()` instead.

Member `fl_ask (const char *fmt,...)`

`fl_ask()` is deprecated since it uses "Yes" and "No" for the buttons which does not conform to the current FLTK Human Interface Guidelines. Use `fl_choice()` with the appropriate verbs instead.

Member `Fl_Browser::position () const`

"since 1.4.0 - use `vposition()` instead"

Member `Fl_Browser::position (int pos)`

"since 1.4.0 - use `vposition(pos)` instead"

Member `Fl_Browser::scrollbar_width () const`

Use `scrollbar_size()` instead.

Member `Fl_Browser::scrollbar_width (int width)`

Use `scrollbar_size()` instead.

Member `fl_clip (int x, int y, int w, int h)`

Please use `fl_push_clip(int x, int y, int w, int h)` instead. `fl_clip(int, int, int, int)` will be removed in FLTK 1.↔5.

Member `Fl_File_Input::errorcolor () const`

Will be removed in FLTK 1.5.0 or higher.

Member `Fl_File_Input::errorcolor (Fl_Color c)`

Will be removed in FLTK 1.5.0 or higher.

Member `fl_find` (Window `xid`)

Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use `fl_x11_find(Window)`, `fl_wl_find(struct wld_window*)`, `fl_win32_find(HWND)` or `fl_mac_find(FLWindow*)` with FLTK 1.4.0 and above.

Member `FI_GIF_Image::FI_GIF_Image` (const char *`imagename`, const unsigned char *`data`)

Please use `FI_GIF_Image(const char *imagename, const unsigned char *data, const size_t length)` instead.

Member `FI_Group::focus` (FI_Widget *`W`)

This is for backwards compatibility only. You should use `W->take_focus()` instead.

Member `FI_Group::sizes` ()

Deprecated since 1.4.0. Please use `bounds()` instead.

Member `FI_Image::draw_scaled` (int `X`, int `Y`, int `W`, int `H`)

Only for API compatibility with FLTK 1.3.4.

Member `FI_Image::label` (FI_Widget *`w`)

Please use `FI_Widget::image()` or `FI_Widget::deimage()` instead.

Member `FI_Image::label` (FI_Menu_Item *`m`)

Please use `FI_Menu_Item::image()` instead.

Member `FI_Image_Surface::highres_image` ()

Use `image()` instead.

Member `FI_Input::position` () const

"since 1.4.0 - use `insert_position()` instead"

Member `FI_Input::position` (int `p`, int `m`)

"since 1.4.0 - use `insert_position(p, m)` or `FI_Widget::position(x, y)` instead"

Member `FI_Input::position` (int `p`)

"since 1.4.0 - use `insert_position(p)` instead"

Member `FI_Menu_Item::check` ()

Please use `FI_Menu_Item::set()` instead. This method will be removed in FLTK 1.5.0 or later.

Member `FI_Menu_Item::checked` () const

Please use `FI_Menu_Item::value()` instead. This method will be removed in FLTK 1.5.0 or later.

Member `FI_Menu_Item::uncheck` ()

Please use `FI_Menu_Item::clear()` instead. This method will be removed in FLTK 1.5.0 or later.

Member `FI_Multi_Label::label` (FI_Menu_Item *)

since 1.4.0: please use `FI_Menu_Item::label(FI_Multi_Label *)`

Member `FI_Preferences::FI_Preferences` (const char *`path`, const char *`vendor`, const char *`application`)

"since 1.4.0 - use `FI_Preferences(path, vendor, application, flags)` instead"

Member `FI_Text_Display::scrollbar_width ()` const

Use `scrollbar_size()` instead.

Member `FI_Text_Display::scrollbar_width (int width)`

Use `scrollbar_size()` instead.

Member `FI_Text_Selection::position (int *startpos, int *endpos)` const

"since 1.4.0 - use `selected(startpos, endpos)` instead"

Member `FI_Tile::position (int oldx, int oldy, int newx, int newy)`

"since 1.4.0 - use `move_intersection(p)` instead"

Member `FI_Tree::first_visible ()`

in 1.3.3 ABI – use `first_visible_item()` instead.

Member `FI_Tree::item_clicked (FI_Tree_Item *val)`

in 1.3.3 ABI – use `callback_item()` instead.

Member `FI_Tree::item_clicked ()`

in 1.3.3 ABI – use `callback_item()` instead.

Member `FI_Tree::last_visible ()`

in 1.3.3 – use `last_visible_item()` instead.

Member `FI_Tree_Item::FI_Tree_Item (const FI_Tree_Prefs &prefs)`

in 1.3.3 ABI – you must use `FI_Tree_Item(FI_Tree*)` for proper horizontal scrollbar behavior.

Member `FI_Tree_Item::next_displayed (FI_Tree_Prefs &prefs)`

in 1.3.3 for confusing name, use `next_visible()` instead

Member `FI_Tree_Item::prev_displayed (FI_Tree_Prefs &prefs)`

in 1.3.3 for confusing name, use `prev_visible()`

Member `FL_VERSION`

This `double` version number is retained for compatibility with existing program code. New code should use `int FL_API_VERSION` instead. `FL_VERSION` is deprecated because comparisons of floating point values may fail due to rounding errors. However, there are currently no plans to remove this deprecated constant.

Member `FI_Widget::color2 ()` const

Use `selection_color()` instead.

Member `FI_Widget::color2 (unsigned a)`

Use `selection_color(unsigned)` instead.

Member `FI_Window::icon ()` const

in 1.3.3

Member [Fl_Window::icon](#) (const void *ic)

in 1.3.3 in favor of platform-independent methods [Fl_Window::icon\(const Fl_RGB_Image *icon\)](#) and [Fl_Window::icons\(const Fl_RGB_Image *icons\[\], int count\)](#).

Page [Operating System Issues](#)

Kept for compatibility with FLTK versions before 1.4. Use preferentially [fl_x11_xid\(const Fl_Window *\)](#) with versions 1.4 and above.

Kept for compatibility with FLTK versions before 1.4. Use preferentially [fl_x11_find\(Window\)](#) with versions 1.4 and above.

Chapter 6

Topic Index

6.1 Topics

Here is a list of all topics with brief descriptions:

Callback Function Typedefs	233
Windows handling functions	234
Events handling functions	236
Selection & Clipboard functions	252
Screen functions	256
Color & Font functions	263
Drawing functions	277
Multithreading support functions	314
Safe widget deletion support functions	316
Cairo Support Functions and Classes	318
Unicode and UTF-8 functions	321
String handling functions	337
Mac OS X-specific symbols	338
Common Dialog Classes and Functions	339
File names and URI utility functions	353

Chapter 7

Hierarchical Index

7.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

FI_Grid::Cell	361
FI_Terminal::CharStyle	362
FI_GIF_Image::GIF_FRAME::CPAL	363
FI_Terminal::Cursor	363
FI_Preferences::Entry	363
FI_Terminal::EscapeSeq	364
FI	364
FI_Cairo_State	506
FI_Callback_User_Data	520
FL_CHART_ENTRY	534
FI_End	643
FI_File_Chooser	662
FI_File_Icon	669
FI_Gl_Choice	767
FI_Glut_Bitmap_Font	788
FI_Glut_StrokeChar	788
FI_Glut_StrokeFont	788
FI_Glut_StrokeStrip	789
FI_Glut_StrokeVertex	789
FI_Help_Block	846
FI_Help_Dialog	846
FI_Help_Font_Stack	848
FI_Help_Font_Style	849
FI_Help_Link	849
FI_Help_Target	850
FI_Image	917
FI_Bitmap	422
FI_XBM_Image	1969
FI_Pixmap	1192
FI_GIF_Image	762
FI_Anim_GIF_Image	407
FI_XPM_Image	1972
FI_RGB_Image	1308
FI_BMP_Image	427
FI_ICO_Image	913
FI_JPEG_Image	996
FI_PNG_Image	1202
FI_PNM_Image	1205
FI_SVG_Image	1485
FI_Shared_Image	1405

FI_Tiled_Image	1727
FI_Image_Reader	927
FI_Label	1000
FI_Mac_App_Menu	1019
FI_Menu_Item	1065
FI_Multi_Label	1105
FI_Native_File_Chooser	1128
FI_Plugin	1196
FI_Device_Plugin	617
FI_Preferences	1227
FI_Plugin_Manager	1197
FI_Rect	1288
FI_Scroll::FI_Region_LRTB	1290
FI_Scroll::FI_Region_XYWH	1291
FI_Scheme	1341
FI_Scroll::FI_Scrollbar_Data	1380
FI_Surface_Device	1479
FI_Display_Device	628
FI_Widget_Surface	1923
FI_Copy_Surface	602
FI_EPS_File_Surface	643
FI_Image_Surface	927
FI_Paged_Device	1178
FI_PDF_File_Surface	1185
FI_PostScript_File_Device	1218
FI_Printer	1248
FI_SVG_File_Surface	1481
FI_Text_Buffer	1617
FI_Text_Selection	1706
FI_Timeout	1732
FI_Tooltip	1755
FI_Tree_Item	1808
FI_Tree_Item_Array	1830
FI_Tree_Prefs	1833
FI_Widget	1880
FI_Box	432
FI_Button	494
FI_Light_Button	1002
FI_Check_Button	550
FI_Radio_Light_Button	1272
FI_Round_Button	1325
FI_Radio_Round_Button	1280
FI_Radio_Button	1264
FI_Repeat_Button	1291
FI_Return_Button	1300
FI_Shortcut_Button	1415
FI_Toggle_Button	1747
FI_Chart	521
FI_Clock_Output	579
FI_Clock	570
FI_Round_Clock	1333
FI_FormsBitmap	731
FI_FormsPixmap	738
FI_FormsText	746
FI_Free	753
FI_Group	826

FI_Browser_	470
FI_Browser	440
FI_File_Browser	647
FI_Hold_Browser	865
FI_Multi_Browser	1092
FI_Select_Browser	1391
FI_Check_Browser	534
FI_Color_Chooser	589
FI_Flex	703
FI_Grid	804
FI_Help_View	850
FI_Input_Choice	973
FI_Pack	1168
FI_Scroll	1353
FI_Spinner	1456
FI_Table	1509
FI_Table_Row	1535
FI_Tabs	1551
FI_Terminal	1573
FI_Text_Display	1634
FI_Text_Editor	1683
FI_Tile	1710
FI_Tree	1759
FI_Window	1928
FI_Double_Window	629
FI_Cairo_Window	507
FI_Overlay_Window	1154
FI_Gl_Window	767
FI_Glut_Window	789
FI_Single_Window	1433
FI_Menu_Window	1079
FI_Wizard	1960
FI_Input_	946
FI_Input	933
FI_File_Input	674
FI_Float_Input	721
FI_Int_Input	986
FI_Multiline_Input	1108
FI_Output	1143
FI_Multiline_Output	1118
FI_Secret_Input	1380
FI_Spinner::FI_Spinner_Input	1469
FI_Menu_	1021
FI_Choice	558
FI_Scheme_Choice	1343
FI_Menu_Bar	1043
FI_Sys_Menu_Bar	1493
FI_Menu_Button	1054
FI_Positioner	1209
FI_Progress	1257
FI_Timer	1738
FI_Valuator	1838
FI_Adjuster	397
FI_Counter	606
FI_Simple_Counter	1424
FI_Dial	618

FI_Fill_Dial	686
FI_Line_Dial	1011
FI_Roller	1315
FI_Slider	1446
FI_Fill_Slider	695
FI_Hor_Fill_Slider	879
FI_Hor_Nice_Slider	887
FI_Hor_Slider	896
FI_Nice_Slider	1135
FI_Scrollbar	1369
FI_Value_Slider	1868
FI_Hor_Value_Slider	904
FI_Value_Input	1848
FI_Value_Output	1859
FI_Widget_Tracker	1926
FI_GIF_Image::GIF_FRAME	1975
FI_ICO_Image::IconDirEntry	1975
FI_Text_Editor::Key_Binding	1976
FI_Terminal::Margin	1976
FI_Preferences::Name	1976
FI_Preferences::Node	1977
FI_Paged_Device::page_format	1978
FI_Terminal::PartialUtf8Buf	1979
FI_Terminal::RingBuffer	1979
FI_Preferences::RootNode	1980
FI_Scroll::ScrollInfo	1980
FI_Terminal::Selection	1981
FI_Tile::Size_Range	1982
FI_Text_Display::Style_Table_Entry	1982
FI_Terminal::Utf8Char	1982

Chapter 8

Class Index

8.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

FI_Grid::Cell	361
FI_Terminal::CharStyle	362
FI_GIF_Image::GIF_FRAME::CPAL	363
FI_Terminal::Cursor	363
FI_Preferences::Entry	363
FI_Terminal::EscapeSeq	364
FI	
The FI is the FLTK global (static) class containing state information and global methods for the current application	364
FI_Adjuster	
Was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range	397
FI_Anim_GIF_Image	
Supports loading, caching, and drawing of animated Compuserve GIF SM images	407
FI_Bitmap	
Supports caching and drawing of mono-color (bitmap) images	422
FI_BMP_Image	
Supports loading, caching, and drawing of Windows Bitmap (BMP) image files	427
FI_Box	
This widget simply draws its box, and possibly its label	432
FI_Browser	
Displays a scrolling list of text lines, and manages all the storage for the text	440
FI_Browser_	
This is the base class for browsers	470
FI_Button	
Buttons generate callbacks when they are clicked by the user	494
FI_Cairo_State	
Contains all the necessary info on the current cairo context	506
FI_Cairo_Window	
This defines an FLTK window with Cairo support	507
FI_Callback_User_Data	
A class prototype that allows for additional data in callbacks	520
FI_Chart	
FI_Chart displays simple charts	521
FL_CHART_ENTRY	
For internal use only	534
FI_Check_Browser	
Displays a scrolling list of text lines that may be selected and/or checked by the user	534
FI_Check_Button	
A button with a "checkmark" to show its status	550

FI_Choice	A button that is used to pop up a menu	558
FI_Clock	This widget provides a round analog clock display	570
FI_Clock_Output	This widget can be used to display a program-supplied time	579
FI_Color_Chooser	Standard RGB color chooser	589
FI_Copy_Surface	Supports copying of graphical data to the clipboard	602
FI_Counter	Controls a single floating point value with button (or keyboard) arrows	606
FI_Device_Plugin	This plugin socket allows the integration of new device drivers for special window or screen types	617
FI_Dial	Circular dial to control a single floating point value	618
FI_Display_Device	The computer's display	628
FI_Double_Window	The FI_Double_Window provides a double-buffered window	629
FI_End	This is a dummy class that allows you to end a FI_Group in a constructor list of a class:	643
FI_EPS_File_Surface	Encapsulated PostScript drawing surface	643
FI_File_Browser	Displays a list of filenames, optionally with file-specific icons	647
FI_File_Chooser	Displays a standard file selection dialog that supports various selection modes	662
FI_File_Icon	Manages icon images that can be used as labels in other widgets and as icons in the FileBrowser widget	669
FI_File_Input	This widget displays a pathname in a text input field	674
FI_Fill_Dial	Draws a dial with a filled arc	686
FI_Fill_Slider	Widget that draws a filled horizontal slider, useful as a progress or value meter	695
FI_Flex	FI_Flex is a container (layout) widget for one row or one column of widgets	703
FI_Float_Input	Subclass of FI_Input that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits)	721
FI_FormsBitmap	Forms compatibility Bitmap Image Widget	731
FI_FormsPixmap	Forms pixmap drawing routines	738
FI_FormsText	746
FI_Free	Emulation of the Forms "free" widget	753
FI_GIF_Image	Supports loading, caching, and drawing of Compuserve GIF SM images	762
FI_GI_Choice	767
FI_GI_Window	Sets things up so OpenGL works	767
FI_Glut_Bitmap_Font	Fltk glut font/size attributes used in the glutXXX functions	788
FI_Glut_StrokeChar	788
FI_Glut_StrokeFont	788

FI_Glut_StrokeStrip	789
FI_Glut_StrokeVertex	789
FI_Glut_Window	
GLUT is emulated using this window class and these static variables (plus several more static variables hidden in glut_compatibility.cxx):	789
FI_Grid	
FI_Grid is a container (layout) widget with multiple columns and rows	804
FI_Group	
Main FLTK container widget	826
FI_Help_Block	846
FI_Help_Dialog	
Displays a standard help dialog window using the FI_Help_View widget	846
FI_Help_Font_Stack	848
FI_Help_Font_Style	
FI_Help_View font stack element definition	849
FI_Help_Link	
Definition of a link for the html viewer	849
FI_Help_Target	
FI_Help_Target structure	850
FI_Help_View	
Displays HTML text	850
FI_Hold_Browser	
The FI_Hold_Browser is a subclass of FI_Browser which lets the user select a single item, or no items by clicking on the empty space	865
FI_Hor_Fill_Slider	879
FI_Hor_Nice_Slider	
Single thumb tab slider	887
FI_Hor_Slider	
Horizontal Slider class	896
FI_Hor_Value_Slider	904
FI_ICO_Image	
Supports loading, caching, and drawing of Windows icon (.ico) files	913
FI_Image	
Base class for image caching, scaling and drawing	917
FI_Image_Reader	927
FI_Image_Surface	
Directs all graphics requests to an FI_Image	927
FI_Input	
This is the FLTK text input widget	933
FI_Input_	
This class provides a low-overhead text input field	946
FI_Input_Choice	
A combination of the input widget and a menu button	973
FI_Int_Input	
Subclass of FI_Input that only allows the user to type decimal digits (or hex numbers of the form 0xae)	986
FI_JPEG_Image	
Supports loading, caching, and drawing of Joint Photographic Experts Group (JPEG) File Interchange Format (JFIF) images	996
FI_Label	
This struct stores all information for a text or mixed graphics label	1000
FI_Light_Button	
This subclass displays the "on" state by turning on a light, rather than drawing pushed in	1002
FI_Line_Dial	1011
FI_Mac_App_Menu	1019
FI_Menu_	
Base class of all widgets that have a menu in FLTK	1021

FI_Menu_Bar	This widget provides a standard menubar interface	1043
FI_Menu_Button	This is a button that when pushed pops up a menu (or hierarchy of menus) defined by an array of FI_Menu_Item objects	1054
FI_Menu_Item	The FI_Menu_Item structure defines a single menu item that is used by the FI_Menu_ class	1065
FI_Menu_Window	Window type used for menus	1079
FI_Multi_Browser	Subclass of FI_Browser which lets the user select any set of the lines	1092
FI_Multi_Label	Allows a mixed text and/or graphics label to be applied to an FI_Menu_Item or FI_Widget	1105
FI_Multiline_Input	This input field displays '\n' characters as new lines rather than ^J, and accepts the Return, Tab, and up and down arrow keys	1108
FI_Multiline_Output	This widget is a subclass of FI_Output that displays multiple lines of text	1118
FI_Native_File_Chooser	This class lets an FLTK application easily and consistently access the operating system's native file chooser	1128
FI_Nice_Slider	1135
FI_Output	This widget displays a piece of text	1143
FI_Overlay_Window	This window provides double buffering and also the ability to draw the "overlay" which is another picture placed on top of the main image	1154
FI_Pack	This widget was designed to add the functionality of compressing and aligning widgets	1168
FI_Paged_Device	Represents page-structured drawing surfaces	1178
FI_PDF_File_Surface	To send graphical output to a PDF file	1185
FI_Pixmap	Supports caching and drawing of colormap (pixmap) images, including transparency	1192
FI_Plugin	FI_Plugin allows link-time and run-time integration of binary modules	1196
FI_Plugin_Manager	FI_Plugin_Manager manages link-time and run-time plugin binaries	1197
FI_PNG_Image	Supports loading, caching, and drawing of Portable Network Graphics (PNG) image files	1202
FI_PNM_Image	Supports loading, caching, and drawing of Portable Anymap (PNM, PBM, PGM, PPM) image files	1205
FI_Positioner	This class is provided for Forms compatibility	1209
FI_PostScript_File_Device	To send graphical output to a PostScript file	1218
FI_Preferences	FI_Preferences store user settings between application starts	1227
FI_Printer	OS-independent print support	1248
FI_Progress	Displays a progress bar for the user	1257
FI_Radio_Button	1264
FI_Radio_Light_Button	1272
FI_Radio_Round_Button	1280
FI_Rect	Rectangle with standard FLTK coordinates (X, Y, W, H)	1288

FI_Scroll::FI_Region_LRTB	
A local struct to manage a region defined by left/right/top/bottom	1290
FI_Scroll::FI_Region_XYWH	
A local struct to manage a region defined by xywh	1291
FI_Repeat_Button	
The FI_Repeat_Button is a subclass of FI_Button that generates a callback when it is pressed and then repeatedly generates callbacks as long as it is held down	1291
FI_Return_Button	
The FI_Return_Button is a subclass of FI_Button that generates a callback when it is pressed or when the user presses the Enter key	1300
FI_RGB_Image	
Supports caching and drawing of full-color images with 1 to 4 channels of color information . . .	1308
FI_Roller	
"dolly" control commonly used to move 3D objects	1315
FI_Round_Button	
Buttons generate callbacks when they are clicked by the user	1325
FI_Round_Clock	
A clock widget of type FL_ROUND_CLOCK	1333
FI_Scheme	1341
FI_Scheme_Choice	1343
FI_Scroll	
This container widget lets you maneuver around a set of widgets much larger than your window	1353
FI_Scrollbar	
Displays a slider with arrow buttons at the ends of the scrollbar	1369
FI_Scroll::FI_Scrollbar_Data	
A local struct to manage a scrollbar's xywh region and tab values	1380
FI_Secret_Input	
Subclass of FI_Input that displays its input as a string of placeholders	1380
FI_Select_Browser	
The class is a subclass of FI_Browser which lets the user select a single item, or no items by clicking on the empty space	1391
FI_Shared_Image	
This class supports caching, loading, and drawing of image files	1405
FI_Shortcut_Button	
A button that allows the user to type a key combination to create shortcuts	1415
FI_Simple_Counter	
This widget creates a counter with only 2 arrow buttons	1424
FI_Single_Window	
This is the same as FI_Window	1433
FI_Slider	
Sliding knob inside a box	1446
FI_Spinner	
This widget is a combination of a numerical input widget and repeat buttons	1456
FI_Spinner::FI_Spinner_Input	1469
FI_Surface_Device	
A drawing surface that's susceptible to receive graphical output	1479
FI_SVG_File_Surface	
A drawing surface producing a Scalable Vector Graphics (SVG) file	1481
FI_SVG_Image	
Supports loading, caching and drawing of scalable vector graphics (SVG) images	1485
FI_Sys_Menu_Bar	
A class to create and modify menus that appear on macOS in the menu bar at the top of the screen	1493
FI_Table	
A table of widgets or other content	1509
FI_Table_Row	
A table with row selection capabilities	1535

Fl_Tabs	Container widget that displays a set of tabs, with each tab representing a different child widget	1551
Fl_Terminal	Terminal widget supporting Unicode/utf-8, ANSI/xterm escape codes with full RGB color control	1573
Fl_Text_Buffer	This class manages Unicode text displayed in one or more Fl_Text_Display widgets	1617
Fl_Text_Display	Rich text display widget	1634
Fl_Text_Editor	This is the FLTK text editor widget	1683
Fl_Text_Selection	This is an internal class for Fl_Text_Buffer to manage text selections	1706
Fl_Tile	Lets you resize its children by dragging the border between them	1710
Fl_Tiled_Image	This class supports tiling of images over a specified area	1727
Fl_Timeout	The internal class Fl_Timeout handles all timeout related functions	1732
Fl_Timer	This is provided only to emulate the Forms Timer widget	1738
Fl_Toggle_Button	The toggle button is a push button that needs to be clicked once to toggle on, and one more time to toggle off	1747
Fl_Tooltip	Tooltip support for all FLTK widgets	1755
Fl_Tree	Tree widget	1759
Fl_Tree_Item	Tree widget item	1808
Fl_Tree_Item_Array	Manages an array of Fl_Tree_Item pointers	1830
Fl_Tree_Prefs	Tree widget's preferences	1833
Fl_Valuator	Controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object	1838
Fl_Value_Input	Displays a numeric value	1848
Fl_Value_Output	Displays a floating point value	1859
Fl_Value_Slider	Fl_Slider widget with a box displaying the current value	1868
Fl_Widget	Fl_Widget is the base class for all widgets in FLTK	1880
Fl_Widget_Surface	A surface on which any FLTK widget can be drawn	1923
Fl_Widget_Tracker	This class should be used to control safe widget deletion	1926
Fl_Window	This widget produces an actual window	1928
Fl_Wizard	This widget is based off the Fl_Tabs widget, but instead of displaying tabs it only changes "tabs" under program control	1960
Fl_XBM_Image	Supports loading, caching, and drawing of X Bitmap (XBM) bitmap files	1969
Fl_XPM_Image	Supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency	1972
Fl_GIF_Image::GIF_FRAME		1975

FI_ICO_Image::IconDirEntry	
Windows ICONDIRENTRY structure	1975
FI_Text_Editor::Key_Binding	
Simple linked list item associating a key/state to a function	1976
FI_Terminal::Margin	1976
FI_Preferences::Name	
'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly	1976
FI_Preferences::Node	1977
FI_Paged_Device::page_format	
Width, height and name of a page format	1978
FI_Terminal::PartialUtf8Buf	1979
FI_Terminal::RingBuffer	1979
FI_Preferences::RootNode	1980
FI_Scroll::ScrollInfo	
Structure to manage scrollbar and widget interior sizes	1980
FI_Terminal::Selection	1981
FI_Tile::Size_Range	1982
FI_Text_Display::Style_Table_Entry	
This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr	1982
FI_Terminal::Utf8Char	1982

Chapter 9

File Index

9.1 File List

Here is a list of all documented files with brief descriptions:

Enumerations.H	
This file contains type definitions and general enumerations	1985
filename.H	
File names and URI utility functions	2019
Fl.H	
Fl static class	2022
Fl_Adjuster.H	2030
Fl_Anim_GIF_Image.H	2030
fl_ask.H	
API for common dialogs	2032
fl_attr.h	
This file defines compiler-specific macros	2035
Fl_Bitmap.H	2038
Fl_BMP_Image.H	2039
Fl_Box.H	
Fl_Box widget	2040
Fl_Browser.H	2040
Fl_Browser_.H	2042
Fl_Button.H	2044
Fl_Cairo.H	
Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland)	2045
Fl_Cairo_Window.H	
Fl_Cairo_Window, an FLTK window incorporating a Cairo draw callback	2046
fl_callback_macros.H	
This file provides macros for easy function and method callbacks with multiple type safe arguments	2048
fl_casts.H	2056
Fl_Chart.H	
Fl_Chart widget	2056
Fl_Check_Browser.H	2059
Fl_Check_Button.H	2060
Fl_Choice.H	2060
Fl_Clock.H	2061
Fl_Color_Chooser.H	
Fl_Color_Chooser widget	2062
Fl_Copy_Surface.H	2064
Fl_Counter.H	2064
Fl_Device.H	
Declaration of classes Fl_Surface_Device , Fl_Display_Device , Fl_Device_Plugin	2065

FI_Dial.H	2066
FI_Double_Window.H	2067
fl_draw.H	
Utility header to pull drawing functions together	2068
FI_Export.H	2079

Chapter 10

Topic Documentation

10.1 Callback Function Typedefs

Typedefs defined in [<FL/FL.H>](#) for callback or handler functions passed as function parameters.

Typedefs

- typedef void(* **FI_Abort_Handler**) (const char *format,...)
Signature of set_abort functions passed as parameters.
- typedef int(* **FI_Args_Handler**) (int argc, char **argv, int &i)
Signature of args functions passed as parameters.
- typedef void(* **FI_Atclose_Handler**) ([FI_Window](#) *window, void *data)
Signature of set_atclose functions passed as parameters.
- typedef void(* **FI_Awake_Handler**) (void *data)
Signature of some wakeup callback functions passed as parameters.
- typedef void **FI_Box_Draw_F**(int x, int y, int w, int h, [FI_Color](#) color)
Signature of some box drawing functions passed as parameters.
- typedef void **FI_Box_Draw_Focus_F**([FI_Boxtype](#) bt, int x, int y, int w, int h, [FI_Color](#) fg, [FI_Color](#) bg)
Signature of box focus frame drawing functions.
- typedef void(* **FI_Clipboard_Notify_Handler**) (int source, void *data)
Signature of add_clipboard_notify functions passed as parameters.
- typedef int(* [FI_Event_Dispatch](#)) (int event, [FI_Window](#) *w)
Signature of event_dispatch functions passed as parameters.
- typedef int(* **FI_Event_Handler**) (int event)
Signature of add_handler functions passed as parameters.
- typedef void(* **FI_FD_Handler**) ([FL_SOCKET](#) fd, void *data)
Signature of add_fd functions passed as parameters.
- typedef void(* **FI_Idle_Handler**) (void *data)
Signature of add_idle callback functions passed as parameters.
- typedef void **FI_Label_Draw_F**(const [FI_Label](#) *label, int x, int y, int w, int h, [FI_Align](#) align)
Signature of some label drawing functions passed as parameters.
- typedef void **FI_Label_Measure_F**(const [FI_Label](#) *label, int &width, int &height)
Signature of some label measurement functions passed as parameters.
- typedef void(* **FI_Old_Idle_Handler**) ()
Signature of set_idle callback functions passed as parameters.
- typedef int(* **FI_System_Handler**) (void *event, void *data)
Signature of add_system_handler functions passed as parameters.
- typedef void(* [FI_Timeout_Handler](#)) (void *data)
Signature of timeout callback functions passed as parameters.

10.1.1 Detailed Description

Typedefs defined in <FL/Fl.H> for callback or handler functions passed as function parameters.

FLTK uses callback functions as parameters for some function calls, e.g. to set up global event handlers ([Fl::add_handler\(\)](#)), to add a timeout handler ([Fl::add_timeout\(\)](#)), and many more.

The typedefs defined in this group describe the function parameters used to set up or clear the callback functions and should also be referenced to define the callback function to handle such events in the user's code.

See also

[Fl::add_handler\(\)](#), [Fl::add_timeout\(\)](#), [Fl::repeat_timeout\(\)](#), [Fl::remove_timeout\(\)](#) and others

10.1.2 Typedef Documentation

10.1.2.1 Fl_Event_Dispatch

```
typedef int(* Fl_Event_Dispatch) (int event, Fl_Window *w)
```

Signature of event_dispatch functions passed as parameters.

See also

[Fl::event_dispatch\(Fl_Event_Dispatch\)](#)

10.1.2.2 Fl_Timeout_Handler

```
typedef void(* Fl_Timeout_Handler) (void *data)
```

Signature of timeout callback functions passed as parameters.

Please see [Fl::add_timeout\(\)](#) for details.

10.2 Windows handling functions

Windows and standard dialogs handling declared in <FL/Fl.H>

Functions

- static void [Fl::default_atclose](#) ([Fl_Window](#) *, void *)
Default callback for window widgets.
- static [Fl_Window](#) * [Fl::first_window](#) ()
Returns the first top-level window in the list of shown() windows.
- static void [Fl::first_window](#) ([Fl_Window](#) *)
Sets the window that is returned by [first_window\(\)](#).
- static [Fl_Window](#) * [Fl::grab](#) ()
Returns the window that currently receives all events.
- static void [Fl::grab](#) ([Fl_Window](#) *)
Selects the window to grab.
- static [Fl_Window](#) * [Fl::modal](#) ()
Returns the top-most [modal\(\)](#) window currently shown.
- static [Fl_Window](#) * [Fl::next_window](#) (const [Fl_Window](#) *)
Returns the next top-level window in the list of shown() windows.
- static void [Fl::set_abort](#) ([Fl_Abort_Handler](#) f)
For back compatibility, sets the void [Fl::fatal](#) handler callback.
- static void [Fl::set_atclose](#) ([Fl_Atclose_Handler](#) f)
For back compatibility, sets the [Fl::atclose](#) handler callback.

Variables

- static void(* [Fl::atclose](#))([Fl_Window](#) *, void *)
Back compatibility: default window callback handler.

10.2.1 Detailed Description

Windows and standard dialogs handling declared in `<FL/FL.H>`

10.2.2 Function Documentation

10.2.2.1 `default_atclose()`

```
void Fl::default_atclose (
    Fl_Window * window,
    void * v) [static]
```

Default callback for window widgets.

It hides the window and then calls the default widget callback.

10.2.2.2 `first_window()` [1/2]

```
Fl_Window * Fl::first_window () [static]
```

Returns the first top-level window in the list of `shown()` windows.

If a `modal()` window is shown this is the top-most modal window, otherwise it is the most recent window to get an event.

10.2.2.3 `first_window()` [2/2]

```
void Fl::first_window (
    Fl_Window * window) [static]
```

Sets the window that is returned by `first_window()`.

The window is removed from wherever it is in the list and inserted at the top. This is not done if `Fl::modal()` is on or if the window is not `shown()`. Because the first window is used to set the "parent" of modal windows, this is often useful.

10.2.2.4 `grab()` [1/2]

```
static Fl_Window * Fl::grab () [inline], [static]
```

Returns the window that currently receives all events.

Returns

The window that currently receives all events, or NULL if event grabbing is currently OFF.

10.2.2.5 `grab()` [2/2]

```
void Fl::grab (
    Fl_Window * win) [static]
```

Selects the window to grab.

This is used when pop-up menu systems are active.

Send all events to the passed window no matter where the pointer or focus is (including in other programs). The window *does not have to be shown()*, this lets the `handle()` method of a "dummy" window override all event handling and allows you to map and unmap a complex set of windows (under both X and Windows *some* window must be mapped because the system interface needs a window id).

If `grab()` is on it will also affect `show()` of windows by doing system-specific operations (on X it turns on override-redirect). These are designed to make menus popup reliably and faster on the system.

To turn off grabbing do `Fl::grab(0)`.

Be careful that your program does not enter an infinite loop while `grab()` is on. On X this will lock up your screen!

To avoid this potential lockup, all newer operating systems seem to limit mouse pointer grabbing to the time during which a mouse button is held down. Some OS's may not support grabbing at all.

10.2.2.6 `modal()`

```
static Fl_Window * Fl::modal () [inline], [static]
```

Returns the top-most `modal()` window currently shown.

This is the most recently shown() window with [modal\(\)](#) true, or NULL if there are no [modal\(\)](#) windows shown(). The [modal\(\)](#) window has its [handle\(\)](#) method called for all events, and no other windows will have [handle\(\)](#) called ([grab\(\)](#) overrides this).

10.2.2.7 next_window()

```
Fl_Window * Fl::next_window (
    const Fl_Window * window) [static]
```

Returns the next top-level window in the list of shown() windows.
You can use this call to iterate through all the windows that are shown().

Parameters

in	<i>window</i>	must be shown and not NULL
----	---------------	----------------------------

10.2.2.8 set_atclose()

```
static void Fl::set_atclose (
    Fl_Atclose_Handler f) [inline], [static]
```

For back compatibility, sets the [Fl::atclose](#) handler callback.
You can now simply change the callback for the window instead.

See also

[Fl_Window::callback\(Fl_Callback*\)](#)

10.2.3 Variable Documentation

10.2.3.1 atclose

```
void(* Fl::atclose)(Fl_Window *, void *)=default\_atclose [static], [default]
```

Back compatibility: default window callback handler.

See also

[Fl::set_atclose\(\)](#)

10.3 Events handling functions

[Fl](#) class events handling API declared in [<FL/Fl.H>](#)

Functions

- static void [Fl::add_handler](#) ([Fl_Event_Handler](#) ha)
Install a function to parse unrecognized events.
- static void [Fl::add_handler](#) ([Fl_Event_Handler](#) ha, [Fl_Event_Handler](#) before)
Install a function to parse unrecognized events with less priority than another function.
- static void [Fl::add_system_handler](#) ([Fl_System_Handler](#) h, void *data)
Install a function to intercept system events.
- static [Fl_Widget](#) * [Fl::belowmouse](#) ()
Gets the widget that is below the mouse.
- static void [Fl::belowmouse](#) ([Fl_Widget](#) *)
Sets the widget that is below the mouse.
- static [Fl_Callback_Reason](#) [Fl::callback_reason](#) ()
Give the reason for calling a callback.
- static int [Fl::compose](#) (int &del)
Any text editing widget should call this for each FL_KEYBOARD event.

- static void `Fl::compose_reset ()`
If the user moves the cursor, be sure to call `Fl::compose_reset()`.
- static void `Fl::disable_im ()`
Disables the system input methods facilities.
- static void `Fl::enable_im ()`
Enables the system input methods facilities.
- static int `Fl::event ()`
Returns the last event that was processed.
- static int `Fl::event_alt ()`
Returns non-zero if the Alt key is pressed.
- static int `Fl::event_button ()`
Gets which particular mouse button caused the current event.
- static int `Fl::event_button1 ()`
Returns non-zero if mouse button 1 is currently held down.
- static int `Fl::event_button2 ()`
Returns non-zero if mouse button 2 is currently held down.
- static int `Fl::event_button3 ()`
Returns non-zero if mouse button 3 is currently held down.
- static int `Fl::event_button4 ()`
Returns non-zero if mouse button 4 is currently held down.
- static int `Fl::event_button5 ()`
Returns non-zero if mouse button 5 is currently held down.
- static int `Fl::event_buttons ()`
Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.
- static int `Fl::event_clicks ()`
Returns non zero if we had a double click event.
- static void `Fl::event_clicks (int i)`
Manually sets the number returned by `Fl::event_clicks()`.
- static void * `Fl::event_clipboard ()`
During an `FL_PASTE` event of non-textual data, returns a pointer to the pasted data.
- static const char * `Fl::event_clipboard_type ()`
Returns the type of the pasted data during an `FL_PASTE` event.
- static int `Fl::event_command ()`
Returns non-zero if the `FL_COMMAND` key is pressed, either `FL_CTRL` or on OSX `FL_META`.
- static int `Fl::event_ctrl ()`
Returns non-zero if the Control key is pressed.
- static `Fl_Event_Dispatch Fl::event_dispatch ()`
Return the current event dispatch function.
- static void `Fl::event_dispatch (Fl_Event_Dispatch d)`
Set a new event dispatch function.
- static int `Fl::event_dx ()`
Returns the current horizontal mouse scrolling associated with the `FL_MOUSEWHEEL` event.
- static int `Fl::event_dy ()`
Returns the current vertical mouse scrolling associated with the `FL_MOUSEWHEEL` event.
- static int `Fl::event_inside (const Fl_Widget *)`
Returns whether or not the mouse event is inside a given child widget.
- static int `Fl::event_inside (int, int, int, int)`
Returns whether or not the mouse event is inside the given rectangle.
- static int `Fl::event_is_click ()`
Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".

- static void [Fl::event_is_click](#) (int i)
Clears the value returned by [Fl::event_is_click\(\)](#).
- static int [Fl::event_key](#) ()
Gets which key on the keyboard was last pushed.
- static int [Fl::event_key](#) (int key)
Returns true if the given `key` was held down (or pressed) during the last event.
- static int [Fl::event_length](#) ()
Returns the length of the text in [Fl::event_text\(\)](#).
- static int [Fl::event_original_key](#) ()
Returns the keycode of the last key event, regardless of the NumLock state.
- static int [Fl::event_shift](#) ()
Returns non-zero if the Shift key is pressed.
- static int [Fl::event_state](#) ()
Returns the keyboard and mouse button states of the last event.
- static int [Fl::event_state](#) (int mask)
Returns non-zero if any of the passed event state bits are turned on.
- static const char * [Fl::event_text](#) ()
Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.
- static int [Fl::event_x](#) ()
Returns the mouse position of the event relative to the [Fl_Window](#) it was passed to.
- static int [Fl::event_x_root](#) ()
Returns the mouse position on the screen of the event.
- static int [Fl::event_y](#) ()
Returns the mouse position of the event relative to the [Fl_Window](#) it was passed to.
- static int [Fl::event_y_root](#) ()
Returns the mouse position on the screen of the event.
- static [Fl_Widget](#) * [Fl::focus](#) ()
Gets the current [Fl::focus\(\)](#) widget.
- static void [Fl::focus](#) ([Fl_Widget](#) *)
Sets the widget that will receive `FL_KEYBOARD` events.
- static int [Fl::get_key](#) (int key)
Returns true if the given `key` is held down now.
- static void [Fl::get_mouse](#) (int &, int &)
Return where the mouse is on the screen by doing a round-trip query to the server.
- static int [Fl::handle](#) (int, [Fl_Window](#) *)
Handle events from the window system.
- static int [Fl::handle_](#) (int, [Fl_Window](#) *)
Handle events from the window system.
- static [Fl_Event_Handler](#) [Fl::last_handler](#) ()
Returns the last function installed by a call to [Fl::add_handler\(\)](#).
- static [Fl_Widget](#) * [Fl::pushed](#) ()
Gets the widget that is being pushed.
- static void [Fl::pushed](#) ([Fl_Widget](#) *)
Sets the widget that is being pushed.
- static void [Fl::remove_handler](#) ([Fl_Event_Handler](#) h)
Removes a previously added event handler.
- static void [Fl::remove_system_handler](#) ([Fl_System_Handler](#) h)
Removes a previously added system event handler.
- static int [Fl::test_shortcut](#) ([Fl_Shortcut](#))
Tests the current event, which must be an `FL_KEYBOARD` or `FL_SHORTCUT`, against a shortcut value (described in [Fl_Button](#)).

Variables

- `const char *const fl_callback_reason_names []`
This is an array of callback reason names you can use to convert callback reasons into names.
- `const char *const fl_eventnames []`
This is an array of event names you can use to convert event numbers into names.
- `const char *const fl_fontnames []`
This is an array of font names you can use to convert font numbers into names.

10.3.1 Detailed Description

Fl class events handling API declared in `<FL/Fl.H>`

10.3.2 Function Documentation**10.3.2.1 add_handler() [1/2]**

```
void Fl::add_handler (
    Fl_Event_Handler ha) [static]
```

Install a function to parse unrecognized events.

If FLTK cannot figure out what to do with an event, it calls each of these functions (most recent first) until one of them returns non-zero. If none of them returns non-zero then the event is ignored. Events that cause this to be called are:

- `FL_SHORTCUT` events that are not recognized by any widget. This lets you provide global shortcut keys.
- `FL_SCREEN_CONFIGURATION_CHANGED` events. Under X11, this event requires the libXrandr.so shared library to be loadable at run-time and the X server to implement the RandR extension.
- `FL_ZOOM_EVENT` events.
- System events that FLTK does not recognize. See `fl_xevent`.
- *Some* other events when the widget FLTK selected returns zero from its `handle()` method. Exactly which ones may change in future versions, however.

`Fl::remove_handler(Fl_Event_Handler)`
`Fl::event_dispatch(Fl_Event_Dispatch d)`
`Fl::handle(int, Fl_Window*)`

10.3.2.2 add_handler() [2/2]

```
void Fl::add_handler (
    Fl_Event_Handler ha,
    Fl_Event_Handler before) [static]
```

Install a function to parse unrecognized events with less priority than another function.

Install function `ha` to handle unrecognized events giving it the priority just lower than that of function `before` which was previously installed.

See also

`Fl::add_handler(Fl_Event_Handler)`
`Fl::last_handler()`

Since

1.4.0

10.3.2.3 add_system_handler()

```
void Fl::add_system_handler (
    Fl_System_Handler ha,
    void * data) [static]
```

Install a function to intercept system events.

FLTK calls each of these functions as soon as a new system event is received. The processing will stop at the first function to return non-zero. If all functions return zero then the event is passed on for normal handling by FLTK.

Each function will be called with a pointer to the system event as the first argument and `data` as the second argument. The system event pointer will always be `void *`, but will point to different objects depending on the platform:

- X11: XEvent
- Windows: MSG
- OS X: NSEvent
- Wayland: NULL (FLTK runs the event handler(s) just before calling `wl_display_dispatch()`)

Parameters

<i>ha</i>	The event handler function to register
<i>data</i>	User data to include on each call

See also

[Fl::remove_system_handler\(Fl_System_Handler\)](#)

10.3.2.4 belowmouse() [1/2]

```
static Fl_Widget * Fl::belowmouse () [inline], [static]
```

Gets the widget that is below the mouse.

See also

[belowmouse\(Fl_Widget*\)](#)

10.3.2.5 belowmouse() [2/2]

```
void Fl::belowmouse (
    Fl_Widget * o) [static]
```

Sets the widget that is below the mouse.

This is for highlighting buttons. It is not used to send `FL_PUSH` or `FL_MOVE` directly, for several obscure reasons, but those events typically go to this widget. This is also the first widget tried for `FL_SHORTCUT` events.

If you change the `belowmouse` widget, the previous one and all parents (that don't contain the new widget) are sent `FL_LEAVE` events. Changing this does *not* send `FL_ENTER` to this or any widget, because sending `FL_ENTER` is supposed to *test* if the widget wants the mouse (by it returning non-zero from [handle\(\)](#)).

10.3.2.6 callback_reason()

```
Fl_Callback_Reason Fl::callback_reason () [static]
```

Give the reason for calling a callback.

Returns

the reason for the current callback

See also

[Fl_Widget::when\(\)](#), [Fl_Widget::do_callback\(\)](#), [Fl_Widget::callback\(\)](#)

Since

1.4.0

10.3.2.7 compose()

```
int Fl::compose (
    int & del) [static]
```

Any text editing widget should call this for each FL_KEYBOARD event.

Use of this function is very simple.

If *true* is returned, then it has modified the [Fl::event_text\(\)](#) and [Fl::event_length\(\)](#) to a set of *bytes* to insert (it may be of zero length!). It will also set the "del" parameter to the number of *bytes* to the left of the cursor to delete, this is used to delete the results of the previous call to [Fl::compose\(\)](#).

If *false* is returned, the keys should be treated as function keys, and del is set to zero. You could insert the text anyways, if you don't know what else to do.

Text editing widgets can preferentially call [fl_set_spot\(\)](#) to indicate the window coordinates of the bottom of the current insertion point and the line height. This way, auxiliary windows that help choosing among alternative characters with some text input methods appear just below or above the insertion point. If widgets don't do that, such auxiliary windows appear at the widget's bottom.

On some platforms, text input can involve marked text, that is, temporary text replaced by other text during the input process. This occurs, e.g., under Wayland or macOS when using dead keys or when entering CJK characters. Text editing widgets should preferentially signal marked text, usually underlining it. Widgets can use `int Fl::compose_state` after having called [Fl::compose\(int&\)](#) to obtain the length in bytes of marked text that always finishes at the current insertion point. Widgets should also call void [fl_reset_spot\(\)](#) when processing FL_UNFOCUS events. The [Fl_Input](#) and [Fl_Text_Editor](#) widgets underline marked text. If none of this is done by a user-defined text editing widget, text input will work, but will not signal to the user what text is marked.

Finally, text editing widgets should call `set_flag(MAC_USE_ACCENTS_MENU)` ; in their constructor if they want to use, on the macOS platform, the feature introduced with Mac OS 10.7 "Lion" where pressing and holding certain keys on the keyboard opens a diacritic marks popup window.

Note

For compatibility with FLTK 1.3, text editing widgets can call `Fl::insertion_point_location(int x, int y, int height)` and `Fl::reset_marked_text()` only under the macOS platform to indicate/reset the coordinates of the current insertion point. This is deprecated in version 1.4 because redundant with the platform-independent [fl_set_spot\(\)](#) and [fl_reset_spot\(\)](#) functions.

10.3.2.8 compose_reset()

```
void Fl::compose_reset () [static]
```

If the user moves the cursor, be sure to call [Fl::compose_reset\(\)](#).

The next call to [Fl::compose\(\)](#) will start out in an initial state. In particular it will not set "del" to non-zero. This call is very fast so it is ok to call it many times and in many places.

10.3.2.9 disable_im()

```
void Fl::disable_im () [static]
```

Disables the system input methods facilities.

See also

[enable_im\(\)](#)

10.3.2.10 enable_im()

```
void Fl::enable_im () [static]
```

Enables the system input methods facilities.

This is the default.

See also

[disable_im\(\)](#)

10.3.2.11 event()

```
static int Fl::event () [inline], [static]
```

Returns the last event that was processed.

This can be used to determine if a callback is being done in response to a keypress, mouse click, etc.

10.3.2.12 event_button()

```
static int Fl::event_button () [inline], [static]
```

Gets which particular mouse button caused the current event.

This returns garbage if the most recent event was not a FL_PUSH or FL_RELEASE event.

Return values

<i>FL_LEFT_MOUSE</i>	
<i>FL_MIDDLE_MOUSE</i>	
<i>FL_RIGHT_MOUSE</i>	
<i>FL_BACK_MOUSE</i>	
<i>FL_FORWARD_MOUSE</i>	

See also

[Fl::event_buttons\(\)](#), [Fl::event_state\(\)](#)

10.3.2.13 event_button1()

```
static int Fl::event_button1 () [inline], [static]
```

Returns non-zero if mouse button 1 is currently held down.

For more details, see [Fl::event_buttons\(\)](#).

10.3.2.14 event_button2()

```
static int Fl::event_button2 () [inline], [static]
```

Returns non-zero if mouse button 2 is currently held down.

For more details, see [Fl::event_buttons\(\)](#).

10.3.2.15 event_button3()

```
static int Fl::event_button3 () [inline], [static]
```

Returns non-zero if mouse button 3 is currently held down.

For more details, see [Fl::event_buttons\(\)](#).

10.3.2.16 event_button4()

```
static int Fl::event_button4 () [inline], [static]
```

Returns non-zero if mouse button 4 is currently held down.

For more details, see [Fl::event_buttons\(\)](#).

10.3.2.17 event_button5()

```
static int Fl::event_button5 () [inline], [static]
```

Returns non-zero if mouse button 5 is currently held down.

For more details, see [Fl::event_buttons\(\)](#).

10.3.2.18 event_buttons()

```
static int Fl::event_buttons () [inline], [static]
```

Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.

This function returns the button state at the time of the event. During an FL_RELEASE event, the state of the released button will be 0. To find out, which button caused an FL_RELEASE event, you can use [Fl::event_button\(\)](#) instead.

Returns

a bit mask value like { [FL_BUTTON1] | [FL_BUTTON2] | ... | [FL_BUTTON5] }

10.3.2.19 event_clicks() [1/2]

```
static int Fl::event_clicks () [inline], [static]
```

Returns non zero if we had a double click event.

Return values

<i>Non-zero</i>	if the most recent FL_PUSH or FL_KEYBOARD was a "double click".
<i>N-1</i>	for N clicks. A double click is counted if the same button is pressed again while event_is_click() is true.

10.3.2.20 event_clicks() [2/2]

```
static void Fl::event_clicks (
    int i) [inline], [static]
```

Manually sets the number returned by [Fl::event_clicks\(\)](#).

This can be used to set it to zero so that later code does not think an item was double-clicked.

Parameters

in	<i>i</i>	corresponds to no double-click if 0, i+1 mouse clicks otherwise
----	----------	---

See also

int [event_clicks\(\)](#)

10.3.2.21 event_clipboard()

```
static void * Fl::event_clipboard () [inline], [static]
```

During an FL_PASTE event of non-textual data, returns a pointer to the pasted data.

The returned data is an [Fl_RGB_Image](#) * when the result of [Fl::event_clipboard_type\(\)](#) is [Fl::clipboard_image](#).

10.3.2.22 event_clipboard_type()

```
static const char * Fl::event_clipboard_type () [inline], [static]
```

Returns the type of the pasted data during an FL_PASTE event.

This type can be [Fl::clipboard_plain_text](#) or [Fl::clipboard_image](#).

10.3.2.23 event_dispatch()

```
void Fl::event_dispatch (
    Fl_Event_Dispatch d) [static]
```

Set a new event dispatch function.

The event dispatch function is called after native events are converted to FLTK events, but before they are handled by FLTK. If the dispatch function [Fl_Event_Dispatch d](#) is set, it is up to the dispatch function to call [Fl::handle_\(int, Fl_Window*\)](#) or to ignore the event.

The dispatch function itself must return 0 if it ignored the event, or non-zero if it used the event. If you call [Fl::handle_\(\)](#), then this will return the correct value.

The event dispatch can be used to handle exceptions in FLTK events and callbacks before they reach the native event handler:

```
int myHandler(int e, Fl_Window *w) {
    try {
        return Fl::handle_(e, w);
    } catch () {
        ...
    }
}

main() {
    Fl::event_dispatch(myHandler);
    ...
    Fl::run();
}
```

Parameters

<i>d</i>	new dispatch function, or NULL
----------	--------------------------------

See also

[Fl::add_handler\(Fl_Event_Handler\)](#)

[Fl::handle\(int, Fl_Window*\)](#)

[Fl::handle_\(int, Fl_Window*\)](#)

10.3.2.24 event_dx()

```
static int Fl::event_dx () [inline], [static]
```

Returns the current horizontal mouse scrolling associated with the FL_MOUSEWHEEL event.

Right is positive.

10.3.2.25 event_dy()

```
static int Fl::event_dy () [inline], [static]
```

Returns the current vertical mouse scrolling associated with the FL_MOUSEWHEEL event.

Down is positive.

10.3.2.26 event_inside() [1/2]

```
int Fl::event_inside (
    const Fl_Widget * o) [static]
```

Returns whether or not the mouse event is inside a given child widget.

Returns non-zero if the current [Fl::event_x\(\)](#) and [Fl::event_y\(\)](#) put it inside the given child widget's bounding box.

This method can only be used to check whether the mouse event is inside a **child** widget of the window that handles the event, and there must not be an intermediate subwindow (i.e. the widget must not be inside a subwindow of the current window). However, it is valid if the widget is inside a nested [Fl_Group](#).

You must not use it with the window itself as the *o* argument in a window's [handle\(\)](#) method.

Note

The mentioned restrictions are necessary, because this method does not transform coordinates of child widgets, and thus the given widget `o` must be within the *same* window that is handling the current event. Otherwise the results are undefined.

You should always call this rather than doing your own comparison so you are consistent about edge effects.

See also

[Fl::event_inside\(int, int, int, int\)](#)

Parameters

<code>in</code>	<code>o</code>	child widget to be tested
-----------------	----------------	---------------------------

Returns

non-zero, if mouse event is inside the widget

10.3.2.27 event_inside() [2/2]

```
int Fl::event_inside (
    int xx,
    int yy,
    int ww,
    int hh) [static]
```

Returns whether or not the mouse event is inside the given rectangle.

Returns non-zero if the current [Fl::event_x\(\)](#) and [Fl::event_y\(\)](#) put it inside the given arbitrary bounding box.

You should always call this rather than doing your own comparison so you are consistent about edge effects.

To find out, whether the event is inside a child widget of the current window, you can use [Fl::event_inside\(const Fl_Widget *\)](#).

Parameters

<code>in</code>	<code>xx,yy,ww,hh</code>	bounding box
-----------------	--------------------------	--------------

Returns

non-zero, if mouse event is inside

10.3.2.28 event_is_click() [1/2]

```
static int Fl::event_is_click () [inline], [static]
```

Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".

You can test this on `FL_DRAG`, `FL_RELEASE`, and `FL_MOVE` events.

10.3.2.29 event_is_click() [2/2]

```
static void Fl::event_is_click (
    int i) [inline], [static]
```

Clears the value returned by [Fl::event_is_click\(\)](#).

Useful to prevent the *next* click from being counted as a double-click or to make a popup menu pick an item with a single click. Don't pass non-zero to this.

10.3.2.30 event_key() [1/2]

```
static int Fl::event_key () [inline], [static]
```

Gets which key on the keyboard was last pushed.

The returned integer 'key code' is not necessarily a text equivalent for the keystroke. For instance: if someone presses '5' on the numeric keypad with numlock on, [Fl::event_key\(\)](#) may return the 'key code' for this key, and NOT the character '5'. To always get the '5', use [Fl::event_text\(\)](#) instead.

Returns

an integer 'key code', or 0 if the last event was not a key press or release.

See also

int [event_key\(int\)](#), [event_text\(\)](#), [compose\(int&\)](#).

10.3.2.31 event_key() [2/2]

```
int Fl::event_key (
    int key) [static]
```

Returns true if the given *key* was held down (or pressed) *during* the last event.

This is constant until the next event is read from the server.

[Fl::get_key\(int\)](#) returns true if the given key is held down *now*. Under X this requires a round-trip to the server and is *much* slower than [Fl::event_key\(int\)](#).

Keys are identified by the *unshifted* values. FLTK defines a set of symbols that should work on most modern machines for every key on the keyboard:

- All keys on the main keyboard producing a printable ASCII character use the value of that ASCII character (as though shift, ctrl, and caps lock were not on). The space bar is 32.
- All keys on the numeric keypad producing a printable ASCII character use the value of that ASCII character plus FL_KP (e.g., FL_KP + '4', FL_KP + '/'). The highest possible value is FL_KP_Last so you can range-check to see if something is on the keypad.
- All numbered function keys use the number on the function key plus FL_F. The highest possible number is FL_F_Last, so you can range-check a value.
- Buttons on the mouse are considered keys, and use the button number (where the left button is 1) plus FL_Button.
- All other keys on the keypad have a symbol: FL_Escape, FL_BackSpace, FL_Tab, FL_Enter, FL_Print, FL_Scroll_Lock, FL_Pause, FL_Insert, FL_Home, FL_Page_Up, FL_Delete, FL_End, FL_Page_Down, FL_Left, FL_Up, FL_Right, FL_Down, FL_Iso_Key, FL_Shift_L, FL_Shift_R, FL_Control_L, FL_Control_R, FL_Caps_Lock, FL_Alt_L, FL_Alt_R, FL_Meta_L, FL_Meta_R, FL_Menu, FL_Num_Lock, FL_KP_Enter. Be careful not to confuse these with the very similar, but all-caps, symbols used by [Fl::event_state\(\)](#).

On X [Fl::get_key\(FL_Button+n\)](#) does not work.

On Windows [Fl::get_key\(FL_KP_Enter\)](#) and [Fl::event_key\(FL_KP_Enter\)](#) do not work.

10.3.2.32 event_length()

```
static int Fl::event_length () [inline], [static]
```

Returns the length of the text in [Fl::event_text\(\)](#).

There will always be a nul at this position in the text. However there may be a nul before that if the keystroke translates to a nul character or you paste a nul character.

10.3.2.33 event_original_key()

```
static int Fl::event_original_key () [inline], [static]
```

Returns the keycode of the last key event, regardless of the NumLock state.

If NumLock is deactivated, FLTK translates events from the numeric keypad into the corresponding arrow key events. [event_key\(\)](#) returns the translated key code, whereas [event_original_key\(\)](#) returns the keycode before NumLock translation.

10.3.2.34 event_state() [1/2]

```
static int Fl::event_state () [inline], [static]
```

Returns the keyboard and mouse button states of the last event.

This is a bitfield of what shift states were on and what mouse buttons were held down during the most recent event.

Note

FLTK platforms differ in what [Fl::event_state\(\)](#) returns when it is called while a modifier key or mouse button is being pressed or released.

- Under X11 and Wayland, [Fl::event_state\(\)](#) indicates the state of the modifier keys and mouse buttons just **prior** to the event. Thus, during the `FL_KEYDOWN` event generated when pressing the shift key, for example, the `FL_SHIFT` bit of [event_state\(\)](#) is 0 and becomes 1 only at the next event which can be any other event, including e.g. `FL_MOVE`.
- Under other platforms the reported state of modifier keys or mouse buttons includes that of the key or button being pressed or released.
- [Fl::event_state\(\)](#) returns the same value under all platforms when it's called while a non-modifier key (e.g. a letter or function key) is being pressed or released.
- X servers do not agree on shift states, and `FL_NUM_LOCK`, `FL_META`, and `FL_SCROLL_LOCK` may not work.
- The values were selected to match the XFree86 server on Linux.

Note

This inconsistency **may** be fixed (on X11 and Wayland) in a later release.

The legal event state bits are:

Device	State Bit	Key or Button	Since
Keyboard	<code>FL_SHIFT</code>	Shift	
Keyboard	<code>FL_CAPS_LOCK</code>	Caps Lock	
Keyboard	<code>FL_CTRL</code>	Ctrl	
Keyboard	<code>FL_ALT</code>	Alt	
Keyboard	<code>FL_NUM_LOCK</code>	Num Lock	
Keyboard	<code>FL_META</code>	Meta, e.g. "Windows"	
Keyboard	<code>FL_SCROLL_LOCK</code>	Scroll Lock	
Mouse	<code>FL_BUTTON1</code>	left button	
Mouse	<code>FL_BUTTON2</code>	middle button	
Mouse	<code>FL_BUTTON3</code>	right button	
Mouse	<code>FL_BUTTON4</code>	side button 1 (back)	1.3.10
Mouse	<code>FL_BUTTON5</code>	side button 2 (forward)	1.3.10

10.3.2.35 event_state() [2/2]

```
static int Fl::event_state (
    int mask) [inline], [static]
```

Returns non-zero if any of the passed event state bits are turned on.

Use `mask` to pass the event states you're interested in. The legal event state bits are defined in [Fl::event_state\(\)](#).

10.3.2.36 `event_text()`

```
static const char * Fl::event_text () [inline], [static]
```

Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.

This can be used in response to `FL_KEYUP`, `FL_KEYDOWN`, `FL_PASTE`, and `FL_DND_RELEASE`.

When responding to `FL_KEYUP`/`FL_KEYDOWN`, use this function instead of `Fl::event_key()` to get the text equivalent of keystrokes suitable for inserting into strings and text widgets.

The returned string is guaranteed to be NULL terminated. However, see `Fl::event_length()` for the actual length of the string, in case the string itself contains NULLs that are part of the text data.

Returns

A NULL terminated text string equivalent of the last keystroke.

10.3.2.37 `event_x_root()`

```
static int Fl::event_x_root () [inline], [static]
```

Returns the mouse position on the screen of the event.

To find the absolute position of an `Fl_Window` on the screen, use the difference between `event_x_root()`, `event_y_root()` and `event_x()`, `event_y()`.

10.3.2.38 `event_y_root()`

```
static int Fl::event_y_root () [inline], [static]
```

Returns the mouse position on the screen of the event.

To find the absolute position of an `Fl_Window` on the screen, use the difference between `event_x_root()`, `event_y_root()` and `event_x()`, `event_y()`.

10.3.2.39 `focus()` [1/2]

```
static Fl_Widget * Fl::focus () [inline], [static]
```

Gets the current `Fl::focus()` widget.

See also

`Fl::focus(Fl_Widget*)`

10.3.2.40 `focus()` [2/2]

```
void Fl::focus (
    Fl_Widget * o) [static]
```

Sets the widget that will receive `FL_KEYBOARD` events.

Use this function inside the `handle(int)` member function of a widget of yours to give focus to the widget, for example when it receives the `FL_FOCUS` or the `FL_PUSH` event. Otherwise, use `Fl_Widget::take_focus()` to give focus to a widget;

If you change `Fl::focus()`, the previous widget and all parents (that don't contain the new widget) are sent `FL_↔UNFOCUS` events. Changing the focus does *not* send `FL_FOCUS` to this or any widget, because sending `FL_↔FOCUS` is supposed to *test* if the widget wants the focus (by it returning non-zero from `handle()`).

Since FLTK 1.4.0 widgets can set the `NEEDS_KEYBOARD` flag to indicate that a keyboard is essential for the widget to function. Touchscreen devices will be sent a request to show an on-screen keyboard if no hardware keyboard is connected.

See also

`Fl_Widget::take_focus()`

`Fl_Widget::needs_keyboard() const`

`Fl_Widget::needs_keyboard(bool)`

10.3.2.41 get_key()

```
int Fl::get_key (
    int key) [static]
```

Returns true if the given `key` is held down *now*.

Under X this requires a round-trip to the server and is *much* slower than [Fl::event_key\(int\)](#).

See also

[event_key\(int\)](#)

10.3.2.42 get_mouse()

```
void Fl::get_mouse (
    int & x,
    int & y) [static]
```

Return where the mouse is on the screen by doing a round-trip query to the server.

You should use [Fl::event_x_root\(\)](#) and [Fl::event_y_root\(\)](#) if possible, but this is necessary if you are not sure if a mouse event has been processed recently (such as to position your first window). If the display is not open, this will open it.

10.3.2.43 handle()

```
int Fl::handle (
    int e,
    Fl_Window * window) [static]
```

Handle events from the window system.

This is called from the native event dispatch after native events have been converted to FLTK notation. This function calls [Fl::handle_\(int, Fl_Window*\)](#) unless the user sets a dispatch function. If a user dispatch function is set, the user must make sure that [Fl::handle_\(\)](#) is called, or the event will be ignored.

Parameters

<i>e</i>	the event type (Fl::event_number() is not yet set)
<i>window</i>	the window that caused this event

Returns

0 if the event was not handled

See also

[Fl::add_handler\(Fl_Event_Handler\)](#)

[Fl::event_dispatch\(Fl_Event_Dispatch\)](#)

10.3.2.44 handle_()

```
int Fl::handle_ (
    int e,
    Fl_Window * window) [static]
```

Handle events from the window system.

This function is called from the native event dispatch, unless the user sets another dispatch function. In that case, the user dispatch function must decide when to call [Fl::handle_\(int, Fl_Window*\)](#)

Callbacks can set `FL_REASON_CLOSED` and `FL_REASON_CANCELLED`.

Parameters

<i>e</i>	the event type (Fl::event_number() is not yet set)
<i>window</i>	the window that caused this event

Returns

0 if the event was not handled

See also

[Fl::event_dispatch\(Fl_Event_Dispatch\)](#)

10.3.2.45 last_handler()

```
Fl_Event_Handler Fl::last_handler () [static]
```

Returns the last function installed by a call to [Fl::add_handler\(\)](#).

Since

1.4.0

10.3.2.46 pushed() [1/2]

```
static Fl_Widget * Fl::pushed () [inline], [static]
```

Gets the widget that is being pushed.

See also

[void pushed\(Fl_Widget*\)](#)

10.3.2.47 pushed() [2/2]

```
void Fl::pushed (
    Fl_Widget * o) [static]
```

Sets the widget that is being pushed.

FL_DRAG or FL_RELEASE (and any more FL_PUSH) events will be sent to this widget.

If you change the pushed widget, the previous one and all parents (that don't contain the new widget) are sent FL_RELEASE events. Changing this does *not* send FL_PUSH to this or any widget, because sending FL_PUSH is supposed to *test* if the widget wants the mouse (by it returning non-zero from [handle\(\)](#)).

10.3.2.48 remove_handler()

```
void Fl::remove_handler (
    Fl_Event_Handler ha) [static]
```

Removes a previously added event handler.

See also

[Fl::handle\(int, Fl_Window*\)](#)

10.3.2.49 remove_system_handler()

```
void Fl::remove_system_handler (
    Fl_System_Handler ha) [static]
```

Removes a previously added system event handler.

Parameters

<i>ha</i>	The event handler function to remove
-----------	--------------------------------------

See also

[Fl::add_system_handler\(Fl_System_Handler\)](#)

10.3.2.50 test_shortcut()

```
int Fl::test_shortcut (
    Fl\_Shortcut shortcut) [static]
```

Tests the current event, which must be an FL_KEYBOARD or FL_SHORTCUT, against a shortcut value (described in [Fl_Button](#)).

Not to be confused with [Fl_Widget::test_shortcut\(\)](#).

Returns

non-zero if there is a match.

10.3.3 Variable Documentation

10.3.3.1 fl_callback_reason_names

```
const char* const fl_callback_reason_names[]
```

Initial value:

```
=
{
    "FL_REASON_UNKNOWN",
    "FL_REASON_SELECTED",
    "FL_REASON_DESELECTED",
    "FL_REASON_RESELECTED",
    "FL_REASON_OPENED",
    "FL_REASON_CLOSED",
    "FL_REASON_DRAGGED",
    "FL_REASON_CANCELLED",
    "FL_REASON_CHANGED",
    "FL_REASON_GOT_FOCUS",
    "FL_REASON_LOST_FOCUS",
    "FL_REASON_RELEASED",
    "FL_REASON_ENTER_KEY",
    NULL, NULL, NULL,
    NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL,
    NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL,
    "FL_REASON_USER", "FL_REASON_USER+1", "FL_REASON_USER+2", "FL_REASON_USER+3",
}
```

This is an array of callback reason names you can use to convert callback reasons into names.

The array gets defined inline wherever your '#include <[FL/names.h](#)>' appears.

10.3.3.2 fl_eventnames

```
const char* const fl_eventnames[]
```

This is an array of event names you can use to convert event numbers into names.

The array gets defined inline wherever your '#include <[FL/names.h](#)>' appears.

Example:

```
#include <FL/names.h>           // array will be defined here
int MyClass::handle(int e) {
    printf("Event was %s (%d)\n", fl_eventnames[e], e);
    // ..resulting output might be e.g. "Event was FL_PUSH (1)"..
    [...]
}
```

10.3.3.3 fl_fontnames

```
const char* const fl_fontnames[]
```

Initial value:

```
=
{
    "FL_HELVETICA",
    "FL_HELVETICA_BOLD",
    "FL_HELVETICA_ITALIC",
    "FL_HELVETICA_BOLD_ITALIC",
    "FL_COURIER",
    "FL_COURIER_BOLD",
    "FL_COURIER_ITALIC",
    "FL_COURIER_BOLD_ITALIC",
    "FL_TIMES",
    "FL_TIMES_BOLD",
    "FL_TIMES_ITALIC",
    "FL_TIMES_BOLD_ITALIC",
    "FL_SYMBOL",
}
```

```

    "FL_SCREEN",
    "FL_SCREEN_BOLD",
    "FL_ZAPF_DINGBATS",
}

```

This is an array of font names you can use to convert font numbers into names. The array gets defined inline wherever your '#include <FL/names.h>' appears.

Example:

```

#include <FL/names.h>           // array will be defined here
int MyClass::my_callback(Fl_Widget *w, void*) {
    int fnum = w->labelfont();
    // Resulting output might be e.g. "Label's font is FL_HELVETICA (0)"
    printf("Label's font is %s (%d)\n", fl_fontnames[fnum], fnum);
    // ..resulting output might be e.g. "Label's font is FL_HELVETICA (0)"..
    [...]
}

```

10.4 Selection & Clipboard functions

FLTK global copy/cut/paste functions declared in <FL/Fl.H>

Functions

- static void **Fl::add_clipboard_notify** (Fl_Clipboard_Notify_Handler h, void *data=0)
FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.
- static int **Fl::clipboard_contains** (const char *type)
Returns non 0 if the clipboard contains data matching type.
- static void **Fl::copy** (const char *stuff, int len, int destination=0, const char *type=Fl::clipboard_plain_text)
Copies data to the selection buffer, the clipboard, or both.
- static int **Fl::dnd** ()
Initiate a Drag And Drop operation.
- static void **Fl::paste** (Fl_Widget &receiver)
Backward compatibility only.
- static void **Fl::paste** (Fl_Widget &receiver, int source, const char *type=Fl::clipboard_plain_text)
Pastes the data from the selection buffer (source is 0) or the clipboard (source is 1) into receiver.
- static void **Fl::remove_clipboard_notify** (Fl_Clipboard_Notify_Handler h)
Stop calling the specified callback when there are changes to the selection buffer or the clipboard.
- static void **Fl::selection** (Fl_Widget &owner, const char *, int len)
Changes the current selection.
- static Fl_Widget * **Fl::selection_owner** ()
back-compatibility only: Gets the widget owning the current selection
- static void **Fl::selection_owner** (Fl_Widget *)
Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.
- static int **Fl::selection_to_clipboard** ()
Returns the current selection_to_clipboard mode.
- static void **Fl::selection_to_clipboard** (int mode)
Copies selections on X11 directly to the clipboard if enabled.

Variables

- static char const *const **Fl::clipboard_image** = "image"
Denotes image data.
- static char const *const **Fl::clipboard_plain_text** = "text/plain"
Denotes plain textual data.

10.4.1 Detailed Description

FLTK global copy/cut/paste functions declared in <FL/Fl.H>

10.4.2 Function Documentation

10.4.2.1 `add_clipboard_notify()`

```
void Fl::add_clipboard_notify (
    Fl_Clipboard_Notify_Handler h,
    void * data = 0) [static]
```

FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard. The source argument indicates which of the two has changed. Only changes by other applications are reported. Example:

```
void clip_callback(int source, void *data) {
    if ( source == 0 ) printf("CLIP CALLBACK: selection buffer changed\n");
    if ( source == 1 ) printf("CLIP CALLBACK: clipboard changed\n");
}
[..]
int main() {
    [..]
    Fl::add_clipboard_notify(clip_callback);
    [..]
}
```

Note

Some systems require polling to monitor the clipboard and may therefore have some delay in detecting changes.

10.4.2.2 `clipboard_contains()`

```
int Fl::clipboard_contains (
    const char * type) [static]
```

Returns non 0 if the clipboard contains data matching `type`.

The clipboard can contain both text and image data; in that situation this function returns non 0 to both requests. This function is *not* meant to check whether the clipboard is empty. This function does not allow to query the selection buffer because FLTK allows to copy/paste non-textual data only from/to the clipboard.

Parameters

<i>type</i>	can be Fl::clipboard_plain_text or Fl::clipboard_image .
-------------	--

10.4.2.3 `copy()`

```
void Fl::copy (
    const char * stuff,
    int len,
    int destination = 0,
    const char * type = Fl::clipboard_plain_text) [static]
```

Copies data to the selection buffer, the clipboard, or both.

The `destination` can be:

- 0: selection buffer (see note below)
- 1: clipboard
- 2: both

The selection buffer exists only on the X11 platform and is used for middle-mouse pastes and for drag-and-drop selections. The clipboard is used for traditional copy/cut/paste operations. On all other platforms the selection buffer (`destination = 0`) is mapped to the clipboard, i.e. on platforms other than X11 all `destinations` are equivalent and the data is always copied to the clipboard.

Note

Please see [Fl::selection_to_clipboard\(\)](#) to enable duplication of the selection buffer to the clipboard on X11, i.e. if `destination = 0` (selection buffer) **and** [Fl::selection_to_clipboard\(\)](#) is enabled, then the data is copied to both the selection buffer and the clipboard. This makes the X11 behavior similar to other platforms but keeps the selection buffer for X11 specific inter process communication.

`type` should always be [Fl::clipboard_plain_text](#) which is the default. Other values are ignored and reserved for future extensions.

Note

This function is, at present, intended only to copy UTF-8 encoded textual data. To copy graphical data, use the [FL_Copy_Surface](#) class. The `type` argument may allow to copy other kinds of data in the future.

Parameters

in	<i>stuff</i>	text data to be copied
in	<i>len</i>	the number of relevant bytes in <i>stuff</i>
in	<i>destination</i>	0 = selection, 1 = clipboard, 2 = both (see description)
in	<i>type</i>	usually plain text (see description)

10.4.2.4 dnd()

```
int Fl::dnd () [static]
```

Initiate a Drag And Drop operation.

The selection buffer should be filled with relevant data before calling this method. FLTK will then initiate the system wide drag and drop handling. Dropped data will be marked as *text*.

Create a selection first using: [Fl::copy\(const char *stuff, int len, 0\)](#)

10.4.2.5 paste() [1/2]

```
void Fl::paste (
    Fl_Widget & receiver) [static]
```

Backward compatibility only.

This calls [Fl::paste\(receiver, 0\)](#);

See also

[Fl::paste\(Fl_Widget &receiver, int clipboard, const char* type\)](#)

10.4.2.6 paste() [2/2]

```
void Fl::paste (
    Fl_Widget & receiver,
    int source,
    const char * type = Fl::clipboard_plain_text) [static]
```

Pastes the data from the selection buffer (`source` is 0) or the clipboard (`source` is 1) into `receiver`.

The selection buffer (`source` is 0) is used for middle-mouse pastes and for drag-and-drop selections. The clipboard (`source` is 1) is used for copy/cut/paste operations.

If `source` is 1, the optional `type` argument indicates what type of data is requested from the clipboard. At present, [Fl::clipboard_plain_text](#) (requesting text data) and [Fl::clipboard_image](#) (requesting image data) are possible. Set things up so the handle function of the `receiver` widget will be called with an `FL_PASTE` event some time in the future if the clipboard does contain data of the requested type.

The handle function of `receiver` can process the `FL_PASTE` event as follows:

- If the `receiver` widget is known to only receive text data, the text string from the specified `source` is in [Fl::event_text\(\)](#) with UTF-8 encoding, and the number of bytes is in [Fl::event_length\(\)](#). If [Fl::paste\(\)](#) gets called during the drop step of a files-drag-and-drop operation, [Fl::event_text\(\)](#) contains a list of filenames (see [Drag and Drop Events](#)).

- If the `receiver` widget can potentially receive non-text data, use `Fl::event_clipboard_type()` to determine what sort of data is being sent. If `Fl::event_clipboard_type()` returns `Fl::clipboard_plain_text`, proceed as above. If it returns `Fl::clipboard_image`, the pointer returned by `Fl::event_clipboard()` can be safely cast to type `Fl_RGB_Image *` to obtain a pointer to the pasted image. If `receiver` accepts the clipboard image, `receiver.handle()` should return 1 and the application should take ownership of this image (that is, delete it after use). Conversely, if `receiver.handle()` returns 0, the application must not use the image.

The receiver should be prepared to be called *directly* by this, or for it to happen *later*, or possibly *not at all*. This allows the window system to take as long as necessary to retrieve the paste buffer (or even to screw up completely) without complex and error-prone synchronization code in FLTK.

Platform details for image data:

- Unix/Linux platform: Clipboard images in PNG or BMP formats are recognized. Requires linking with the `fltk_images` library.
- Windows platform: Both bitmap and vectorial (Enhanced metafile) data from clipboard can be pasted as image data.
- Mac OS X platform: Both bitmap (TIFF) and vectorial (PDF) data from clipboard can be pasted as image data.

10.4.2.7 selection()

```
void Fl::selection (
    Fl_Widget & owner,
    const char * text,
    int len) [static]
```

Changes the current selection.

The block of text is copied to an internal buffer by FLTK (be careful if doing this in response to an `FL_PASTE` as this *may* be the same buffer returned by `event_text()`). The `selection_owner()` widget is set to the passed owner.

10.4.2.8 selection_owner() [1/2]

```
static Fl_Widget * Fl::selection_owner () [inline], [static]
```

back-compatibility only: Gets the widget owning the current selection

See also

`Fl_Widget*` [selection_owner\(Fl_Widget*\)](#)

10.4.2.9 selection_owner() [2/2]

```
void Fl::selection_owner (
    Fl_Widget * owner) [static]
```

Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.

`FL_SELECTIONCLEAR` is sent to the previous selection owner, if any.

Copying the buffer every time the selection is changed is obviously wasteful, especially for large selections. An interface will probably be added in a future version to allow the selection to be made by a callback function. The current interface will be emulated on top of this.

10.4.2.10 selection_to_clipboard() [1/2]

```
static int Fl::selection_to_clipboard () [inline], [static]
```

Returns the current `selection_to_clipboard` mode.

See also

`void` [selection_to_clipboard\(int\)](#)

10.4.2.11 selection_to_clipboard() [2/2]

```
static void Fl::selection_to_clipboard (
    int mode) [inline], [static]
```

Copies selections on X11 directly to the clipboard if enabled.

This method can be called on all platforms. Other platforms than X11 are not affected by this feature.

If this is switched on (`mode = 1`), [Fl::copy\(\)](#) copies all data to the clipboard regardless of its `destination` argument. If the destination is 0 (selection buffer) data is copied to both the selection buffer and the clipboard.

Drag and drop is also affected since drag-and-drop data is copied to the selection buffer.

You can use this to make the experience of data selection and copying more like that on other platforms (Windows, macOS, and even Wayland).

The default operation mode is the standard X11 behavior (disabled).

Note

This feature is experimental and enabling it may have unexpected side effects. It is your own responsibility if you enable it.

Since

1.4.0

Parameters

<code>in</code>	<code>mode</code>	1 = enable <code>selection_to_clipboard</code> , 0 = disable <code>selection_to_clipboard</code>
-----------------	-------------------	--

See also

[copy\(const char *, int, int, const char *\)](#)

10.5 Screen functions

[Fl](#) global screen functions declared in `<FL/Fl.H>`.

Functions

- static int [Fl::h](#) ()
Returns the height in pixels of the main screen work area.
- static void [Fl::keyboard_screen_scaling](#) (int value)
Controls the possibility to scale all windows by ctrl/+/-/0/ or cmd/+/-/0/.
- static int [Fl::screen_count](#) ()
Gets the total count of available screens.
- static void [Fl::screen_dpi](#) (float &h, float &v, int n=0)
Gets the screen resolution in dots-per-inch for the given screen.
- static int [Fl::screen_num](#) (int x, int y)
Gets the screen number of a screen that contains the specified screen position x, y.
- static int [Fl::screen_num](#) (int x, int y, int w, int h)
Gets the screen number of the screen which intersects the most with the rectangle defined by x, y, w, h.
- static float [Fl::screen_scale](#) (int n)
Gets the GUI scaling factor of screen number n.
- static void [Fl::screen_scale](#) (int n, float factor)
Sets the GUI scaling factor of screen number n.
- static int [Fl::screen_scaling_supported](#) ()
Returns whether scaling factors are supported by this platform.
- static void [Fl::screen_work_area](#) (int &X, int &Y, int &W, int &H)

- Gets the bounding box of the work area of the screen that contains the mouse pointer.*
- static void [Fl::screen_work_area](#) (int &X, int &Y, int &W, int &H, int mx, int my)
 - Gets the bounding box of the work area of a screen that contains the specified screen position `mx`, `my`.*
- static void [Fl::screen_work_area](#) (int &X, int &Y, int &W, int &H, int n)
 - Gets the bounding box of the work area of the given screen.*
- static void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H)
 - Gets the bounding box of a screen that contains the mouse pointer.*
- static void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H, int mx, int my)
 - Gets the bounding box of a screen that contains the specified screen position `mx`, `my`.*
- static void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)
 - Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by `mx`, `my`, `mw`, `mh`.*
- static void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H, int n)
 - Gets the screen bounding rect for the given screen.*
- static int [Fl::w](#) ()
 - Returns the width in pixels of the main screen work area.*
- static int [Fl::x](#) ()
 - Returns the leftmost x coordinate of the main screen work area.*
- static int [Fl::y](#) ()
 - Returns the topmost y coordinate of the main screen work area.*

10.5.1 Detailed Description

[Fl](#) global screen functions declared in `<FL/Fl.H>`.

FLTK supports high-DPI screens using a screen scaling factor. The scaling factor is initialized by the library to a value based on information obtained from the OS. If this initial value is not satisfactory, the `FLTK_SCALING_FACTOR` environment variable can be set to a value FLTK will multiply to the OS-given value. The 2 variants of functions [Fl::screen_scale\(\)](#) allow to programmatically get and set scaling factor values. The scaling factor value can be further changed at runtime by typing `Ctrl/+/-/0/` (`Cmd/+/-/0/` under macOS). See [FL_SHORTCUT](#) for more details about these shortcuts.

10.5.2 Function Documentation

10.5.2.1 keyboard_screen_scaling()

```
void Fl::keyboard_screen_scaling (
    int value) [static]
```

Controls the possibility to scale all windows by `ctrl/+/-/0/` or `cmd/+/-/0/`.

This function **should** be called before [fl_open_display\(\)](#) runs. If it is not called, the default is to handle these keys for window scaling.

Note

This function can currently only be used to switch the internal handler **off**, i.e. `value` must be 0 (zero) - all other values result in undefined behavior and are reserved for future extension.

Parameters

<i>value</i>	0 to stop recognition of <code>ctrl/+/-/0/</code> (or <code>cmd/+/-/0/</code> under macOS) keys as window scaling.
--------------	--

Since

1.4.0

10.5.2.2 screen_count()

```
int Fl::screen_count () [static]
```

Gets the total count of available screens.

Note

Screen numbers range from 0 to [Fl::screen_count\(\)](#) - 1 in the FLTK API.

10.5.2.3 screen_dpi()

```
void Fl::screen_dpi (
    float & h,
    float & v,
    int n = 0) [static]
```

Gets the screen resolution in dots-per-inch for the given screen.

Parameters

out	<i>h,v</i>	horizontal and vertical resolution
in	<i>n</i>	the screen number (0 to Fl::screen_count() - 1)

See also

void [screen_xywh\(int &x, int &y, int &w, int &h, int mx, int my\)](#)

10.5.2.4 screen_num() [1/2]

```
int Fl::screen_num (
    int x,
    int y) [static]
```

Gets the screen number of a screen that contains the specified screen position *x*, *y*.

Parameters

in	<i>x,y</i>	the absolute screen position
----	------------	------------------------------

Returns

a screen number [0 , [Fl::screen_count\(\)](#)-1]

Attention

When the running system contains screens with different scaling factors, this API may become ambiguous because a given value pair (*x*, *y*) may belong to distinct screens. In that situation other APIs should be preferred, e.g. [Fl_Window::screen_num\(\)](#) and [Fl::screen_scale\(int\)](#).

10.5.2.5 screen_num() [2/2]

```
int Fl::screen_num (
    int x,
    int y,
    int w,
    int h) [static]
```

Gets the screen number of the screen which intersects the most with the rectangle defined by *x*, *y*, *w*, *h*.

Parameters

in	<i>x,y,w,h</i>	the rectangle to search for intersection with
----	----------------	---

Returns

a screen number [0 , [Fl::screen_count\(\)](#)-1]

10.5.2.6 screen_scale() [1/2]

```
float Fl::screen_scale (
    int n) [static]
```

Gets the GUI scaling factor of screen number *n*.

The valid range of *n* is 0 .. [Fl::screen_count\(\)](#) - 1.

The return value is 1.0 if screen scaling is not supported or *n* is outside the valid range.

Returns

Current screen scaling factor (default: 1.0)

See also

[Fl::screen_count\(\)](#)

[Fl::screen_scaling_supported\(\)](#)

Since

1.4.0

10.5.2.7 screen_scale() [2/2]

```
void Fl::screen_scale (
    int n,
    float factor) [static]
```

Sets the GUI scaling factor of screen number *n*.

The valid range of *n* is 0 .. [Fl::screen_count\(\)](#) - 1.

This method does nothing if *n* is out of range or screen scaling is not supported by this platform.

Otherwise it also sets the scaling factor of all windows mapped to screen number *n* or all screens, depending on the type of screen scaling support on the platform.

Parameters

in	<i>n</i>	screen number
in	<i>factor</i>	scaling factor of screen <i>n</i>

See also

[Fl::screen_scaling_supported\(\)](#)

Since

1.4.0

10.5.2.8 screen_scaling_supported()

```
int Fl::screen_scaling_supported () [static]
```

Returns whether scaling factors are supported by this platform.

Return values

0	scaling factors are not supported by this platform
1	a single scaling factor is shared by all screens
2	each screen can have its own scaling factor

See also

[Fl::screen_scale\(int\)](#)

Since

1.4.0

10.5.2.9 screen_work_area() [1/3]

```
void Fl::screen_work_area (
    int & X,
    int & Y,
    int & W,
    int & H) [static]
```

Gets the bounding box of the work area of the screen that contains the mouse pointer.

Parameters

out	<i>X,Y,W,H</i>	the work area bounding box
-----	----------------	----------------------------

See also

void [screen_work_area\(int &x, int &y, int &w, int &h, int n\)](#)

10.5.2.10 screen_work_area() [2/3]

```
void Fl::screen_work_area (
    int & X,
    int & Y,
    int & W,
    int & H,
    int mx,
    int my) [static]
```

Gets the bounding box of the work area of a screen that contains the specified screen position *mx*, *my*.

Parameters

out	<i>X,Y,W,H</i>	the work area bounding box
in	<i>mx,my</i>	the absolute screen position

See also

void [screen_work_area\(int &x, int &y, int &w, int &h, int n\)](#)

10.5.2.11 screen_work_area() [3/3]

```
void Fl::screen_work_area (
    int & X,
    int & Y,
    int & W,
    int & H,
    int n) [static]
```

Gets the bounding box of the work area of the given screen.

Parameters

out	<i>X,Y,W,H</i>	the work area bounding box
in	<i>n</i>	the screen number (0 to Fl::screen_count() - 1)

See also

void [screen_xywh](#)(int &x, int &y, int &w, int &h, int mx, int my)

Note

Under X11, the screen work area is given values that differ from that screen's bounding box only if the system contains a single screen. Under Wayland, a screen work area is always equal to that screen's bounding box.

Like all quantities accessible via public APIs of FLTK, values of *x,y,w,h* are given in FLTK units, that is, in drawing units divided by the scaling factor of screen *n*.

10.5.2.12 screen_xywh() [1/4]

```
void Fl::screen_xywh (
    int & X,
    int & Y,
    int & W,
    int & H) [static]
```

Gets the bounding box of a screen that contains the mouse pointer.

Parameters

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
-----	----------------	---------------------------------------

See also

void [screen_xywh](#)(int &x, int &y, int &w, int &h, int mx, int my)

10.5.2.13 screen_xywh() [2/4]

```
void Fl::screen_xywh (
    int & X,
    int & Y,
    int & W,
    int & H,
    int mx,
    int my) [static]
```

Gets the bounding box of a screen that contains the specified screen position *mx, my*.

Parameters

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
in	<i>mx,my</i>	the absolute screen position

10.5.2.14 screen_xywh() [3/4]

```
void Fl::screen_xywh (
    int & X,
    int & Y,
    int & W,
```

```

    int & H,
    int mx,
    int my,
    int mw,
    int mh) [static]

```

Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by `mx`, `my`, `mw`, `mh`.

Parameters

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
in	<i>mx,my,mw,mh</i>	the rectangle to search for intersection with

See also

void [screen_xywh](#)(int &X, int &Y, int &W, int &H, int n)

10.5.2.15 screen_xywh() [4/4]

```

void Fl::screen_xywh (
    int & X,
    int & Y,
    int & W,
    int & H,
    int n) [static]

```

Gets the screen bounding rect for the given screen.

Under Windows, Mac OS X, and X11 + the Gnome desktop, screen #0 contains the menubar/taskbar

Parameters

out	<i>X,Y,W,H</i>	the corresponding screen bounding box
in	<i>n</i>	the screen number (0 to Fl::screen_count() - 1)

Note

Like all quantities accessible via public APIs of FLTK, values of `X,Y,W,H` are given in FLTK units, that is, in drawing units divided by the scaling factor of screen `n`.

See also

void [screen_xywh](#)(int &x, int &y, int &w, int &h, int mx, int my)

10.6 Color & Font functions

fl global color, font functions.

Functions

- [Fl_Color fl_color](#) ()
Return the last [fl_color\(\)](#) that was set.
- void [fl_color](#) ([Fl_Color](#) c)
Set the color for all subsequent drawing operations.
- void [fl_color](#) (int c)
for back compatibility - use [fl_color\(Fl_Color c\)](#) instead
- void [fl_color](#) (uchar r, uchar g, uchar b)

- Set the color for all subsequent drawing operations.*

 - `FI_Color fl_color_average (FI_Color color1, FI_Color color2, float weight)`

Returns the weighted average color between the two given colors.
- `FI_Color fl_contrast (FI_Color fg, FI_Color bg, int context, int size)`

Returns a color that contrasts with the background color.
- `void fl_contrast_function (FI_Contrast_Function *f)`

Register a custom contrast function.
- `int fl_contrast_level ()`

Get the contrast level (sensitivity) of the `fl_contrast()` method.
- `void fl_contrast_level (int level)`

Set the contrast level (sensitivity) of the `fl_contrast()` method.
- `int fl_contrast_mode ()`

Return the current contrast algorithm (mode).
- `void fl_contrast_mode (int mode)`

Set the contrast algorithm (mode).
- `int fl_descent ()`

Return the recommended distance above the bottom of a `fl_height()` tall box to draw the text at so it looks centered vertically in that box.
- `FI_Font fl_font ()`

Return the `face` set by the most recent call to `fl_font()`.
- `void fl_font (FI_Font face, FI_Fontsize fsize)`

Sets the current font, which is then used in various drawing routines.
- `int fl_height ()`

Return the recommended minimum line spacing for the current font.
- `int fl_height (int font, int size)`

This function returns the actual height of the specified `font` and `size`.
- `FI_Color fl_inactive (FI_Color c)`

Returns the inactive, dimmed version of the given color.
- `const char * fl_latin1_to_local (const char *t, int n=-1)`

Convert text from Windows/X11 latin1 character set to local encoding.
- `double fl_lightness (FI_Color color)`

Return the perceived lightness of a color.
- `const char * fl_local_to_latin1 (const char *t, int n=-1)`

Convert text from local encoding to Windows/X11 latin1 character set.
- `const char * fl_local_to_mac_roman (const char *t, int n=-1)`

Convert text from local encoding to Mac Roman character set.
- `double fl_luminance (FI_Color color)`

Return the raw / physical luminance of a color.
- `const char * fl_mac_roman_to_local (const char *t, int n=-1)`

Convert text from Mac Roman character set to local encoding.
- `FI_Color fl_show_colormap (FI_Color oldcol)`

Pops up a window to let the user pick a colormap entry.
- `FI_Fontsize fl_size ()`

Return the `size` set by the most recent call to `fl_font()`.
- `void fl_text_extents (const char *, int &dx, int &dy, int &w, int &h)`

Determine the minimum pixel dimensions of a nul-terminated string using the current `fl_font()`.
- `void fl_text_extents (const char *t, int n, int &dx, int &dy, int &w, int &h)`

Determine the minimum pixel dimensions of a sequence of `n` characters (bytes) using the current `fl_font()`.
- `double fl_width (const char *txt)`

Return the typographical width of a nul-terminated string using the current font face and size.
- `double fl_width (const char *txt, int n)`

- Return the typographical width of a sequence of n characters using the current font face and size.*
- double `fl_width` (unsigned int `c`)
 - Return the typographical width of a single character using the current font face and size.*
- static void `Fl::free_color` (`Fl_Color` `i`, int `overlay=0`)
 - Frees the specified color from the colormap, if applicable.*
- static unsigned `Fl::get_color` (`Fl_Color` `i`)
 - Returns the RGB value(s) for the given FLTK color index.*
- static void `Fl::get_color` (`Fl_Color` `i`, `uchar` &`red`, `uchar` &`green`, `uchar` &`blue`)
 - Returns the RGB value(s) for the given FLTK color index.*
- static void `Fl::get_color` (`Fl_Color` `i`, `uchar` &`red`, `uchar` &`green`, `uchar` &`blue`, `uchar` &`alpha`)
 - Returns the RGBA value(s) for the given FLTK color index.*
- static const char * `Fl::get_font` (`Fl_Font`)
 - Gets the string for this face.*
- static const char * `Fl::get_font_name` (`Fl_Font`, int *`attributes=0`)
 - Get a human-readable string describing the family of this face.*
- static int `Fl::get_font_sizes` (`Fl_Font`, int *`&sizep`)
 - Return an array of sizes in `sizep`.*
- static void `Fl::set_color` (`Fl_Color` `i`, unsigned `c`)
 - Sets an entry in the `fl_color` index table.*
- static void `Fl::set_color` (`Fl_Color`, `uchar`, `uchar`, `uchar`)
 - Sets an entry in the `fl_color` index table.*
- static void `Fl::set_color` (`Fl_Color`, `uchar`, `uchar`, `uchar`, `uchar`)
 - Sets an entry in the `fl_color` index table.*
- static void `Fl::set_font` (`Fl_Font`, const char *)
 - Changes a face.*
- static void `Fl::set_font` (`Fl_Font`, `Fl_Font`)
 - Copies one face to another.*
- static `Fl_Font` `Fl::set_fonts` (const char *`=0`)
 - FLTK will open the display, and add every fonts on the server to the face table.*

10.6.1 Detailed Description

`fl` global color, font functions.

These functions are declared in `<FL/Fl.H>` or `<FL/fl_draw.H>`.

10.6.2 Function Documentation

10.6.2.1 `fl_color()` [1/3]

```
Fl_Color fl_color () [inline]
```

Return the last `fl_color()` that was set.

This can be used for state save/restore.

10.6.2.2 `fl_color()` [2/3]

```
void fl_color (
    Fl_Color c) [inline]
```

Set the color for all subsequent drawing operations.

For color-mapped displays, a color cell will be allocated out of `fl_colormap` the first time you use a color. If the colormap fills up then a least-squares algorithm is used to find the closest color. If no valid graphical context (`fl_gc`) is available, the foreground is not set for the current window.

Parameters

<code>in</code>	<code>c</code>	<code>color</code>
-----------------	----------------	--------------------

10.6.2.3 fl_color() [3/3]

```
void fl_color (
    uchar r,
    uchar g,
    uchar b) [inline]
```

Set the color for all subsequent drawing operations.

The closest possible match to the RGB color is used. The RGB color is used directly on TrueColor displays. For colormap visuals the nearest index in the gray ramp or color cube is used. If no valid graphical context (fl_gc) is available, the foreground is not set for the current window.

Parameters

in	<i>r,g,b</i>	color components
----	--------------	------------------

10.6.2.4 fl_color_average()

```
Fl_Color fl_color_average (
    Fl_Color color1,
    Fl_Color color2,
    float weight)
```

Returns the weighted average color between the two given colors.

The red, green and blue values are averages using the following formula:

```
color = color1 * weight + color2 * (1 - weight)
```

Thus, a `weight` value of 1.0 will return the first color, while a value of 0.0 will return the second color.

Parameters

in	<i>color1,color2</i>	boundary colors
in	<i>weight</i>	weighting factor

10.6.2.5 fl_contrast()

```
Fl_Color fl_contrast (
    Fl_Color fg,
    Fl_Color bg,
    int context,
    int size)
```

Returns a color that contrasts with the background color.

This will be the foreground color if it contrasts sufficiently with the background color. Otherwise, returns `FL_WHITE` or `FL_BLACK` depending on which color provides the best contrast.

FLTK 1.4.0 uses a different default contrast function than earlier releases (1.3.x) but you can use the old "legacy" contrast function by calling

```
fl_contrast_mode(FL_CONTRAST_LEGACY);
```

early in your main program.

Note

It is a known issue that static initialization using `fl_contrast()` may already have been executed before you call this function in `main()`. You should be aware of this and, if necessary, write your own (static) contrast initialization function. This should rarely be necessary.

You can change the behavior of `fl_contrast()` in several ways:

- Change the "level" (sensitivity) for contrast calculation, see `fl_contrast_level()`. Valid levels are 0 - 100, the default "medium" value depends on the contrast mode. If you raise the level above the default value the overall contrast will generally be higher, i.e. the required contrast to return the foreground color is raised and therefore the calculated color switches "earlier" to either black or white. In other words, using the following values:

- 0 always uses the foreground color
- the default, unmodified algorithm allows a sufficient contrast such that the text is readable
- 100 will always use black or white

Changing the `level` is particularly useful and intended for the "legacy mode" to improve the results partially. Values slightly above 50 (50 - 70) will likely return the best results (50 is the default, as used in FLTK 1.3.x).

Note

Different contrast modes (algorithms) can use their own values and defaults of `fl_contrast_level()`.

- Change the used contrast calculation function. You can either use the old (FLTK 1.3.x) function or use the better but slower function based on the CIELAB ($L^*a^*b^*$) color model, or you can define your own custom contrast function if you need even better contrast results.

The following contrast functions are available:

- `FL_CONTRAST_LEGACY`, the old FLTK 1.3.x compatible function. This is the fastest function (using integer arithmetic) but it provides worse results in border cases. You may want to use this on embedded or otherwise CPU constrained systems or if you need strict backwards compatibility. For slightly better results you may utilize the new `fl_contrast_level(int)` function (since 1.4.0) to increase the contrast sensitivity. This will provide slightly better results than FLTK 1.3.x and earlier but we recommend to use the new default function:
- `FL_CONTRAST_CIELAB`, based on the CIELAB ($L^*a^*b^*$) color model. This function is superior regarding the human contrast perception but may be slightly slower - which should not matter on a modern CPU. The default contrast level in this mode is 39 which results in a very similar experience as the old contrast function but avoids unreadable border cases. **This is the default since FLTK 1.4.0.**
- `FL_CONTRAST_CUSTOM`, your own contrast calculation function.

In the future we **may** provide even more (and superior) contrast algorithms.

The new parameters `context` and `size` (since 1.4.0) are defined for future extensions and are currently not used. Default values are 0.

- The `context` is intended to differentiate text and other kinds of objects, e.g. radio buttons, check marks, or icon types.
- The `size` parameter is an unspecified (object) size that may be used to calculate the required contrast. In text mode this must be the font size. Rule: the larger the object (font), the lower the required contrast.

Note

These new optional parameters must be provided in the custom contrast function which is the reason why they are added now. In the future we may use the (font) size to adjust the calculated contrast, and users defining their own contrast functions may use them in their functions.

Parameters

in	<i>fg</i>	foreground (text) color
in	<i>bg</i>	background color
in	<i>context</i>	graphical context (optional, default = 0 == text)
in	<i>size</i>	unspecified size (optional, default = 0 == undefined)

Returns

contrasting color: `fg`, `FL_BLACK`, or `FL_WHITE`

See also

[fl_contrast_level\(int\)](#)
[fl_contrast_mode\(int\)](#)
[fl_contrast_function\(\)](#)

10.6.2.6 fl_contrast_function()

```
void fl_contrast_function (
    Fl_Contrast_Function * f)
```

Register a custom contrast function.

Your custom contrast function will be called when [fl_contrast\(\)](#) is called if and only if you previously registered your function and called `fl_contrast_mode(FL_CONTRAST_CUSTOM)`.

Your custom contrast function must provide the signature

```
Fl_Color my_contrast_function(Fl_Color fg, Fl_Color bg, int context, int size)
```

The arguments are the same as for the full [fl_contrast\(\)](#) function since FLTK 1.4. You can use the supplied `size` to modify the result. Depending on the caller the `size` parameter can be 0 (default) or a valid size. In the context of text, i.e. `context == 0`, the `size` parameter is the fontsize.

The `context` parameter is not yet used and will always be 0 unless included in a call to [fl_contrast\(\)](#). The value 0 must be interpreted as text. In the future the `context` argument will be used to supply a different context than text (small icons, large icons, etc.). The exact usage is not yet specified.

Your function may also use [fl_contrast_level\(\)](#) to modify the result accordingly.

Since

1.4.0

See also

[fl_contrast_mode\(int\)](#)

[fl_contrast_level\(int\)](#)

[fl_contrast\(\)](#)

10.6.2.7 fl_contrast_level() [1/2]

```
int fl_contrast_level ()
```

Get the contrast level (sensitivity) of the [fl_contrast\(\)](#) method.

This returns the level of the currently selected contrast mode.

Returns

The current contrast level.

See also

[fl_contrast_level\(int level\)](#)

[fl_contrast_mode\(int mode\)](#)

Since

1.4.0

10.6.2.8 fl_contrast_level() [2/2]

```
void fl_contrast_level (
    int level)
```

Set the contrast level (sensitivity) of the [fl_contrast\(\)](#) method.

This can be used to tune the legacy [fl_contrast\(\)](#) function to achieve slightly better results. The default value is defined per contrast mode (see below). Values between 50 and 70 may be useful for the legacy contrast mode but you can raise it up to 100. Lower values than 50 are probably not useful.

The contrast `level` affects not only the legacy (1.3.x) [fl_contrast\(\)](#) function but also the new CIELAB contrast mode which is the default since FLTK 1.4.0. See default value below.

Other contrast modes are currently not affected by the contrast level.

You may use the contrast level if you define your own custom contrast function in mode `FL_CONTRAST_CUSTOM`.

Note

All contrast modes store their own contrast level because the behavior is slightly different. You must change the contrast mode `fl_contrast_mode()` **before** you set or get the contrast level.

The default contrast level is

- 50 in mode `FL_CONTRAST_LEGACY` (compatible with FLTK 1.3.x)
- 39 in mode `FL_CONTRAST_CIELAB` (similar threshold as in FLTK 1.3.x)
- 0 (undefined) for all other modes

See the description of `fl_contrast_mode(int mode)` for more information about the contrast level per mode.

Example:

```
fl_contrast_mode(FL_CONTRAST_LEGACY);
fl_contrast_level(60);
```

A level greater than 50 (probably best in the range 50 to 70) may achieve better results of the legacy `fl_contrast()` function in some border cases of low contrast between foreground and background colors but we recommend to use the new default algorithm `FL_CONTRAST_CIELAB` unless you need strict backwards compatibility or use a CPU constrained embedded system.

Parameters

<i>in</i>	<i>level</i>	valid range is 0 to 100
-----------	--------------	-------------------------

Since

1.4.0

10.6.2.9 fl_contrast_mode() [1/2]

```
int fl_contrast_mode ()
```

Return the current contrast algorithm (mode).

Returns

Contrast algorithm (mode).

Since

1.4.0

See also

[fl_contrast_mode\(int\)](#)

10.6.2.10 fl_contrast_mode() [2/2]

```
void fl_contrast_mode (
    int mode)
```

Set the contrast algorithm (mode).

You can use one of

- `FL_CONTRAST_NONE` (not recommended: returns the foreground color)
- `FL_CONTRAST_LEGACY` (same as in FLTK 1.3.x)
- `FL_CONTRAST_CIELAB` (better, this is the default since FLTK 1.4.0)
- `FL_CONTRAST_CUSTOM` (you must define your own contrast algorithm)

If you set `FL_CONTRAST_CUSTOM` you must also register your custom contrast function by calling `fl_contrast_function()`.

You may set the contrast level `fl_contrast_level(int)` after setting the contrast mode. This affects the contrast algorithm as described below:

- `FL_CONTRAST_LEGACY`: default level is 50 which is compatible with FLTK 1.3.x and older. This mode is no longer the default and is not recommended because it doesn't take human contrast perception into account and doesn't properly handle sRGB color values. You may get better contrasts if you set the level higher than 50. Values in the range 50 to 70 may be useful. Higher values result in higher contrast, i.e. the algorithm switches "earlier" to black or white mode.
- `FL_CONTRAST_CIELAB`: default level is 39 which appears to be a good value. The higher the level is, the more contrast is to be expected. Values in the range below 39 accept lower contrast and values above 39 switch "earlier" to black or white. Values between 36 and 46 may yield usable contrast experience.

Note

The goal of `fl_contrast()` is to achieve a "sufficient" contrast between text and background. Level 39 in CIELAB mode means that the accepted contrast is about 39% of the lightness difference between both colors. This can be perceived as very low contrast in some cases, but the text should at least be readable. Note that the highest possible contrast value on a medium gray background is 50% (either black or white). Bill Spitzak wrote on May 16, 2024 in fltk.general in thread "FLTK 1.4 Menu Bar Style": *"I would certainly aim for a function that does not alter color combinations where it is physically possible to read the text, even if squinting is needed."* See <https://groups.google.com/g/fltkgeneral/c/EkWI4HTHSLA/m/rsZunZ1vAwAJ>

Parameters

in	mode	if invalid, FL_CONTRAST_CIELAB will be selected
----	------	---

Since

1.4.0

See also

[fl_contrast_function\(Fl_Contrast_Function *\)](#)

[fl_contrast_level\(int\)](#)

10.6.2.11 fl_font() [1/2]

```
Fl_Font fl_font () [inline]
```

Return the `face` set by the most recent call to `fl_font()`.

This can be used to save/restore the font.

10.6.2.12 fl_font() [2/2]

```
void fl_font (
    Fl_Font face,
    Fl_Fontsize fsize)
```

Sets the current font, which is then used in various drawing routines.

You may call this outside a draw context if necessary to measure text, for instance by calling `fl_width()`, `fl_measure()`, or `fl_text_extents()`, but on X this will open the display.

The font is identified by a `face` and a `size`. The size of the font is measured in pixels and not "points". Lines should be spaced `size` pixels apart or more.

10.6.2.13 fl_height() [1/2]

```
int fl_height () [inline]
```

Return the recommended minimum line spacing for the current font.

You can also use the value of `size` passed to `fl_font()`.

10.6.2.14 fl_height() [2/2]

```
int fl_height (
    int font,
    int size)
```

This function returns the actual height of the specified `font` and `size`.

Normally the font height should always be 'size', but with the advent of XFT, there are (currently) complexities that seem to only be solved by asking the font what its actual font height is. (See STR#2115)

This function was originally undocumented in 1.1.x, and was used only by [Fl_Text_Display](#). We're now documenting it in 1.3.x so that apps that need precise height info can get it with this function.

Returns

the height of the font in pixels.

Todo In the future, when the XFT issues are resolved, this function should simply return the 'size' value.

10.6.2.15 fl_latin1_to_local()

```
const char * fl_latin1_to_local (
    const char * t,
    int n = -1)
```

Convert text from Windows/X11 latin1 character set to local encoding.

Parameters

in	<i>t</i>	character string (latin1 encoding)
in	<i>n</i>	optional number of characters (bytes) to convert (default is all)

Returns

pointer to internal buffer containing converted characters

10.6.2.16 fl_lightness()

```
double fl_lightness (
    Fl_Color color)
```

Return the perceived lightness of a color.

This function calculates the perceived lightness of [Fl_Color](#) `color`.

The returned lightness value `Lstar` according to the CIELAB ($L^*a^*b^*$) color model is almost linear with respect to human perception. It is in the range 0 (black) to 100 (white).

The result values of two colors can be compared directly and the difference is their perceived contrast.

Parameters

in	<i>color</i>	Fl_Color value
----	--------------	--------------------------------

Returns

perceived lightness (0 .. 100)

Since

1.4.0

10.6.2.17 fl_local_to_latin1()

```
const char * fl_local_to_latin1 (
    const char * t,
    int n = -1)
```

Convert text from local encoding to Windows/X11 latin1 character set.

Parameters

in	<i>t</i>	character string (local encoding)
in	<i>n</i>	optional number of characters (bytes) to convert (default is all)

Returns

pointer to internal buffer containing converted characters

10.6.2.18 fl_local_to_mac_roman()

```
const char * fl_local_to_mac_roman (
    const char * t,
    int n = -1)
```

Convert text from local encoding to Mac Roman character set.

Parameters

in	<i>t</i>	character string (local encoding)
in	<i>n</i>	optional number of characters to convert (default is all)

Returns

pointer to internal buffer containing converted characters

10.6.2.19 fl_luminance()

```
double fl_luminance (
    Fl_Color color)
```

Return the raw / physical luminance of a color.

This function calculates the physical luminance of [Fl_Color color](#).

The returned luminance value (aka Y) is the physical luminance of the [Fl_Color color](#).

The result is in the range 0.0 (black) to 1.0 (white).

Note

This is probably not what you want if you are interested in perceived contrast or lightness calculation because the luminance Y is **not** linear with respect to human perception.

See [fl_lightness\(Fl_Color\)](#) for a function that returns the perceived lightness of a color which can be used directly for contrast calculation.

Parameters

in	<i>color</i>	Fl_Color value
----	--------------	--------------------------------

Returns

Raw (physical) luminance (0.0 .. 1.0)

Since

1.4.0

See also

[fl_lightness\(Fl_Color\)](#)

10.6.2.20 fl_mac_roman_to_local()

```
const char * fl_mac_roman_to_local (
    const char * t,
    int n = -1)
```

Convert text from Mac Roman character set to local encoding.

Parameters

in	<i>t</i>	character string (Mac Roman encoding)
in	<i>n</i>	optional number of characters to convert (default is all)

Returns

pointer to internal buffer containing converted characters

10.6.2.21 fl_show_colormap()

```
Fl_Color fl_show_colormap (
    Fl_Color oldcol)
```

Pops up a window to let the user pick a colormap entry.

Figure 10.1 fl_show_colormap

Parameters

in	<i>oldcol</i>	color to be highlighted when grid is shown.
----	---------------	---

Return values

<i>Fl_Color</i>	value of the chosen colormap entry.
-----------------	-------------------------------------

See also

[Fl_Color_Chooser](#)

10.6.2.22 fl_size()

```
Fl_Fonsize fl_size () [inline]
```

Return the size set by the most recent call to [fl_font\(\)](#).

This can be used to save/restore the font.

10.6.2.23 fl_text_extents() [1/2]

```
void fl_text_extents (
    const char * c,
    int & dx,
    int & dy,
    int & w,
    int & h)
```

Determine the minimum pixel dimensions of a nul-terminated string using the current [fl_font\(\)](#).

Usage: given a string "txt" drawn using `fl_draw(txt, x, y)` you would determine its pixel extents on the display using `fl_text_extents(txt, dx, dy, wo, ho)` such that a bounding box that exactly fits around the text could be drawn with `fl_rect(x+dx, y+dy, wo, ho)`. Note the dx, dy values hold the offset of the first "colored in" pixel of the string, from the draw origin.

Note the desired font and font size must be set with [fl_font\(\)](#) before calling this function.

This differs slightly from [fl_measure\(\)](#) in that the dx/dy values are also returned.

No FLTK symbol expansion will be performed.

Example use:

```
int dx,dy,W,H;
fl_font(FL_HELVETICA, 12); // set font face+size first
fl_text_extents("Some text", dx, dy, W, H); // get width and height of string
printf("text's width=%d, height=%d\n", W, H);
```

10.6.2.24 fl_text_extents() [2/2]

```
void fl_text_extents (
    const char * t,
    int n,
    int & dx,
    int & dy,
    int & w,
    int & h) [inline]
```

Determine the minimum pixel dimensions of a sequence of n characters (bytes) using the current [fl_font\(\)](#).

Note

The string length is measured in bytes, not (UTF-8) characters.

See also

[fl_text_extents\(const char*, int& dx, int& dy, int& w, int& h\)](#)

10.6.2.25 fl_width()

```
double fl_width (
    unsigned int c) [inline]
```

Return the typographical width of a single character using the current font face and size.

Note

If a valid `fl_gc` is NOT found then it uses the first window `gc`, or the screen `gc` if no fltk window is available when called.

10.6.2.26 free_color()

```
void Fl::free_color (
    Fl_Color i,
    int overlay = 0) [static]
```

Frees the specified color from the colormap, if applicable.

If overlay is non-zero then the color is freed from the overlay colormap.

10.6.2.27 get_color() [1/3]

```
unsigned Fl::get_color (
    Fl_Color i) [static]
```

Returns the RGB value(s) for the given FLTK color index.

This form returns the RGB values packed in a 32-bit unsigned integer with the red value in the upper 8 bits, the green value in the next 8 bits, and the blue value in bits 8-15. The lower 8 bits will always be 0.

10.6.2.28 get_color() [2/3]

```
void Fl::get_color (
    Fl_Color i,
    uchar & red,
    uchar & green,
    uchar & blue) [static]
```

Returns the RGB value(s) for the given FLTK color index.

This form returns the red, green, and blue values separately in referenced variables.

See also

unsigned [get_color\(Fl_Color c\)](#)

10.6.2.29 get_color() [3/3]

```
void Fl::get_color (
    Fl_Color i,
    uchar & red,
    uchar & green,
    uchar & blue,
    uchar & alpha) [static]
```

Returns the RGBA value(s) for the given FLTK color index.

This form returns the red, green, blue, and alpha values separately in referenced variables.

See also

unsigned [get_color\(Fl_Color c\)](#)

10.6.2.30 get_font()

```
const char * Fl::get_font (
    Fl_Font fnum) [static]
```

Gets the string for this face.

This string is different for each face. Under X this value is passed to XListFonts to get all the sizes of this face.

10.6.2.31 get_font_name()

```
const char * Fl::get_font_name (
    Fl_Font fnum,
    int * attributes = 0) [static]
```

Get a human-readable string describing the family of this face.

This is useful if you are presenting a choice to the user. There is no guarantee that each face has a different name. The return value points to a static buffer that is overwritten each call.

The integer pointed to by `attributes` (if the pointer is not zero) is set to zero, `FL_BOLD` or `FL_ITALIC` or `FL_↵_BOLD | FL_ITALIC`. To locate a "family" of fonts, search forward and back for a set with non-zero attributes, these faces along with the face with a zero attribute before them constitute a family.

10.6.2.32 `get_font_sizes()`

```
int Fl::get_font_sizes (
    Fl_Font fnum,
    int *& sizep) [static]
```

Return an array of sizes in `sizep`.

The return value is the length of this array. The sizes are sorted from smallest to largest and indicate what sizes can be given to `fl_font()` that will be matched exactly (`fl_font()` will pick the closest size for other sizes). A zero in the first location of the array indicates a scalable font, where any size works, although the array may list sizes that work "better" than others. Warning: the returned array points at a static buffer that is overwritten each call. Under X this will open the display.

10.6.2.33 `set_color()` [1/3]

```
void Fl::set_color (
    Fl_Color i,
    unsigned c) [static]
```

Sets an entry in the `fl_color` index table.

You can set it to any 8-bit RGB color. The color is not allocated until `fl_color(i)` is used.

10.6.2.34 `set_color()` [2/3]

```
void Fl::set_color (
    Fl_Color i,
    uchar red,
    uchar green,
    uchar blue) [static]
```

Sets an entry in the `fl_color` index table.

You can set it to any 8-bit RGB color. The color is not allocated until `fl_color(i)` is used.

10.6.2.35 `set_color()` [3/3]

```
void Fl::set_color (
    Fl_Color i,
    uchar red,
    uchar green,
    uchar blue,
    uchar alpha) [static]
```

Sets an entry in the `fl_color` index table.

You can set it to any 8-bit RGBA color.

Note

The color transparency is effective under the Wayland, hybrid Wayland/X11 and macOS platforms, whereas it has no effect under the X11 and Windows platforms. It's also effective for widgets added to an [Fl_Gl_Window](#).

Version

1.4

10.6.2.36 `set_font()`

```
void Fl::set_font (
    Fl_Font fnum,
    const char * name) [static]
```

Changes a face.

Parameters

<i>fnum</i>	The font number to be assigned a new face
<i>name</i>	Name of the font to assign. The string pointer is simply stored, the string is not copied, so the string must be in static memory. The exact name to be used depends on the platform :

- Windows, X11, Xft: use the family name prefixed by one character to indicate the desired font variant. Characters ' ', 'I', 'B', 'P' denote plain, italic, bold, and bold-italic variants, respectively. For example, string "IGabriola" is to be used to denote the "Gabriola italic" font. The "Oblique" suffix, in whatever case, is to be treated as "italic", that is, prefix the family name with 'I'.
- Other platforms, i.e., X11 + Pango, Wayland, macOS: use the full font name as returned by function [Fl::get_font_name\(\)](#) or as listed by applications test/fonts or test/utf8. No prefix is to be added.

10.6.2.37 set_fonts()

```
Fl_Font Fl::set_fonts (
    const char * xstarname = 0) [static]
```

FLTK will open the display, and add every fonts on the server to the face table.

It will attempt to put "families" of faces together, so that the normal one is first, followed by bold, italic, and bold italic. The only argument to this function is somewhat obsolete since FLTK and most underlying operating systems move to support Unicode. For completeness, following is the original documentation and a few updates:

On X11, the optional argument is a string to describe the set of fonts to add. Passing NULL will select only fonts that have the ISO8859-1 character set (and are thus usable by normal text). Passing "-*" will select all fonts with any encoding as long as they have normal X font names with dashes in them. Passing "*" will list every font that exists (on X this may produce some strange output). Other values may be useful but are system dependent.

With the Xft option on Linux, this parameter is ignored.

With Windows, NULL selects fonts with ANSI_CHARSET encoding and non-NULL selects all fonts.

On macOS, this parameter is ignored.

The return value is how many faces are in the table after this is done.

10.7 Drawing functions

FLTK global graphics and GUI drawing functions.

Enumerations

- enum {
[FL_SOLID](#) = 0 , [FL_DASH](#) = 1 , [FL_DOT](#) = 2 , [FL_DASHDOT](#) = 3 ,
[FL_DASHDOTDOT](#) = 4 , [FL_CAP_FLAT](#) = 0x100 , [FL_CAP_ROUND](#) = 0x200 , [FL_CAP_SQUARE](#) = 0x300 ,
[FL_JOIN_MITER](#) = 0x1000 , [FL_JOIN_ROUND](#) = 0x2000 , [FL_JOIN_BEVEL](#) = 0x3000 }

Functions

- int [fl_add_symbol](#) (const char *name, void(*drawit)([Fl_Color](#)), int scalable)
Adds a symbol to the system.
- int [fl_antialias](#) ()
Return whether line drawings are currently antialiased.
- void [fl_antialias](#) (int state)
Turn antialiased line drawings ON or OFF, if supported by platform.
- void [fl_arc](#) (double x, double y, double r, double start, double end)
Add a series of points to the current path on the arc of a circle.
- void [fl_arc](#) (int x, int y, int w, int h, double a1, double a2)
Draw ellipse sections using integer coordinates.

- void [fl_begin_complex_polygon](#) ()
Start drawing a complex filled polygon.
- void [fl_begin_line](#) ()
Start drawing a list of lines.
- void [fl_begin_loop](#) ()
Start drawing a closed sequence of lines.
- void [fl_begin_offscreen](#) ([Fl_Offscreen](#) ctx)
Send all subsequent drawing commands to this offscreen buffer.
- void [fl_begin_points](#) ()
Start drawing a list of points.
- void [fl_begin_polygon](#) ()
Start drawing a convex filled polygon.
- char [fl_can_do_alpha_blending](#) ()
Check whether platform supports true alpha blending for RGBA images.
- [Fl_RGB_Image](#) * [fl_capture_window](#) ([Fl_Window](#) *win, int x, int y, int w, int h)
Captures the content of a rectangular zone of a mapped window.
- void [fl_chord](#) (int x, int y, int w, int h, double a1, double a2)
fl_chord declaration is a place holder - the function does not yet exist
- void [fl_circle](#) (double x, double y, double r)
fl_circle(x,y,r) is equivalent to fl_arc(x,y,r,0,360), but may be faster.
- void [fl_clip](#) (int x, int y, int w, int h)
Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).
- int [fl_clip_box](#) (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)
Intersect a rectangle with the current clip region and return the bounding box of the result.
- [Fl_Region](#) [fl_clip_region](#) ()
Return the current clipping region.
- void [fl_clip_region](#) ([Fl_Region](#) r)
Replace the top of the clipping stack with a clipping region of any shape.
- void [fl_copy_offscreen](#) (int x, int y, int w, int h, [Fl_Offscreen](#) pixmap, int srcx, int srcy)
Copy a rectangular area of the given offscreen buffer into the current drawing destination.
- [Fl_Offscreen](#) [fl_create_offscreen](#) (int w, int h)
Creation of an offscreen graphics buffer.
- void [fl_cursor](#) ([Fl_Cursor](#))
Sets the cursor for the current window to the specified shape and colors.
- void [fl_cursor](#) ([Fl_Cursor](#), [Fl_Color](#) fg, [Fl_Color](#) bg=[FL_WHITE](#))
- void [fl_curve](#) (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)
Add a series of points on a Bézier curve to the path.
- void [fl_delete_offscreen](#) ([Fl_Offscreen](#) ctx)
Deletion of an offscreen graphics buffer.
- void [fl_draw](#) (const char *str, int n, int x, int y)
Draws starting at the given x, y location a UTF-8 string of length n bytes.
- void [fl_draw](#) (const char *str, int x, int y)
Draw a nul-terminated UTF-8 string starting at the given x, y location.
- void [fl_draw](#) (const char *str, int x, int y, int w, int h, [Fl_Align](#) align, [Fl_Image](#) *img=0, int draw_symbols=1, int spacing=0)
Fancy string drawing function which is used to draw all the labels.
- void [fl_draw](#) (const char *str, int x, int y, int w, int h, [Fl_Align](#) align, void(*callthis)(const char *, int, int, int), [Fl_Image](#) *img=0, int draw_symbols=1, int spacing=0)
The same as fl_draw(const char,int,int,int,int,Fl_Align,Fl_Image*,int) with the addition of the callthis parameter, which is a pointer to a text drawing function such as fl_draw(const char*, int, int, int) to do the real work.*
- void [fl_draw](#) (int angle, const char *str, int n, int x, int y)

- Draw at the given x , y location a UTF-8 string of length n bytes rotating $angle$ degrees counter-clockwise.*

 - void `fl_draw` (int angle, const char *str, int x, int y)
- Draw a nul-terminated UTF-8 string starting at the given x , y location and rotating $angle$ degrees counter-clockwise.*

 - void `fl_draw_arrow` (FI_Rect bb, FI_Arrow_Type t, FI_Orientation o, FI_Color color)
- Draw an "arrow like" GUI element for the selected scheme.*

 - void `fl_draw_box` (FI_Boxtype, int x, int y, int w, int h, FI_Color)
- Draws a box using given type, position, size and color.*

 - void `fl_draw_box_focus` (FI_Boxtype, int x, int y, int w, int h, FI_Color, FI_Color)
- Draws the focus rectangle inside a box using given type, position, size and color.*

 - void `fl_draw_check` (FI_Rect bb, FI_Color col)
- Draw a check mark inside the given bounding box.*

 - void `fl_draw_circle` (int x, int y, int d, FI_Color color)
- Draw a potentially small, filled circle using a given color.*

 - void `fl_draw_image` (const uchar *buf, int X, int Y, int W, int H, int D=3, int L=0)
- Draw an 8-bit per color RGB or luminance image.*

 - void `fl_draw_image` (FI_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=3)
- Draw an image using a callback function to generate image data.*

 - void `fl_draw_image_mono` (const uchar *buf, int X, int Y, int W, int H, int D=1, int L=0)
- Draw a gray-scale (1 channel) image.*

 - void `fl_draw_image_mono` (FI_Draw_Image_Cb cb, void *data, int X, int Y, int W, int H, int D=1)
- Draw a gray-scale image using a callback function to generate image data.*

 - int `fl_draw_pixmap` (char *const *data, int x, int y, FI_Color bg=FL_GRAY)
- Draw XPM image data, with the top-left corner at the given position.*

 - int `fl_draw_pixmap` (const char *const *cdata, int x, int y, FI_Color bg=FL_GRAY)
- Draw XPM image data, with the top-left corner at the given position.*

 - void `fl_draw_radio` (int x, int y, int d, FI_Color color)
- Draw a round check mark (circle) of a radio button.*

 - int `fl_draw_symbol` (const char *label, int x, int y, int w, int h, FI_Color)
- Draw the named symbol in the given rectangle using the given color.*

 - void `fl_end_complex_polygon` ()
- End complex filled polygon, and draw.*

 - void `fl_end_line` ()
- End list of lines, and draw.*

 - void `fl_end_loop` ()
- End closed sequence of lines, and draw.*

 - void `fl_end_offscreen` ()
- Quit sending drawing commands to the current offscreen buffer.*

 - void `fl_end_points` ()
- End list of points, and draw.*

 - void `fl_end_polygon` ()
- End convex filled polygon, and draw.*

 - const char * `fl_expand_text` (const char *from, char *buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw_symbols=0)
- Copy from to buf, replacing control characters with ^X.*

 - void `fl_focus_rect` (int x, int y, int w, int h)
- Draw a dotted rectangle, used to indicate keyboard focus on a widget.*

 - void `fl_frame` (const char *s, int x, int y, int w, int h)
- Draws a series of line segments around the given box.*

 - void `fl_frame2` (const char *s, int x, int y, int w, int h)
- Draws a series of line segments around the given box.*

 - void `fl_gap` ()

- Separate loops of the path.*

 - void **fl_line** (int x, int y, int x1, int y1)

Draw a line from (x,y) to (x1,y1)
- void **fl_line** (int x, int y, int x1, int y1, int x2, int y2)

Draw a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)
- void **fl_line_style** (int style, int width=0, char *dashes=0)

Set how to draw lines (the "pen").
- void **fl_load_identity** ()

Set the transformation matrix to identity.
- void **fl_load_matrix** (double a, double b, double c, double d, double x, double y)

Set the current transformation matrix.
- void **fl_loop** (int x, int y, int x1, int y1, int x2, int y2)

Outline a 3-sided polygon with lines.
- void **fl_loop** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)

Outline a 4-sided polygon with lines.
- void **fl_measure** (const char *str, int &x, int &y, int draw_symbols=1)

Measure how wide and tall the string will be when printed by the fl_draw() function with align parameter.
- int **fl_measure_pixmap** (char *const *data, int &w, int &h)

Get the dimensions of a pixmap.
- int **fl_measure_pixmap** (const char *const *cdata, int &w, int &h)

Get the dimensions of a pixmap.
- void **fl_mult_matrix** (double a, double b, double c, double d, double x, double y)

Concatenate another transformation onto the current one.
- int **fl_not_clipped** (int x, int y, int w, int h)

Does the rectangle intersect the current clip region?
- unsigned int **fl_old_shortcut** (const char *s)

Emulation of XForms named shortcuts.
- void **fl_overlay_clear** ()

Erase a selection rectangle without drawing a new one.
- void **fl_overlay_rect** (int x, int y, int w, int h)

Draw a transient dotted selection rectangle.
- float **fl_override_scale** ()

Removes any GUI scaling factor in subsequent drawing operations.
- void **fl_pie** (int x, int y, int w, int h, double a1, double a2)

Draw filled ellipse sections using integer coordinates.
- void **fl_point** (int x, int y)

Draw a single pixel at the given coordinates.
- void **fl_polygon** (int x, int y, int x1, int y1, int x2, int y2)

Fill a 3-sided polygon.
- void **fl_polygon** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)

Fill a 4-sided polygon.
- void **fl_pop_clip** ()

Restore the previous clip region.
- void **fl_pop_matrix** ()

Restore the current transformation matrix from the stack.
- void **fl_push_clip** (int x, int y, int w, int h)

Intersect the current clip region with a rectangle and push this new region onto the stack.
- void **fl_push_matrix** ()

Save the current transformation matrix on the stack.
- void **fl_push_no_clip** ()

Push an empty clip region onto the stack so nothing will be clipped.

- `uchar * fl_read_image (uchar *p, int X, int Y, int W, int H, int alpha=0)`
Reads an RGB(A) image from the current window or off-screen buffer.
- `void fl_rect (FI_Rect r)`
Draw a border inside the given bounding box.
- `void fl_rect (int x, int y, int w, int h)`
Draw a border inside the given bounding box.
- `void fl_rect (int x, int y, int w, int h, FI_Color c)`
Draw with passed color a border inside the given bounding box.
- `void fl_rectf (FI_Rect bb, uchar r, uchar g, uchar b)`
Color a rectangle with "exactly" the passed r, g, b color.
- `void fl_rectf (FI_Rect r)`
Color with current color a rectangle that exactly fills the given bounding box.
- `void fl_rectf (FI_Rect r, FI_Color c)`
Color with passed color a rectangle that exactly fills the given bounding box.
- `void fl_rectf (int x, int y, int w, int h)`
Color with current color a rectangle that exactly fills the given bounding box.
- `void fl_rectf (int x, int y, int w, int h, FI_Color c)`
Color with passed color a rectangle that exactly fills the given bounding box.
- `void fl_rectf (int x, int y, int w, int h, uchar r, uchar g, uchar b)`
Color a rectangle with "exactly" the passed r, g, b color.
- `void fl_rescale_offscreen (FI_Offscreen &ctx)`
Adapts an offscreen buffer to a changed value of the scale factor.
- `void fl_reset_spot (void)`
Resets marked text.
- `void fl_restore_clip ()`
Undo any clobbering of the clip region done by your program.
- `void fl_restore_scale (float s)`
Restores the GUI scaling factor in subsequent drawing operations.
- `void fl_rotate (double d)`
Concatenate rotation transformation onto the current one.
- `void fl_rounded_rect (int x, int y, int w, int h, int r)`
Draw a rounded border inside the given bounding box.
- `void fl_rounded_rectf (int x, int y, int w, int h, int r)`
Color with current color a rounded rectangle that exactly fills the given bounding box.
- `void fl_rtl_draw (const char *str, int n, int x, int y)`
Draw a UTF-8 string of length n bytes right to left starting at the given x, y location.
- `void fl_scale (double x)`
Concatenate scaling transformation onto the current one.
- `void fl_scale (double x, double y)`
Concatenate scaling transformation onto the current one.
- `void fl_scroll (int X, int Y, int W, int H, int dx, int dy, void(*draw_area)(void *, int, int, int, int), void *data)`
Scroll a rectangle and draw the newly exposed portions.
- `void fl_set_spot (int font, int size, int X, int Y, int W, int H, FI_Window *win=0)`
Inform text input methods about the current text insertion cursor.
- `void fl_set_status (int X, int Y, int W, int H)`
Related to text input methods under X11.
- `const char * fl_shortcut_label (unsigned int shortcut)`
Get a human-readable string from a shortcut value.
- `const char * fl_shortcut_label (unsigned int shortcut, const char **eom)`
Get a human-readable string from a shortcut value.
- `double fl_transform_dx (double x, double y)`

- Transform distance using current transformation matrix.*
- double [fl_transform_dy](#) (double x, double y)
- Transform distance using current transformation matrix.*
- double [fl_transform_x](#) (double x, double y)
- Transform coordinate using the current transformation matrix.*
- double [fl_transform_y](#) (double x, double y)
- Transform coordinate using the current transformation matrix.*
- void [fl_transformed_vertex](#) (double xf, double yf)
- Add coordinate pair to the vertex list without further transformations.*
- void [fl_translate](#) (double x, double y)
- Concatenate translation transformation onto the current one.*
- void [fl_vertex](#) (double x, double y)
- Add a single vertex to the current path.*
- void [fl_xylene](#) (int x, int y, int x1)
- Draw a horizontal line from (x,y) to (x1,y).*
- void [fl_xylene](#) (int x, int y, int x1, int y2)
- Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).*
- void [fl_xylene](#) (int x, int y, int x1, int y2, int x3)
- Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).*
- void [fl_yxline](#) (int x, int y, int y1)
- Draw a vertical line from (x,y) to (x,y1)*
- void [fl_yxline](#) (int x, int y, int y1, int x2)
- Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).*
- void [fl_yxline](#) (int x, int y, int y1, int x2, int y3)
- Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).*

10.7.1 Detailed Description

FLTK global graphics and GUI drawing functions.

These functions are declared in [<FL/fl_draw.H>](#), and in [<FL/platform.H>](#) for offscreen buffer-related ones.

10.7.2 Enumeration Type Documentation

10.7.2.1 anonymous enum

anonymous enum

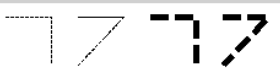

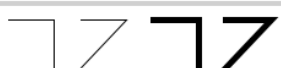

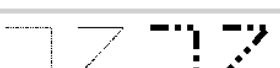

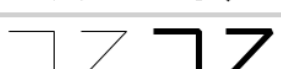

FL_SOLID		FL_CAP_FLAT	
FL_DASH		FL_CAP_ROUND	
FL_DOT		FL_CAP_SQUARE	
FL_DASHDOT		FL_JOIN_MITER	
FL_DASHDOTDOT		FL_JOIN_ROUND	
		FL_JOIN_BEVEL	

Figure 10.2 [fl_line_style\(\)](#) styles

Enumerator

FL_SOLID	line style: solid line
FL_DASH	line style: 75% dashed line
FL_DOT	line style: 50% pixel dotted
FL_DASHDOT	line style: dash / dot pattern
FL_DASHDOTDOT	line style: dash / two dot pattern
FL_CAP_FLAT	cap style: end is flat
FL_CAP_ROUND	cap style: end is round
FL_CAP_SQUARE	cap style: end wraps end point
FL_JOIN_MITER	join style: line join extends to a point
FL_JOIN_ROUND	join style: line join is rounded
FL_JOIN_BEVEL	join style: line join is tidied

10.7.3 Function Documentation

10.7.3.1 fl_add_symbol()

```
int fl_add_symbol (
    const char * name,
    void(* drawit ) (Fl_Color),
    int scalable)
```

Adds a symbol to the system.

Parameters

in	<i>name</i>	name of symbol (without the "@")
in	<i>drawit</i>	function to draw symbol
in	<i>scalable</i>	set to 1 if <i>drawit</i> uses scalable vector drawing

Returns

1 on success, 0 on failure

10.7.3.2 fl_antialias()

```
void fl_antialias (
    int state) [inline]
```

Turn antialiased line drawings ON or OFF, if supported by platform.

Currently, only the Windows platform allows to change whether line drawings are antialiased. Turning it OFF may accelerate heavy drawing operations.

10.7.3.3 fl_arc() [1/2]

```
void fl_arc (
    double x,
    double y,
    double r,
    double start,
    double end) [inline]
```

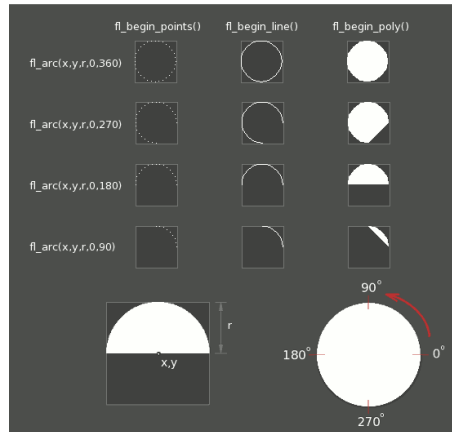

Add a series of points to the current path on the arc of a circle.

The arc is drawn counter-clockwise from 3 o'clock. If *end* is less than *start* then it draws the arc in a clockwise direction. To draw an arc across the 3 o'clock line, *start* and *end* can be greater than 360 or less than 0. For example, to draw a counter-clockwise arc from 6 to 12 o'clock, *start* would be -90 deg, and *end* would be at +90 deg.

You can get elliptical paths by using `scale` and `rotate` before calling `fl_arc()`.

Parameters

in	<i>x,y,r</i>	center and radius of circular arc
in	<i>start,end</i>	angles of start and end of arc measured in degrees

Figure 10.3 `fl_arc(x,y,r,a1,a2)`

Examples:

```
// Draw an arc of points
fl_begin_points();
fl_arc(100.0, 100.0, 50.0, 0.0, 180.0);
fl_end_points();

// Draw arc with a line
fl_begin_line();
fl_arc(200.0, 100.0, 50.0, 0.0, 180.0);
fl_end_line();

// Draw filled arc
fl_begin_polygon();
fl_arc(300.0, 100.0, 50.0, 0.0, 180.0);
fl_end_polygon();
```

10.7.3.4 `fl_arc()` [2/2]

```
void fl_arc (
    int x,
    int y,
    int w,
    int h,
    double a1,
    double a2) [inline]
```

Draw ellipse sections using integer coordinates.

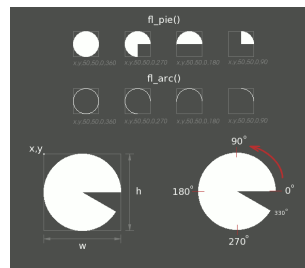

These functions match the rather limited circle drawing code provided by X and Windows. The advantage over using `fl_arc` with floating point coordinates is that they are faster because they often use the hardware, and they draw much nicer small circles, since the small sizes are often hard-coded bitmaps.

If a complete circle is drawn it will fit inside the passed bounding box. The two angles are measured in degrees counter-clockwise from 3 o'clock and are the starting and ending angle of the arc, `a2` must be greater or equal to `a1`.

`fl_arc()` draws a series of lines to approximate the arc. Notice that the integer version of `fl_arc()` has a different number of arguments than the double version `fl_arc(double x, double y, double r, double start, double end)`

Parameters

in	<i>x,y,w,h</i>	bounding box of complete circle
in	<i>a1,a2</i>	start and end angles of arc measured in degrees counter-clockwise from 3 o'clock. <code>a2</code> must be greater than or equal to <code>a1</code> .

Figure 10.4 `fl_pie()` and `fl_arc()`

10.7.3.5 `fl_begin_complex_polygon()`

```
void fl_begin_complex_polygon () [inline]
```

Start drawing a complex filled polygon.

The polygon may be concave, may have holes in it, or may be several disconnected pieces. Call `fl_gap()` to separate loops of the path.

To outline the polygon, use `fl_begin_loop()` and replace each `fl_gap()` with `fl_end_loop();fl_begin_loop()` pairs.

Note

For portability, you should only draw polygons that appear the same whether "even/odd" or "non-zero" winding rules are used to fill them. Holes should be drawn in the opposite direction to the outside loop.

10.7.3.6 `fl_begin_offscreen()`

```
void fl_begin_offscreen (
    Fl_Offscreen ctx)
```

Send all subsequent drawing commands to this offscreen buffer.

Parameters

<code>ctx</code>	the offscreen buffer.
------------------	-----------------------

Note

The `ctx` argument must have been created by `fl_create_offscreen()`.

10.7.3.7 `fl_begin_points()`

```
void fl_begin_points () [inline]
```

Start drawing a list of points.

Points are added to the list with `fl_vertex()`.

10.7.3.8 `fl_can_do_alpha_blending()`

```
char fl_can_do_alpha_blending () [inline]
```

Check whether platform supports true alpha blending for RGBA images.

Returns

1 if true alpha blending supported by platform

0 not supported so FLTK will use screen door transparency

10.7.3.9 fl_capture_window()

```
Fl_RGB_Image * fl_capture_window (
    Fl_Window * win,
    int x,
    int y,
    int w,
    int h)
```

Captures the content of a rectangular zone of a mapped window.

Parameters

<i>win</i>	a mapped Fl_Window (derived types including Fl_Gl_Window are also possible)
<i>x,y,w,h</i>	window area to be captured. Intersecting sub-windows are captured too.

Returns

The captured pixels as an [Fl_RGB_Image](#). The raw and drawing sizes of the image can differ. Returns NULL when capture was not successful. The image depth may differ between platforms.

Version

1.4

10.7.3.10 fl_circle()

```
void fl_circle (
    double x,
    double y,
    double r) [inline]
```

`fl_circle(x,y,r)` is equivalent to `fl_arc(x,y,r,0,360)`, but may be faster.

Parameters

in	<i>x,y,r</i>	center and radius of circle
----	--------------	-----------------------------

Note

`fl_circle()` is best used as part of the [Drawing Complex Shapes](#) API, that is, flanked by `fl_begin_XXX()` and `fl_end_XXX()` calls where XXX can be 'loop' or 'polygon' to draw, respectively a circle or a disk. Transformation functions (e.g., [fl_scale\(double, double\)](#)) can be also used for `fl_circle()` to draw empty or filled ellipses. It must be the *only* thing in the path: if you want a circle as part of a complex polygon you must use `fl_arc()`. Nevertheless, `fl_circle()` can also be used by itself to draw circles.

10.7.3.11 fl_clip()

```
void fl_clip (
    int x,
    int y,
    int w,
    int h) [inline]
```

Intersect the current clip region with a rectangle and push this new region onto the stack (deprecated).

Parameters

in	<i>x,y,w,h</i>	position and size
----	----------------	-------------------

Deprecated Please use `fl_push_clip(int x, int y, int w, int h)` instead. `fl_clip(int, int, int, int)` will be removed in FLTK 1.5.

10.7.3.12 fl_clip_box()

```
int fl_clip_box (
    int x,
    int y,
    int w,
    int h,
    int & X,
    int & Y,
    int & W,
    int & H) [inline]
```

Intersect a rectangle with the current clip region and return the bounding box of the result.

Returns non-zero if the resulting rectangle is different to the original. The given rectangle (*x*, *y*, *w*, *h*) *should* be entirely inside its window, otherwise the result may be unexpected, i.e. this function *may* not clip the rectangle to the window coordinates and size. In particular *x* and *y* *should* not be negative.

The resulting bounding box can be used to limit the necessary drawing to this rectangle.

Example:

```
void MyGroup::draw() {
    int X = 0, Y = 0, W = 0, H = 0;
    int ret = fl_clip_box(x(), y(), w(), h(), X, Y, W, H);
    if (ret == 0) { // entire group is visible (not clipped)
        // full drawing code here
    } else { // parts of this group are clipped
        // partial drawing code here (uses X, Y, W, and H to test)
    }
}
```

W and *H* are set to zero if the rectangle is completely outside the clipping region. In this case *X* and *Y* are undefined and should not be used. Possible values are (0, 0), (*x*, *y*), or anything else (platform dependent).

Note

This function is platform-dependent. If the given rectangle is not entirely inside the window, the results are not guaranteed to be the same on all platforms.

Parameters

in	<i>x,y,w,h</i>	position and size of rectangle
out	<i>X,Y,W,H</i>	position and size of resulting bounding box.

Returns

Non-zero if the resulting rectangle is different to the original.

See also

[fl_not_clipped\(\)](#)

10.7.3.13 fl_clip_region() [1/2]

```
Fl_Region fl_clip_region () [inline]
```

Return the current clipping region.

Note

This function is mostly intended for internal use by the FLTK library when drawing to the display. Its return value can be always NULL if the current drawing surface is not the display.

10.7.3.14 fl_clip_region() [2/2]

```
void fl_clip_region (
    Fl_Region r) [inline]
```

Replace the top of the clipping stack with a clipping region of any shape.

[Fl_Region](#) is an operating system specific type.

Note

This function is mostly intended for internal use by the FLTK library when drawing to the display. Its effect can be null if the current drawing surface is not the display.

Parameters

<code>in</code>	<code>r</code>	clipping region
-----------------	----------------	-----------------

10.7.3.15 fl_copy_offscreen()

```
void fl_copy_offscreen (
    int x,
    int y,
    int w,
    int h,
    Fl_Offscreen pixmap,
    int srcx,
    int srcy) [inline]
```

Copy a rectangular area of the given offscreen buffer into the current drawing destination.

Parameters

<code>x,y</code>	position where to draw the copied rectangle
<code>w,h</code>	size of the copied rectangle
<code>pixmap</code>	offscreen buffer containing the rectangle to copy
<code>srcx,srcy</code>	origin in offscreen buffer of rectangle to copy

10.7.3.16 fl_create_offscreen()

```
Fl_Offscreen fl_create_offscreen (
    int w,
    int h)
```

Creation of an offscreen graphics buffer.

Parameters

<code>w,h</code>	width and height in FLTK units of the buffer.
------------------	---

Returns

the created graphics buffer.

The pixel size of the created graphics buffer is equal to the number of pixels in an area of the screen containing the current window sized at `w,h` FLTK units. This pixel size varies with the value of the scale factor of this screen.

Note

Work with the `fl_XXX_offscreen()` functions is equivalent to work with an [Fl_Image_Surface](#) object, as follows :

Fl_Offscreen-based approach	Fl_Image_Surface-based approach
<code>Fl_Offscreen off = fl_create_offscreen(w, h)</code>	<code>Fl_Image_Surface *surface = new Fl_Image_Surface(w, h, 1)</code>
<code>fl_begin_offscreen(off)</code>	<code>Fl_Surface_Device::push_current(surface)</code>
<code>fl_end_offscreen()</code>	<code>Fl_Surface_Device::pop_current()</code>
<code>fl_copy_offscreen(x,y,w,h, off, sx,sy)</code>	<code>fl_copy_offscreen(x,y,w,h, surface->offscreen(), sx,sy)</code>
<code>fl_rescale_offscreen(off)</code>	<code>surface->rescale()</code>
<code>fl_delete_offscreen(off)</code>	delete surface

10.7.3.17 fl_cursor()

```
void fl_cursor (
    Fl\_Cursor c)
```

Sets the cursor for the current window to the specified shape and colors. The cursors are defined in the [<FL/Enumerations.H>](#) header file.

10.7.3.18 fl_curve()

```
void fl_curve (
    double X0,
    double Y0,
    double X1,
    double Y1,
    double X2,
    double Y2,
    double X3,
    double Y3) [inline]
```

Add a series of points on a Bézier curve to the path. The curve ends (and two of the points) are at X0,Y0 and X3,Y3.

Parameters

in	X0,Y0	curve start point
in	X1,Y1	curve control point
in	X2,Y2	curve control point
in	X3,Y3	curve end point

10.7.3.19 fl_delete_offscreen()

```
void fl_delete_offscreen (
    Fl\_Offscreen ctx)
```

Deletion of an offscreen graphics buffer.

Parameters

ctx	the buffer to be deleted.
-----	---------------------------

Note

The `ctx` argument must have been created by [fl_create_offscreen\(\)](#).

10.7.3.20 fl_draw() [1/5]

```
void fl_draw (
    const char * str,
    int x,
    int y)
```

Draw a nul-terminated UTF-8 string starting at the given `x`, `y` location.

Text is aligned to the left and to the baseline of the font. To align to the bottom, subtract [fl_descent\(\)](#) from `y`. To align to the top, subtract [fl_descent\(\)](#) and add [fl_height\(\)](#). This version of `fl_draw` provides direct access to the text drawing function of the underlying OS. It does not apply any special handling to control characters.

10.7.3.21 fl_draw() [2/5]

```
void fl_draw (
    const char * str,
    int x,
    int y,
    int w,
    int h,
    Fl_Align align,
    Fl_Image * img = 0,
    int draw_symbols = 1,
    int spacing = 0)
```

Fancy string drawing function which is used to draw all the labels.

The string is formatted and aligned inside the passed box. Handles '\t' and '\n', expands all other control characters to '^X', and aligns inside or against the edges of the box. See [Fl_Widget::align\(\)](#) for values of `align`. The value `FL_ALIGN_INSIDE` is ignored, as this function always prints inside the box. If `img` is provided and is not `NULL`, the image is drawn above or below the text as specified by the `align` value. The `draw_symbols` argument specifies whether or not to look for symbol names starting with the '@' character

Parameters

in	<i>str</i>	UTF-8 string, can start and end with an '@sym' symbol, can contain '\n'
in	<i>x,y,w,h</i>	bounding box
in	<i>align</i>	label and image alignment in bounding box
in	<i>img</i>	pointer to image
in	<i>draw_symbols</i>	if true, interpret leading and trailing '@sym' as graphical symbols
in	<i>spacing</i>	spacing between text and image

10.7.3.22 fl_draw() [3/5]

```
void fl_draw (
    const char * str,
    int x,
    int y,
    int w,
    int h,
    Fl_Align align,
    void(* callthis )(const char *, int, int, int),
    Fl_Image * img = 0,
    int draw_symbols = 1,
    int spacing = 0)
```

The same as `fl_draw(const char*,int,int,int,int,Fl_Align,Fl_Image*,int)` with the addition of the `callthis` parameter, which is a pointer to a text drawing function such as `fl_draw(const char*, int, int, int)` to do the real work.

Parameters

in	<i>str</i>	UTF-8 string, can start and end with an '@sym' symbol, can contain '\n'
in	<i>x,y,w,h</i>	bounding box
in	<i>align</i>	label and image alignment in bounding box
in	<i>callthis</i>	pointer to text drawing function
in	<i>img</i>	pointer to image
in	<i>draw_symbols</i>	if true, interpret leading and trailing '@sym' as graphical symbols
in	<i>spacing</i>	spacing between text and image

10.7.3.23 fl_draw() [4/5]

```
void fl_draw (
    int angle,
    const char * str,
    int n,
    int x,
    int y) [inline]
```

Draw at the given *x*, *y* location a UTF-8 string of length *n* bytes rotating *angle* degrees counter-clockwise.

Note

When using X11 (Unix, Linux, Cygwin et al.) this needs Xft to work. Under plain X11 (w/o Xft) rotated text is not supported by FLTK. A warning will be issued to stderr at runtime (only once) if you use this method with an angle other than 0.

10.7.3.24 fl_draw() [5/5]

```
void fl_draw (
    int angle,
    const char * str,
    int x,
    int y)
```

Draw a nul-terminated UTF-8 string starting at the given *x*, *y* location and rotating *angle* degrees counter-clockwise.

This version of `fl_draw` provides direct access to the text drawing function of the underlying OS and is supported by all fltk platforms except X11 without Xft.

10.7.3.25 fl_draw_arrow()

```
void fl_draw_arrow (
    Fl_Rect r,
    Fl_Arrow_Type t,
    Fl_Orientation o,
    Fl_Color col)
```

Draw an "arrow like" GUI element for the selected scheme.

In the future this function should be integrated in [Fl_Scheme](#) as a virtual method, i.e. it would call a method like ...

```
Fl_Scheme::current()->draw_arrow(r, t, o, col);
```

Parameters

in	<i>r</i>	bounding box
in	<i>t</i>	arrow type
in	<i>o</i>	orientation
in	<i>col</i>	arrow color

Since

1.4.0

10.7.3.26 fl_draw_box()

```
void fl_draw_box (
    Fl_Boxtype t,
    int x,
    int y,
    int w,
    int h,
    Fl_Color c)
```

Draws a box using given type, position, size and color.

Parameters

in	<i>t</i>	box type
in	<i>x,y,w,h</i>	position and size
in	<i>c</i>	color

10.7.3.27 fl_draw_box_focus()

```
void fl_draw_box_focus (
    Fl_Boxtype bt,
    int x,
    int y,
    int w,
    int h,
    Fl_Color fg,
    Fl_Color bg)
```

Draws the focus rectangle inside a box using given type, position, size and color.

Boxes can set their own focus drawing callback. The focus frame does not need to be a rectangle at all, but should fit inside the shape of the box.

Parameters

in	<i>bt</i>	box type
in	<i>x,y,w,h</i>	position and size
in	<i>fg,bg</i>	foreground and background color

10.7.3.28 fl_draw_check()

```
void fl_draw_check (
    Fl_Rect bb,
    Fl_Color col)
```

Draw a check mark inside the given bounding box.

The check mark is allowed to fill the entire box but the algorithm used makes sure that a 1-pixel border is kept free if the box is large enough. You need to calculate margins for box borders etc. yourself.

The check mark size is limited (minimum and maximum size) and the check mark is always centered in the given box.

Note

If the box is too small (bad GUI design) the check mark will be drawn over the box borders. This is intentional for better user experience. Otherwise users might not be able to recognize if a box is checked.

The size limits are implementation details and may be changed at any time.

Parameters

in	<i>bb</i>	rectangle that defines the bounding box
in	<i>col</i>	Fl_Color to draw the check mark

Since

1.4.0

10.7.3.29 fl_draw_circle()

```
void fl_draw_circle (
    int x,
    int y,
    int d,
    Fl_Color color)
```

Draw a potentially small, filled circle using a given color.

This function draws a filled circle bounded by rectangle (x, y, d, d) using color `color`

This function is the same as `fl_pie(x, y, d, d, 0, 360)` except with some systems that don't draw small circles well. In that situation, the circle diameter `d` is converted from FLTK units to pixels and this function approximates a filled circle by drawing several filled rectangles if the converted diameter is 6 pixels.

The current drawing color `fl_color()` is preserved across the call.

Parameters

in	<i>x,y</i>	coordinates of top left of the bounding box
in	<i>d</i>	diameter == width and height of the bounding box in FLTK units
in	<i>color</i>	the color used to draw the circle

Since

1.4.0

10.7.3.30 fl_draw_image() [1/2]

```
void fl_draw_image (
    const uchar * buf,
    int X,
    int Y,
    int W,
    int H,
    int D = 3,
    int L = 0) [inline]
```

Draw an 8-bit per color RGB or luminance image.

Parameters

in	<i>buf</i>	points at the "r" data of the top-left pixel. Color data must be in <i>r, g, b</i> order. Luminance data is only one <i>gray</i> byte.
in	<i>X,Y</i>	position where to put top-left corner of image
in	<i>W,H</i>	size of the image
in	<i>D</i>	delta to add to the pointer between pixels. It may be any value greater than or equal to 1, or it can be negative to flip the image horizontally
in	<i>L</i>	delta to add to the pointer between lines (if 0 is passed it uses $W * D$), and may be larger than $W * D$ to crop data, or negative to flip the image vertically

It is highly recommended that you put the following code before the first `show()` of *any* window in your program to get rid of the dithering if possible:

```
Fl::visual(FL_RGB);
```

Gray scale (1-channel) images may be drawn. This is done if `abs(D)` is less than 3, or by calling `fl_draw_image_mono()`. Only one 8-bit sample is used for each pixel, and on screens with different numbers of bits for red, green, and blue only gray colors are used. Setting `D` greater than 1 will let you display one channel of a color image.

Note:

The X version does not support all possible visuals. If FLTK cannot draw the image in the current visual it will abort. FLTK supports any visual of 8 bits or less, and all common TrueColor visuals up to 32 bits.

10.7.3.31 fl_draw_image() [2/2]

```
void fl_draw_image (
    Fl_Draw_Image_Cb cb,
    void * data,
    int X,
    int Y,
    int W,
    int H,
    int D = 3) [inline]
```

Draw an image using a callback function to generate image data.

You can generate the image as it is being drawn, or do arbitrary decompression of stored data, provided it can be decompressed to individual scan lines.

Parameters

in	<i>cb</i>	callback function to generate scan line data
in	<i>data</i>	user data passed to callback function
in	<i>X,Y</i>	screen position of top left pixel
in	<i>W,H</i>	image width and height
in	<i>D</i>	data size per pixel in bytes (must be greater than 0)

See also

[fl_draw_image\(const uchar* buf, int X, int Y, int W, int H, int D, int L\)](#)

The callback function *cb* is called with the `void* data` user data pointer to allow access to a structure of information about the image, and the *x*, *y*, and *w* of the scan line desired from the image. 0,0 is the upper-left corner of the image, not *x*, *y*. A pointer to a buffer to put the data into is passed. You must copy *w* pixels from scanline *y*, starting at pixel *x*, to this buffer.

Due to cropping, less than the whole image may be requested. So *x* may be greater than zero, the first *y* may be greater than zero, and *w* may be less than *W*. The buffer is long enough to store the entire *W* * *D* pixels, this is for convenience with some decompression schemes where you must decompress the entire line at once: decompress it into the buffer, and then if *x* is not zero, copy the data over so the *x*'th pixel is at the start of the buffer.

You can assume the *y*'s will be consecutive, except the first one may be greater than zero.

If *D* is 4 or more, you must fill in the unused bytes with zero.

10.7.3.32 fl_draw_image_mono() [1/2]

```
void fl_draw_image_mono (
    const uchar * buf,
    int X,
    int Y,
    int W,
    int H,
    int D = 1,
    int L = 0) [inline]
```

Draw a gray-scale (1 channel) image.

See also

[fl_draw_image\(const uchar* buf, int X,int Y,int W,int H, int D, int L\)](#)

10.7.3.33 fl_draw_image_mono() [2/2]

```
void fl_draw_image_mono (
    Fl_Draw_Image_Cb cb,
    void * data,
```

```

int X,
int Y,
int W,
int H,
int D = 1) [inline]

```

Draw a gray-scale image using a callback function to generate image data.

See also

[fl_draw_image\(Fl_Draw_Image_Cb cb, void* data, int X,int Y,int W,int H, int D\)](#)

10.7.3.34 fl_draw_pixmap() [1/2]

```

int fl_draw_pixmap (
    char *const * data,
    int x,
    int y,
    Fl_Color bg = FL_GRAY) [inline]

```

Draw XPM image data, with the top-left corner at the given position.

See also

[fl_draw_pixmap\(const char* const* data, int x, int y, Fl_Color bg\)](#)

10.7.3.35 fl_draw_pixmap() [2/2]

```

int fl_draw_pixmap (
    const char *const * cdata,
    int x,
    int y,
    Fl_Color bg = FL_GRAY)

```

Draw XPM image data, with the top-left corner at the given position.

The image is dithered on 8-bit displays so you won't lose color space for programs displaying both images and pixmaps.

Parameters

in	<i>cdata</i>	pointer to XPM image data
in	<i>x,y</i>	position of top-left corner
in	<i>bg</i>	background color

Returns

0 if there was any error decoding the XPM data.

10.7.3.36 fl_draw_radio()

```

void fl_draw_radio (
    int x,
    int y,
    int d,
    Fl_Color color)

```

Draw a round check mark (circle) of a radio button.

This draws only the round "radio button mark", it does not draw the (also typically round) box of the radio button.

Call this only if the radio button is ON.

This method draws a scheme specific "circle" with a particular light effect if the scheme is gtk+. For all other schemes this function draws a simple, small circle.

The *color* must be chosen by the caller so it has enough contrast with the background.

The bounding box of the circle is the rectangle (*x*, *y*, *d*, *d*).

The current drawing color [fl_color\(\)](#) is preserved across the call.

Parameters

in	<i>x,y</i>	coordinates of top left of the bounding box
in	<i>d</i>	diameter == width and height of the bounding box in FLTK units
in	<i>color</i>	the base color used to draw the circle

Since

1.4.0

10.7.3.37 fl_draw_symbol()

```
int fl_draw_symbol (
    const char * label,
    int x,
    int y,
    int w,
    int h,
    Fl_Color col)
```

Draw the named symbol in the given rectangle using the given color.

Parameters

in	<i>label</i>	name of symbol
in	<i>x,y</i>	position of symbol
in	<i>w,h</i>	size of symbol
in	<i>col</i>	color of symbox

Returns

1 on success, 0 on failure

10.7.3.38 fl_expand_text()

```
const char * fl_expand_text (
    const char * from,
    char * buf,
    int maxbuf,
    double maxw,
    int & n,
    double & width,
    int wrap,
    int draw_symbols)
```

Copy *from* to *buf*, replacing control characters with ^X.

Stop at a newline or if *maxbuf* characters written to buffer. Also word-wrap if width exceeds *maxw*. Returns a pointer to the start of the next line of characters. Sets *n* to the number of characters put into the buffer. Sets width to the width of the string in the [current font](#).

Parameters

in	<i>from</i>	input text, can contain ' ' and single or double '@' characters
out	<i>buf</i>	buffer for the output text segment
in	<i>maxbuf</i>	size of the buffer, or 0 to use the internal buffer allocated in this function
in	<i>maxw</i>	maximum width in pixels of the output text

Parameters

out	<i>n</i>	number of characters in the output text segment
out	<i>width</i>	actual width in pixels of the output text
in	<i>wrap</i>	if true, wrap at maxw, else wrap at newlines
in	<i>draw_symbols</i>	if true, double '@' characters are escaped into a single '@'

Returns

pointer to the next character in the input text

10.7.3.39 fl_focus_rect()

```
void fl_focus_rect (
    int x,
    int y,
    int w,
    int h) [inline]
```

Draw a dotted rectangle, used to indicate keyboard focus on a widget.

This method draws the rectangle in the current color and independent of the [Fl::visible_focus\(\)](#) option. You may need to set the current color with [fl_color\(\)](#) before you call this.

10.7.3.40 fl_frame()

```
void fl_frame (
    const char * s,
    int x,
    int y,
    int w,
    int h)
```

Draws a series of line segments around the given box.

The string *s* must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The order of each set of 4 characters is: top, left, bottom, right. The result of calling [fl_frame\(\)](#) with a string that is not a multiple of 4 characters in length is undefined. The only difference between this function and [fl_frame2\(\)](#) is the order of the line segments.

Parameters

in	<i>s</i>	sets of 4 grayscale values in top, left, bottom, right order
in	<i>x,y,w,h</i>	position and size

10.7.3.41 fl_frame2()

```
void fl_frame2 (
    const char * s,
    int x,
    int y,
    int w,
    int h)
```

Draws a series of line segments around the given box.

The string *s* must contain groups of 4 letters which specify one of 24 standard grayscale values, where 'A' is black and 'X' is white. The order of each set of 4 characters is: bottom, right, top, left. The result of calling [fl_frame2\(\)](#) with a string that is not a multiple of 4 characters in length is undefined. The only difference between this function and [fl_frame\(\)](#) is the order of the line segments.

Parameters

in	<i>s</i>	sets of 4 grayscale values in bottom, right, top, left order
in	<i>x,y,w,h</i>	position and size

10.7.3.42 fl_gap()

```
void fl_gap () [inline]
```

Separate loops of the path.

It is unnecessary but harmless to call `fl_gap()` before the first vertex, after the last vertex, or several times in a row.

10.7.3.43 fl_line_style()

```
void fl_line_style (
    int style,
    int width = 0,
    char * dashes = 0) [inline]
```

Set how to draw lines (the "pen").

If you change this it is your responsibility to set it back to the default using `fl_line_style(0)`.

Figure 10.5 fl_line_style() styles

Parameters

in	<i>style</i>	A bitmask which is a bitwise-OR of Line Styles , a cap style, and a join style. If you don't specify a dash type you will get a solid line. If you don't specify a cap or join type you will get a system-defined default of whatever value is fastest.
in	<i>width</i>	The thickness of the lines in pixels. Zero results in the system defined default, which on both X and Windows is somewhat different and nicer than 1.
in	<i>dashes</i>	A pointer to an array of dash lengths, measured in pixels. The first location is how long to draw a solid portion, the next is how long to draw the gap, then the solid, etc. It is terminated with a zero-length entry. A <code>NULL</code> pointer or a zero-length array results in a solid line. Odd array sizes are not supported and result in undefined behavior.

Note

Because of how line styles are implemented on Win32 systems, you *must* set the line style *after* setting the drawing color. If you set the color after the line style you will lose the line style settings.

The `dashes` array does not work under the (unsupported!) operating systems Windows 95, 98 or Me, since those operating systems do not support complex line styles.

10.7.3.44 fl_load_matrix()

```
void fl_load_matrix (
    double a,
    double b,
    double c,
    double d,
    double x,
    double y) [inline]
```

Set the current transformation matrix.

Parameters

in	<i>a,b,c,d,x,y</i>	transformation matrix elements
----	--------------------	--------------------------------

10.7.3.45 fl_measure()

```
void fl_measure (
    const char * str,
    int & w,
    int & h,
    int draw_symbols)
```

Measure how wide and tall the string will be when printed by the `fl_draw()` function with `align` parameter.

If the incoming `w` is non-zero it will wrap to that width.

The [current font](#) is used to do the width/height calculations, so unless its value is known at the time `fl_measure()` is called, it is advised to first set the current font with `fl_font()`. With event-driven GUI programming you can never be sure which widget was exposed and redrawn last, nor which font it used. If you have not called `fl_font()` explicitly in your own code, the width and height may be set to unexpected values, even zero!

Note: In the general use case, it's a common error to forget to set `w` to 0 before calling `fl_measure()` when wrap behavior isn't needed.

Parameters

in	<i>str</i>	nul-terminated string
in, out	<i>w</i>	call with <code>w=0</code> , or with the preferred width for word wrapping, returns with the width of the string in current font
out	<i>h</i>	height of string in current font
in	<i>draw_symbols</i>	non-zero to enable @symbol handling [default=1]

```
// Example: Common use case for fl_measure()
const char *s = "This is a test";
int wi=0, hi=0; // initialize to zero before calling fl_measure()
fl_font(FL_HELVETICA, 14); // set current font face/size to be used for measuring
fl_measure(s, wi, hi); // returns pixel width/height of string in current font
```

10.7.3.46 fl_measure_pixmap() [1/2]

```
int fl_measure_pixmap (
    char *const * data,
    int & w,
    int & h)
```

Get the dimensions of a pixmap.

An XPM image contains the dimensions in its data. This function returns the width and height.

Parameters

in	<i>data</i>	pointer to XPM image data.
out	<i>w,h</i>	width and height of image

Returns

non-zero if the dimensions were parsed OK
 0 if there were any problems

10.7.3.47 fl_measure_pixmap() [2/2]

```
int fl_measure_pixmap (
    const char *const * cdata,
    int & w,
    int & h)
```

Get the dimensions of a pixmap.

See also

[fl_measure_pixmap\(char* const* data, int &w, int &h\)](#)

10.7.3.48 fl_mult_matrix()

```
void fl_mult_matrix (
    double a,
    double b,
    double c,
    double d,
    double x,
    double y) [inline]
```

Concatenate another transformation onto the current one.

Parameters

in	a, b, c, d, x, y	transformation matrix elements such that $X' = aX + cY + x$ and $Y' = bX + dY + y$
----	--------------------	--

10.7.3.49 fl_not_clipped()

```
int fl_not_clipped (
    int x,
    int y,
    int w,
    int h) [inline]
```

Does the rectangle intersect the current clip region?

Parameters

in	x, y, w, h	position and size of rectangle
----	--------------	--------------------------------

Returns

non-zero if any of the rectangle intersects the current clip region. If this returns 0 you don't have to draw the object.

Note

Under X this returns 2 if the rectangle is partially clipped and 1 if it is entirely inside the clip region.

See also

[fl_clip_box\(\)](#)

10.7.3.50 fl_old_shortcut()

```
unsigned int fl_old_shortcut (
    const char * s)
```

Emulation of XForms named shortcuts.

Converts ASCII shortcut specifications (eg. "^c") into the FLTK integer equivalent (eg. FL_CTRL+'c')

These ASCII characters are used to specify the various keyboard modifier keys:

```
# - Alt
+ - Shift
^ - Control
! - Meta
@ - Command (Ctrl on linux/win, Meta on OSX)
```

These special characters can be combined to form chords of modifier keys. (See 'Remarks' below)

After the optional modifier key prefixes listed above, one can either specify a single keyboard character to use as the shortcut, or a numeric sequence in hex, decimal or octal.

Examples:

```
"c"      -- Uses 'c' as the shortcut
"#^c"    -- Same as FL_ALT|FL_CTRL|'c'
"#^!c"   -- Same as FL_ALT|FL_CTRL|FL_META|'c'
"@c"     -- Same as FL_COMMAND|'c' (see FL_COMMAND for platform specific behavior)
"0x63"   -- Same as "c" (hex 63=='c')
"99"     -- Same as "c" (dec 99=='c')
"0143"   -- Same as "c" (octal 0143=='c')
"^0x63"  -- Same as (FL_CTRL|'c'), or (FL_CTRL|0x63)
"^99"    -- Same as (FL_CTRL|'c'), or (FL_CTRL|99)
"^0143"  -- Same as (FL_CTRL|'c'), or (FL_CTRL|0143)
```

Remarks

Due to XForms legacy, there are some odd things to consider when using the modifier characters.

(1) You can use the special modifier keys for chords *only* if the modifiers are provided in this order: #, +, ^, !, @. Other ordering can yield undefined results.

So for instance, Ctrl-Alt-c must be specified as "#^c" (and not "^#c"), due to the above ordering rule.

(2) If you want to make a shortcut that uses one of the special modifier characters (as the character being modified), then to avoid confusion, specify the numeric equivalent, e.g.

If you want..	Then use..
'#' as the shortcut..	"0x23" (instead of just "#").
'+' as the shortcut..	"0x2b" (instead of just "+").
'^' as the shortcut..	"0x5e" (instead of just "^").
Alt-+ as the shortcut..	"#0x2b" (instead of "##+").
Alt-^ as the shortcut..	"#0x5e" (instead of "#^").
..etc..	

As a general rule that's easy to remember, unless the shortcut key to be modified is a single alpha-numeric character [A-Z,a-z,0-9], it's probably best to use the numeric equivalents.

Don't fix these silly legacy issues in a future release. Nobody is using this anymore.

10.7.3.51 fl_overlay_clear()

```
void fl_overlay_clear ()
```

Erase a selection rectangle without drawing a new one.

See also

[fl_overlay_rect\(int x, int y, int w, int h\)](#)

10.7.3.52 fl_overlay_rect()

```
void fl_overlay_rect (
    int x,
    int y,
    int w,
    int h)
```

Draw a transient dotted selection rectangle.

This function saves the current screen content and then draws a dotted selection rectangle into the front screen buffer. If another selection rectangle was drawn earlier, the previous screen graphics are restored first.

To clear the selection rectangle, call [fl_overlay_clear\(\)](#).

The typical (and only) use for this function is to draw a selection rectangle during a mouse drag event sequence without having to redraw the entire content of the widget.

Your event handle should look similar to this (also see `test/mandelbrot.cxx`):

```
int MyWidget::handle(int event) {
    static int ix, iy;
    switch (event) {
        case FL_PUSH:
            ix = Fl::event_x(); iy = Fl::event_y();
            return 1;
        case FL_DRAG:
            this->make_current();
            fl_overlay_rect(ix, iy, ix-Fl::event_x(), iy-Fl::event_y());
            return 1;
        case FL_RELEASE:
            this->make_current();
            fl_overlay_clear();
            // select the element under the rectangle
            return 1;
    }
    return MySuperWidget::handle(event);
}
```

Note

Between drawing an overlay rect and clearing it, the content of the widget must not change.

[fl_overlay_rect\(\)](#) and [fl_overlay_clear\(\)](#) should be called when the actual event occurs, and *not* within `MyWidget::draw()`.

[fl_overlay_rect\(\)](#) and [fl_overlay_clear\(\)](#) should not be mixed with [Fl_Overlay_Window](#). [Fl_Overlay_Window](#) provides an entirely different way of drawing selection outlines and is not limited to rectangles.

Parameters

<code>x,y,w,h</code>	position and size of the overlay rectangle.
----------------------	---

See also

[fl_overlay_clear\(\)](#)

10.7.3.53 fl_override_scale()

```
float fl_override_scale ()
```

Removes any GUI scaling factor in subsequent drawing operations.

This must be matched by a later call to [fl_restore_scale\(\)](#). This function can be used to transiently perform drawing operations that are not rescaled by the current value of the GUI scaling factor. It's not supported to call [fl_push_clip\(\)](#) while transiently removing scaling.

Returns

The GUI scaling factor value that was in place when the function started.

10.7.3.54 fl_pie()

```
void fl_pie (
    int x,
    int y,
    int w,
    int h,
    double a1,
    double a2) [inline]
```

Draw filled ellipse sections using integer coordinates.

Like [fl_arc\(\)](#), but [fl_pie\(\)](#) draws a filled-in pie slice. This slice may extend outside the line drawn by [fl_arc\(\)](#); to avoid this use $w - 1$ and $h - 1$.

Parameters

in	x, y, w, h	bounding box of complete circle
in	$a1, a2$	start and end angles of arc measured in degrees counter-clockwise from 3 o'clock. $a2$ must be greater than or equal to $a1$.

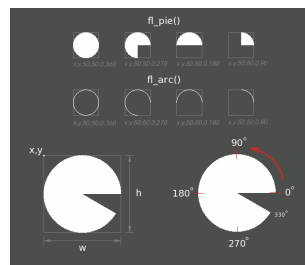

Figure 10.6 [fl_pie\(\)](#) and [fl_arc\(\)](#)

10.7.3.55 fl_polygon()

```
void fl_polygon (
    int x,
    int y,
    int x1,
    int y1,
    int x2,
    int y2,
    int x3,
    int y3) [inline]
```

Fill a 4-sided polygon.

The polygon must be convex.

10.7.3.56 fl_pop_clip()

```
void fl_pop_clip () [inline]
```

Restore the previous clip region.

You must call [fl_pop_clip\(\)](#) once for every time you call [fl_push_clip\(\)](#). Unpredictable results may occur if the clip stack is not empty when you return to FLTK.

10.7.3.57 fl_push_clip()

```
void fl_push_clip (
    int x,
    int y,
```

```

    int w,
    int h) [inline]

```

Intersect the current clip region with a rectangle and push this new region onto the stack.

Parameters

in	<i>x,y,w,h</i>	position and size
----	----------------	-------------------

10.7.3.58 fl_push_matrix()

```
void fl_push_matrix () [inline]
```

Save the current transformation matrix on the stack.

The maximum depth of the stack is 32.

10.7.3.59 fl_read_image()

```

uchar * fl_read_image (
    uchar * p,
    int X,
    int Y,
    int w,
    int h,
    int alpha)

```

Reads an RGB(A) image from the current window or off-screen buffer.

Parameters

in	<i>p</i>	pixel buffer, or NULL to allocate one
in	<i>X,Y</i>	position of top-left of image to read
in	<i>w,h</i>	width and height of image to read
in	<i>alpha</i>	alpha value for image (0 for none)

Returns

pointer to pixel buffer, or NULL if allocation failed.

The *p* argument points to a buffer that can hold the image and must be at least *w*h*3* bytes when reading RGB images, or *w*h*4* bytes when reading RGBA images. If NULL, [fl_read_image\(\)](#) will create an array of the proper size which can be freed using `delete[]`.

The *alpha* parameter controls whether an alpha channel is created and the value that is placed in the alpha channel. If 0, no alpha channel is generated.

See also

[fl_capture_window\(\)](#)

10.7.3.60 fl_rect() [1/3]

```

void fl_rect (
    Fl_Rect r) [inline]

```

Draw a border *inside* the given bounding box.

This is the same as [fl_rect\(int x, int y, int w, int h\)](#) but with [Fl_Rect](#) *r* as input argument.

10.7.3.61 fl_rect() [2/3]

```
void fl_rect (
    int x,
    int y,
    int w,
    int h) [inline]
```

Draw a border *inside* the given bounding box.

This function is meant for quick drawing of simple boxes. The behavior is undefined for line widths that are not 1.

10.7.3.62 fl_rect() [3/3]

```
void fl_rect (
    int x,
    int y,
    int w,
    int h,
    Fl_Color c) [inline]
```

Draw with passed color a border *inside* the given bounding box.

Warning

The current color is changed to `c` upon return.

10.7.3.63 fl_rectf() [1/4]

```
void fl_rectf (
    Fl_Rect bb,
    uchar r,
    uchar g,
    uchar b) [inline]
```

Color a rectangle with "exactly" the passed `r`, `g`, `b` color.

This is the same as `fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)` but with `Fl_Rect bb` (bounding box) as argument instead of `(x, y, w, h)`.

See also

`fl_rectf(int x, int y, int w, int h, uchar r, uchar g, uchar b)`

10.7.3.64 fl_rectf() [2/4]

```
void fl_rectf (
    Fl_Rect r,
    Fl_Color c) [inline]
```

Color with passed color a rectangle that exactly fills the given bounding box.

Warning

The current color is changed to `c` upon return.

10.7.3.65 fl_rectf() [3/4]

```
void fl_rectf (
    int x,
    int y,
    int w,
    int h,
    Fl_Color c) [inline]
```

Color with passed color a rectangle that exactly fills the given bounding box.

Warning

The current color is changed to `c` upon return.

10.7.3.66 fl_rectf() [4/4]

```
void fl_rectf (
    int x,
    int y,
    int w,
    int h,
    uchar r,
    uchar g,
    uchar b) [inline]
```

Color a rectangle with "exactly" the passed `r, g, b` color.

On screens with less than 24 bits of color this is done by drawing a solid-colored block using [fl_draw_image\(\)](#) so that the correct color shade is produced. On other screens, the current color is changed to `fl_color(r, g, b)` upon return.

10.7.3.67 fl_rescale_offscreen()

```
void fl_rescale_offscreen (
    Fl_Offscreen & ctx)
```

Adapts an offscreen buffer to a changed value of the scale factor.

The `ctx` argument must have been created by [fl_create_offscreen\(\)](#) and the calling context must not be between [fl_begin_offscreen\(\)](#) and [fl_end_offscreen\(\)](#). The graphical content of the offscreen is preserved. The current scale factor value is given by `Fl_Graphics_Driver::default_driver().scale()`.

Version

1.4

10.7.3.68 fl_reset_spot()

```
void fl_reset_spot (
    void )
```

Resets marked text.

In many languages, typing a character can involve multiple keystrokes. For example, the Å can be composed of two dots (¨) on top of the character, followed by the letter A (on a Mac with U.S. keyboard, you'd type Alt-U, Shift-A. To inform the user that the dots may be followed by another character, the ¨ is underlined).

Call this function if character composition needs to be aborted for some reason. One such example would be the text input widget losing focus.

10.7.3.69 fl_restore_scale()

```
void fl_restore_scale (
    float s)
```

Restores the GUI scaling factor in subsequent drawing operations.

Parameters

<code>s</code>	Value returned by a previous call to fl_override_scale() .
----------------	--

10.7.3.70 fl_rotate()

```
void fl_rotate (
    double d) [inline]
```

Concatenate rotation transformation onto the current one.

Parameters

in	d	- rotation angle, counter-clockwise in degrees (not radians)
----	-----	--

10.7.3.71 fl_rounded_rect()

```
void fl_rounded_rect (
    int x,
    int y,
    int w,
    int h,
    int r) [inline]
```

Draw a rounded border *inside* the given bounding box.

The radius code is optimized for speed and works best for values between 5 and 15 units.

10.7.3.72 fl_rounded_rectf()

```
void fl_rounded_rectf (
    int x,
    int y,
    int w,
    int h,
    int r) [inline]
```

Color with current color a rounded rectangle that exactly fills the given bounding box.

The radius code is optimized for speed and works best for values between 5 and 15 units.

10.7.3.73 fl_scale() [1/2]

```
void fl_scale (
    double x) [inline]
```

Concatenate scaling transformation onto the current one.

Parameters

in	x	scale factor in both x-direction and y-direction
----	-----	--

10.7.3.74 fl_scale() [2/2]

```
void fl_scale (
    double x,
    double y) [inline]
```

Concatenate scaling transformation onto the current one.

Parameters

in	x,y	scale factors in x-direction and y-direction
----	-------	--

10.7.3.75 fl_scroll()

```
void fl_scroll (
    int X,
    int Y,
    int W,
    int H,
    int dx,
```

```

    int dy,
    void(* draw_area )(void *, int, int, int, int),
    void * data)

```

Scroll a rectangle and draw the newly exposed portions.

Parameters

in	<i>X,Y</i>	position of top-left of rectangle
in	<i>W,H</i>	size of rectangle
in	<i>dx,dy</i>	pixel offsets for shifting rectangle
in	<i>draw_area</i>	callback function to draw rectangular areas
in	<i>data</i>	pointer to user data for callback The contents of the rectangular area is first shifted by <i>dx</i> and <i>dy</i> pixels. The <i>draw_area</i> callback is then called for every newly exposed rectangular area.

Warning

With FLTK 1.4 and above, it's recommended to put graphical elements in an [Fl_Scroll](#) widget rather than use function [fl_scroll\(\)](#) to update those elements. That's because [fl_scroll\(\)](#) may not produce a pixel-accurate result when the GUI scaling factor value is not a multiple of 100%. Alternatively, use [fl_scroll\(\)](#) when the scaling factor value is a multiple of 100% and perform a full redraw of the graphical elements otherwise. Statement `float s = Fl::screen_scale(win->screen_num());` gives the current scaling factor value given [Fl_Window](#) *win.

10.7.3.76 fl_set_spot()

```

void fl_set_spot (
    int font,
    int size,
    int X,
    int Y,
    int W,
    int H,
    Fl\_Window * win = 0)

```

Inform text input methods about the current text insertion cursor.

Parameters

<i>font</i>	Font currently in use in text input.
<i>size</i>	Size of the current font.
<i>X,Y</i>	Position of the bottom of the current text insertion cursor.
<i>W,H</i>	Width and height of the current text insertion cursor.
<i>win</i>	Points to the Fl_Window object containing the current text widget, or NULL.

10.7.3.77 fl_set_status()

```

void fl_set_status (
    int X,
    int Y,
    int W,
    int H)

```

Related to text input methods under X11.

This function is presently used only by the `utf8` test application and only for the X11 platform. This function is apparently not indispensable for text input to work correctly as suggested by other apps that don't use it (e.g., editor).

10.7.3.78 fl_shortcut_label() [1/2]

```
const char * fl_shortcut_label (
    unsigned int shortcut)
```

Get a human-readable string from a shortcut value.

Unparse a shortcut value as used by [Fl_Button](#) or [Fl_Menu_Item](#) into a human-readable string like "Alt+N". This only works if the shortcut is a character key or a numbered function key. If the shortcut is zero then an empty string is returned. The return value points at a static buffer that is overwritten with each call.

Since

FLTK 1.3.4 modifier key names can be localized, but key names can not yet be localized. This may be added to a future FLTK version.

Modifier key names (human-readable shortcut names) can be defined with the following global const char * pointer variables:

- fl_local_ctrl => name of FL_CTRL
- fl_local_alt => name of FL_ALT
- fl_local_shift => name of FL_SHIFT
- fl_local_meta => name of FL_META

```
fl_local_ctrl = "Strg";      // German for "Ctrl"
fl_local_shift = "Umschalt"; // German for "Shift"
```

Note

Due to **random** static initialization order this should always be done from code in main() or called by main() as opposed to static initialization since the default strings in the FLTK library are set by static initializers. Otherwise this **might** result in the wrong order so FLTK's internal initialization overwrites your strings.

The shortcut name will be constructed by adding all modifier names in the order defined above plus the name of the key. A '+' character is added to each modifier name unless it has a trailing '\' or a trailing '+'.
Example:

Ctrl+Alt+Shift+Meta+F12

The default values for modifier key names are as given above for all platforms except macOS. macOS uses graphical characters that represent the typical macOS modifier names in menus, e.g. cloverleaf, saucepan, etc. You may, however, redefine macOS modifier names as well.

Parameters

in	<i>shortcut</i>	the integer value containing the ASCII character or extended keystroke plus modifiers
----	-----------------	---

Returns

a pointer to a static buffer containing human readable text for the shortcut

10.7.3.79 fl_shortcut_label() [2/2]

```
const char * fl_shortcut_label (
    unsigned int shortcut,
    const char ** eom)
```

Get a human-readable string from a shortcut value.

Parameters

in	<i>shortcut</i>	the integer value containing the ASCII character or extended keystroke plus modifiers
in	<i>eom</i>	if this pointer is set, it will receive a pointer to the end of the modifier text

Returns

a pointer to a static buffer containing human readable text for the shortcut

See also

[fl_shortcut_label\(unsigned int shortcut\)](#)

10.7.3.80 fl_transform_dx()

```
double fl_transform_dx (  
    double x,  
    double y) [inline]
```

Transform distance using current transformation matrix.

Parameters

in	x,y	coordinate
----	-----	------------

10.7.3.81 fl_transform_dy()

```
double fl_transform_dy (  
    double x,  
    double y) [inline]
```

Transform distance using current transformation matrix.

Parameters

in	x,y	coordinate
----	-----	------------

10.7.3.82 fl_transform_x()

```
double fl_transform_x (  
    double x,  
    double y) [inline]
```

Transform coordinate using the current transformation matrix.

Parameters

in	x,y	coordinate
----	-----	------------

10.7.3.83 fl_transform_y()

```
double fl_transform_y (  
    double x,  
    double y) [inline]
```

Transform coordinate using the current transformation matrix.

Parameters

in	x,y	coordinate
----	-----	------------

10.7.3.84 fl_transformed_vertex()

```
void fl_transformed_vertex (  
    double xf,  
    double yf) [inline]
```

Add coordinate pair to the vertex list without further transformations.

Parameters

in	<i>xf,yf</i>	transformed coordinate
----	--------------	------------------------

10.7.3.85 fl_translate()

```
void fl_translate (
    double x,
    double y) [inline]
```

Concatenate translation transformation onto the current one.

Parameters

in	<i>x,y</i>	translation factor in x-direction and y-direction
----	------------	---

10.7.3.86 fl_vertex()

```
void fl_vertex (
    double x,
    double y) [inline]
```

Add a single vertex to the current path.

Parameters

in	<i>x,y</i>	coordinate
----	------------	------------

10.8 Multithreading support functions

fl multithreading support functions declared in <FL/FL.H>

Functions

- static int [Fl::awake](#) ([Fl_Awake_Handler](#) cb, void *message=0)
See void awake(void message=0).*
- static void [Fl::awake](#) (void *message=0)
Sends a message pointer to the main thread, causing any pending [Fl::wait\(\)](#) call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.
- static int [Fl::lock](#) ()
The [lock\(\)](#) method blocks the current thread until it can safely access FLTK widgets and data.
- static void * [Fl::thread_message](#) ()
The [thread_message\(\)](#) method returns the last message that was sent from a child by the [awake\(\)](#) method.
- static void [Fl::unlock](#) ()
The [unlock\(\)](#) method releases the lock that was set using the [lock\(\)](#) method.

10.8.1 Detailed Description

fl multithreading support functions declared in <FL/FL.H>

10.8.2 Function Documentation

10.8.2.1 `awake()` [1/2]

```
int Fl::awake (
    Fl_Awake_Handler func,
    void * data = 0) [static]
```

See `void awake(void* message=0)`.

Let the main thread know an update is pending and have it call a specific function.

Registers a function that will be called by the main thread during the next message handling cycle. Returns 0 if the callback function was registered, and -1 if registration failed. Over a thousand awake callbacks can be registered simultaneously.

See also

[Fl::awake\(void* message=0\)](#)

10.8.2.2 `awake()` [2/2]

```
void Fl::awake (
    void * msg = 0) [static]
```

Sends a message pointer to the main thread, causing any pending [Fl::wait\(\)](#) call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.

Multiple calls to [Fl::awake\(\)](#) will queue multiple pointers for the main thread to process, up to a system-defined (typically several thousand) depth. The default message handler saves the last message which can be accessed using the [Fl::thread_message\(\)](#) function.

In the context of a threaded application, a call to [Fl::awake\(\)](#) with no argument will trigger event loop handling in the main thread. Since it is not possible to call [Fl::flush\(\)](#) from a subsidiary thread, [Fl::awake\(\)](#) is the best (and only, really) substitute.

It's *not* necessary to wrap calls to any form of [Fl::awake\(\)](#) by [Fl::lock\(\)](#) and [Fl::unlock\(\)](#). Nevertheless, the early, single call to [Fl::lock\(\)](#) used to initialize threading support is necessary.

Function [Fl::awake\(\)](#) in all its forms is typically called by worker threads, but it can be used safely by the main thread too, as a means to break the event loop.

See also

[Multithreading](#)

10.8.2.3 `lock()`

```
int Fl::lock () [static]
```

The [lock\(\)](#) method blocks the current thread until it can safely access FLTK widgets and data.

Child threads should call this method prior to updating any widgets or accessing data. The main thread must call [lock\(\)](#) to initialize the threading support in FLTK. [lock\(\)](#) will return non-zero if threading is not available on the platform.

Child threads must call [unlock\(\)](#) when they are done accessing FLTK.

When the [wait\(\)](#) method is waiting for input or timeouts, child threads are given access to FLTK. Similarly, when the main thread needs to do processing, it will wait until all child threads have called [unlock\(\)](#) before processing additional data.

Returns

0 if threading is available on the platform; non-zero otherwise.

See also: [Multithreading](#)

10.8.2.4 `thread_message()`

```
void * Fl::thread_message () [static]
```

The [thread_message\(\)](#) method returns the last message that was sent from a child by the [awake\(\)](#) method.

See also: [Multithreading](#)

10.8.2.5 unlock()

```
void Fl::unlock () [static]
```

The `unlock()` method releases the lock that was set using the `lock()` method.

Child threads should call this method as soon as they are finished accessing FLTK.

See also: [Multithreading](#)

10.9 Safe widget deletion support functions

These functions, declared in `<FL/Fl.H>`, support deletion of widgets inside callbacks.

Functions

- static void `Fl::clear_widget_pointer (FL_Widget const *w)`
Clears a widget pointer in the watch list.
- static void `Fl::delete_widget (FL_Widget *w)`
Schedules a widget for deletion at the next call to the event loop.
- static void `Fl::do_widget_deletion ()`
Deletes widgets previously scheduled for deletion.
- static void `Fl::release_widget_pointer (FL_Widget *w)`
Releases a widget pointer from the watch list.
- static void `Fl::watch_widget_pointer (FL_Widget *w)`
Adds a widget pointer to the widget watch list.

10.9.1 Detailed Description

These functions, declared in `<FL/Fl.H>`, support deletion of widgets inside callbacks.

`Fl::delete_widget()` should be called when deleting widgets or complete widget trees (`Fl_Group`, `Fl_Window`, ...) inside callbacks.

The other functions are intended for internal use. The preferred way to use them is by using the helper class `Fl_Widget_Tracker`.

The following is to show how it works ...

There are three groups of related methods:

1. scheduled widget deletion
 - `Fl::delete_widget()` schedules widgets for deletion
 - `Fl::do_widget_deletion()` deletes all scheduled widgets
2. widget watch list ("smart pointers")
 - `Fl::watch_widget_pointer()` adds a widget pointer to the watch list
 - `Fl::release_widget_pointer()` removes a widget pointer from the watch list
 - `Fl::clear_widget_pointer()` clears a widget pointer *in* the watch list
3. the class `Fl_Widget_Tracker`:
 - the constructor calls `Fl::watch_widget_pointer()`
 - the destructor calls `Fl::release_widget_pointer()`
 - the access methods can be used to test, if a widget has been deleted

See also

[Fl_Widget_Tracker](#).

10.9.2 Function Documentation

10.9.2.1 `clear_widget_pointer()`

```
void Fl::clear_widget_pointer (
    Fl_Widget const * w) [static]
```

Clears a widget pointer *in* the watch list.

This is called when a widget is destroyed (by its destructor). You should never call this directly.

Note

Internal use only !

This method searches the widget watch list for pointers to the widget and clears each pointer that points to it. Widget pointers can be added to the widget watch list by calling `Fl::watch_widget_pointer()` or by using the helper class `Fl_Widget_Tracker` (recommended).

See also

`Fl::watch_widget_pointer()`
class `Fl_Widget_Tracker`

10.9.2.2 `delete_widget()`

```
void Fl::delete_widget (
    Fl_Widget * wi) [static]
```

Schedules a widget for deletion at the next call to the event loop.

Use this method to delete a widget inside a callback function.

To avoid early deletion of widgets, this function should be called toward the end of a callback and only after any call to the event loop (`Fl::wait()`, `Fl::flush()`, `Fl::check()`, `fl_ask()`, etc.).

When deleting groups or windows, you must only delete the group or window widget and not the individual child widgets.

Since

FLTK 1.3.4 the widget will be hidden immediately, but the actual destruction will be delayed until the event loop is finished. Up to FLTK 1.3.3 windows wouldn't be hidden before the event loop was done, hence you had to `hide()` a window in your window close callback if you called `Fl::delete_widget()` to destroy (and hide) the window.

FLTK 1.3.0 it is not necessary to remove widgets from their parent groups or windows before calling this, because it will be done in the widget's destructor, but it is not a failure to do this nevertheless.

Note

In FLTK 1.1 you **must** remove widgets from their parent group (or window) before deleting them.

See also

`Fl_Widget::~~Fl_Widget()`

10.9.2.3 `do_widget_deletion()`

```
void Fl::do_widget_deletion () [static]
```

Deletes widgets previously scheduled for deletion.

This is for internal use only. You should never call this directly.

`Fl::do_widget_deletion()` is called from the FLTK event loop or whenever you call `Fl::wait()`. The previously scheduled widgets are deleted in the same order they were scheduled by calling `Fl::delete_widget()`.

See also

`Fl::delete_widget(Fl_Widget *wi)`

10.9.2.4 `release_widget_pointer()`

```
void Fl::release_widget_pointer (
    Fl_Widget *& w) [static]
```

Releases a widget pointer from the watch list.

This is used to remove a widget pointer that has been added to the watch list with `Fl::watch_widget_pointer()`, when it is not needed anymore.

Note

Internal use only, please use class `Fl_Widget_Tracker` instead.

See also

[Fl::watch_widget_pointer\(\)](#)

10.9.2.5 `watch_widget_pointer()`

```
void Fl::watch_widget_pointer (
    Fl_Widget *& w) [static]
```

Adds a widget pointer to the widget watch list.

Note

Internal use only, please use class `Fl_Widget_Tracker` instead.

This can be used, if it is possible that a widget might be deleted during a callback or similar function. The widget pointer must be added to the watch list before calling the callback. After the callback the widget pointer can be queried, if it is NULL. If it is NULL, then the widget has been deleted during the callback and must not be accessed anymore. If the widget pointer is *not* NULL, then the widget has not been deleted and can be accessed safely.

After accessing the widget, the widget pointer must be released from the watch list by calling `Fl::release_widget_pointer()`.

Example for a button that is clicked (from its `handle()` method):

```
Fl_Widget *wp = this;           // save 'this' in a pointer variable
Fl::watch_widget_pointer(wp);    // add the pointer to the watch list
set_changed();                  // set the changed flag
do_callback();                  // call the callback
if (!wp) {                      // the widget has been deleted

    // DO NOT ACCESS THE DELETED WIDGET !

} else {                        // the widget still exists
    clear_changed();             // reset the changed flag
}
```

```
Fl::release_widget_pointer(wp); // remove the pointer from the watch list
```

This works, because all widgets call `Fl::clear_widget_pointer()` in their destructors.

See also

[Fl::release_widget_pointer\(\)](#)

[Fl::clear_widget_pointer\(\)](#)

An easier and more convenient method to control widget deletion during callbacks is to use the class `Fl_Widget_Tracker` with a local (automatic) variable.

class [Fl_Widget_Tracker](#)

10.10 Cairo Support Functions and Classes

Classes

- class [Fl_Cairo_State](#)
Contains all the necessary info on the current cairo context.
- class [Fl_Cairo_Window](#)
This defines an FLTK window with Cairo support.

Functions

- static bool [Fl::cairo_autolink_context](#) ()
Gets the current autolink mode for Cairo support.
- static void [Fl::cairo_autolink_context](#) (bool alink)
When FLTK_HAVE_CAIRO is defined and [cairo_autolink_context\(\)](#) is true, any current window dc is linked to a current Cairo context.
- static cairo_t * [Fl::cairo_cc](#) ()
Gets the current Cairo context linked with a fltk window.
- static void [Fl::cairo_cc](#) (cairo_t *c, bool own=false)
Sets the current Cairo context to c.
- static void [Fl::cairo_flush](#) (cairo_t *c)
Flush Cairo drawings on Cairo context c.
- static cairo_t * [Fl::cairo_make_current](#) (Fl_Window *w)
Provides a Cairo context for window wi.

10.10.1 Detailed Description

10.10.2 Function Documentation

10.10.2.1 [cairo_autolink_context\(\)](#) [1/2]

```
static bool Fl::cairo_autolink_context () [inline], [static]
```

Gets the current autolink mode for Cairo support.

Return values

<i>false</i>	if no Cairo context autolink is made for each window.
<i>true</i>	if any fltk window is attached a Cairo context when it is current.

See also

void [cairo_autolink_context](#)(bool alink)

Note

Only available when configure has the `--enable-cairo` option

10.10.2.2 [cairo_autolink_context\(\)](#) [2/2]

```
static void Fl::cairo_autolink_context (
    bool alink) [inline], [static]
```

When FLTK_HAVE_CAIRO is defined and [cairo_autolink_context\(\)](#) is true, any current window dc is linked to a current Cairo context.

This is not the default, because it may not be necessary to add Cairo support to all fltk supported windows. When you wish to associate a Cairo context in this mode, you need to call explicitly in your draw() overridden method, [Fl::cairo_make_current\(Fl_Window*\)](#). This will create a Cairo context only for this Window. Still in custom Cairo application it is possible to handle completely this process automatically by setting `alink` to true. In this last case, you don't need anymore to call [Fl::cairo_make_current\(\)](#). You can use [Fl::cairo_cc\(\)](#) to get the current Cairo context anytime.

Note

Only available when configure has the `--enable-cairo` option

10.10.2.3 `cairo_cc()`

```
static void Fl::cairo_cc (
    cairo_t * c,
    bool own = false) [inline], [static]
```

Sets the current Cairo context to `c`.

Set `own` to true if you want fltk to handle this cc deletion.

Note

Only available when configure has the `--enable-Cairo` option

10.10.2.4 `cairo_flush()`

```
static void Fl::cairo_flush (
    cairo_t * c) [inline], [static]
```

Flush Cairo drawings on Cairo context `c`.

This is **required** on Windows if you use the Cairo context provided by the "Cairo autolink" option. Call this when all your drawings on the Cairo context are finished. This is maybe not necessary on other platforms than Windows but it does no harm if you call it always.

You don't need to use this if you use an [Fl_Cairo_Window](#) which does this automatically after the draw callback returns.

Code example for "Cairo autolink" mode:

In the overridden `draw()` method of your subclass of [Fl_Window](#) or any widget:

```
cairo_t *cc = Fl::cairo_cc(); // get the "autolink" Cairo context
// ... your Cairo drawings are here ...
Fl::cairo_flush(cc); // flush Cairo drawings to the device
```

If you configure FLTK with `'--enable-cairo'` or CMake option `'FLTK_OPTION_CAIRO_WINDOW'` (i.e. without `'--enable-cairoext'` or CMake option `'FLTK_OPTION_CAIRO_EXT'`) or if you don't enable the `'autolink'` Cairo context you may do the equivalent to use Cairo drawings in an overridden `draw()` method of derived classes by using

```
// get the Cairo context for the \c window
cairo_t *cc = Fl::cairo_make_current(window);
// ... your Cairo drawings are here ...
Fl::cairo_flush(cc); // flush Cairo drawings to the device
```

See also

[Fl::cairo_autolink_context\(bool\)](#)

[Fl::cairo_make_current\(Fl_Window*\)](#);

10.10.2.5 `cairo_make_current()`

```
cairo_t * Fl::cairo_make_current (
    Fl_Window * wi) [static]
```

Provides a Cairo context for window `wi`.

This is needed in a `draw()` override if [Fl::cairo_autolink_context\(\)](#) returns false, which is the default. The `cairo_context()` does not need to be freed as it is freed every time a new Cairo context is created. When the program terminates, a call to `Fl::cairo_make_current(0)` will destroy any residual context.

Note

A new Cairo context is not always re-created when this method is used. In particular, if the current graphical context and the current window didn't change between two calls, the previous gc is internally kept, thus optimizing the drawing performances. Also, after this call, [Fl::cairo_cc\(\)](#) is adequately updated with this Cairo context.

Only available when configure has the `--enable-cairo` option

Returns

The valid `cairo_t *cairo` context associated to this window.

Return values

<code>NULL</code>	if <code>wi</code> is <code>NULL</code> or maybe with GL windows under Wayland
-------------------	--

10.11 Unicode and UTF-8 functions

fl global Unicode and UTF-8 handling functions declared in `<FL/fl_utf8.h>`

Macros

- `#define ERRORS_TO_CP1252 1`
Set to 1 to turn bad UTF-8 bytes in the 0x80-0x9f range into the Unicode index for Microsoft's CP1252 character set.
- `#define ERRORS_TO_ISO8859_1 1`
Set to 1 to turn bad UTF-8 bytes into ISO-8859-1.
- `#define NBC 0xFFFF + 1`
- `#define STRICT_RFC3629 0`
A number of Unicode code points are in fact illegal and should not be produced by a UTF-8 converter.

Functions

- `int fl_access (const char *f, int mode)`
Cross-platform function to test a files access() with a UTF-8 encoded name or value.
- `int fl_chdir (const char *path)`
Cross-platform function to change the current working directory, given as a UTF-8 encoded string.
- `int fl_chmod (const char *f, int mode)`
Cross-platform function to set a files mode() with a UTF-8 encoded name or value.
- `int fl_close_fd (int fd)`
Cross-platform function to close a file descriptor.
- `int fl_execvp (const char *file, char *const *argv)`
- `FILE * fl_fopen (const char *f, const char *mode)`
Cross-platform function to open files with a UTF-8 encoded name.
- `char * fl_getcwd (char *buf, int len)`
Cross-platform function to get the current working directory as a UTF-8 encoded value.
- `char * fl_getenv (const char *v)`
Cross-platform function to get environment variables with a UTF-8 encoded name or value.
- `char fl_make_path (const char *path)`
Cross-platform function to recursively create a path in the file system.
- `void fl_make_path_for_file (const char *path)`
Cross-platform function to create a path for the file in the file system.
- `int fl_mkdir (const char *f, int mode)`
Cross-platform function to create a directory with a UTF-8 encoded name.
- `unsigned int fl_nonspacing (unsigned int ucs)`
Returns true if the Unicode character `ucs` is non-spacing.
- `int fl_open (const char *fname, int oflags,...)`
Cross-platform function to open files with a UTF-8 encoded name.
- `int fl_open_ext (const char *fname, int binary, int oflags,...)`
Cross-platform function to open files with a UTF-8 encoded name.
- `int fl_putenv (const char *var)`
Cross-platform function to write environment variables with a UTF-8 encoded name or value.
- `int fl_rename (const char *f, const char *n)`
Cross-platform function to rename a filesystem object using UTF-8 encoded names.

- `int fl_rmdir (const char *f)`
Cross-platform function to remove a directory with a UTF-8 encoded name.
- `int fl_stat (const char *f, struct stat *b)`
Cross-platform function to stat() a file using a UTF-8 encoded name or value.
- `int fl_system (const char *cmd)`
Cross-platform function to run a system command with a UTF-8 encoded string.
- `int fl_tolower (unsigned int ucs)`
Returns the Unicode lower case value of `ucs`.
- `int fl_toupper (unsigned int ucs)`
Returns the Unicode upper case value of `ucs`.
- `unsigned fl_ucs_to_Utf16 (const unsigned ucs, unsigned short *dst, const unsigned dstlen)`
Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.
- `int fl_unlink (const char *fname)`
Cross-platform function to unlink() (that is, delete) a file using a UTF-8 encoded filename.
- `char * fl_utf2mbcs (const char *s)`
Converts UTF-8 string `s` to a local multi-byte character string.
- `const char * fl_utf8back (const char *p, const char *start, const char *end)`
Move `p` backward until it points to the start of a UTF-8 character.
- `int fl_utf8bytes (unsigned ucs)`
Return the number of bytes needed to encode the given UCS4 character in UTF-8.
- `unsigned fl_utf8decode (const char *p, const char *end, int *len)`
Decode a single UTF-8 encoded character starting at `p`.
- `int fl_utf8encode (unsigned ucs, char *buf)`
Write the UTF-8 encoding of `ucs` into `buf` and return the number of bytes written.
- `unsigned fl_utf8from_mb (char *dst, unsigned dstlen, const char *src, unsigned srclen)`
Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.
- `unsigned fl_utf8froma (char *dst, unsigned dstlen, const char *src, unsigned srclen)`
Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.
- `unsigned fl_utf8fromwc (char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)`
Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.
- `const char * fl_utf8fwd (const char *p, const char *start, const char *end)`
Move `p` forward until it points to the start of a UTF-8 character.
- `int fl_utf8len (char c)`
Returns the byte length of the UTF-8 sequence with first byte `c`, or -1 if `c` is not valid.
- `int fl_utf8len1 (char c)`
Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid.
- `int fl_utf8locale ()`
Return true if the "locale" seems to indicate that UTF-8 encoding is used.
- `int fl_utf8strlen (const char *text, int len)`
Return the length in bytes of a UTF-8 string.
- `int fl_utf8test (const char *src, unsigned srclen)`
Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.
- `unsigned fl_utf8to_mb (const char *src, unsigned srclen, char *dst, unsigned dstlen)`
Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).
- `unsigned fl_utf8toa (const char *src, unsigned srclen, char *dst, unsigned dstlen)`
Convert a UTF-8 sequence into an array of 1-byte characters.
- `unsigned fl_utf8toUtf16 (const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)`
Convert a UTF-8 sequence into an array of 16-bit characters.
- `unsigned fl_utf8towc (const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)`
Converts a UTF-8 string into a wide character string.

- `int fl_utf_nb_char` (const unsigned char *buf, int len)
Returns the number of Unicode chars in the UTF-8 string.
- `int fl_utf_strcasecmp` (const char *s1, const char *s2)
UTF-8 aware strcasecmp - converts to Unicode and tests.
- `int fl_utf_strncasecmp` (const char *s1, const char *s2, int n)
UTF-8 aware strncasecmp - converts to lower case Unicode and tests.
- `int fl_utf_tolower` (const unsigned char *str, int len, char *buf)
Converts the string str to its lower case equivalent into buf.
- `int fl_utf_toupper` (const unsigned char *str, int len, char *buf)
Converts the string str to its upper case equivalent into buf.
- `int fl_wcwidth` (const char *src)
extended wrapper around `fl_wcwidth_(unsigned int ucs)` function.
- `int fl_wcwidth_` (unsigned int ucs)
Wrapper to adapt Markus Kuhn's implementation of wcwidth() for FLTK.

10.11.1 Detailed Description

fl global Unicode and UTF-8 handling functions declared in `<FL/fl_utf8.h>`

10.11.2 Macro Definition Documentation

10.11.2.1 ERRORS_TO_CP1252

```
#define ERRORS_TO_CP1252 1
```

Set to 1 to turn bad UTF-8 bytes in the 0x80-0x9f range into the Unicode index for Microsoft's CP1252 character set.

You should also set `ERRORS_TO_ISO8859_1`. With this a huge amount of more available text (such as all web pages) are correctly converted to Unicode.

10.11.2.2 ERRORS_TO_ISO8859_1

```
#define ERRORS_TO_ISO8859_1 1
```

Set to 1 to turn bad UTF-8 bytes into ISO-8859-1.

If this is zero they are instead turned into the Unicode REPLACEMENT CHARACTER, of value 0xfffd. If this is on `fl_utf8decode()` will correctly map most (perhaps all) human-readable text that is in ISO-8859-1. This may allow you to completely ignore character sets in your code because virtually everything is either ISO-8859-1 or UTF-8.

10.11.2.3 STRICT_RFC3629

```
#define STRICT_RFC3629 0
```

A number of Unicode code points are in fact illegal and should not be produced by a UTF-8 converter.

Turn this on will replace the bytes in those encodings with errors. If you do this then converting arbitrary 16-bit data to UTF-8 and then back is not an identity, which will probably break a lot of software.

10.11.3 Function Documentation

10.11.3.1 fl_access()

```
int fl_access (
    const char * f,
    int mode)
```

Cross-platform function to test a files `access()` with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where the standard `access()` function fails with UTF-8 encoded non-ASCII filenames.

Windows defines the mode values 0 for existence, 2 for writable, 4 for readable, and 6 of readable and writable. On other systems, the modes `X_OK`, `W_OK`, and `R_OK` are usually defined as 1, 2, and 4.

Upon successful completion, the value 0 is returned on all platforms.

Parameters

in	<i>f</i>	the UTF-8 encoded filename
in	<i>mode</i>	the mode to test

Returns

the return value of `_waccess()` on Windows or `access()` on other platforms.

10.11.3.2 fl_chdir()

```
int fl_chdir (
    const char * path)
```

Cross-platform function to change the current working directory, given as a UTF-8 encoded string.

This function is especially useful on the Windows platform where the standard `_wchdir()` function needs a `path` in UTF-16 encoding.

The `path` is converted to a system specific encoding if necessary and the system specific `chdir(converted↵_path)` function is called.

The function returns 0 on success and -1 on error. Depending on the platform, `errno` **may** be set if an error occurs.

Note

The possible `errno` values are platform specific. Refer to the documentation of the platform specific `chdir()` function.

If the function is not implemented on a particular platform the default implementation returns -1 and `errno` is **not** set.

If the `path` is `NULL` the function returns -1, but `errno` is **not** changed. This is a convenience feature of `fl_chdir()` as opposed to `chdir()`.

Parameters

in	<i>path</i>	the target directory for <code>chdir</code> (may be <code>NULL</code>)
----	-------------	---

Returns

0 if successful, -1 on error (`errno` may be set)

10.11.3.3 fl_chmod()

```
int fl_chmod (
    const char * f,
    int mode)
```

Cross-platform function to set a files `mode()` with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where the standard `chmod()` function fails with UTF-8 encoded non-ASCII filenames.

Parameters

in	<i>f</i>	the UTF-8 encoded filename
in	<i>mode</i>	the mode to set

Returns

the return value of `_wchmod()` on Windows or `chmod()` on other platforms.

10.11.3.4 fl_close_fd()

```
int fl_close_fd (
    int fd)
```

Cross-platform function to close a file descriptor.

Returns

0 in case of success, or -1 in case of error.

10.11.3.5 fl_fopen()

```
FILE * fl_fopen (
    const char * f,
    const char * mode)
```

Cross-platform function to open files with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard fopen() function fails with UTF-8 encoded non-ASCII filenames.

Parameters

<i>f</i>	the UTF-8 encoded filename
<i>mode</i>	same as the second argument of the standard fopen() function

Returns

a FILE pointer upon successful completion, or NULL in case of error.

See also

[fl_open\(\)](#).

10.11.3.6 fl_getcwd()

```
char * fl_getcwd (
    char * buf,
    int len)
```

Cross-platform function to get the current working directory as a UTF-8 encoded value.

This function is especially useful on the Windows platform where the standard _wgetcwd() function returns UTF-16 encoded non-ASCII filenames.

If buf is NULL a buffer of size (len+1) is allocated, filled with the current working directory, and returned. In this case the buffer must be released by the caller with free() to prevent memory leaks.

Parameters

in	<i>buf</i>	the buffer to populate (may be NULL)
in	<i>len</i>	the length of the buffer

Returns

the CWD encoded as UTF-8

10.11.3.7 fl_getenv()

```
char * fl_getenv (
    const char * v)
```

Cross-platform function to get environment variables with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where non-ASCII environment variables are encoded as wide characters. The returned value of the variable is encoded in UTF-8 as well.

On platforms other than Windows this function calls getenv directly. The return value is returned as-is.

The return value is a pointer to an implementation defined buffer:

- an internal buffer that is (re)allocated as needed (Windows) or
- the string in the environment itself (Unix, Linux, MacOS) or
- any other implementation (other platforms). This string must be considered read-only and must not be freed by the caller.

If the resultant string is to be used later it must be copied to a safe place. The next call to [fl_getenv\(\)](#) or any other environment changes may overwrite the string.

Note

This function is not thread-safe.

Parameters

in	<i>v</i>	the UTF-8 encoded environment variable
----	----------	--

Returns

the environment variable in UTF-8 encoding, or NULL in case of error.

10.11.3.8 fl_make_path()

```
char fl_make_path (
    const char * path)
```

Cross-platform function to recursively create a path in the file system.

This function creates a *path* in the file system by recursively creating all directories.

Parameters

in	<i>path</i>	a Unix style ('/' forward slashes) absolute or relative pathname
----	-------------	--

Returns

1 if the path was created, 0 if creating the path failed at some point

10.11.3.9 fl_make_path_for_file()

```
void fl_make_path_for_file (
    const char * path)
```

Cross-platform function to create a path for the file in the file system.

This function strips the filename from the given *path* and creates a path in the file system by recursively creating all directories.

10.11.3.10 fl_mkdir()

```
int fl_mkdir (
    const char * f,
    int mode)
```

Cross-platform function to create a directory with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `_wmkdir()` function expects UTF-16 encoded non-ASCII filenames.

Parameters

in	<i>f</i>	the UTF-8 encoded filename
in	<i>mode</i>	the mode of the directory

Returns

the return value of `_wmkdir()` on Windows or `mkdir()` on other platforms.

10.11.3.11 `fl_nonspacing()`

```
unsigned int fl_nonspacing (  
    unsigned int ucs)
```

Returns true if the Unicode character `ucs` is non-spacing.

Non-spacing characters in Unicode are typically combining marks like tilde (~), diaeresis (¨), or other marks that are added to a base character, for instance 'a' (base character) + '¨' (combining mark) = 'ä' (German Umlaut).

- http://unicode.org/glossary/#base_character
- http://unicode.org/glossary/#nonspacing_mark
- http://unicode.org/glossary/#combining_character

10.11.3.12 `fl_open()`

```
int fl_open (  
    const char * fname,  
    int oflags,  
    ...)
```

Cross-platform function to open files with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `open()` function fails with UTF-8 encoded non-ASCII filenames.

Parameters

in	<i>fname</i>	the UTF-8 encoded filename
in	<i>oflags</i>	other arguments are as in the standard <code>open()</code> function

Returns

a file descriptor upon successful completion, or -1 in case of error.

See also

[fl_fopen\(\)](#), [fl_open_ext\(\)](#), [fl_close_fd\(int fd\)](#).

10.11.3.13 `fl_open_ext()`

```
int fl_open_ext (  
    const char * fname,  
    int binary,  
    int oflags,  
    ...)
```

Cross-platform function to open files with a UTF-8 encoded name.

In comparison with [fl_open\(\)](#), this function allows to control whether the file is opened in binary (a.k.a. untranslated) mode. This is especially useful on the Windows platform where files are by default opened in text (translated) mode.

Parameters

in	<i>fname</i>	the UTF-8 encoded filename
in	<i>binary</i>	if non-zero, the file is to be accessed in binary (a.k.a. untranslated) mode.
in	<i>oflags</i> ,...	these arguments are as in the standard <code>open()</code> function. Setting <code>oflags</code> to zero opens the file for reading.

Returns

a file descriptor upon successful completion, or -1 in case of error.

10.11.3.14 fl_putenv()

```
int fl_putenv (
    const char * var)
```

Cross-platform function to write environment variables with a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where non-ASCII environment variables are encoded as wide characters.

The given argument `var` must be encoded in UTF-8 in the form "name=value". The 'name' part must conform to platform dependent restrictions on environment variable names.

The string given in `var` is copied and optionally converted to the required encoding for the platform. On platforms other than Windows this function calls `putenv` directly.

The return value is zero on success and non-zero in case of error. The value in case of error is platform specific and returned as-is.

Note

The copied string is allocated on the heap and "lost" on some platforms, i.e. calling `fl_putenv()` to change environment variables frequently may cause memory leaks. There may be an option to avoid this in a future implementation.

This function is not thread-safe.

Parameters

in	<i>var</i>	the UTF-8 encoded environment variable 'name=value'
----	------------	---

Returns

0 on success, non-zero in case of error.

10.11.3.15 fl_rename()

```
int fl_rename (
    const char * f,
    const char * n)
```

Cross-platform function to rename a filesystem object using UTF-8 encoded names.

This function is especially useful on the Windows platform where the standard `_wrename()` function expects UTF-16 encoded non-ASCII filenames.

Parameters

in	<i>f</i>	the UTF-8 encoded filename to change
in	<i>n</i>	the new UTF-8 encoded filename to set

Returns

the return value of `_wrename()` on Windows or `rename()` on other platforms.

10.11.3.16 fl_rmdir()

```
int fl_rmdir (  
    const char * f)
```

Cross-platform function to remove a directory with a UTF-8 encoded name.

This function is especially useful on the Windows platform where the standard `_wrmdir()` function expects UTF-16 encoded non-ASCII filenames.

Parameters

in	<i>f</i>	the UTF-8 encoded filename to remove
----	----------	--------------------------------------

Returns

the return value of `_wrmdir()` on Windows or `rmdir()` on other platforms.

10.11.3.17 fl_stat()

```
int fl_stat (  
    const char * f,  
    struct stat * b)
```

Cross-platform function to `stat()` a file using a UTF-8 encoded name or value.

This function is especially useful on the Windows platform where the standard `stat()` function fails with UTF-8 encoded non-ASCII filenames.

Parameters

in	<i>f</i>	the UTF-8 encoded filename
	<i>b</i>	the stat struct to populate

Returns

the return value of `_wstat()` on Windows or `stat()` on other platforms.

10.11.3.18 fl_system()

```
int fl_system (  
    const char * cmd)
```

Cross-platform function to run a system command with a UTF-8 encoded string.

This function is especially useful on the Windows platform where non-ASCII program (file) names must be encoded as wide characters.

On platforms other than Windows this function calls `system()` directly.

Parameters

in	<i>cmd</i>	the UTF-8 encoded command string
----	------------	----------------------------------

Returns

the return value of `_wsystem()` on Windows or `system()` on other platforms.

10.11.3.19 fl_ucs_to_Utf16()

```
unsigned fl_ucs_to_Utf16 (
    const unsigned ucs,
    unsigned short * dst,
    const unsigned dstlen)
```

Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.

These are used by some system calls, especially on Windows.

`ucs` is the value to convert.

`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen` words will be written, and a 0 terminating word will be added if `dstlen` is large enough. Thus this function will never overwrite the buffer and will attempt return a zero-terminated string if space permits. If `dstlen` is zero then `dst` can be set to NULL and no data is written, but the length is returned.

The return value is the number of 16-bit words that *would* be written to `dst` if it is large enough, not counting any terminating zero.

If the return value is greater than `dstlen` it indicates truncation, you should then allocate a new array of size `return+1` and call this again.

Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (in UTF-16 encoding). Typically, setting `dstlen` to 2 will ensure that any valid Unicode value can be converted, and setting `dstlen` to 3 or more will allow a NULL terminated sequence to be returned.

10.11.3.20 fl_unlink()

```
int fl_unlink (
    const char * fname)
```

Cross-platform function to `unlink()` (that is, delete) a file using a UTF-8 encoded filename.

This function is especially useful on the Windows platform where the standard function expects UTF-16 encoded non-ASCII filenames.

Parameters

<i>fname</i>	the filename to unlink
--------------	------------------------

Returns

the return value of `_wunlink()` on Windows or `unlink()` on other platforms.

10.11.3.21 fl_utf8back()

```
const char * fl_utf8back (
    const char * p,
    const char * start,
    const char * end)
```

Move `p` backward until it points to the start of a UTF-8 character.

If it already points at the start of one then it is returned unchanged. Any UTF-8 errors are treated as though each byte of the error is an individual character.

`start` is the start of the string and is used to limit the backwards search for the start of a UTF-8 character.

`end` is the end of the string and is assumed to be a break between characters. It is assumed to be greater than `p`.

If you wish to decrement a UTF-8 pointer, pass `p-1` to this.

10.11.3.22 fl_utf8bytes()

```
int fl_utf8bytes (
    unsigned ucs)
```

Return the number of bytes needed to encode the given UCS4 character in UTF-8.

Returns number of bytes that `utf8encode()` will use to encode the character `ucs`.

Parameters

in	<i>ucs</i>	UCS4 encoded character
----	------------	------------------------

Returns

number of bytes required

10.11.3.23 `fl_utf8decode()`

```
unsigned fl_utf8decode (
    const char * p,
    const char * end,
    int * len)
```

Decode a single UTF-8 encoded character starting at *p*.

The resulting Unicode value (in the range 0-0x10ffff) is returned, and *len* is set to the number of bytes in the UTF-8 encoding (adding *len* to *p* will point at the next character).

If *p* points at an illegal UTF-8 encoding, including one that would go past *end*, or where a code uses more bytes than necessary, then (*unsigned char*)*p* is translated as though it is in the Microsoft CP1252 character set and *len* is set to 1. Treating errors this way allows this to decode almost any ISO-8859-1 or CP1252 text that has been mistakenly placed where UTF-8 is expected, and has proven very useful.

If you want errors to be converted to error characters (as the standards recommend), adding a test to see if the length is unexpectedly 1 will work:

```
if (*p & 0x80) { // what should be a multibyte encoding
    code = fl_utf8decode(p, end, &len);
    if (len < 2) code = 0xFFFD; // Turn errors into REPLACEMENT CHARACTER
} else { // handle the 1-byte UTF-8 encoding:
    code = *p;
    len = 1;
}
```

Direct testing for the 1-byte case (as shown above) will also speed up the scanning of strings where the majority of characters are ASCII.

10.11.3.24 `fl_utf8encode()`

```
int fl_utf8encode (
    unsigned ucs,
    char * buf)
```

Write the UTF-8 encoding of *ucs* into *buf* and return the number of bytes written.

Up to 4 bytes may be written. If you know that *ucs* is less than 0x10000 then at most 3 bytes will be written. If you wish to speed this up, remember that anything less than 0x80 is written as a single byte.

If *ucs* is greater than 0x10ffff this is an illegal character according to RFC 3629. These are converted as though they are 0xFFFD (REPLACEMENT CHARACTER).

RFC 3629 also says many other values for *ucs* are illegal (in the range 0xd800 to 0xdfff, or ending with 0xfffe or 0xffff). However I encode these as though they are legal, so that `utf8encode/fl_utf8decode` will be the identity for all codes between 0 and 0x10ffff.

10.11.3.25 `fl_utf8from_mb()`

```
unsigned fl_utf8from_mb (
    char * dst,
    unsigned dstlen,
    const char * src,
    unsigned srclen)
```

Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.

Up to *dstlen* bytes are written to *dst*, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to *dstlen* then if you malloc a new array of size *n*+1 you will have the space needed for the entire string. If *dstlen* is zero then nothing is written and this call just measures the storage space needed.

On Unix or on Windows when a UTF-8 locale is in effect, this does not change the data. You may also want to check if `fl_utf8test()` returns non-zero, so that the filesystem can store filenames in UTF-8 encoding regardless of the locale.

10.11.3.26 `fl_utf8froma()`

```
unsigned fl_utf8froma (
    char * dst,
    unsigned dstlen,
    const char * src,
    unsigned srclen)
```

Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.

It is possible this should convert Microsoft's CP1252 to UTF-8 instead. This would translate the codes in the range 0x80-0x9f to different characters. Currently it does not do this.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

`srclen` is the number of bytes in `src` to convert.

If the return value equals `srclen` then this indicates that no conversion is necessary, as only ASCII characters are in the string.

10.11.3.27 `fl_utf8fromwc()`

```
unsigned fl_utf8fromwc (
    char * dst,
    unsigned dstlen,
    const wchar_t * src,
    unsigned srclen)
```

Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

`srclen` is the number of words in `src` to convert. On Windows this is not necessarily the number of characters, due to there possibly being "surrogate pairs" in the UTF-16 encoding used. On Unix `wchar_t` is 32 bits and each location is a character.

On Unix if a `src` word is greater than 0x10ffff then this is an illegal character according to RFC 3629. These are converted as though they are 0xFFFFD (REPLACEMENT CHARACTER). Characters in the range 0xd800 to 0xdfff, or ending with 0xfffe or 0xffff are also illegal according to RFC 3629. However I encode these as though they are legal, so that `fl_utf8towc` will return the original data.

On Windows "surrogate pairs" are converted to a single character and UTF-8 encoded (as 4 bytes). Mismatched halves of surrogate pairs are converted as though they are individual characters.

10.11.3.28 `fl_utf8fwd()`

```
const char * fl_utf8fwd (
    const char * p,
    const char * start,
    const char * end)
```

Move `p` forward until it points to the start of a UTF-8 character.

If it already points at the start of one then it is returned unchanged. Any UTF-8 errors are treated as though each byte of the error is an individual character.

`start` is the start of the string and is used to limit the backwards search for the start of a UTF-8 character.

`end` is the end of the string and is assumed to be a break between characters. It is assumed to be greater than `p`.

This function is for moving a pointer that was jumped to the middle of a string, such as when doing a binary search for a position. You should use either this or `fl_utf8back()` depending on which direction your algorithm can handle the pointer moving. Do not use this to scan strings, use `fl_utf8decode()` instead.

10.11.3.29 fl_utf8len()

```
int fl_utf8len (
    char c)
```

Returns the byte length of the UTF-8 sequence with first byte `c`, or -1 if `c` is not valid. This function is helpful for finding faulty UTF-8 sequences.

See also

[fl_utf8len1](#)

10.11.3.30 fl_utf8len1()

```
int fl_utf8len1 (
    char c)
```

Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid. This function can be used to scan faulty UTF-8 sequences, albeit ignoring invalid codes.

See also

[fl_utf8len](#)

10.11.3.31 fl_utf8locale()

```
int fl_utf8locale (
    void )
```

Return true if the "locale" seems to indicate that UTF-8 encoding is used.

If true the `fl_utf8to_mb` and `fl_utf8from_mb` don't do anything useful.

It is highly recommended that you change your system so this does return true. On Windows this is done by setting the "codepage" to CP_UTF8. On Unix this is done by setting `$LC_CTYPE` to a string containing the letters "utf" or "UTF" in it, or by deleting all `$LC*` and `$LANG` environment variables. In the future it is likely that all non-Asian Unix systems will return true, due to the compatibility of UTF-8 with ISO-8859-1.

10.11.3.32 fl_utf8strlen()

```
int fl_utf8strlen (
    const char * text,
    int len)
```

Return the length in bytes of a UTF-8 string.

Parameters

in	<i>text</i>	encoded in UTF-8
in	<i>len</i>	number of Unicode characters, -1 to test until the end of text

Returns

number of bytes that make up the Unicode string

See also

[fl_utf_nb_char\(const unsigned char *buf, int len\)](#)

10.11.3.33 fl_utf8test()

```
int fl_utf8test (
    const char * src,
    unsigned srclen)
```

Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.

- Returns 0 if there is any illegal UTF-8 sequences, using the same rules as [fl_utf8decode\(\)](#). Note that some UCS values considered illegal by RFC 3629, such as 0xffff, are considered legal by this.
- Returns 1 if there are only single-byte characters (ie no bytes have the high bit set). This is legal UTF-8, but also indicates plain ASCII. It also returns 1 if `srclen` is zero.
- Returns 2 if there are only characters less than 0x800.
- Returns 3 if there are only characters less than 0x10000.
- Returns 4 if there are characters in the 0x10000 to 0x10ffff range.

Because there are many illegal sequences in UTF-8, it is almost impossible for a string in another encoding to be confused with UTF-8. This is very useful for transitioning Unix to UTF-8 filenames, you can simply test each filename with this to decide if it is UTF-8 or in the locale encoding. My hope is that if this is done we will be able to cleanly transition to a locale-less encoding.

10.11.3.34 fl_utf8to_mb()

```
unsigned fl_utf8to_mb (
    const char * src,
    unsigned srclen,
    char * dst,
    unsigned dstlen)
```

Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).

Unfortunately due to stupid design you will have to do this as needed for filenames. This is a bug on both Unix and Windows.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

If [fl_utf8locale\(\)](#) returns true then this does not change the data.

10.11.3.35 fl_utf8toa()

```
unsigned fl_utf8toa (
    const char * src,
    unsigned srclen,
    char * dst,
    unsigned dstlen)
```

Convert a UTF-8 sequence into an array of 1-byte characters.

If the UTF-8 decodes to a character greater than 0xff then it is replaced with '?'.

Errors in the UTF-8 sequence are converted as individual bytes, same as [fl_utf8decode\(\)](#) does. This allows ISO-8859-1 text mistakenly identified as UTF-8 to be printed correctly (and possibly CP1252 on Windows).

`src` points at the UTF-8 sequence, and `srclen` is the number of bytes to convert.

Up to `dstlen` bytes are written to `dst`, including a null terminator. The return value is the number of bytes that would be written, not counting the null terminator. If greater or equal to `dstlen` then if you malloc a new array of size `n+1` you will have the space needed for the entire string. If `dstlen` is zero then nothing is written and this call just measures the storage space needed.

10.11.3.36 fl_utf8toUtf16()

```
unsigned fl_utf8toUtf16 (
    const char * src,
    unsigned srclen,
    unsigned short * dst,
    unsigned dstlen)
```

Convert a UTF-8 sequence into an array of 16-bit characters.

These are used by some system calls, especially on Windows.

`src` points at the UTF-8, and `srclen` is the number of bytes to convert.

`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen-1` words will be written there, plus a 0 terminating word. Thus this function will never overwrite the buffer and will always return a zero-terminated string. If `dstlen` is zero then `dst` can be null and no data is written, but the length is returned. The return value is the number of 16-bit words that *would* be written to `dst` if it were long enough, not counting the terminating zero. If the return value is greater or equal to `dstlen` it indicates truncation, you can then allocate a new array of size `return+1` and call this again.

Errors in the UTF-8 are converted as though each byte in the erroneous string is in the Microsoft CP1252 encoding. This allows ISO-8859-1 text mistakenly identified as UTF-8 to be printed correctly.

Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (this is called UTF-16 encoding).

10.11.3.37 `fl_utf8towc()`

```
unsigned fl_utf8towc (
    const char * src,
    unsigned srclen,
    wchar_t * dst,
    unsigned dstlen)
```

Converts a UTF-8 string into a wide character string.

This function generates 32-bit `wchar_t` (e.g. "ucs4" as it were) except on Windows where it is equivalent to `fl_utf8toUtf16` and returns UTF-16.

`src` points at the UTF-8, and `srclen` is the number of bytes to convert.

`dst` points at an array to write, and `dstlen` is the number of locations in this array. At most `dstlen-1` `wchar_t` will be written there, plus a 0 terminating `wchar_t`.

The return value is the number of `wchar_t` that *would* be written to `dst` if it were long enough, not counting the terminating zero. If the return value is greater or equal to `dstlen` it indicates truncation, you can then allocate a new array of size `return+1` and call this again.

Notice that `sizeof(wchar_t)` is 2 on Windows and is 4 on Linux and most other systems. Where `wchar_t` is 16 bits, Unicode characters in the range 0x10000 to 0x10ffff are converted to "surrogate pairs" which take two words each (this is called UTF-16 encoding). If `wchar_t` is 32 bits this rather nasty problem is avoided.

Note that Windows includes Cygwin, i.e. compiled with Cygwin's POSIX layer (`cygwin1.dll`, `-enable-cygwin`), either native (GDI) or X11.

10.11.3.38 `fl_utf_nb_char()`

```
int fl_utf_nb_char (
    const unsigned char * buf,
    int len)
```

Returns the number of Unicode chars in the UTF-8 string.

See also

[fl_utf8strlen\(const char *text, int len\)](#)

10.11.3.39 `fl_utf_strcasecmp()`

```
int fl_utf_strcasecmp (
    const char * s1,
    const char * s2)
```

UTF-8 aware `strcasecmp` - converts to Unicode and tests.

Returns

result of comparison

Return values

0	if the strings are equal
---	--------------------------

1	if s1 is greater than s2
-1	if s1 is less than s2

10.11.3.40 fl_utf_strncasecmp()

```
int fl_utf_strncasecmp (
    const char * s1,
    const char * s2,
    int n)
```

UTF-8 aware strncasecmp - converts to lower case Unicode and tests.

Parameters

<i>s1,s2</i>	the UTF-8 strings to compare
<i>n</i>	the maximum number of UTF-8 characters to compare

Returns

result of comparison

Return values

0	if the strings are equal
>0	if s1 is greater than s2
<0	if s1 is less than s2

10.11.3.41 fl_utf_tolower()

```
int fl_utf_tolower (
    const unsigned char * str,
    int len,
    char * buf)
```

Converts the string `str` to its lower case equivalent into `buf`.

Warning: to be safe `buf` length must be at least $3 * len$ [for 16-bit Unicode]

10.11.3.42 fl_utf_toupper()

```
int fl_utf_toupper (
    const unsigned char * str,
    int len,
    char * buf)
```

Converts the string `str` to its upper case equivalent into `buf`.

Warning: to be safe `buf` length must be at least $3 * len$ [for 16-bit Unicode]

10.11.3.43 fl_wcwidth()

```
int fl_wcwidth (
    const char * src)
```

extended wrapper around [fl_wcwidth_\(unsigned int ucs\)](#) function.

Parameters

<i>in</i>	<i>src</i>	pointer to start of UTF-8 byte sequence
-----------	------------	---

Returns

width of character in columns

Depending on build options, this function may map C1 control characters (0x80 to 0x9f) to CP1252, and return the width of that character instead. This is not the same behaviour as `fl_wcwidth_(unsigned int ucs)`.

Note that other control characters and DEL will still return -1, so if you want different behaviour, you need to test for those characters before calling `fl_wcwidth()`, and handle them separately.

10.11.3.44 fl_wcwidth_()

```
int fl_wcwidth_ (
    unsigned int ucs)
```

Wrapper to adapt Markus Kuhn's implementation of `wcwidth()` for FLTK.

Parameters

in	ucs	Unicode character value
----	-----	-------------------------

Returns

width of character in columns

See <http://www.cl.cam.ac.uk/~mgk25/ucs/wcwidth.c> for Markus Kuhn's original implementation of `wcwidth()` and `wcswidth()` (defined in IEEE Std 1002.1-2001) for Unicode.

WARNING: this function returns widths for "raw" Unicode characters. It does not even try to map C1 control characters (0x80 to 0x9F) to CP1252, and C0/C1 control characters and DEL will return -1. You are advised to use `fl_width(const char* src)` instead.

10.12 String handling functions

String handling functions declared in `<FL/fl_string_functions.h>`

Functions

- `char * fl_strdup (const char *s)`
Cross platform interface to POSIX function `strdup()`.
- `size_t fl_strlcpy (char *, const char *, size_t)`

10.12.1 Detailed Description

String handling functions declared in `<FL/fl_string_functions.h>`

10.12.2 Function Documentation

10.12.2.1 fl_strdup()

```
char * fl_strdup (
    const char * s)
```

Cross platform interface to POSIX function `strdup()`.

The `fl_strdup()` function returns a pointer to a new string which is a duplicate of the string 's'. Memory for the new string is obtained with `malloc(3)`, and can be freed with `free(3)`.

Implementation:

- POSIX: `strdup()`
- WinAPI: `_strdup()`

10.13 Mac OS X-specific symbols

Mac OS X-specific symbols declared in `<FL/platform.H>`

Classes

- class `Fl_Mac_App_Menu`

Functions

- `Fl_Window * fl_mac_find (FLWindow *)`
Returns the `Fl_Window` corresponding to the given macOS-specific window reference.
- `CGContextRef fl_mac_gc ()`
Returns the macOS-specific graphics context for the current window.
- `void fl_mac_set_about (Fl_Callback *cb, void *user_data, int shortcut=0)`
Attaches a callback to the "About myprog" item of the system application menu.
- `FLWindow * fl_mac_xid (const Fl_Window *win)`
Returns the macOS-specific window reference corresponding to the given `Fl_Window` object.
- `void fl_open_callback (void(*cb)(const char *))`
Register a function called for each file dropped onto an application icon.

Variables

- `int fl_mac_os_version`
The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).

10.13.1 Detailed Description

Mac OS X-specific symbols declared in `<FL/platform.H>`

See also

[The Apple OS X Interface](#)

10.13.2 Function Documentation

10.13.2.1 fl_mac_set_about()

```
void fl_mac_set_about (
    Fl_Callback * cb,
    void * user_data,
    int shortcut = 0)
```

Attaches a callback to the "About myprog" item of the system application menu.

For back-compatibility. Equivalent to `Fl_Sys_Menu_Bar::about(Fl_Callback *cb, void *user_data)`.

10.13.2.2 fl_open_callback()

```
void fl_open_callback (
    void(* cb )(const char *))
```

Register a function called for each file dropped onto an application icon.

This function is effective only on the Mac OS X platform. `cb` will be called with a single Unix-style file name and path. If multiple files were dropped, `cb` will be called multiple times.

This function should be called before `fl_open_display()` is called, either directly or indirectly (this happens at the first `show()` of a window), to be effective for files dropped on the application icon at launch time. It can also be called at any point to change the function used to open dropped files. A call with a NULL argument, after a previous call, makes the app ignore files dropped later.

10.13.3 Variable Documentation

10.13.3.1 fl_mac_os_version

```
int fl_mac_os_version [extern]
```

The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2). FLTK initializes this global variable before main() begins running. If the value is needed in a static initializer, a previous call to `Fl::system_driver()` makes sure `fl_mac_os_version` has been initialized.

10.14 Common Dialog Classes and Functions

Common dialog functions for file selection, message output, and more.

Files

- file [fl_ask.cxx](#)

Utility functions for common dialogs.

Classes

- class [Fl_Color_Chooser](#)

The [Fl_Color_Chooser](#) widget provides a standard RGB color chooser.

- class [Fl_File_Chooser](#)

The [Fl_File_Chooser](#) widget displays a standard file selection dialog that supports various selection modes.

Functions

- void [fl_alert](#) (const char *fmt,...)
Shows an alert message dialog box.
- int [fl_ask](#) (const char *fmt,...)
Shows a dialog displaying the `fmt` message, this dialog features 2 yes/no buttons.
- void [fl_beep](#) (int type)
Emits a system beep.
- int [fl_choice](#) (const char *fmt, const char *b0, const char *b1, const char *b2,...)
Shows a dialog displaying the printf style `fmt` message.
- int [fl_choice_n](#) (const char *fmt, const char *b0, const char *b1, const char *b2,...)
Shows a dialog displaying the printf style `fmt` message.
- int [fl_color_chooser](#) (const char *name, double &r, double &g, double &b, int cmode)
Pops up a window to let the user pick an arbitrary RGB color.
- int [fl_color_chooser](#) (const char *name, uchar &r, uchar &g, uchar &b, int cmode)
Pops up a window to let the user pick an arbitrary RGB color.
- char * [fl_dir_chooser](#) (const char *message, const char *fname, int relative)
Shows a file chooser dialog and gets a directory.
- char * [fl_file_chooser](#) (const char *message, const char *pat, const char *fname, int relative)
Shows a file chooser dialog and gets a filename.
- void [fl_file_chooser_callback](#) (void(*cb)(const char *))
Set the file chooser callback.
- void [fl_file_chooser_ok_label](#) (const char *l)
Set the "OK" button label.
- const char * [fl_input](#) (const char *fmt, const char *defstr,...)
Shows an input dialog displaying the `fmt` message with variable arguments.
- const char * [fl_input](#) (int maxchar, const char *fmt, const char *defstr,...)
Shows an input dialog displaying the `fmt` message with variable arguments.
- void [fl_message](#) (const char *fmt,...)

- Shows an information message dialog box.*
- `int fl_message_hotspot ()`
Gets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.
- `void fl_message_hotspot (int enable)`
Sets whether or not to move the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()` to follow the mouse pointer.
- `Fl_Widget * fl_message_icon ()`
Gets the `Fl_Box` icon container of the current default dialog used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.
- `void fl_message_icon_label (const char *str)`
Sets the icon label of the dialog window used in many common dialogs.
- `void fl_message_position (const int x, const int y, const int center)`
Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.
- `void fl_message_position (Fl_Widget *widget)`
Sets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.
- `int fl_message_position (int *x, int *y)`
Gets the preferred position for the message box used in many common dialogs like `fl_message()`, `fl_alert()`, `fl_ask()`, `fl_choice()`, `fl_input()`, `fl_password()`.
- `void fl_message_title (const char *title)`
Sets the title of the dialog window used in many common dialogs.
- `void fl_message_title_default (const char *title)`
Sets the default title of the dialog window used in many common dialogs.
- `const char * fl_password (const char *fmt, const char *defstr,...)`
Shows an input dialog displaying the `fmt` message with variable arguments.
- `const char * fl_password (int maxchar, const char *fmt, const char *defstr,...)`
Shows an input dialog displaying the `fmt` message with variable arguments.

Variables

- `static void(* Fl::error)(const char *,...) = Fl_System_Driver::error`
FLTK calls `Fl::error()` to output a normal error message.
- `static void(* Fl::fatal)(const char *,...) = Fl_System_Driver::fatal`
FLTK calls `Fl::fatal()` to output a fatal error message.
- `const char * fl_cancel = "Cancel"`
string pointer used in common dialogs, you can change it to another language
- `const char * fl_close = "Close"`
string pointer used in common dialogs, you can change it to another language
- `Fl_Font fl_message_font_ = FL_HELVETICA`
- `Fl_Fontsize fl_message_size_ = -1`
- `const char * fl_no = "No"`
string pointer used in common dialogs, you can change it to another language
- `const char * fl_ok = "OK"`
string pointer used in common dialogs, you can change it to another language
- `const char * fl_yes = "Yes"`
string pointer used in common dialogs, you can change it to another language
- `static void(* Fl::warning)(const char *,...) = Fl_System_Driver::warning`
FLTK calls `Fl::warning()` to output a warning message.

10.14.1 Detailed Description

Common dialog functions for file selection, message output, and more.

10.14.2 Function Documentation

10.14.2.1 fl_alert()

```
void fl_alert (
    const char * fmt,
    ...)
```

Shows an alert message dialog box.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
----	------------	--

10.14.2.2 fl_ask()

```
int fl_ask (
    const char * fmt,
    ...)
```

Shows a dialog displaying the *fmt* message, this dialog features 2 yes/no buttons.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
----	------------	--

Return values

0	if the no button is selected
1	if yes is selected

Deprecated [fl_ask\(\)](#) is deprecated since it uses "Yes" and "No" for the buttons which does not conform to the current FLTK Human Interface Guidelines. Use [fl_choice\(\)](#) with the appropriate verbs instead.

10.14.2.3 fl_beep()

```
void fl_beep (
    int type)
```

Emits a system beep.

This function is platform specific. Depending on the input *type* a different sound may be played or the system speaker may beep with a different volume.

On X the system speaker is used which may not work at all on newer systems that don't have a speaker. Since 1.4.0 `FL_BEEP_DEFAULT` and other types honor the system or user settings whereas `FL_BEEP_ERROR` uses 100% volume. This may be changed in a future version.

On Wayland an ASCII BEL (0x07) is output to stderr.

On Windows the `MessageBeep()` function is used to play different sounds depending on the *type* argument.

On macOS the system beep function `NSBeep()` is used for `FL_BEEP_DEFAULT` and `FL_BEEP_ERROR`. Other types are ignored.

On other platforms the behavior is undefined and may change in the future.

Parameters

in	<i>type</i>	The beep type from the FL_Beep enumeration (optional)
----	-------------	---

```
#include <FL/fl_ask.H>
```

10.14.2.4 fl_choice()

```
int fl_choice (
    const char * fmt,
    const char * b0,
    const char * b1,
    const char * b2,
    ...)
```

Shows a dialog displaying the printf style `fmt` message.

This dialog features up to 3 customizable choice buttons which are specified in order of *right-to-left* in the dialog, e.g.

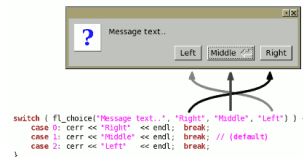

Figure 10.7 fl_choice() button ordering

```
#include <FL/fl_ask.H>
```

Three choices with printf() style formatting:

Figure 10.8 fl_choice() three choices with printf formatting

```
int num_msgs = GetNumberOfMessages();
switch ( fl_choice("What to do with %d messages?", "Send", "Save", "Delete", num_msgs) ) {
    case 0: .. // Send
    case 1: .. // Save (default)
    case 2: .. // Delete
    ..
}
```

Three choice example:

Figure 10.9 fl_choice() three choices

```
switch ( fl_choice("How many bedrooms?", "Zero", "One", "Two") ) {
    case 0: .. // "Zero"
    case 1: .. // "One" (default)
    case 2: .. // "Two"
}
```

Two choice example:

Figure 10.10 fl_choice() two choices

```
switch ( fl_choice("Empty trash?", "Yes", "No", 0) ) {
    case 0: .. // Yes
    case 1: .. // No (default)
}
```

One choice example:

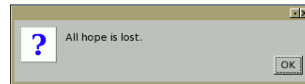

Figure 10.11 fl_choice() one choice

```
fl_choice("All hope is lost.", "OK", 0, 0); // "OK" default
```

Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>b0</i>	text label for right button 0
in	<i>b1</i>	text label for middle button 1 (can be 0)
in	<i>b2</i>	text label for left button 2 (can be 0)

Return values

0	if the button with <i>b0</i> text is pushed or the user pressed the <code>Escape</code> key or clicked the window close button
1	if the button with <i>b1</i> text is pushed or the user pressed the <code>Return</code> key
2	if the button with <i>b2</i> text is pushed

10.14.2.5 fl_choice_n()

```
int fl_choice_n (
    const char * fmt,
    const char * b0,
    const char * b1,
    const char * b2,
    ...)
```

Shows a dialog displaying the printf style *fmt* message.

This function is like [fl_choice\(\)](#) but returns `-1` if the dialog window was closed by pressing the `Escape` key or the window close button rather than pushing one of the dialog buttons.

See also

[fl_choice\(\)](#)

Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>b0</i>	text label for right button 0
in	<i>b1</i>	text label for middle button 1 (can be 0)
in	<i>b2</i>	text label for left button 2 (can be 0)

Return values

-3	reserved, FLTK 1.3 only: another dialog is still open (not possible in 1.4)
-2	if the dialog was closed by pushing the window close button
-1	if the dialog was closed by hitting <code>Escape</code>
0	if the button with <i>b0</i> text is pushed
1	if the button with <i>b1</i> text is pushed
2	if the button with <i>b2</i> text is pushed

10.14.2.6 fl_color_chooser() [1/2]

```
int fl_color_chooser (
    const char * name,
    double & r,
    double & g,
    double & b,
    int cmode) [related]
```

Pops up a window to let the user pick an arbitrary RGB color.

Note

```
#include <FL/Fl_Color_Chooser.H>
```

Figure 10.12 fl_color_chooser

Parameters

in	<i>name</i>	Title label for the window
in, out	<i>r,g,b</i>	Color components in the range 0.0 to 1.0.
in	<i>cmode</i>	Optional mode for color chooser. See mode(int) . Default -1 if none (rgb mode).

Return values

1	if user confirms the selection
0	if user cancels the dialog

10.14.2.7 fl_color_chooser() [2/2]

```
int fl_color_chooser (
    const char * name,
    uchar & r,
    uchar & g,
    uchar & b,
    int cmode) [related]
```

Pops up a window to let the user pick an arbitrary RGB color.

Note

```
#include <FL/Fl_Color_Chooser.H>
```

Figure 10.13 fl_color_chooser

Parameters

in	<i>name</i>	Title label for the window
in, out	<i>r,g,b</i>	Color components in the range 0 to 255.
in	<i>cmode</i>	Optional mode for color chooser. See mode(int) . Default -1 if none (rgb mode).

Return values

1	if user confirms the selection
0	if user cancels the dialog

10.14.2.8 fl_dir_chooser()

```
char * fl_dir_chooser (
    const char * message,
    const char * fname,
    int relative) [related]
```

Shows a file chooser dialog and gets a directory.

Note

```
#include <FL/Fl_File_Chooser.H>
```

Parameters

in	<i>message</i>	title bar text
in	<i>fname</i>	initial/default directory name
in	<i>relative</i>	0 for absolute path return, relative otherwise

Returns

the directory path string chosen by the user or NULL if user cancels

10.14.2.9 fl_file_chooser()

```
char * fl_file_chooser (
    const char * message,
    const char * pat,
    const char * fname,
    int relative) [related]
```

Shows a file chooser dialog and gets a filename.

Note

```
#include <FL/Fl_File_Chooser.H>
```

Figure 10.14 Fl_File_Chooser

Parameters

in	<i>message</i>	text in title bar
in	<i>pat</i>	filename pattern filter
in	<i>fname</i>	initial/default filename selection
in	<i>relative</i>	0 for absolute path name, relative path name otherwise

Returns

the user selected filename, in absolute or relative format or NULL if user cancels

10.14.2.10 fl_file_chooser_callback()

```
void fl_file_chooser_callback (
    void(* cb ) (const char *)) [related]
```

Set the file chooser callback.

Note

```
#include <FL/Fl_File_Chooser.H>
```

10.14.2.11 fl_file_chooser_ok_label()

```
void fl_file_chooser_ok_label (
    const char * l) [related]
```

Set the "OK" button label.

Note

```
#include <FL/Fl_File_Chooser.H>
```

10.14.2.12 fl_input() [1/2]

```
const char * fl_input (
    const char * fmt,
    const char * defstr,
    ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Returns the string in an internally allocated buffer that may be changed later. You **must** copy the string immediately after return from this method - at least before the next execution of the event loop.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

Returns

the user string input if OK was pushed

Return values

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	---

10.14.2.13 fl_input() [2/2]

```
const char * fl_input (
    int maxchar,
    const char * fmt,
    const char * defstr,
    ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

This is the same as `const char *fl_input(const char *fmt, const char *defstr, ...)` except that it has an additional parameter to limit the number of characters the user can input.

Returns the string in an internally allocated buffer that may be changed later. You **must** copy the string immediately after return from this method - at least before the next execution of the event loop.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>maxchar</i>	maximum number of characters the user can input (UTF-8 aware)
in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

Returns

the user string input if OK was pushed

Return values

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	---

10.14.2.14 fl_message()

```
void fl_message (
    const char * fmt,
    ...)
```

Shows an information message dialog box.

```
#include <FL/fl_ask.H>
```

Parameters

<i>in</i>	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
-----------	------------	--

10.14.2.15 fl_message_hotspot() [1/2]

```
int fl_message_hotspot (
    void )
```

Gets whether or not to move the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#) to follow the mouse pointer.

This is a permanent setting. It remains active and affects the window position unless overridden by an explicit positioning request by means of one of the [fl_message_position\(\)](#) variants.

```
#include <FL/fl_ask.H>
```

Returns

0 if disabled, non-zero otherwise

See also

```
void fl_message_hotspot(int)
int fl_message_position(int *x, int *y)
void fl_message_position(Fl_Widget *)
fl_message_position()
```

10.14.2.16 fl_message_hotspot() [2/2]

```
void fl_message_hotspot (
    int enable)
```

Sets whether or not to move the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#) to follow the mouse pointer.

The default is *enabled*, so that the default button is the hotspot and appears at the mouse position.

```
#include <FL/fl_ask.H>
```

Parameters

<i>in</i>	<i>enable</i>	non-zero enables hotspot behavior, 0 disables hotspot
-----------	---------------	---

10.14.2.17 fl_message_icon()

```
Fl_Widget * fl_message_icon ()
```

Gets the [Fl_Box](#) icon container of the current default dialog used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

The return value cannot be Null. The object pointed to is an [Fl_Box](#) widget. The returned pointer ([Fl_Widget *](#)) can be safely cast to an [Fl_Box*](#) pointer.

Note

You can set some attributes of this **default** icon box. These attributes are sticky, i.e. they will be used in all subsequent common dialogs unless overridden by specific "one shot" variables. Setting any attribute except those mentioned below causes undefined behavior.

Supported icon attributes:

- [box\(\)](#)
- [labelfont\(\)](#)
- [labelsize\(\)](#)
- [color\(\)](#)
- [labelcolor\(\)](#)
- [image\(\)](#)
- [align\(\)](#)

The icon size can not be changed. If you set an [image\(\)](#) you should scale it to the available size, i.e. [w\(\)](#) and [h\(\)](#) of the icon box.

```
#include <FL/fl_ask.H>
```

10.14.2.18 fl_message_icon_label()

```
void fl_message_icon_label (
    const char * str)
```

Sets the icon label of the dialog window used in many common dialogs.

This icon label will be used in the next call of one of the common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

The label `str` is stored internally as a reference, it must be in scope until the dialog function (e.g. [fl_choice\(\)](#)) is called.

It applies only to the **next** call of one of the common dialogs and will be reset after that call so the next dialog will use its default label unless set again.

Note

This label string must be short, usually only one character so it fits in the icon box. You can use any valid UTF-8 character, e.g. the Euro sign ("€") which is three bytes in UTF-8 encoding.

```
#include <FL/fl_ask.H>
```

Parameters

<code>in</code>	<code>str</code>	icon label
-----------------	------------------	------------

10.14.2.19 fl_message_position() [1/3]

```
void fl_message_position (
    const int x,
    const int y,
    const int center)
```

Sets the preferred position for the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

The position set with this method overrides the hotspot setting, i.e. setting a position has higher priority than the hotspot mode set by [fl_message_hotspot\(int\)](#).

The preferred position set by any of the [fl_message_position\(\)](#) variants affects only the next call of one of the common dialogs. The preferred position is reset to 0 (unset) as soon as the dialog is shown.

If the optional argument *center* is non-zero (true) the message box will be centered at the given coordinates rather than using the X/Y position as the window position (top left corner).

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>x</i>	Preferred X position
in	<i>y</i>	Preferred Y position
in	<i>center</i>	1 = centered, 0 = absolute

See also

```
int fl_message_position(int *x, int *y)
```

10.14.2.20 fl_message_position() [2/3]

```
void fl_message_position (
    Fl_Widget * widget)
```

Sets the preferred position for the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

The message box will be centered over the given widget or window extensions.

Everything else is like [fl_message_position\(int, int, int\)](#) with argument 'center' set to 1.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>widget</i>	Widget or window to position the message box over.
----	---------------	--

See also

```
int fl_message_position(int x, int y, int center)
```

10.14.2.21 fl_message_position() [3/3]

```
int fl_message_position (
    int * x,
    int * y)
```

Gets the preferred position for the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

```
#include <FL/fl_ask.H>
```

The position set with this method overrides the hotspot setting, i.e. setting a position has higher priority than the hotspot mode set by [fl_message_hotspot\(int\)](#).

The preferred position set by any of the [fl_message_position\(\)](#) variants affects only the next call of one of the common dialogs. The preferred position is reset to 0 (unset) as soon as the dialog is shown.

Parameters

out	x	Preferred X position, returns -1 if not set
out	y	Preferred Y position, returns -1 if not set

Returns

whether position is currently set or not

Return values

0	position is not set (hotspot may be enabled or not)
1	position is set (window position)
2	position is set (message box centered)

See also

[fl_message_hotspot\(\)](#)
[fl_message_hotspot\(int\)](#)
[fl_message_position\(int, int\)](#)
[fl_message_position\(const int x, const int y, const int center\)](#)
[fl_message_position\(Fl_Widget *\)](#)

10.14.2.22 fl_message_title()

```
void fl_message_title (
    const char * title)
```

Sets the title of the dialog window used in many common dialogs.

This window `title` will be used in the next call of one of the common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

The `title` string is copied internally, so that you can use a local variable or free the string immediately after this call. It applies only to the **next** call of one of the common dialogs and will be reset to an empty title (the default for all dialogs) after that call.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>title</i>	window label, string copied internally
----	--------------	--

10.14.2.23 fl_message_title_default()

```
void fl_message_title_default (
    const char * title)
```

Sets the default title of the dialog window used in many common dialogs.

This window `title` will be used in all subsequent calls of one of the common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#), unless a specific title has been set with [fl_message_title\(const char *title\)](#). The default is no title. You can override the default title for a single dialog with [fl_message_title\(const char *title\)](#).

The `title` string is copied internally, so that you can use a local variable or free the string immediately after this call.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>title</i>	default window label, string copied internally
----	--------------	--

10.14.2.24 fl_password() [1/2]

```
const char * fl_password (
    const char * fmt,
    const char * defstr,
    ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Like `fl_input()` except the input text is not shown, '*' or similar replacement characters are displayed instead.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

Returns

the user string input if OK was pushed

Return values

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	---

10.14.2.25 fl_password() [2/2]

```
const char * fl_password (
    int maxchar,
    const char * fmt,
    const char * defstr,
    ...)
```

Shows an input dialog displaying the `fmt` message with variable arguments.

Like `fl_input()` except the input text is not shown, '*' or similar replacement characters are displayed instead.

```
#include <FL/fl_ask.H>
```

Parameters

in	<i>maxchar</i>	input lenght limit in chars, 0 = no limit
in	<i>fmt</i>	can be used as an sprintf-like format and variables for the message text
in	<i>defstr</i>	defines the default returned string if no text is entered

Returns

the user string input if OK was pushed

Return values

<i>NULL</i>	if Cancel was pushed or the window was closed by the user
-------------	---

10.14.3 Variable Documentation**10.14.3.1 error**

```
void(* Fl::error)(const char *format,...) = Fl_System_Driver::error [static]
```

FLTK calls `Fl::error()` to output a normal error message.

The default version on Windows displays the error message in a MessageBox window.

The default version on all other platforms prints the error message to stderr.

You can override the behavior by setting the function pointer to your own routine.

`Fl::error()` means there is a recoverable error such as the inability to read an image file. The default implementation returns after displaying the message.

Note

```
#include <FL/Fl.H>
```

10.14.3.2 fatal

```
void(* Fl::fatal)(const char *format,...) = Fl_System_Driver::fatal [static]
```

FLTK calls `Fl::fatal()` to output a fatal error message.

The default version on Windows displays the error message in a MessageBox window.

The default version on all other platforms prints the error message to stderr.

You can override the behavior by setting the function pointer to your own routine.

`Fl::fatal()` must not return, as FLTK is in an unusable state, however your version may be able to use `longjmp` or an exception to continue, as long as it does not call FLTK again. The default implementation exits with status 1 after displaying the message.

Note

```
#include <FL/Fl.H>
```

10.14.3.3 warning

```
void(* Fl::warning)(const char *format,...) = Fl_System_Driver::warning [static]
```

FLTK calls `Fl::warning()` to output a warning message.

The default version on Windows returns *without* printing a warning message, because Windows programs normally don't have stderr (a console window) enabled.

The default version on all other platforms prints the warning message to stderr.

You can override the behavior by setting the function pointer to your own routine.

`Fl::warning()` means that there was a recoverable problem, the display may be messed up, but the user can probably keep working - all X protocol errors call this, for example. The default implementation returns after displaying the message.

Note

```
#include <FL/Fl.H>
```

10.15 File names and URI utility functions

File names and URI functions defined in `<FL/filename.H>`

Macros

- `#define FL_PATH_MAX 2048`
all path buffers should use this length

Typedefs

- `typedef int Fl_File_Sort_F(struct dirent **, struct dirent **)`
File sorting function.

Functions

- void [fl_decode_uri](#) (char *uri)
Decodes a URL-encoded string.
- int [fl_filename_absolute](#) (char *to, int tolen, const char *from)
Makes a filename absolute from a relative filename to the current working directory.
- int [fl_filename_absolute](#) (char *to, int tolen, const char *from, const char *cwd)
*Concatenate the absolute path *base* with *from* to form the new absolute path in *to*.*
- int [fl_filename_expand](#) (char *to, int tolen, const char *from)
Expands a filename containing shell variables and tilde (~).
- const char * [fl_filename_ext](#) (const char *buf)
Gets the extension of a filename.
- void [fl_filename_free_list](#) (struct dirent **l, int n)
Free the list of filenames that is generated by [fl_filename_list](#)().
- int [fl_filename_isdir](#) (const char *name)
Determines if a file exists and is a directory from its filename.
- int [fl_filename_list](#) (const char *d, struct dirent **l, [Fl_File_Sort_F](#) *s=[fl_numeric_sort](#))
Portable and const-correct wrapper for the `scandir()` function.
- int [fl_filename_match](#) (const char *name, const char *pattern)
*Checks if a string *s* matches a pattern *p*.*
- const char * [fl_filename_name](#) (const char *filename)
Gets the file name from a path.
- int [fl_filename_relative](#) (char *to, int tolen, const char *from)
Makes a filename relative to the current working directory.
- int [fl_filename_relative](#) (char *to, int tolen, const char *from, const char *cwd)
Makes a filename relative to any other directory.
- char * [fl_filename_setext](#) (char *to, int tolen, const char *ext)
*Replaces the extension in *buf* of *max*.*
- int [fl_open_uri](#) (const char *uri, char *msg, int msglen)
Opens the specified Uniform Resource Identifier (URI).

10.15.1 Detailed Description

File names and URI functions defined in [<FL/filename.H>](#)

10.15.2 Typedef Documentation

10.15.2.1 [Fl_File_Sort_F](#)

```
typedef int Fl_File_Sort_F(struct dirent **, struct dirent **)
```

File sorting function.

See also

[fl_filename_list\(\)](#)

10.15.3 Function Documentation

10.15.3.1 [fl_decode_uri\(\)](#)

```
void fl_decode_uri (
    char * uri)
```

Decodes a URL-encoded string.

In a Uniform Resource Identifier (URI), all non-ASCII bytes and several others (e.g., '<', '"', ' ') are URL-encoded using 3 bytes by "%XY" where XY is the hexadecimal value of the byte. This function decodes the URI restoring its original UTF-8 encoded content. Decoding is done in-place.

10.15.3.2 fl_filename_absolute() [1/2]

```
int fl_filename_absolute (
    char * to,
    int tolen,
    const char * from)
```

Makes a filename absolute from a relative filename to the current working directory.

```
#include <FL/filename.H>
[...]
```

```
fl_chdir("/var/tmp");
fl_filename_absolute(out, sizeof(out), "foo.txt");           // out="/var/tmp/foo.txt"
fl_filename_absolute(out, sizeof(out), "../foo.txt");       // out="/var/tmp/foo.txt"
fl_filename_absolute(out, sizeof(out), "../log/messages");  // out="/var/log/messages"
```

Parameters

out	<i>to</i>	resulting absolute filename
in	<i>tolen</i>	size of the absolute filename buffer
in	<i>from</i>	relative filename

Returns

0 if no change, non zero otherwise

10.15.3.3 fl_filename_absolute() [2/2]

```
int fl_filename_absolute (
    char * to,
    int tolen,
    const char * from,
    const char * base)
```

Concatenate the absolute path base with from to form the new absolute path in to.

```
#include <FL/filename.H>
char out[FL_PATH_MAX];
fl_filename_absolute(out, sizeof(out), "../foo.txt", "/var/tmp"); // out="/var/foo.txt"
fl_filename_absolute(out, sizeof(out), "../local/bin", "/usr/bin"); // out="/usr/local/bin"
```

Parameters

out	<i>to</i>	resulting absolute filename
in	<i>tolen</i>	size of the absolute filename buffer
in	<i>from</i>	relative filename
in	<i>base</i>	from is relative to this absolute file path

Returns

0 if no change, non zero otherwise

10.15.3.4 fl_filename_expand()

```
int fl_filename_expand (
    char * to,
    int tolen,
    const char * from)
```

Expands a filename containing shell variables and tilde (~).

Currently handles these variants:

```
"~username"           // if 'username' does not exist, result will be unchanged
"~/file"
"${VARNAME}"           // does NOT handle ${VARNAME}
```

Examples:

```
#include <FL/filename.H>
[...]
```

```
putenv("TMPDIR=/var/tmp");
fl_filename_expand(out, sizeof(out), "~fred/.cshrc");      // out="/usr/fred/.cshrc"
fl_filename_expand(out, sizeof(out), "~/.cshrc");          // out="/usr/<yourname>/.cshrc"
fl_filename_expand(out, sizeof(out), "$TMPDIR/foo.txt");    // out="/var/tmp/foo.txt"
```

Parameters

out	<i>to</i>	resulting expanded filename
in	<i>to len</i>	size of the expanded filename buffer
in	<i>from</i>	filename containing shell variables

Returns

0 if no change, non zero otherwise

10.15.3.5 fl_filename_ext()

```
const char * fl_filename_ext (
    const char * buf)
```

Gets the extension of a filename.

```
#include <FL/filename.H>
[...]
```

```
const char *out;
out = fl_filename_ext("/some/path/foo.txt");      // result: ".txt"
out = fl_filename_ext("/some/path/foo");          // result: NULL
```

Parameters

in	<i>buf</i>	the filename to be parsed
----	------------	---------------------------

Returns

a pointer to the extension (including '.') if any or NULL otherwise

10.15.3.6 fl_filename_free_list()

```
void fl_filename_free_list (
    struct dirent *** list,
    int n)
```

Free the list of filenames that is generated by [fl_filename_list\(\)](#).

Free everything that was allocated by a previous call to [fl_filename_list\(\)](#). Use the return values as parameters for this function.

Parameters

in, out	<i>list</i>	table containing the resulting directory listing
in	<i>n</i>	number of entries in the list

10.15.3.7 fl_filename_isdir()

```
int fl_filename_isdir (
    const char * n)
```

Determines if a file exists and is a directory from its filename.

```
#include <FL/filename.H>
[...]
```

```
fl_filename_isdir("/etc");          // returns non-zero
fl_filename_isdir("/etc/hosts");    // returns 0
```

Parameters

in	<i>n</i>	the filename to parse
----	----------	-----------------------

Returns

non zero if file exists and is a directory, zero otherwise

10.15.3.8 fl_filename_list()

```
int fl_filename_list (
    const char * d,
    dirent *** list,
    Fl_File_Sort_F * sort)
```

Portable and const-correct wrapper for the scandir() function.

For each file in that directory a "dirent" structure is created. The only portable thing about a dirent is that dirent.d_name is the nul-terminated file name. A pointers array to these dirent's is created and a pointer to the array is returned in *list. The number of entries is given as a return value. If there is an error reading the directory a number less than zero is returned, and errno has the reason; errno does not work under Windows.

Include:

```
#include <FL/filename.H>
```

Parameters

in	<i>d</i>	the name of the directory to list. It does not matter if it has a trailing slash.
out	<i>list</i>	table containing the resulting directory listing
in	<i>sort</i>	sorting functor: <ul style="list-style-type: none"> • fl_alphasort: The files are sorted in ascending alphabetical order; upper and lowercase letters are compared according to their ASCII ordering uppercase before lowercase. • fl_casealphasort: The files are sorted in ascending alphabetical order; upper and lowercase letters are compared equally case is not significant. • fl_casenumERICsort: The files are sorted in ascending "alphanumeric" order, where an attempt is made to put unpadding numbers in consecutive order; upper and lowercase letters are compared equally case is not significant. • fl_numericSORT: The files are sorted in ascending "alphanumeric" order, where an attempt is made to put unpadding numbers in consecutive order; upper and lowercase letters are compared according to their ASCII ordering - uppercase before lowercase.

Returns

the number of entries if no error, a negative value otherwise.

Todo should support returning OS error messages

10.15.3.9 fl_filename_match()

```
int fl_filename_match (
    const char * s,
    const char * p)
```

Checks if a string *s* matches a pattern *p*.

The following syntax is used for the pattern:

- * matches any sequence of 0 or more characters.

- `?` matches any single character.
- `[set]` matches any character in the set. Set can contain any single characters, or a-z to represent a range. To match `^` or `!` they must not be the first characters.
- `[^set]` or `[!set]` matches any character not in the set.
- `{X|Y|Z}` or `{X,Y,Z}` matches any one of the subexpressions literally.
- `\x` quotes the character `x` so it has no special meaning.
- `x` all other characters are matched "exactly" on a **case-insensitive** basis.

Notes:

- `s` and `p` are matched on a char/byte basis, not as UCS codepoints or UTF-8 sequences.
- `[set]` ranges must run from low to high, i.e. `[a-z]` and not `[z-a]`
- `[set]` comparison is **case-sensitive**, i.e. `[a-z]` won't match `"A"`.
- `\x` only applies to the `fl_filename_match` special characters `*` `?` `[` `{`
- `\x` needs a double `\` or the compiler will complain about non-standard escape sequences.

Include:

```
#include <FL/filename.H>
```

Parameters

in	<code>s</code>	the string to check for a match
in	<code>p</code>	the string pattern

Returns

non zero if the string matches the pattern

10.15.3.10 fl_filename_name()

```
const char * fl_filename_name (
    const char * filename)
```

Gets the file name from a path.

Similar to `basename(3)`, exceptions shown below.

```
#include <FL/filename.H>
[...]
```

<code>const char *out;</code>		
<code>out = fl_filename_name("/usr/lib");</code>	<code>// out="lib"</code>	
<code>out = fl_filename_name("/usr/");</code>	<code>// out=""</code>	<code>(basename(3) returns "usr" instead)</code>
<code>out = fl_filename_name("/usr");</code>	<code>// out="usr"</code>	
<code>out = fl_filename_name("/");</code>	<code>// out=""</code>	<code>(basename(3) returns "/" instead)</code>
<code>out = fl_filename_name(".");</code>	<code>// out="."</code>	
<code>out = fl_filename_name("../");</code>	<code>// out=".."</code>	

Returns

a pointer to the char after the last slash, or to `filename` if there is none.

10.15.3.11 fl_filename_relative() [1/2]

```
int fl_filename_relative (
    char * to,
    int tolen,
    const char * from)
```

Makes a filename relative to the current working directory.

Return the *from* path made relative to the working directory, similar to C++17 `std::filesystem::path::lexically_relative`. This function can also be called with a fourth argument for a user supplied *base* directory path

These conversions are purely lexical. They do not check that the paths exist, do not follow symlinks, and do not access the filesystem at all.

Path arguments must be absolute (start at the root directory) and must not contain `.` or `..` segments, or double separators. A single trailing separator is ok.

On Windows, path arguments must start with a drive name, e.g. `c:\.` Windows network paths and other special paths starting with a double separator are not supported (`\\cloud\drive\path`, `\\?\.`, etc.) . Separators can be `\` and `/` and will be preserved. Newly created separators are always the forward slash `/`.

On Windows and macOS, the path segment tests are case insensitive.

If the path can not be generated, *from* path is copied into the *to* buffer and 0 is returned.

```
#include <FL/filename.H>
[...]
```

```
fl_chdir("/var/tmp/somedir");           // set cwd to /var/tmp/somedir
[...]
```

```
char out[FL_PATH_MAX];
fl_filename_relative(out, sizeof(out), "/var/tmp/somedir/foo.txt"); // out="foo.txt",    return=1
fl_filename_relative(out, sizeof(out), "/var/tmp/foo.txt");         // out="../foo.txt", return=1
fl_filename_relative(out, sizeof(out), "foo.txt");                  // out="foo.txt",    return=0 (no
    change)
fl_filename_relative(out, sizeof(out), "../foo.txt");               // out="../foo.txt", return=0 (no
    change)
fl_filename_relative(out, sizeof(out), "../foo.txt");               // out="../foo.txt", return=0 (no
    change)
```

Parameters

out	<i>to</i>	resulting relative filename
in	<i>tolen</i>	size of the relative filename buffer
in	<i>from</i>	absolute filename

Returns

0 if no change, non zero otherwise

See also

[fl_filename_relative\(char *to, int tolen, const char *from, const char *base\)](#)

10.15.3.12 fl_filename_relative() [2/2]

```
int fl_filename_relative (
    char * to,
    int tolen,
    const char * from,
    const char * base)
```

Makes a filename relative to any other directory.

Parameters

out	<i>to</i>	resulting relative filepath
in	<i>tolen</i>	size of the relative filename buffer
in	<i>from</i>	absolute filepath
in	<i>base</i>	generate filepath relative to this absolute filepath

Returns

0 if no change, non zero otherwise

See also

[fl_filename_relative\(char *to, int tolen, const char *from\)](#)

10.15.3.13 fl_filename_setext()

```
char * fl_filename_setext (
    char * buf,
    int buflen,
    const char * ext)
```

Replaces the extension in `buf` of max.

size `buflen` with the extension in `ext`.

If there's no '.' in `buf`, `ext` is appended.

If `ext` is NULL, behaves as if it were an empty string ("").

Example

```
#include <FL/filename.H>
[...]  
char buf[FL_PATH_MAX] = "/path/myfile.cxx";  
fl_filename_setext(buf, sizeof(buf), ".txt"); // buf[] becomes "/path/myfile.txt"
```

Returns

`buf` itself for calling convenience.

10.15.3.14 fl_open_uri()

```
int fl_open_uri (
    const char * uri,
    char * msg,
    int msglen)
```

Opens the specified Uniform Resource Identifier (URI).

Uses an operating-system dependent program or interface. For URIs using the "ftp", "http", or "https" schemes, the system default web browser is used to open the URI, while "mailto" and "news" URIs are typically opened using the system default mail reader and "file" URIs are opened using the file system navigator.

On success, the (optional) `msg` buffer is filled with the command that was run to open the URI; on Windows, this will always be "open uri".

On failure, the `msg` buffer is filled with an English error message.

Note

Platform Specific Issues: Windows

With "file:" based URIs on Windows, you may encounter issues with anchors being ignored. Example: "file:///c:/some/index.html#anchor" may open in the browser without the "#anchor" suffix. The behavior seems to vary across different Windows versions. Workaround: open a link to a separate html file that redirects to the desired "file:" URI.

Example

```
#include <FL/filename.H>
[...]  
char errmsg[512];  
if ( !fl_open_uri("http://google.com/", errmsg, sizeof(errmsg)) ) {  
    char warnmsg[768];  
    sprintf(warnmsg, "Error: %s", errmsg);  
    fl_alert(warnmsg);  
}
```

Parameters

<i>uri</i>	The URI to open
<i>msg</i>	Optional buffer which contains the command or error message
<i>msglen</i>	Length of optional buffer

Returns

1 on success, 0 on failure

Chapter 11

Class Documentation

11.1 FL_Grid::Cell Class Reference

Public Member Functions

- [FL_Grid_Align](#) **align** () const
- void **align** ([FL_Grid_Align](#) align)
- **Cell** ([FL_Widget](#) *w, int row, int col)
- **Cell** (int row, int col)

- void **colspan** (short v)
- void **minimum_size** (int *w, int *h) const
- void **minimum_size** (int w, int h)
- [Cell](#) * **next** ()
Returns the next widget cell of the same row of this cell.
- void **next** ([Cell](#) *c)
Sets the next pointer of a grid's cell.
- short **row** () const
- short **rowspan** () const
- void **rowspan** (short v)
- [FL_Widget](#) * **widget** () const
- **~Cell** ()
The destructor deletes the cell.

Friends

- class **FL_Grid**

11.1.1 Constructor & Destructor Documentation

11.1.1.1 ~Cell()

`FL_Grid::Cell::~Cell () [inline]`

The destructor deletes the cell.

Todo [FL_Grid](#)'s cell destructor should remove the cell from the grid. Currently it does nothing!

11.1.2 Member Function Documentation

11.1.2.1 next()

```
void Fl_Grid::Cell::next (
    Cell * c) [inline]
```

Sets the `next` pointer of a grid's cell.

Internal use only!

Do not use this method, it may corrupt the allocated memory.

The documentation for this class was generated from the following file:

- [Fl_Grid.H](#)

11.2 FL_Terminal::CharStyle Class Reference

11.7 FL Class Reference

The [FL](#) is the FLTK global (static) class containing state information and global methods for the current application.
`#include <FL.H>`

Public Types

- enum [FL_Option](#) {
[OPTION_ARROW_FOCUS](#) = 0 , [OPTION_VISIBLE_FOCUS](#) , [OPTION_DND_TEXT](#) , [OPTION_SHOW_TOOLTIPS](#) ,
[OPTION_FNFC_USES_GTK](#) , [OPTION_FNFC_USES_ZENITY](#) , [OPTION_FNFC_USES_KDIALOG](#) ,
[OPTION_PRINTER_USES_GTK](#) ,
[OPTION_SHOW_SCALING](#) , [OPTION_SIMPLE_ZOOM_SHORTCUT](#) , [OPTION_LAST](#) }

Enumerator for global FLTK options.

Static Public Member Functions

- static int [abi_check](#) (const int val=[FL_ABI_VERSION](#))
Returns whether the runtime library ABI version is correct.
- static int [abi_version](#) ()
Returns the compiled-in value of the [FL_ABI_VERSION](#) constant.
- static int [add_awake_handler_](#) ([FL_Awake_Handler](#), void *)
Adds an awake handler for use in [awake\(\)](#).
- static void [add_check](#) ([FL_Timeout_Handler](#), void *=0)
FLTK will call this callback just before it flushes the display and waits for events.
- static void [add_clipboard_notify](#) ([FL_Clipboard_Notify_Handler](#) h, void *data=0)
FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.

- static void `add_fd` (int fd, `FI_FD_Handler` cb, void *=0)
Adds file descriptor fd to listen to.
- static void `add_fd` (int fd, int when, `FI_FD_Handler` cb, void *=0)
Adds file descriptor fd to listen to.
- static void `add_handler` (`FI_Event_Handler` ha)
Install a function to parse unrecognized events.
- static void `add_handler` (`FI_Event_Handler` ha, `FI_Event_Handler` before)
Install a function to parse unrecognized events with less priority than another function.
- static void `add_idle` (`FI_Idle_Handler` cb, void *data=0)
Adds a callback function that is called every time by `FI::wait()` and also makes it act as though the timeout is zero (this makes `FI::wait()` return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).
- static void `add_system_handler` (`FI_System_Handler` h, void *data)
Install a function to intercept system events.
- static void `add_timeout` (double t, `FI_Timeout_Handler` cb, void *data=0)
Adds a one-shot timeout callback.
- static int `api_version` ()
Returns the compiled-in value of the `FL_API_VERSION` constant.
- static int `arg` (int argc, char **argv, int &i)
Parse a single switch from argv, starting at word i.
- static void `args` (int argc, char **argv)
Parse all command line switches matching standard FLTK options only.
- static int `args` (int argc, char **argv, int &i, `FI_Args_Handler` cb=0)
Parse command line switches using the cb argument handler.
- static int `args_to_utf8` (int argc, char **&argv)
Convert Windows commandline arguments to UTF-8.
- static int `awake` (`FI_Awake_Handler` cb, void *message=0)
See void awake(void message=0).*
- static void `awake` (void *message=0)
Sends a message pointer to the main thread, causing any pending `FI::wait()` call to terminate so that the main thread can retrieve the message and any pending redraws can be processed.
- static void `background` (uchar, uchar, uchar)
Changes fl_color(FL_BACKGROUND_COLOR) to the given color, and changes the gray ramp from 32 to 56 to black to white.
- static void `background2` (uchar, uchar, uchar)
Changes the alternative background color.
- static `FI_Widget` * `belowmouse` ()
Gets the widget that is below the mouse.
- static void `belowmouse` (`FI_Widget` *)
Sets the widget that is below the mouse.
- static int `box_border_radius_max` ()
Get the maximum border radius of all "rounded" boxtypes in pixels.
- static void `box_border_radius_max` (int R)
Set the maximum border radius of all "rounded" boxtypes in pixels.
- static `FI_Color` `box_color` (`FI_Color`)
Gets the drawing color to be used for the background of a box.
- static int `box_dh` (`FI_Boxtype`)
Returns the height offset for the given boxtype.
- static int `box_dw` (`FI_Boxtype`)
Returns the width offset for the given boxtype.
- static int `box_dx` (`FI_Boxtype`)

- Returns the X offset for the given boxtype.*

 - static int [box_dy](#) ([Fl_Boxtype](#))
- Returns the Y offset for the given boxtype.*

 - static int [box_shadow_width](#) ()
- Get the box shadow width of all "shadow" boxtypes in pixels.*

 - static void [box_shadow_width](#) (int W)
- Set the box shadow width of all "shadow" boxtypes in pixels.*

 - static bool [cairo_autolink_context](#) ()
- Gets the current autolink mode for Cairo support.*

 - static void [cairo_autolink_context](#) (bool alink)
- When FLTK_HAVE_CAIRO is defined and [cairo_autolink_context\(\)](#) is true, any current window dc is linked to a current Cairo context.*

 - static cairo_t * [cairo_cc](#) ()
- Gets the current Cairo context linked with a fltk window.*

 - static void [cairo_cc](#) (cairo_t *c, bool own=false)
- Sets the current Cairo context to c.*

 - static void [cairo_flush](#) (cairo_t *c)
- Flush Cairo drawings on Cairo context c.*

 - static cairo_t * [cairo_make_current](#) ([Fl_Window](#) *w)
- Provides a Cairo context for window wi.*

 - static [Fl_Callback_Reason](#) [callback_reason](#) ()
- Give the reason for calling a callback.*

 - static int [check](#) ()
- Same as Fl::wait(0).*

 - static void [clear_widget_pointer](#) ([Fl_Widget](#) const *w)
- Clears a widget pointer in the watch list.*

 - static int [clipboard_contains](#) (const char *type)
- Returns non 0 if the clipboard contains data matching type.*

 - static int [compose](#) (int &del)
- Any text editing widget should call this for each FL_KEYBOARD event.*

 - static void [compose_reset](#) ()
- If the user moves the cursor, be sure to call [Fl::compose_reset\(\)](#).*

 - static void [copy](#) (const char *stuff, int len, int destination=0, const char *type=[Fl::clipboard_plain_text](#))
- Copies data to the selection buffer, the clipboard, or both.*

 - static int [damage](#) ()
- If true then [flush\(\)](#) will do something.*

 - static void [damage](#) (int d)
- If true then [flush\(\)](#) will do something.*

 - static void [default_atclose](#) ([Fl_Window](#) *, void *)
- Default callback for window widgets.*

 - static void [delete_widget](#) ([Fl_Widget](#) *w)
- Schedules a widget for deletion at the next call to the event loop.*

 - static void [disable_im](#) ()
- Disables the system input methods facilities.*

 - static void [display](#) (const char *)
- Sets the X or Wayland display to use for all windows.*

 - static int [dnd](#) ()
- Initiate a Drag And Drop operation.*

 - static int [dnd_text_ops](#) ()
- Gets whether drag and drop text operations are supported.*

 - static void [dnd_text_ops](#) (int v)

- Sets whether drag and drop text operations are supported.*

 - static void `do_widget_deletion` ()

Deletes widgets previously scheduled for deletion.
- static int `draw_box_active` ()

Determines if the currently drawn box is active or inactive.
- static int `draw_GL_text_with_textures` ()

returns whether whether OpenGL uses textures to draw all text.
- static void `draw_GL_text_with_textures` (int val)

sets whether OpenGL uses textures to draw all text.
- static void `enable_im` ()

Enables the system input methods facilities.
- static int `event` ()

Returns the last event that was processed.
- static int `event_alt` ()

Returns non-zero if the Alt key is pressed.
- static int `event_button` ()

Gets which particular mouse button caused the current event.
- static int `event_button1` ()

Returns non-zero if mouse button 1 is currently held down.
- static int `event_button2` ()

Returns non-zero if mouse button 2 is currently held down.
- static int `event_button3` ()

Returns non-zero if mouse button 3 is currently held down.
- static int `event_button4` ()

Returns non-zero if mouse button 4 is currently held down.
- static int `event_button5` ()

Returns non-zero if mouse button 5 is currently held down.
- static int `event_buttons` ()

Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.
- static int `event_clicks` ()

Returns non zero if we had a double click event.
- static void `event_clicks` (int i)

Manually sets the number returned by `FL::event_clicks()`.
- static void * `event_clipboard` ()

During an FL_PASTE event of non-textual data, returns a pointer to the pasted data.
- static const char * `event_clipboard_type` ()

Returns the type of the pasted data during an FL_PASTE event.
- static int `event_command` ()

Returns non-zero if the FL_COMMAND key is pressed, either FL_CTRL or on OSX FL_META.
- static int `event_ctrl` ()

Returns non-zero if the Control key is pressed.
- static `FL_Event_Dispatch` `event_dispatch` ()

Return the current event dispatch function.
- static void `event_dispatch` (`FL_Event_Dispatch` d)

Set a new event dispatch function.
- static int `event_dx` ()

Returns the current horizontal mouse scrolling associated with the FL_MOUSEWHEEL event.
- static int `event_dy` ()

Returns the current vertical mouse scrolling associated with the FL_MOUSEWHEEL event.
- static int `event_inside` (const `FL_Widget` *)

Returns whether or not the mouse event is inside a given child widget.

- static int [event_inside](#) (int, int, int, int)
Returns whether or not the mouse event is inside the given rectangle.
- static int [event_is_click](#) ()
Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".
- static void [event_is_click](#) (int i)
Clears the value returned by `Fl::event_is_click()`.
- static int [event_key](#) ()
Gets which key on the keyboard was last pushed.
- static int [event_key](#) (int key)
Returns true if the given `key` was held down (or pressed) during the last event.
- static int [event_length](#) ()
Returns the length of the text in `Fl::event_text()`.
- static int [event_original_key](#) ()
Returns the keycode of the last key event, regardless of the NumLock state.
- static int [event_shift](#) ()
Returns non-zero if the Shift key is pressed.
- static int [event_state](#) ()
Returns the keyboard and mouse button states of the last event.
- static int [event_state](#) (int mask)
Returns non-zero if any of the passed event state bits are turned on.
- static const char * [event_text](#) ()
Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.
- static int [event_x](#) ()
Returns the mouse position of the event relative to the `Fl_Window` it was passed to.
- static int [event_x_root](#) ()
Returns the mouse position on the screen of the event.
- static int [event_y](#) ()
Returns the mouse position of the event relative to the `Fl_Window` it was passed to.
- static int [event_y_root](#) ()
Returns the mouse position on the screen of the event.
- static `Fl_Window` * [first_window](#) ()
Returns the first top-level window in the list of `shown()` windows.
- static void [first_window](#) (`Fl_Window` *)
Sets the window that is returned by `first_window()`.
- static void [flush](#) ()
Causes all the windows that need it to be redrawn and graphics forced out through the pipes.
- static `Fl_Widget` * [focus](#) ()
Gets the current `Fl::focus()` widget.
- static void [focus](#) (`Fl_Widget` *)
Sets the widget that will receive `FL_KEYBOARD` events.
- static void [foreground](#) (`uchar`, `uchar`, `uchar`)
Changes `fl_color(FL_FOREGROUND_COLOR)`.
- static void [free_color](#) (`Fl_Color` i, int overlay=0)
Frees the specified color from the colormap, if applicable.
- static int [get_awesome_handler_](#) (`Fl_Awake_Handler` &, void *&)
Gets the last stored awake handler for use in `awake()`.
- static `Fl_Box_Draw_F` * [get_boxtype](#) (`Fl_Boxtype`)
Gets the current box drawing function for the specified box type.
- static unsigned [get_color](#) (`Fl_Color` i)
Returns the RGB value(s) for the given FLTK color index.

- static void [get_color](#) ([FL_Color](#) i, [uchar](#) &red, [uchar](#) &green, [uchar](#) &blue)

Returns the RGB value(s) for the given FLTK color index.
- static void [get_color](#) ([FL_Color](#) i, [uchar](#) &red, [uchar](#) &green, [uchar](#) &blue, [uchar](#) &alpha)

Returns the RGBA value(s) for the given FLTK color index.
- static const char * [get_font](#) ([FL_Font](#))

Gets the string for this face.
- static const char * [get_font_name](#) ([FL_Font](#), int *attributes=0)

Get a human-readable string describing the family of this face.
- static int [get_font_sizes](#) ([FL_Font](#), int *&sizep)

Return an array of sizes in sizep.
- static int [get_key](#) (int key)

Returns true if the given key is held down now.
- static void [get_mouse](#) (int &, int &)

Return where the mouse is on the screen by doing a round-trip query to the server.
- static void [get_system_colors](#) ()

Read the user preference colors from the system and use them to call [Fl::foreground\(\)](#), [Fl::background\(\)](#), and [Fl::background2\(\)](#).
- static int [gl_visual](#) (int, int *alist=0)

This does the same thing as [Fl::visual\(int\)](#) but also requires OpenGL drawing to work.
- static [FL_Window](#) * [grab](#) ()

Returns the window that currently receives all events.
- static void [grab](#) ([FL_Window](#) &win)

See [grab\(FL_Window\)](#)*
- static void [grab](#) ([FL_Window](#) *)

Selects the window to grab.
- static int [h](#) ()

Returns the height in pixels of the main screen work area.
- static int [handle](#) (int, [FL_Window](#) *)

Handle events from the window system.
- static int [handle_](#) (int, [FL_Window](#) *)

Handle events from the window system.
- static int [has_check](#) ([FL_Timeout_Handler](#), void *=0)

Returns 1 if the check exists and has not been called yet, 0 otherwise.
- static int [has_idle](#) ([FL_Idle_Handler](#) cb, void *data=0)

Returns true if the specified idle callback is currently installed.
- static int [has_timeout](#) ([FL_Timeout_Handler](#) cb, void *data=0)

Returns true if the timeout exists and has not been called yet.
- static void [hide_all_windows](#) ()

Hide all visible windows to make FLTK leave [Fl::run\(\)](#).
- static int [is_scheme](#) (const char *name)

Returns whether the current scheme is the given name.
- static void [keyboard_screen_scaling](#) (int value)

Controls the possibility to scale all windows by ctrl+/-/0/ or cmd+/-/0/.
- static [FL_Event_Handler](#) [last_handler](#) ()

Returns the last function installed by a call to [Fl::add_handler\(\)](#).
- static int [lock](#) ()

The [lock\(\)](#) method blocks the current thread until it can safely access FLTK widgets and data.
- static int [menu_linespacing](#) ()

Gets the default line spacing used by menus.
- static void [menu_linespacing](#) (int H)

Sets the default line spacing used by menus.

- static `FL_Window * modal ()`
Returns the top-most *modal()* window currently shown.
- static `FL_Window * next_window (const FL_Window *)`
Returns the next top-level window in the list of shown() windows.
- static `FL_Timestamp now (double offset=0)`
Set a time stamp at this point in time with optional signed offset in seconds.
- static bool `option (FL_Option opt)`
FLTK library options management.
- static void `option (FL_Option opt, bool val)`
Override an option while the application is running.
- static void `own_colormap ()`
Makes FLTK use its *own colormap*.
- static void `paste (FL_Widget &receiver)`
Backward compatibility only.
- static void `paste (FL_Widget &receiver, int source, const char *type=FL::clipboard_plain_text)`
Pastes the data from the selection buffer (*source is 0*) or the clipboard (*source is 1*) into receiver.
- static int `program_should_quit ()`
Returns non-zero when a request for program termination was received and accepted.
- static void `program_should_quit (int should_i)`
Indicate to the FLTK library whether a program termination request was received and accepted.
- static `FL_Widget * pushed ()`
Gets the widget that is being pushed.
- static void `pushed (FL_Widget *)`
Sets the widget that is being pushed.
- static `FL_Widget * readqueue ()`
Reads the default callback queue and returns the first widget.
- static int `ready ()`
This is similar to *FL::check()* except this does not call *FL::flush()* or any callbacks, which is useful if your program is in a state where such callbacks are illegal.
- static void `redraw ()`
Redraws all widgets.
- static void `release ()`
Releases the current grabbed window, equals *grab(0)*.
- static void `release_widget_pointer (FL_Widget *&w)`
Releases a widget pointer from the watch list.
- static int `reload_scheme ()`
Called internally when setting a new scheme according to scheme name.
- static void `remove_check (FL_Timeout_Handler, void *=0)`
Removes a check callback.
- static void `remove_clipboard_notify (FL_Clipboard_Notify_Handler h)`
Stop calling the specified callback when there are changes to the selection buffer or the clipboard.
- static void `remove_fd (int)`
Removes a file descriptor handler.
- static void `remove_fd (int, int when)`
Removes a file descriptor handler.
- static void `remove_handler (FL_Event_Handler h)`
Removes a previously added event handler.
- static void `remove_idle (FL_Idle_Handler cb, void *data=0)`
Removes the specified idle callback, if it is installed.
- static int `remove_next_timeout (FL_Timeout_Handler cb, void *data=0, void **data_return=0)`
Remove the next matching timeout callback and return its *data* pointer.

- static void [remove_system_handler](#) (FI_System_Handler h)
Removes a previously added system event handler.
- static void [remove_timeout](#) (FI_Timeout_Handler cb, void *data=0)
Remove one or more matching timeout callbacks from the timer queue.
- static void [repeat_timeout](#) (double t, FI_Timeout_Handler cb, void *data=0)
Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.
- static int [run](#) ()
Calls [Fl::wait\(\)](#) repeatedly as long as any windows are displayed.
- static void [run_checks](#) ()
- static void [run_idle](#) ()
- static const char * [scheme](#) ()
*See void [scheme\(const char *name\)](#)*
- static int [scheme](#) (const char *name)
Sets the current widget scheme.
- static int [screen_count](#) ()
Gets the total count of available screens.
- static void [screen_dpi](#) (float &h, float &v, int n=0)
Gets the screen resolution in dots-per-inch for the given screen.
- static FI_Screen_Driver * [screen_driver](#) ()
Returns a pointer to the unique FI_Screen_Driver object of the platform.
- static int [screen_num](#) (int x, int y)
Gets the screen number of a screen that contains the specified screen position x, y.
- static int [screen_num](#) (int x, int y, int w, int h)
Gets the screen number of the screen which intersects the most with the rectangle defined by x, y, w, h.
- static float [screen_scale](#) (int n)
Gets the GUI scaling factor of screen number n.
- static void [screen_scale](#) (int n, float factor)
Sets the GUI scaling factor of screen number n.
- static int [screen_scaling_supported](#) ()
Returns whether scaling factors are supported by this platform.
- static void [screen_work_area](#) (int &X, int &Y, int &W, int &H)
Gets the bounding box of the work area of the screen that contains the mouse pointer.
- static void [screen_work_area](#) (int &X, int &Y, int &W, int &H, int mx, int my)
Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.
- static void [screen_work_area](#) (int &X, int &Y, int &W, int &H, int n)
Gets the bounding box of the work area of the given screen.
- static void [screen_xywh](#) (int &X, int &Y, int &W, int &H)
Gets the bounding box of a screen that contains the mouse pointer.
- static void [screen_xywh](#) (int &X, int &Y, int &W, int &H, int mx, int my)
Gets the bounding box of a screen that contains the specified screen position mx, my.
- static void [screen_xywh](#) (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)
Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by mx, my, mw, mh.
- static void [screen_xywh](#) (int &X, int &Y, int &W, int &H, int n)
Gets the screen bounding rect for the given screen.
- static int [scrollbar_size](#) ()
Gets the default scrollbar size used by [FI_Browser](#), [FI_Help_View](#), [FI_Scroll](#), and [FI_Text_Display](#) widgets.
- static void [scrollbar_size](#) (int W)
Sets the default scrollbar size that is used by the [FI_Browser](#), [FI_Help_View](#), [FI_Scroll](#), and [FI_Text_Display](#) widgets.
- static double [seconds_between](#) (FI_Timestamp &back, FI_Timestamp &further_back)
Return the time in seconds between two time stamps.
- static double [seconds_since](#) (FI_Timestamp &then)

- Return the time in seconds between now and a previously taken time stamp.*

 - static void [selection](#) ([Fl_Widget](#) &owner, const char *, int len)

Changes the current selection.
- static [Fl_Widget](#) * [selection_owner](#) ()

back-compatibility only: Gets the widget owning the current selection
- static void [selection_owner](#) ([Fl_Widget](#) *)

Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.
- static int [selection_to_clipboard](#) ()

Returns the current selection_to_clipboard mode.
- static void [selection_to_clipboard](#) (int mode)

Copies selections on X11 directly to the clipboard if enabled.
- static void **set_abort** ([Fl_Abort_Handler](#) f)

For back compatibility, sets the void [Fl::fatal](#) handler callback.
- static void [set_atclose](#) ([Fl_Atclose_Handler](#) f)

For back compatibility, sets the [Fl::atclose](#) handler callback.
- static void [set_box_color](#) ([Fl_Color](#))

Sets the drawing color for the box that is currently drawn.
- static void [set_boxtype](#) ([Fl_Boxtype](#), [Fl_Box_Draw_F](#) *, [uchar](#), [uchar](#), [uchar](#), [uchar](#), [Fl_Box_Draw_Focus_F](#) *[=NULL](#))

Sets the function to call to draw a specific box type.
- static void **set_boxtype** ([Fl_Boxtype](#), [Fl_Boxtype](#) from)

Copies the from boxtype.
- static void [set_color](#) ([Fl_Color](#) i, unsigned c)

Sets an entry in the [fl_color](#) index table.
- static void [set_color](#) ([Fl_Color](#), [uchar](#), [uchar](#), [uchar](#))

Sets an entry in the [fl_color](#) index table.
- static void [set_color](#) ([Fl_Color](#), [uchar](#), [uchar](#), [uchar](#), [uchar](#))

Sets an entry in the [fl_color](#) index table.
- static void [set_font](#) ([Fl_Font](#), const char *)

Changes a face.
- static void **set_font** ([Fl_Font](#), [Fl_Font](#))

Copies one face to another.
- static [Fl_Font](#) [set_fonts](#) (const char *[=0](#))

FLTK will open the display, and add every fonts on the server to the face table.
- static void [set_idle](#) ([Fl_Old_Idle_Handler](#) cb)

Sets an idle callback.
- static void **set_labeltype** ([Fl_Labeltype](#), [Fl_Label_Draw_F](#) *, [Fl_Label_Measure_F](#) *)

Sets the functions to call to draw and measure a specific labeltype.
- static void **set_labeltype** ([Fl_Labeltype](#), [Fl_Labeltype](#) from)

Sets the functions to call to draw and measure a specific labeltype.
- static int **system** (const char *command)

Run a command line on the computer.
- static [Fl_System_Driver](#) * **system_driver** ()

Returns a pointer to the unique [Fl_System_Driver](#) object of the platform.
- static int [test_shortcut](#) ([Fl_Shortcut](#))

Tests the current event, which must be an [FL_KEYBOARD](#) or [FL_SHORTCUT](#), against a shortcut value (described in [Fl_Button](#)).
- static void * [thread_message](#) ()

The [thread_message\(\)](#) method returns the last message that was sent from a child by the [awake\(\)](#) method.
- static long [ticks_between](#) ([Fl_Timestamp](#) &back, [Fl_Timestamp](#) &further_back)

- Return the time in ticks (60Hz) between two time stamps.*

 - static long `ticks_since` (`FL_Timestamp` &then)

Return the time in ticks (60Hz) between now and a previously taken time stamp.
- static void `unlock` ()

The `unlock()` method releases the lock that was set using the `lock()` method.
- static int `use_high_res_GL` ()

returns whether GL windows should be drawn at high resolution on Apple computers with retina displays.
- static void `use_high_res_GL` (int val)

sets whether GL windows should be drawn at high resolution on Apple computers with retina displays
- static double `version` ()

Returns the compiled-in value of the `FL_VERSION` constant.
- static int `visible_focus` ()

Gets or sets the visible keyboard focus on buttons and other non-text widgets.
- static void `visible_focus` (int v)

Gets or sets the visible keyboard focus on buttons and other non-text widgets.
- static int `visual` (int)

Selects a visual so that your graphics are drawn correctly.
- static int `w` ()

Returns the width in pixels of the main screen work area.
- static int `wait` ()

Waits until "something happens" and then returns.
- static double `wait` (double time)

Waits a maximum of `time_to_wait` seconds or until "something happens".
- static void `watch_widget_pointer` (`FL_Widget` *&w)

Adds a widget pointer to the widget watch list.
- static int `x` ()

Returns the leftmost x coordinate of the main screen work area.
- static int `y` ()

Returns the topmost y coordinate of the main screen work area.

Static Public Attributes

- static void(* `atclose`)(FL_Window *, void *)

Back compatibility: default window callback handler.
- static char const *const `clipboard_image` = "image"

Denotes image data.
- static char const *const `clipboard_plain_text` = "text/plain"

Denotes plain textual data.
- static void(* `error`)(const char *,...) = FL_System_Driver::error

FLTK calls `FL::error()` to output a normal error message.
- static void(* `fatal`)(const char *,...) = FL_System_Driver::fatal

FLTK calls `FL::fatal()` to output a fatal error message.
- static const char *const `help` = helpmsg+13

Usage string displayed if `FL::args()` detects an invalid argument.
- static void(* `idle`)()

The currently executing idle callback function: DO NOT USE THIS DIRECTLY!
- static void(* `warning`)(const char *,...) = FL_System_Driver::warning

FLTK calls `FL::warning()` to output a warning message.

Friends

- class `FL_System_Driver`

11.7.1 Detailed Description

The [Fl](#) is the FLTK global (static) class containing state information and global methods for the current application.

11.7.2 Member Enumeration Documentation

11.7.2.1 Fl_Option

enum [Fl::Fl_Option](#)

Enumerator for global FLTK options.

These options can be set system wide, per user, or for the running application only.

See also

[Fl::option\(Fl_Option, bool\)](#)

[Fl::option\(Fl_Option\)](#)

Enumerator

OPTION_ARROW_FOCUS	When switched on, moving the text cursor beyond the start or end of a text in a text widget will change focus to the next text widget. (This is considered 'old' behavior) When switched off (default), the cursor will stop at the end of the text. Pressing Tab or Ctrl-Tab will advance the keyboard focus. See also: Fl_Input::tab_nav()
OPTION_VISIBLE_FOCUS	If visible focus is switched on (default), FLTK will draw a dotted rectangle inside the widget that will receive the next keystroke. If switched off, no such indicator will be drawn and keyboard navigation is disabled.
OPTION_DND_TEXT	If text drag-and-drop is enabled (default), the user can select and drag text from any text widget. If disabled, no dragging is possible, however dropping text from other applications still works.
OPTION_SHOW_TOOLTIPS	If tooltips are enabled (default), hovering the mouse over a widget with a tooltip text will open a little tooltip window until the mouse leaves the widget. If disabled, no tooltip is shown.
OPTION_FNFC_USES_GTK	When switched on (default), Fl_Native_File_Chooser runs GTK file dialogs if the GTK library is available on the platform (linux/unix only). When switched off, GTK file dialogs aren't used even if the GTK library is available.
OPTION_FNFC_USES_ZENITY	Meaningful for the Wayland/X11 platform only. When switched on, the library uses a Zenity-based file dialog. When switched off (default), no zenity-based file dialog is used.
OPTION_FNFC_USES_KDIALOG	Meaningful for the Wayland/X11 platform only. When switched on, the library uses a kdialog-based file dialog if command 'kdialog' is available on the running system. When switched off (default), no kdialog-based file dialog is used.
OPTION_PRINTER_USES_GTK	When switched on (default), Fl_Printer runs the GTK printer dialog if the GTK library is available on the platform (linux/unix only). When switched off, the GTK printer dialog isn't used even if the GTK library is available.
OPTION_SHOW_SCALING	When switched on (default), the library shows in a transient yellow window the zoom factor value. When switched off, no such window gets displayed.

Enumerator

OPTION_SIMPLE_ZOOM_SHORTCUT	When switched on and when the keyboard in use has '+' in the shifted position of its key, pressing that key and ctrl triggers the zoom-in operation. When switched off (default), the zoom-in operation requires that also the shift key is pressed. Under macOS, this option has no effect because the OS itself generates = followed by + when pressing and the '= +' key without pressing shift.
OPTION_LAST	For internal use only.

11.7.3 Member Function Documentation

11.7.3.1 `abi_check()`

```
static int Fl::abi_check (
    const int val = FL_ABI_VERSION) [inline], [static]
```

Returns whether the runtime library ABI version is correct.

This enables you to check the ABI version of the linked FLTK library at runtime.

Returns 1 (true) if the compiled ABI version (in the header files) and the linked library ABI version (used at runtime) are the same, 0 (false) otherwise.

Argument `val` can be used to query a particular library ABI version. Use for instance 10303 to query if the runtime library is compatible with FLTK ABI version 1.3.3. This is rarely useful.

The default `val` argument is `FL_ABI_VERSION`, which checks the version defined at configure time (i.e. in the header files at program compilation time) against the linked library version used at runtime. This is particularly useful if you linked with a shared object library, but it also concerns static linking.

See also

[Fl::abi_version\(\)](#)

11.7.3.2 `abi_version()`

```
int Fl::abi_version () [static]
```

Returns the compiled-in value of the `FL_ABI_VERSION` constant.

This is useful for checking the version of a shared library.

11.7.3.3 `add_check()`

```
void Fl::add_check (
    Fl_Timeout_Handler cb,
    void * argp = 0) [static]
```

FLTK will call this callback just before it flushes the display and waits for events.

This is different than an idle callback because it is only called once, then FLTK calls the system and tells it not to return until an event happens.

This can be used by code that wants to monitor the application's state, such as to keep a display up to date. The advantage of using a check callback is that it is called only when no events are pending. If events are coming in quickly, whole blocks of them will be processed before this is called once. This can save significant time and avoid the application falling behind the events.

Sample code:

```
bool state_changed; // anything that changes the display turns this on

void callback(void*) {
    if (!state_changed) return;
    state_changed = false;
    do_expensive_calculation();
    widget->redraw();
}

main() {
    Fl::add_check(callback);
    return Fl::run();
}
```

11.7.3.4 `add_fd()` [1/2]

```
void Fl::add_fd (
    int fd,
    Fl_FD_Handler cb,
    void * d = 0) [static]
```

Adds file descriptor `fd` to listen to.

See [Fl::add_fd\(int fd, int when, Fl_FD_Handler cb, void* = 0\)](#) for details

11.7.3.5 `add_fd()` [2/2]

```
void Fl::add_fd (
    int fd,
    int when,
    Fl_FD_Handler cb,
    void * d = 0) [static]
```

Adds file descriptor `fd` to listen to.

When the `fd` becomes ready for reading [Fl::wait\(\)](#) will call the callback and then return. The callback is passed the `fd` and the arbitrary `void*` argument.

This version takes a `when` bitfield, with the bits `FL_READ`, `FL_WRITE`, and `FL_EXCEPT` defined, to indicate when the callback should be done.

There can only be one callback of each type for a file descriptor. [Fl::remove_fd\(\)](#) gets rid of *all* the callbacks for a given file descriptor.

Under UNIX/Linux/macOS *any* file descriptor can be monitored (files, devices, pipes, sockets, etc.). Due to limitations in Microsoft Windows, Windows applications can only monitor sockets.

Under macOS, [Fl::add_fd\(\)](#) opens the display if that's not been done before.

11.7.3.6 `add_idle()`

```
void Fl::add_idle (
    Fl_Idle_Handler cb,
    void * data = 0) [static]
```

Adds a callback function that is called every time by [Fl::wait\(\)](#) and also makes it act as though the timeout is zero (this makes [Fl::wait\(\)](#) return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).

The idle function can be used to get background processing done.

You can have multiple idle callbacks. To remove an idle callback use [Fl::remove_idle\(\)](#).

[Fl::wait\(\)](#) and [Fl::check\(\)](#) call idle callbacks, but [Fl::ready\(\)](#) does not.

The idle callback can call any FLTK functions, including [Fl::wait\(\)](#), [Fl::check\(\)](#), and [Fl::ready\(\)](#).

FLTK will not recursively call the idle callback.

Parameters

in	<i>cb</i>	your idle callback
in	<i>data</i>	an arbitrary data value provided to your callback

11.7.3.7 `add_timeout()`

```
void Fl::add_timeout (
    double time,
    Fl_Timeout_Handler cb,
    void * data = 0) [static]
```

Adds a one-shot timeout callback.

The callback function `cb` will be called by [Fl::wait\(\)](#) at `time` seconds after this function is called. The callback function must have the signature [Fl_Timeout_Handler](#). The optional `data` argument is passed to the callback (default: `NULL`).

The timer is removed from the timer queue before the callback function is called. It is safe to reschedule the timeout inside the callback function.

You can have multiple timeout callbacks, even the same timeout callback with different timeout values and/or different `data` values. They are all considered different timer objects.

To remove a timeout while it is active (pending) use [FL::remove_timeout\(\)](#).

If you need more accurate, repeated timeouts, use [FL::repeat_timeout\(\)](#) to reschedule the subsequent timeouts. Please see [FL::repeat_timeout\(\)](#) for an example.

Since version 1.4, a timeout can be started from a child thread under the condition that the call to [FL::add_timeout](#) is wrapped in [FL::lock\(\)](#) and [FL::unlock\(\)](#).

Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

See also

[FL_Timeout_Handler](#)

[FL::repeat_timeout\(double time, FL_Timeout_Handler cb, void *data\)](#)

[FL::remove_timeout\(FL_Timeout_Handler cb, void *data\)](#)

[FL::has_timeout\(FL_Timeout_Handler cb, void *data\)](#)

11.7.3.8 api_version()

```
int FL::api_version () [static]
```

Returns the compiled-in value of the `FL_API_VERSION` constant.

This is useful for checking the version of a shared library.

11.7.3.9 arg()

```
int FL::arg (
    int argc,
    char ** argv,
    int & i) [static]
```

Parse a single switch from `argv`, starting at word `i`.

Returns the number of words eaten (1 or 2, or 0 if it is not recognized) and adds the same value to `i`.

This is the default argument handler used internally by [FL::args\(...\)](#), but you can use this function if you prefer to step through the standard FLTK switches yourself.

All standard FLTK switches except `-bg2` may be abbreviated to just one letter and case is ignored:

- `-bg color` or `-background color`
Sets the background color using [FL::background\(\)](#).
- `-bg2 color` or `-background2 color`
Sets the secondary background color using [FL::background2\(\)](#).
- `-display host:n.n`
Sets the X display to use; this option is silently ignored under Windows and MacOS.
- `-dnd` and `-nodnd`
Enables or disables drag and drop text operations using [FL::dnd_text_ops\(\)](#).
- `-fg color` or `-foreground color`
Sets the foreground color using [FL::foreground\(\)](#).
- `-geometry WxH+X+Y`
Sets the initial window position and size according to the standard X geometry string.
- `-iconic`
Iconifies the window using [FL_Window::iconize\(\)](#).

- `-kbd` and `-nokbd`
Enables or disables visible keyboard focus for non-text widgets using [Fl::visible_focus\(\)](#).
- `-name` string
Sets the window class using [Fl_Window::xclass\(\)](#).
- `-scheme` string
Sets the widget scheme using [Fl::scheme\(\)](#).
- `-title` string
Sets the window title using [Fl_Window::label\(\)](#).
- `-tooltips` and `-notooltips`
Enables or disables tooltips using [Fl_Tooltip::enable\(\)](#).

Color values are commonly given as three digit or six digit hex numbers.

- The order of fg, bg, and bg2 in the command line does not matter
- There is no way at the moment to set the selection color.
- Setting the bg2 color also changes the fg color to have sufficient contrast
- Explicitly setting fg color overrides the bg2/contrast constraint.
- Setting the bg color will update the color lookup table for the gray ramp, so color index values can stay the same for all apps, it's just mapped to different RGB values.
- The calculation of the gray ramp is only based on the bg color, so there is no way at the moment to create an inverted (dark mode) ramp.
- Consequently, setting bg to black creates a an all-black ramp, setting a somewhat dark bg color creates a extremely dark ramp.
- Setting the bg has no influence on bg2 or fg.

If your program requires other switches in addition to the standard FLTK options, you will need to pass your own argument handler to [Fl::args\(int,char**,int&,Fl_Args_Handler\)](#) explicitly.

See also

[fl_parse_color\(const char* p, uchar& r, uchar& g, uchar& b\)](#) to see how color values can be defined

11.7.3.10 args() [1/2]

```
void Fl::args (
    int argc,
    char ** argv) [static]
```

Parse all command line switches matching standard FLTK options only.

It parses all the switches, and if any are not recognized it calls `Fl::abort(Fl::help)`, i.e. unlike the long form, an unrecognized switch generates an error message and causes the program to exit.

11.7.3.11 args() [2/2]

```
int Fl::args (
    int argc,
    char ** argv,
    int & i,
    Fl_Args_Handler cb = 0) [static]
```

Parse command line switches using the `cb` argument handler.

Returns 0 on error, or the number of words processed.

FLTK provides this as an *entirely optional* command line switch parser. You don't have to call it if you don't want to. Everything it can do can be done with other calls to FLTK.

To use the switch parser, call `Fl::args(...)` near the start of your program. This does **not** open the display, instead switches that need the display open are stashed into static variables. Then you **must** display your first window by calling `window->show(argc, argv)`, which will do anything stored in the static variables.

Providing an argument handler callback `cb` lets you define your own switches. It is called with the same `argc` and `argv`, and with `i` set to the index of the switch to be processed. The `cb` handler should return zero if the switch is unrecognized, and not change `i`. It should return non-zero to indicate the number of words processed if the switch is recognized, i.e. 1 for just the switch, and more than 1 for the switch plus associated parameters. `i` should be incremented by the same amount.

The `cb` handler is called **before** any other tests, so *you can also override any standard FLTK switch* (this is why FLTK can use very short switches instead of the long ones all other toolkits force you to use). See [Fl::arg\(\)](#) for descriptions of the standard switches.

On return `i` is set to the index of the first non-switch. This is either:

- The first word that does not start with '-'.
- The word '-' (used by many programs to name stdin as a file)
- The first unrecognized switch (return value is 0).
- `argc`

The return value is `i` unless an unrecognized switch is found, in which case it is zero. If your program takes no arguments other than switches you should produce an error if the return value is less than `argc`.

A usage string is displayed if [Fl::args\(\)](#) detects an invalid argument on the command-line. You can change the message by setting the [Fl::help](#) pointer.

A very simple command line parser can be found in `examples/howto-parse-args.cxx`

The simpler [Fl::args\(int argc, char **argv\)](#) form is useful if your program does not have command line switches of its own.

11.7.3.12 args_to_utf8()

```
int Fl::args_to_utf8 (
    int argc,
    char **& argv) [static]
```

Convert Windows commandline arguments to UTF-8.

Note

This function does nothing on other (non-Windows) platforms, hence you may call it on all platforms or only on Windows by using platform specific code like `'#ifdef _WIN32'` etc. - it's your choice. Calling it on other platforms returns quickly w/o wasting much CPU time.

This function *must be called on Windows platforms* in `main()` before the array `argv` is used if your program uses any commandline argument strings (these should be UTF-8 encoded). This applies also to standard FLTK commandline arguments like `"-name"` (class name) and `"-title"` (window title in the title bar).

Unfortunately Windows **neither** provides commandline arguments in UTF-8 encoding **nor** as Windows "Wide Character" strings in the standard `main()` and/or the Windows specific `WinMain()` function.

On Windows platforms (no matter which build system) this function calls a Windows specific function to retrieve commandline arguments as Windows "Wide Character" strings, converts these strings to an internally allocated buffer (or multiple buffers) and returns the result in `argv`. For implementation details please refer to the source code; however these details may be changed in the future.

Note that `argv` is provided by reference so it can be overwritten.

In the recommended simple form the function overwrites the variable `argv` and allocates a new array of strings pointed to by `argv`. You may use this form on all platforms and it is as simple as adding one line to old programs to make them work with international (UTF-8) commandline arguments.

```
int main(int argc, char **argv) {
    Fl::args_to_utf8(argc, argv); // add this line
    // ... use argc and argv, e.g. for commandline parsing
    window->show(argc, argv);
    return Fl::run();
}
```

For an example see 'examples/howto-parse-args.cxx' in the FLTK sources.

If you want to retain the original `argc` and `argv` variables the following slightly longer and more complicated code works as well on all platforms.

```
int main(int argc, char **argv) {
    char **argvn = argv;           // must copy argv to work on all platforms
    int argcn = Fl::args_to_utf8(argc, argvn);
    // ... use argcn and argvn, e.g. for commandline parsing
    window->show(argcn, argvn);
    return Fl::run();
}
```

Parameters

in	<code>argc</code>	used only on non-Windows platforms
out	<code>argv</code>	modified only on Windows platforms

Returns

argument count (always the same as `argc`)

Since

1.4.0

11.7.3.13 `background()`

```
void Fl::background (
    uchar r,
    uchar g,
    uchar b) [static]
```

Changes `fl_color(FL_BACKGROUND_COLOR)` to the given color, and changes the gray ramp from 32 to 56 to black to white.

These are the colors used as backgrounds by almost all widgets and used to draw the edges of all the boxtypes.

11.7.3.14 `background2()`

```
void Fl::background2 (
    uchar r,
    uchar g,
    uchar b) [static]
```

Changes the alternative background color.

This color is used as a background by [FL_Input](#) and other text widgets.

This call may change `fl_color(FL_FOREGROUND_COLOR)` if it does not provide sufficient contrast to `FL_BACKGROUND2_COLOR`.

11.7.3.15 `box_border_radius_max()` [1/2]

```
static int Fl::box_border_radius_max () [inline], [static]
```

Get the maximum border radius of all "rounded" boxtypes in pixels.

Since

1.4.0

11.7.3.16 `box_border_radius_max()` [2/2]

```
static void Fl::box_border_radius_max (
    int R) [inline], [static]
```

Set the maximum border radius of all "rounded" boxtypes in pixels.

Must be at least 5, default = 15.

Note

This does **not** apply to the "round" boxtypes which have really round sides (i.e. composed of half circles) as opposed to "rounded" boxtypes that have only rounded corners with a straight border between corners.

The box border radius of "rounded" boxtypes is typically calculated as about 2/5 of the box height or width, whichever is smaller. The upper limit can be set by this method for all "rounded" boxtypes.

Since

1.4.0

11.7.3.17 box_color()

```
Fl_Color Fl::box_color (
    Fl_Color c) [static]
```

Gets the drawing color to be used for the background of a box.

This method is only useful inside box drawing code. It returns the color to be used, either fl_inactive(c) if the widget is !active_r() or c otherwise.

11.7.3.18 box_dh()

```
int Fl::box_dh (
    Fl_Boxtype t) [static]
```

Returns the height offset for the given boxtype.

See also

[box_dy\(\)](#).

11.7.3.19 box_dw()

```
int Fl::box_dw (
    Fl_Boxtype t) [static]
```

Returns the width offset for the given boxtype.

See also

[box_dy\(\)](#).

11.7.3.20 box_dx()

```
int Fl::box_dx (
    Fl_Boxtype t) [static]
```

Returns the X offset for the given boxtype.

See also

[box_dy\(\)](#)

11.7.3.21 box_dy()

```
int Fl::box_dy (
    Fl_Boxtype t) [static]
```

Returns the Y offset for the given boxtype.

These functions return the offset values necessary for a given boxtype, useful for computing the area inside a box's borders, to prevent overdrawing the borders.

For instance, in the case of a boxtype like FL_DOWN_BOX where the border width might be 2 pixels all around, the above functions would return 2, 2, 4, and 4 for box_dx, box_dy, box_dw, and box_dh respectively.

An example to compute the area inside a widget's box():

```
int X = yourwidget->x() + Fl::box_dx(yourwidget->box());
```

```
int Y = yourwidget->y() + Fl::box_dy(yourwidget->box());
int W = yourwidget->w() - Fl::box_dw(yourwidget->box());
int H = yourwidget->h() - Fl::box_dh(yourwidget->box());
```

These functions are mainly useful in the `draw()` code for deriving custom widgets, where one wants to avoid drawing over the widget's own border `box()`.

11.7.3.22 `box_shadow_width()` [1/2]

```
static int Fl::box_shadow_width () [inline], [static]
```

Get the box shadow width of all "shadow" boxtypes in pixels.

Since

1.4.0

11.7.3.23 `box_shadow_width()` [2/2]

```
static void Fl::box_shadow_width (
    int W) [inline], [static]
```

Set the box shadow width of all "shadow" boxtypes in pixels.

Must be at least 1, default = 3. There is no upper limit.

Since

1.4.0

11.7.3.24 `check()`

```
int Fl::check () [static]
```

Same as `Fl::wait(0)`.

Calling this during a big calculation will keep the screen up to date and the interface responsive:

```
while (!calculation_done()) {
    calculate();
    Fl::check();
    if (user_hit_abort_button()) break;
}
```

This returns non-zero if any windows are displayed, and 0 if no windows are displayed (this is likely to change in future versions of FLTK).

11.7.3.25 `display()`

```
void Fl::display (
    const char * d) [static]
```

Sets the X or Wayland display to use for all windows.

This sets the environment variable `$DISPLAY` or `$WAYLAND_DISPLAY` to the passed string, so this only works before you `show()` the first window or otherwise open the display.

This does nothing on other platforms.

11.7.3.26 `dnd_text_ops()` [1/2]

```
static int Fl::dnd_text_ops () [inline], [static]
```

Gets whether drag and drop text operations are supported.

This returns whether selected text can be dragged from text fields or dragged within a text field as a cut/paste shortcut.

11.7.3.27 `dnd_text_ops()` [2/2]

```
static void Fl::dnd_text_ops (
    int v) [inline], [static]
```

Sets whether drag and drop text operations are supported.

This specifically affects whether selected text can be dragged from text fields or dragged within a text field as a cut/paste shortcut.

11.7.3.28 draw_box_active()

```
int Fl::draw_box_active () [static]
```

Determines if the currently drawn box is active or inactive.

If inactive, the box color should be changed to the inactive color.

See also

[Fl::box_color\(Fl_Color c\)](#)

11.7.3.29 draw_GL_text_with_textures() [1/2]

```
static int Fl::draw_GL_text_with_textures () [inline], [static]
```

returns whether whether OpenGL uses textures to draw all text.

Default is yes.

See also

[draw_GL_text_with_textures\(int val\)](#)

Version

1.4.0

11.7.3.30 draw_GL_text_with_textures() [2/2]

```
static void Fl::draw_GL_text_with_textures (
    int val) [inline], [static]
```

sets whether OpenGL uses textures to draw all text.

By default, FLTK draws OpenGL text using textures, if the necessary hardware support is available. Call `Fl::draw_GL_text_with_textures(0)` once in your program before the first call to [gl_font\(\)](#) to have FLTK draw instead OpenGL text using a legacy, platform-dependent procedure. It's recommended not to deactivate textures under the MacOS platform because the MacOS legacy procedure is extremely rudimentary.

Parameters

<i>val</i>	use 0 to prevent FLTK from drawing GL text with textures
------------	--

See also

[gl_texture_pile_height\(int max\)](#)

Version

1.4.0

11.7.3.31 flush()

```
void Fl::flush () [static]
```

Causes all the windows that need it to be redrawn and graphics forced out through the pipes.

This is what [wait\(\)](#) does before looking for events.

Note: in multi-threaded applications you should only call [Fl::flush\(\)](#) from the main thread. If a child thread needs to trigger a redraw event, it should instead call [Fl::awake\(\)](#) to get the main thread to process the event queue.

11.7.3.32 get_system_colors()

```
void Fl::get_system_colors () [static]
```

Read the user preference colors from the system and use them to call [Fl::foreground\(\)](#), [Fl::background\(\)](#), and [Fl::background2\(\)](#).

This is done by `Fl_Window::show(argc,argv)` before applying the `-fg` and `-bg` switches.

On X this reads some common values from the Xdefaults database. KDE users can set these values by running the "krdb" program, and newer versions of KDE set this automatically if you check the "apply style to other X programs" switch in their control panel.

11.7.3.33 gl_visual()

```
static int Fl::gl_visual (
    int ,
    int * alist = 0) [static]
```

This does the same thing as [Fl::visual\(int\)](#) but also requires OpenGL drawing to work.

This *must* be done if you want to draw in normal windows with OpenGL with [gl_start\(\)](#) and [gl_end\(\)](#). It may be useful to call this so your X windows use the same visual as an [Fl_Gl_Window](#), which on some servers will reduce colormap flashing.

See [Fl_Gl_Window](#) for a list of additional values for the argument.

11.7.3.34 has_idle()

```
int Fl::has_idle (
    Fl_Idle_Handler cb,
    void * data = 0) [static]
```

Returns true if the specified idle callback is currently installed.

An idle callback matches the request only if `data` matches the `data` argument when the callback was installed. There is no "wildcard" search.

Parameters

in	<i>cb</i>	idle callback in question
in	<i>data</i>	optional data. Default: zero / nullptr.

Returns

Whether the given callback `cb` is queued with `data`.

Return values

1	The callback is currently in the callback queue.
0	The callback is not queued, or <code>data</code> doesn't match.

11.7.3.35 has_timeout()

```
int Fl::has_timeout (
    Fl_Timeout_Handler cb,
    void * data = 0) [static]
```

Returns true if the timeout exists and has not been called yet.

Both arguments `cb` and `data` must match with at least one timer in the queue of active timers to return true (1).

Note

It is a known inconsistency that [Fl::has_timeout\(\)](#) does not use the `data` argument as a wildcard (match all) if it is zero (NULL) which [Fl::remove_timeout\(\)](#) does. This is so for backwards compatibility with FLTK 1.3.x. Therefore using 0 (zero, NULL) as the timeout `data` value is discouraged unless you're sure that you don't need to use `Fl::has_timeout(callback, (void *)0);` or `Fl::remove_timeout(callback, (void *)0);`.

Parameters

in	<i>cb</i>	Timer callback
in	<i>data</i>	User data

Returns

whether the timer was found in the queue

Return values

0	not found
1	found

11.7.3.36 hide_all_windows()

```
void Fl::hide_all_windows () [static]
```

Hide all visible windows to make FLTK leave [Fl::run\(\)](#).

[Fl::run\(\)](#) will run as long as there are visible windows. Call [Fl::hide_all_windows\(\)](#) to hide (close) all currently shown (visible) windows, effectively terminating the [Fl::run\(\)](#) loop.

See also

[Fl::run\(\)](#)

Since

1.4.0

11.7.3.37 is_scheme()

```
static int Fl::is_scheme (
    const char * name) [inline], [static]
```

Returns whether the current scheme is the given name.

This is a fast inline convenience function to support scheme-specific code in widgets, e.g. in their draw() methods, if required.

Use a valid scheme name, not NULL (although NULL is allowed, this is not a useful argument - see below).

If [Fl::scheme\(\)](#) has not been set or has been set to the default scheme ("none" or "base"), then this will always return 0 regardless of the argument, because [Fl::scheme\(\)](#) is NULL in this case.

Note

The stored scheme name is always lowercase, and this method will do a case-sensitive compare, so you **must** provide a lowercase string to return the correct value. This is intentional for performance reasons.

Example:

```
if (Fl::is_scheme("gtk+")) { your_code_here(); }
```

Parameters

in	<i>name</i>	lowercase string of requested scheme name.
----	-------------	---

Returns

1 if the given scheme is active, 0 otherwise.

See also

[Fl::scheme\(const char *name\)](#)

11.7.3.38 menu_linespacing() [1/2]

```
int Fl::menu_linespacing () [static]
```

Gets the default line spacing used by menus.

Returns

The default line spacing, in pixels.

Since

1.4.0

11.7.3.39 menu_linespacing() [2/2]

```
void Fl::menu_linespacing (
    int H) [static]
```

Sets the default line spacing used by menus.
Default is 4.

Parameters

<i>in</i>	<i>H</i>	The new default line spacing between menu items, in pixels.
-----------	----------	---

Since

1.4.0

11.7.3.40 now()

```
Fl_Timestamp Fl::now (
    double offset = 0) [static]
```

Set a time stamp at this point in time with optional signed offset in seconds.

The time stamp is an opaque type and does not represent the time of day or some time and date in the calendar. It is used with [Fl::seconds_between\(\)](#) and [Fl::seconds_since\(\)](#) to measure elapsed time.

```
Fl_Timestamp start = Fl::now();
// do something
double s = Fl::seconds_since(start);
printf("That operation took %g seconds\n", s);
```

Depending on the system the resolution may be milliseconds or microseconds. Under certain conditions (particularly on Windows) the value in member `sec` may wrap around and does not represent a real time (maybe runtime of the system). Function [seconds_since\(\)](#) below uses this to subtract two timestamps which is always a correct delta time with milliseconds or microseconds resolution.

Parameters

<i>offset</i>	optional signed offset in seconds added to the current time
---------------	---

Returns

this moment in time offset by `offset` as an opaque time stamp

Todo [Fl::system_driver\(\)](#)->gettime() was implemented for the Forms library and has a limited resolution (on Windows: milliseconds). On POSIX platforms it uses `gettimeofday()` with microsecond resolution. A new function could use a better resolution on Windows with its multimedia timers which requires a new dependency: `winmm.lib` (dll). This could be a future improvement, maybe set as a build option or generally (requires Win95 or 98?).

See also

[Fl::seconds_since\(Fl_Timestamp& then\)](#)
[Fl::seconds_between\(Fl_Timestamp& back, Fl_Timestamp& further_back\)](#)
[Fl::ticks_since\(Fl_Timestamp& then\)](#)
[Fl::ticks_between\(Fl_Timestamp& back, Fl_Timestamp& further_back\)](#)

11.7.3.41 option() [1/2]

```
bool Fl::option (
    Fl_Option opt) [static]
```

FLTK library options management.

Options provide a way for the user to modify the behavior of an FLTK application. For example, clearing the `OPTION_SHOW_TOOLTIPS` will disable tooltips for all FLTK applications.

Options are set by the user or the administrator on user or machine level. In 1.3, FLUID has an Options dialog for that. In 1.4, there is an app named `fltk-options` that can be used from the command line or as a GUI tool. The machine level setting is read first, and the user setting can override the machine setting.

This function is used throughout FLTK to quickly query the user's wishes. There are options for using a native file chooser instead of the FLTK one wherever possible, disabling tooltips, disabling visible focus, disabling FLTK file chooser preview, etc. .

See [Fl::Fl_Option](#) for a list of available options.

Example:

```
if ( Fl::option(Fl::OPTION_ARROW_FOCUS) )
{ ..on.. }
else
{ ..off.. }
```

Note

Since FLTK 1.4.0 options can be managed with the `fltk-options` program. In FLTK 1.3.x options can be set in FLUID.

Parameters

<i>opt</i>	which option
------------	--------------

Returns

true or false

See also

enum [Fl::Fl_Option](#)

[Fl::option\(Fl_Option, bool\)](#)

`fltk-options` application in command line and GUI mode

Since

FLTK 1.3.0

11.7.3.42 option() [2/2]

```
void Fl::option (
    Fl_Option opt,
    bool val) [static]
```

Override an option while the application is running.

Apps can override the machine settings and the user settings by calling `Fl::option(option, bool)`. The override takes effect immediately for this option for all widgets in the app for the life time of the app.

The override is not saved anywhere, and relaunching the app will restore the old settings.

Example:

```
Fl::option(Fl::OPTION_ARROW_FOCUS, true);    // on
Fl::option(Fl::OPTION_ARROW_FOCUS, false);   // off
```

Parameters

<i>opt</i>	which option
<i>val</i>	set to true or false

See also

enum [Fl::Fl_Option](#)

bool [Fl::option\(Fl_Option\)](#)

11.7.3.43 `own_colormap()`

```
void Fl::own_colormap () [static]
```

Makes FLTK use its `own colormap`.

This may make FLTK display better and will reduce conflicts with other programs that want lots of colors. However the colors may flash as you move the cursor between windows.

This does nothing if the current visual is not colormapped.

11.7.3.44 `program_should_quit()` [1/2]

```
static int Fl::program_should_quit () [inline], [static]
```

Returns non-zero when a request for program termination was received and accepted.

On the MacOS platform, the "Quit xxx" item of the application menu is such a request, that is considered accepted when all windows are closed. On other platforms, this function returns 0 until `Fl::program_should_quit(1)` is called.

Version

1.4.0

11.7.3.45 `program_should_quit()` [2/2]

```
static void Fl::program_should_quit (
    int should_i) [inline], [static]
```

Indicate to the FLTK library whether a program termination request was received and accepted.

A program may set this to 1, for example, while performing a platform-independent command asking the program to cleanly terminate, similarly to the "Quit xxx" item of the application menu under MacOS.

Version

1.4.0

11.7.3.46 `readqueue()`

```
Fl_Widget * Fl::readqueue () [static]
```

Reads the default callback queue and returns the first widget.

All `Fl_Widget`s that don't have a callback defined use the default callback `static Fl_Widget::default_callback()` that puts a pointer to the widget in a queue. This method reads the oldest widget out of this queue.

The queue (FIFO) is limited (currently 20 items). If the queue overflows, the oldest entry (`Fl_Widget *`) is discarded. Relying on the default callback and reading the callback queue with `Fl::readqueue()` is not recommended. If you need a callback, you should set one with `Fl_Widget::callback(Fl_Callback *cb, void *data)` or one of its variants.

See also

[Fl_Widget::callback\(\)](#)

[Fl_Widget::callback\(Fl_Callback *cb, void *data\)](#)

[Fl_Widget::default_callback\(\)](#)

11.7.3.47 `ready()`

```
int Fl::ready () [static]
```

This is similar to `Fl::check()` except this does *not* call `Fl::flush()` or any callbacks, which is useful if your program is in a state where such callbacks are illegal.

This returns true if `Fl::check()` would do anything (it will continue to return true until you call `Fl::check()` or `Fl::wait()`).

```
while (!calculation_done()) {
    calculate();
    if (Fl::ready()) {
        do_expensive_cleanup();
        Fl::check();
        if (user_hit_abort_button()) break;
    }
}
```

11.7.3.48 release()

static void Fl::release () [inline], [static]
 Releases the current grabbed window, equals grab(0).

Deprecated Use Fl::grab(0) instead.

See also

[grab\(Fl_Window*\)](#)

11.7.3.49 reload_scheme()

int Fl::reload_scheme () [static]
 Called internally when setting a new scheme according to scheme name.
 Loads or reloads the current scheme selection.

Returns

Always 1 (this may change in the future)

See void [Fl::scheme\(const char *name\)](#)

11.7.3.50 remove_check()

```
void Fl::remove_check (
    Fl_Timeout_Handler cb,
    void * argp = 0) [static]
```

Removes a check callback.
 It is harmless to remove a check callback that no longer exists.

11.7.3.51 remove_idle()

```
void Fl::remove_idle (
    Fl_Idle_Handler cb,
    void * data = 0) [static]
```

Removes the specified idle callback, if it is installed.

The given idle callback is only removed if `data` matches the value used when the idle callback was installed. If the idle callback wants to remove itself, the value provided by the `data` argument can (and should) be used.

Example for a "one-shot" idle callback, i.e. one that removes itself when it is called for the first time.

```
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Button.H>
void idle1(void *data) {
    printf("idle1 called with data %4d\n", fl_int(data));
    fflush(stdout);
    // ... do something ...
    Fl::remove_idle(idle1, data);
}
void quit_cb(Fl_Widget *w, void *v) {
    w->window()->hide();
}
int main(int argc, char **argv) {
    Fl_Double_Window *window = new Fl_Double_Window(200, 100);
    Fl_Button *button = new Fl_Button(20, 20, 160, 60, "Quit");
    button->callback(quit_cb);
    window->end();
    window->show(argc, argv);
    Fl::add_idle(idle1, (void *)1234);
    return Fl::run();
}
```

Parameters

in	<i>cb</i>	idle callback in question
in	<i>data</i>	optional data. Default: zero / NULL.

11.7.3.52 remove_next_timeout()

```
int Fl::remove_next_timeout (
    Fl_Timeout_Handler cb,
    void * data = 0,
    void ** data_return = 0) [static]
```

Remove the next matching timeout callback and return its `data` pointer.

This method removes only the next matching timeout and returns in `data_return` (if non-NULL) the `data` member given when the timeout was scheduled.

This method is useful if you remove a timeout before it is scheduled and you need to get and use its data value, for instance to `free()` or `delete` the data associated with the timeout.

This method returns non-zero if a matching timeout was found and zero if no timeout matched the request.

If the return value is $N > 1$ then there are $N - 1$ more matching timeouts pending.

If you need to remove all timeouts with a particular callback `cb` you must repeat this call until it returns 1 (all timeouts removed) or zero (no matching timeout), whichever occurs first.

Parameters

<code>in</code>	<code>cb</code>	Timer callback to be removed (must match)
<code>in</code>	<code>data</code>	Wildcard if NULL, must match otherwise
<code>in, out</code>	<code>data_return</code>	Pointer to (void *) to receive the data value

Returns

non-zero if a timer was found and removed

Return values

<code>0</code>	no matching timer was found
<code>1</code>	the last matching timeout was found and removed
<code>N > 1</code>	a matching timeout was removed and there are (N - 1) matching timeouts pending

See also

[Fl::remove_timeout\(Fl_Timeout_Handler cb, void *data\)](#)

Since

1.4.0

11.7.3.53 remove_timeout()

```
void Fl::remove_timeout (
    Fl_Timeout_Handler cb,
    void * data = 0) [static]
```

Remove one or more matching timeout callbacks from the timer queue.

This method removes **all** matching timeouts, not just the first one.

If the `data` argument is NULL (the default!) only the callback `cb` must match, i.e. all timer entries with this callback are removed.

It is harmless to remove a timeout callback that no longer exists.

If you want to remove only the next matching timeout you can use [Fl::remove_next_timeout\(Fl_Timeout_Handler cb, void *data, void **data_return\)](#) (available since FLTK 1.4.0).

Parameters

<code>in</code>	<code>cb</code>	Timer callback to be removed (must match)
<code>in</code>	<code>data</code>	Wildcard if NULL (default), must match otherwise

See also

[Fl::remove_next_timeout\(Fl_Timeout_Handler cb, void *data, void **data_return\)](#)

11.7.3.54 repeat_timeout()

```
void Fl::repeat_timeout (
    double time,
    Fl_Timeout_Handler cb,
    void * data = 0) [static]
```

Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing. You should call this method only inside a timeout callback of the same or a logically related timer from whose expiration time the new timeout shall be scheduled. Otherwise the timing accuracy can't be improved and the exact behavior is undefined.

If you call this outside a timeout callback the behavior is the same as [Fl::add_timeout\(\)](#).

Example: The following code will print "TICK" each second on stdout with a fair degree of accuracy:

```
#include <FL/FL.H>
#include <FL/Fl_Window.H>
#include <stdio.h>

void callback(void *) {
    printf("TICK\n");
    Fl::repeat_timeout(1.0, callback); // retrigger timeout
}

int main() {
    Fl_Window win(100, 100);
    win.show();
    Fl::add_timeout(1.0, callback); // set up first timeout
    return Fl::run();
}
```

Parameters

in	<i>time</i>	delta time in seconds until the timer expires
in	<i>cb</i>	callback function
in	<i>data</i>	optional user data (default: NULL)

11.7.3.55 run()

```
int Fl::run () [static]
```

Calls [Fl::wait\(\)](#) repeatedly as long as any windows are displayed.

When all the windows are closed it returns zero (supposedly it would return non-zero on any errors, but FLTK calls exit directly for these). A normal program will end main() with return [Fl::run\(\)](#);

Note

[Fl::run\(\)](#) and [Fl::wait\(\)](#) (but not [Fl::wait\(double\)](#)) both return when all FLTK windows are closed. Therefore, a MacOS FLTK application possessing [Fl_Sys_Menu_Bar](#) items able to create new windows and expected to keep running without any open window cannot use these two functions. One solution is to run the event loop as follows:

```
while (!Fl::program_should_quit()) Fl::wait(1e20);
```

11.7.3.56 scheme()

```
int Fl::scheme (
    const char * s) [static]
```

Sets the current widget scheme.

NULL will use the scheme defined in the FLTK_SCHEME environment variable or the scheme resource under X11. Otherwise, any of the following schemes can be used:

- "none" - This is the default look-n-feel which resembles old Windows (95/98/Me/NT/2000) and old GTK/KDE

- "base" - This is an alias for "none"
- "plastic" - This scheme is inspired by the Aqua user interface on macOS
- "gtk+" - This scheme is inspired by the Red Hat Bluecurve theme
- "gleam" - This scheme is inspired by the Clearlooks Glossy scheme. (Colin Jones and Edmanuel Torres).
- "oxy" - This is a subset of Dmitrij K's oxy scheme (STR 2675, 3477)

If the given scheme name is unknown, the default scheme will be used.

Setting the scheme (name) is case insensitive, but the stored scheme name will always be lowercase and `Fl::scheme()` will return this lowercase name or `NULL` if no scheme or the default scheme ("none" or "base") was set.

Parameters

in	s	Scheme name of <code>NULL</code>
----	---	----------------------------------

Return values

0	if the scheme has not been set or is the default scheme
1	if a scheme other than "none"/"base" was set

See also

`Fl::scheme()` to get the name of the current [scheme](#)

`Fl::is_scheme(const char*)` to test if the specified [scheme](#) is set

11.7.3.57 scrollbar_size() [1/2]

```
int Fl::scrollbar_size () [static]
```

Gets the default scrollbar size used by [Fl_Browser_](#), [Fl_Help_View](#), [Fl_Scroll](#), and [Fl_Text_Display](#) widgets.

Returns

The default size for widget scrollbars, in pixels.

11.7.3.58 scrollbar_size() [2/2]

```
void Fl::scrollbar_size (
    int W) [static]
```

Sets the default scrollbar size that is used by the [Fl_Browser_](#), [Fl_Help_View](#), [Fl_Scroll](#), and [Fl_Text_Display](#) widgets.

Parameters

in	W	The new default size for widget scrollbars, in pixels.
----	---	--

11.7.3.59 seconds_between()

```
double Fl::seconds_between (
    Fl_Timestamp & back,
    Fl_Timestamp & further_back) [static]
```

Return the time in seconds between two time stamps.

Parameters

in	<i>back</i>	a previously taken time stamp
in	<i>further_back</i>	an even earlier time stamp

Returns

elapsed seconds and fractions of a second

See also

[FI::seconds_since\(FI_Timestamp& then\)](#)

[FI::now\(\)](#)

11.7.3.60 seconds_since()

```
double FI::seconds_since (
    FI_Timestamp & then) [static]
```

Return the time in seconds between now and a previously taken time stamp.

Parameters

in	<i>then</i>	a previously taken time stamp
----	-------------	-------------------------------

Returns

elapsed seconds and fractions of a second

See also

[FI::seconds_between\(FI_Timestamp& back, FI_Timestamp& further_back\)](#)

[FI::now\(\)](#)

[FI::distant_past\(\)](#)

11.7.3.61 set_box_color()

```
void FI::set_box_color (
    FI_Color c) [static]
```

Sets the drawing color for the box that is currently drawn.

This method sets the current drawing color [fl_color\(\)](#) depending on the widget's state to either *c* or [fl_inactive\(c\)](#).

It should be used whenever a box background is drawn in the box (type) drawing code instead of calling [fl_color\(FI_Color bg\)](#) with the background color *bg*, usually [FI_Widget::color\(\)](#).

This method is only useful inside box drawing code. Whenever a box is drawn with one of the standard box drawing methods, a static variable is set depending on the widget's current state - if the widget is [!active_r\(\)](#) then the internal variable is false (0), otherwise it is true (1). This is faster than calling [FI_Widget::active_r\(\)](#) because the state is cached.

See also

[FI::draw_box_active\(\)](#)

[FI::box_color\(FI_Color\)](#)

11.7.3.62 set_boxtype()

```
void Fl::set_boxtype (
    Fl_Boxtype t,
    Fl_Box_Draw_F * f,
    uchar dx,
    uchar dy,
    uchar dw,
    uchar dh,
    Fl_Box_Draw_Focus_F * ff = NULL) [static]
```

Sets the function to call to draw a specific box type.

Parameters

in	<i>t</i>	index of the box type between 0 (FL_NO_BOX) and up to and including FL_MAX_BOXTYPE
in	<i>f</i>	callback function that draws the box
in	<i>dx,dy</i>	top left frame width, distance in pixels to box contents
in	<i>dw,dh</i>	left plus right frame width, top plus bottom frame width
in	<i>ff</i>	optional callback that draws the box focus, defaults to a rectangle, inset by dx, dy, dw, dh

11.7.3.63 set_idle()

```
static void Fl::set_idle (
    Fl_Old_Idle_Handler cb) [inline], [static]
```

Sets an idle callback.

Deprecated This method is obsolete - use the [add_idle\(\)](#) method instead.

11.7.3.64 ticks_between()

```
long Fl::ticks_between (
    Fl_Timestamp & back,
    Fl_Timestamp & further_back) [static]
```

Return the time in ticks (60Hz) between two time stamps.

Parameters

in	<i>back</i>	a previously taken time stamp
in	<i>further_back</i>	an even earlier time stamp

Returns

elapsed ticks in 60th of a second

See also

[Fl::ticks_since\(Fl_Timestamp& then\)](#)

[Fl::now\(\)](#)

11.7.3.65 ticks_since()

```
long Fl::ticks_since (
    Fl_Timestamp & then) [static]
```

Return the time in ticks (60Hz) between now and a previously taken time stamp.

Ticks are a convenient way to time animations 'per frame'. Even though modern computers use all kinds of screen refresh rates, 60Hz is a very good base for animation that is typically shown in user interface graphics.

Parameters

<code>in</code>	<code>then</code>	a previously taken time stamp
-----------------	-------------------	-------------------------------

Returns

elapsed ticks in 60th of a second

See also

[Fl::ticks_between\(Fl_Timestamp& back, Fl_Timestamp& further_back\)](#)

[Fl::now\(\)](#)

11.7.3.66 use_high_res_GL() [1/2]

```
static int Fl::use_high_res_GL () [inline], [static]
```

returns whether GL windows should be drawn at high resolution on Apple computers with retina displays. Default is no.

Version

1.3.4

11.7.3.67 use_high_res_GL() [2/2]

```
static void Fl::use_high_res_GL (
    int val) [inline], [static]
```

sets whether GL windows should be drawn at high resolution on Apple computers with retina displays

Version

1.3.4

11.7.3.68 version()

```
double Fl::version () [static]
```

Returns the compiled-in value of the FL_VERSION constant. This is useful for checking the version of a shared library.

Deprecated Use [int Fl::api_version\(\)](#) instead.

11.7.3.69 visible_focus() [1/2]

```
static int Fl::visible_focus () [inline], [static]
```

Gets or sets the visible keyboard focus on buttons and other non-text widgets. The default mode is to enable keyboard focus for all widgets.

11.7.3.70 visible_focus() [2/2]

```
static void Fl::visible_focus (
    int v) [inline], [static]
```

Gets or sets the visible keyboard focus on buttons and other non-text widgets. The default mode is to enable keyboard focus for all widgets.

11.7.3.71 visual()

```
int Fl::visual (
    int flags) [static]
```

Selects a visual so that your graphics are drawn correctly.

This is only allowed before you call `show()` on any windows. This does nothing if the default visual satisfies the capabilities, or if no visual satisfies the capabilities, or on systems that don't have such brain-dead notions.

Only the following combinations do anything useful:

- `Fl::visual(FL_RGB)`
Full/true color (if there are several depths FLTK chooses the largest). Do this if you use `fl_draw_image` for much better (non-dithered) output.
- `Fl::visual(FL_RGB8)`
Full color with at least 24 bits of color. `FL_RGB` will always pick this if available, but if not it will happily return a less-than-24 bit deep visual. This call fails if 24 bits are not available.

This returns true if the system has the capabilities by default or FLTK succeeded in turning them on. Your program will still work even if this returns false (it just won't look as good).

11.7.3.72 wait() [1/2]

```
int Fl::wait () [static]
```

Waits until "something happens" and then returns.

Call this repeatedly to "run" your program. You can also check what happened each time after this returns, which is quite useful for managing program state.

What this really does is call all idle callbacks, all elapsed timeouts, call [Fl::flush\(\)](#) to get the screen to update, and then wait some time (zero if there are idle callbacks, the shortest of all pending timeouts, or infinity), for any events from the user or any [Fl::add_fd\(\)](#) callbacks. It then handles the events and calls the callbacks and then returns.

Returns

non-zero if there are any visible windows - this may change in future versions of FLTK.

11.7.3.73 wait() [2/2]

```
double Fl::wait (
    double time_to_wait) [static]
```

Waits a maximum of `time_to_wait` seconds or until "something happens".

See [Fl::wait\(\)](#) for the description of operations performed when "something happens".

Returns

Always 1 on Windows. Otherwise, it is positive if an event or fd happens before the time elapsed. It is zero if nothing happens. It is negative if an error occurs (this will happen on X11 if a signal happens).

11.7.4 Member Data Documentation

11.7.4.1 help

```
const char *const Fl::help = helpmsg+13 [static]
```

Usage string displayed if [Fl::args\(\)](#) detects an invalid argument.

This may be changed to point to customized text at run-time.

11.7.4.2 idle

```
void(* Fl::idle) () [static]
```

The currently executing idle callback function: DO NOT USE THIS DIRECTLY!

This is now used as part of a higher level system allowing multiple idle callback functions to be called.

11.8 `Fl_Adjuster` Class Reference

The `Fl_Adjuster` widget was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range.

```
#include <Fl_Adjuster.H>
```

Inheritance diagram for `Fl_Adjuster`:

Public Member Functions

- `Fl_Adjuster` (int X, int Y, int W, int H, const char *l=0)
Creates a new `Fl_Adjuster` widget using the given position, size, and label string.
- int `soft` () const
If "soft" is turned on, the user is allowed to drag the value outside the range.
- void `soft` (int s)
If "soft" is turned on, the user is allowed to drag the value outside the range.

Public Member Functions inherited from [FI_Valuator](#)

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.
- virtual int **format** (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double **increment** (double, int)
Adds n times the step value to the passed value.
- double **maximum** () const
Gets the maximum value for the valuator.
- void **maximum** (double a)
Sets the maximum value for the valuator.
- double **minimum** () const
Gets the minimum value for the valuator.
- void **minimum** (double a)
Sets the minimum value for the valuator.
- void **precision** (int digits)
Sets the step value to $1.0 / 10^{\text{digits}}$.
- void **range** (double a, double b)
Sets the minimum and maximum values for the valuator.
- double **round** (double)
Round the passed value to the nearest step increment.
- double **step** () const
Gets or sets the step value.
- void **step** (double a, int b)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (double s)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (int a)
See double [FI_Valuator::step\(\)](#) const.
- double **value** () const
Gets the floating point(double) value.
- int **value** (double)
Sets the current value.
- **~FI_Valuator** () **FL_OVERRIDE**
Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- **FI_Align align** () const
Gets the label alignment.
- void **align** (**FI_Align** alignment)

- Sets the label alignment.*
- long [argument](#) () const
 - Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)
 - Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
 - Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
 - Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).*
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
 - Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).*
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
 - Sets the image to use as part of the widget label when in the inactive state.*
- void [bind_deimage](#) (int f)
 - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind_image](#) ([FI_Image](#) *img)
 - Sets the image to use as part of the widget label when in the active state.*
- void [bind_image](#) (int f)
 - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI_Boxtype](#) box () const
 - Gets the box type of the widget.*
- void [box](#) ([FI_Boxtype](#) new_box)
 - Sets the box type for the widget.*
- [FI_Callback_p](#) callback () const
 - Gets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb)
 - Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
 - Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, void *p)
 - Sets the current callback function and data for the widget.*
- void [callback](#) ([FI_Callback0](#) *cb)
 - Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
 - Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
 - Checks if the widget value changed since the last callback.*
- void [clear_active](#) ()
 - Marks the widget as inactive without sending events or changing focus.*
- void [clear_changed](#) ()
 - Marks the value of the widget as unchanged.*
- void [clear_damage](#) (uchar c=0)
 - Clears or sets the damage flags.*
- void [clear_output](#) ()
 - Sets a widget to accept input.*
- void [clear_visible](#) ()
 - Hides the widget.*
- void [clear_visible_focus](#) ()

- Disables keyboard focus navigation with this widget.*

 - [FL_Color](#) [color](#) () const

Gets the background color of the widget.

 - void [color](#) ([FL_Color](#) bg)

Sets the background color of the widget.

 - void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)

Sets the background and selection color of the widget.

 - [FL_Color](#) [color2](#) () const

For back compatibility only.

 - void [color2](#) (unsigned a)

For back compatibility only.

 - int [contains](#) (const [FL_Widget](#) *w) const

Checks if w is a child of this widget.

 - void [copy_label](#) (const char *new_label)

Sets the current label.

 - void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.

 - [uchar](#) [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.

 - void [damage](#) ([uchar](#) c)

Sets the damage bits for the widget.

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

 - int [damage_resize](#) (int, int, int, int)

Internal use only.

 - void [deactivate](#) ()

Deactivates the widget.

 - [FL_Image](#) * [deimage](#) ()

Gets the image that is used as part of the widget label when in the inactive state.

 - const [FL_Image](#) * [deimage](#) () const

Gets the image that is used as part of the widget label when in the inactive state.

 - void [deimage](#) ([FL_Image](#) &img)

Sets the image to use as part of the widget label when in the inactive state.

 - void [deimage](#) ([FL_Image](#) *img)

Sets the image to use as part of the widget label when in the inactive state.

 - int [deimage_bound](#) () const

Returns whether the inactive image is managed by the widget.

 - void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))

Calls the widget callback function with default arguments.

 - void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))

Calls the widget callback function with arbitrary arguments.

 - void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))

Calls the widget callback function with arbitrary arguments.

 - void [draw_label](#) (int, int, int, int, [FL_Align](#)) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

 - int [h](#) () const

Gets the widget height.

 - virtual void [hide](#) ()

Makes a widget invisible.

 - int [horizontal_label_margin](#) ()

Get the spacing between the label and the horizontal edge of the widget.

- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const

- Returns a pointer to the parent widget.*

 - void [parent](#) ([Fl_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)

Changes the size or position of the widget.
- [Fl_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.

- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data () const`
Gets the user data for this widget.
- `void user_data (FL_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible () const`
Returns whether a widget is visible.
- `unsigned int visible_focus () const`
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r () const`
Returns whether a widget and all its parents are visible.
- `int w () const`
Gets the widget width.
- `FL_When when () const`
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `FL_Window * window () const`
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~FL_Widget ()`
Destroys the widget.

Protected Member Functions

- `void draw () FL_OVERRIDE`
Draws the widget.
- `int handle (int) FL_OVERRIDE`
Handles the specified event.
- `void value_damage () FL_OVERRIDE`
Asks for partial redraw.

Protected Member Functions inherited from FL_Valuator

- `FL_Valuator (int X, int Y, int W, int H, const char *L)`
Creates a new FL_Valuator widget using the given position, size, and label string.
- `void handle_drag (double newvalue)`
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- `void handle_push ()`
Stores the current value in the previous value.

- void **handle_release** ()
Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)
Clamps the value, but accepts v if the previous value is not already out of range.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void `default_callback` (`Fl_Widget *widget`, `void *data`)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (`const char *t`)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (`const char *`, `const bool require_alt=false`)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
,
`OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
,
`MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
,
`GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.8.1 Detailed Description

The `Fl_Adjuster` widget was stolen from Prisms, and has proven to be very useful for values that need a large dynamic range.

Figure 11.1 Fl_Adjuster

When you press a button and drag to the right the value increases. When you drag to the left it decreases. The largest button adjusts by $100 * \text{step}()$, the next by $10 * \text{step}()$ and that smallest button by $\text{step}()$. Clicking on the buttons increments by 10 times the amount dragging by a pixel does. Shift + click decrements by 10 times the amount.

11.8.2 Constructor & Destructor Documentation

11.8.2.1 Fl_Adjuster()

```
Fl_Adjuster::Fl_Adjuster (
    int X,
    int Y,
```

```
int W,
int H,
const char * l = 0)
```

Creates a new [Fl_Adjuster](#) widget using the given position, size, and label string.

It looks best if one of the dimensions is 3 times the other.

Inherited destructor destroys the Valuator.

11.8.3 Member Function Documentation

11.8.3.1 draw()

```
void Fl_Adjuster::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

11.8.3.2 handle()

```
int Fl_Adjuster::handle (
    int event) [protected], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class.

This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

11.8.3.3 soft() [1/2]

```
int Fl_Adjuster::soft () const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

11.8.3.4 soft() [2/2]

```
void Fl_Adjuster::soft (
    int s) [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

11.8.3.5 value_damage()

```
void Fl_Adjuster::value_damage () [protected], [virtual]
```

Asks for partial redraw.

Reimplemented from [Fl_Valuator](#).

The documentation for this class was generated from the following files:

- [Fl_Adjuster.H](#)
- [Fl_Adjuster.cxx](#)

11.9 Fl_Anim_GIF_Image Class Reference

The [Fl_Anim_GIF_Image](#) class supports loading, caching, and drawing of animated Compuserve GIFSM images.

Inheritance diagram for [Fl_Anim_GIF_Image](#):

Public Types

- enum [Flags](#) {
[DONT_START](#) = 1 , [DONT_RESIZE_CANVAS](#) = 2 , [DONT_SET_AS_IMAGE](#) = 4 , [OPTIMIZE_MEMORY](#) = 8 ,
[LOG_FLAG](#) = 64 , [DEBUG_FLAG](#) = 128 }

When opening an [Fl_Anim_GIF_Image](#) there are some options that can be passed in a *flags* value.

Public Member Functions

- [Fl_Widget](#) * [canvas](#) () const
Gets the current widget, that is used to display the frame images.
- void [canvas](#) ([Fl_Widget](#) *canvas, unsigned short flags=0)
Link the image back to a widget for automated animation.
- int [canvas_h](#) () const
Return the height of the animation canvas.
- int [canvas_w](#) () const
Return the width of the animation canvas.
- void [color_average](#) ([Fl_Color](#) c, float i) [FL_OVERRIDE](#)
Applies a color average to all frames.
- [Fl_Image](#) * [copy](#) () const
- [Fl_Image](#) * [copy](#) (int W, int H) const [FL_OVERRIDE](#)

- Copy and resize the animation frames.*
- int **debug** () const
- void **delay** (int **frame**, double delay)
 - Set the delay of frame [0-frames() -1] in seconds.*
- double **delay** (int frame_) const
 - Return the delay of frame [0-frames() -1] in seconds.*
- void **desaturate** () **FL_OVERRIDE**
 - Desaturate to all frames of the animation.*
- void **draw** (int x, int y, int **w**, int **h**, int cx=0, int cy=0) **FL_OVERRIDE**
 - Draw the current frame of the animation.*
- **FI_Anim_GIF_Image** ()
 - Create an empty animated GIF image shell.*
- **FI_Anim_GIF_Image** (const char *filename, **FI_Widget** *canvas=0, unsigned short flags=0)
 - Load an animated GIF image from a file.*
- **FI_Anim_GIF_Image** (const char *imagename, const unsigned char *data, const size_t length, **FI_Widget** *canvas=0, unsigned short flags=0)
 - Load an animated GIF image from memory.*
- int **frame** () const
 - Return the current frame.*
- void **frame** (int frame)
 - Set the current frame.*
- int **frame_h** (int **frame**) const
 - Return the frame dimensions of a frame.*
- bool **frame_uncache** () const
 - Return the active frame_uncache() setting.*
- void **frame_uncache** (bool uncache)
 - Use frame_uncache() to set or forbid frame image uncaching.*
- int **frame_w** (int **frame**) const
 - Return the frame dimensions of a frame.*
- int **frame_x** (int **frame**) const
 - Return the frame position of a frame.*
- int **frame_y** (int **frame**) const
 - Return the frame position of a frame.*
- int **frames** () const
 - Get the number of frames in the animation.*
- **FI_Image** * **image** () const
 - Return the current frame image.*
- **FI_Image** * **image** (int **frame**) const
 - Return the image of the given frame index.*
- bool **is_animated** () const
 - Check if this is a valid animation with more than one frame.*
- bool **load** (const char *name, const unsigned char *imgdata=NULL, size_t imglength=0)
 - Load an animation from a file or from a memory block.*
- const char * **name** () const
 - Return the name of the played file as specified in the constructor.*
- bool **next** ()
 - Show the next frame if the animation is stopped.*
- bool **playing** () const
 - Return if the animation is currently running or stopped.*
- **FI_Anim_GIF_Image** & **resize** (double scale)
 - Resizes the image to the specified size, replacing the current image.*

- **FI_Anim_GIF_Image** & **resize** (int w, int h)
Resizes the image to the specified size, replacing the current image.
- double **speed** () const
Get the animation speed factor.
- void **speed** (double speed)
Set the animation speed factor.
- bool **start** ()
*The **start()** method (re-)starts the playing of the frames.*
- bool **stop** ()
*The **stop()** method stops the playing of the frames.*
- void **uncache** () **FL_OVERRIDE**
Uncache all cached image data now.
- bool **valid** () const
Check if animation is valid.
- **~FI_Anim_GIF_Image** () **FL_OVERRIDE**
Release the image and all cached data.

Public Member Functions inherited from **FI_GIF_Image**

- **FI_GIF_Image** (const char *filename)
This constructor loads a GIF image from the given file.
- **FI_GIF_Image** (const char *imagename, const unsigned char *data)
This constructor loads a GIF image from memory (deprecated).
- **FI_GIF_Image** (const char *imagename, const unsigned char *data, const size_t length)
This constructor loads a GIF image from memory.

Public Member Functions inherited from **FI_Pixmap**

- int **cache_h** ()
- int **cache_w** ()
- void **color_average** (FI_Color c, float i) **FL_OVERRIDE**
*The **color_average()** method averages the colors in the image with the provided FLTK color value.*
- **FI_Image** * **copy** () const
- **FI_Image** * **copy** (int W, int H) const **FL_OVERRIDE**
Creates a resized copy of the image.
- void **desaturate** () **FL_OVERRIDE**
*The **desaturate()** method converts an image to grayscale.*
- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) **FL_OVERRIDE**
Draws the image to the current drawing surface with a bounding box.
- **FI_Pixmap** (char *const *D)
The constructors create a new pixmap from the specified XPM data.
- **FI_Pixmap** (const char *const *D)
The constructors create a new pixmap from the specified XPM data.
- **FI_Pixmap** (const uchar *const *D)
The constructors create a new pixmap from the specified XPM data.
- **FI_Pixmap** (uchar *const *D)
The constructors create a new pixmap from the specified XPM data.
- void **label** (FI_Menu_Item *m) **FL_OVERRIDE**
This method is an obsolete way to set the image attribute of a menu item.
- void **label** (FI_Widget *w) **FL_OVERRIDE**
This method is an obsolete way to set the image attribute of a widget or menu item.

- void `uncache ()` [FL_OVERRIDE](#)
If the image has been cached for display, delete the cache data.
- virtual `~FI_Pixmap ()`
The destructor frees all memory and server resources that are used by the pixmap.

Public Member Functions inherited from [FI_Image](#)

- virtual class [FI_Shared_Image](#) * `as_shared_image ()`
Returns whether an image is an [FI_Shared_Image](#) or not.
- [FI_Image](#) * `copy ()` const
Creates a copy of the image in the same size.
- int `count ()` const
Returns the number of data values associated with the image.
- int `d ()` const
Returns the image depth.
- const char *const * `data ()` const
Returns a pointer to the current image data array.
- int `data_h ()` const
Returns the height of the image data.
- int `data_w ()` const
Returns the width of the image data.
- void `draw (int X, int Y)`
Draws the image to the current drawing surface.
- int `fail ()` const
Returns a value that is not 0 if there is currently no image available.
- [FI_Image](#) (int W, int H, int D)
The constructor creates an empty image with the specified width, height, and depth.
- int `h ()` const
Returns the current image drawing height in FLTK units.
- void `inactive ()`
The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.
- int `ld ()` const
Returns the current line data size in bytes.
- virtual void `release ()`
Releases an [FI_Image](#) - the same as 'delete this'.
- virtual void `scale (int width, int height, int proportional=1, int can_expand=0)`
Sets the drawing size of the image.
- int `w ()` const
Returns the current image drawing width in FLTK units.
- virtual `~FI_Image ()`
The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

- static int `frame_count (const char *name, const unsigned char *imgdata=NULL, size_t imglength=0)`
Get the number of frames in a GIF file or in a GIF compressed data block.

Static Public Member Functions inherited from [FI_GIF_Image](#)

- static bool `is_animated (const char *name_)`

Static Public Member Functions inherited from FI_Image

- static [FI_Labeltype](#) [define_FL_IMAGE_LABEL](#) ()
- static [FI_RGB_Scaling](#) [RGB_scaling](#) ()
Returns the currently used RGB image scaling method.
- static void [RGB_scaling](#) ([FI_RGB_Scaling](#))
Sets the RGB image scaling method used for copy(int, int).
- static [FI_RGB_Scaling](#) [scaling_algorithm](#) ()
Gets what algorithm is used when resizing a source image to draw it.
- static void [scaling_algorithm](#) ([FI_RGB_Scaling](#) algorithm)
Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes

- static bool [loop](#) = true
The loop flag can be used to (dis-)allow loop count.
- static double [min_delay](#) = 0.
The min_delay value can be used to set a minimum value for the frame delay for playback.

Static Public Attributes inherited from FI_GIF_Image

- static bool [animate](#) = false
Sets how the shared image core routine should treat animated GIF files.

Static Public Attributes inherited from FI_Image

- static const int [ERR_FILE_ACCESS](#) = -2
- static const int [ERR_FORMAT](#) = -3
- static const int [ERR_MEMORY_ACCESS](#) = -4
- static const int [ERR_NO_IMAGE](#) = -1
- static bool [register_images_done](#) = false
True after [fl_register_images\(\)](#) was called, false before.

Protected Member Functions

- void [clear_frames](#) ()
- bool [next_frame](#) ()
- void [on_extension_data](#) ([FI_GIF_Image::GIF_FRAME](#) &f) [FL_OVERRIDE](#)
- void [on_frame_data](#) ([FI_GIF_Image::GIF_FRAME](#) &f) [FL_OVERRIDE](#)
- void [scale_frame](#) ()
- void [set_frame](#) ()
- void [set_frame](#) (int [frame](#))

Protected Member Functions inherited from FI_GIF_Image

- [FI_GIF_Image](#) ()
The default constructor creates an empty GIF image.
- [FI_GIF_Image](#) (const char *filename, bool anim)
- [FI_GIF_Image](#) (const char *imagename, const unsigned char *data, const size_t length, bool anim)
- void [load](#) (const char *filename, bool anim)
The protected [load\(\)](#) methods are used by [FI_Anim_GIF_Image](#) to request loading of animated GIF's.
- void [load](#) (const char *imagename, const unsigned char *data, const size_t length, bool anim)
- void [load_gif_](#) (class [FI_Image_Reader](#) &rdr, bool anim=false)

Protected Member Functions inherited from [FI_Pixmap](#)

- void **measure** ()

Protected Member Functions inherited from [FI_Image](#)

- void **d** (int D)
Sets the current image depth.
- void **data** (const char *const *p, int c)
Sets the current data pointer and count of pointers in the array.
- void **draw_empty** (int X, int Y)
The protected method [draw_empty\(\)](#) draws a box with an X in it.
- int **draw_scaled** (int X, int Y, int W, int H)
Draw the image to the current drawing surface rescaled to a given width and height.
- void **h** (int H)
Sets the height of the image data.
- void **ld** (int LD)
Sets the current line data size in bytes.
- void **w** (int W)
Sets the width of the image data.

Static Protected Member Functions

- static void **cb_animate** (void *d)

Static Protected Member Functions inherited from [FI_Image](#)

- static void **labeltype** (const [FI_Label](#) *lo, int lx, int ly, int lw, int lh, [FI_Align](#) la)
- static void **measure** (const [FI_Label](#) *lo, int &lw, int &lh)

11.9.1 Detailed Description

The [FI_Anim_GIF_Image](#) class supports loading, caching, and drawing of animated Compuserve GIFSM images. The class loads all images contained in the file and animates them by cycling through them as defined by the delay times in the image file.

The user must supply an FLTK widget as "container" in order to see the animation by specifying it in the constructor or later using the [canvas\(\)](#) method.

11.9.2 Member Enumeration Documentation

11.9.2.1 Flags

enum [FI_Anim_GIF_Image::Flags](#)

When opening an [FI_Anim_GIF_Image](#) there are some options that can be passed in a `flags` value.

Enumerator

DONT_START	This flag indicates to the loader that it should not start the animation immediately after successful load, which is the default. It can be started later using the start() method.
------------	---

Enumerator

DONT_RESIZE_CANVAS	This flag indicates to the loader that it should not resize the canvas widget of the animation to the dimensions of the animation, which is the default. Needed for special use cases.
DONT_SET_AS_IMAGE	This flag indicates to the loader that it should not set the animation as image() member of the canvas widget, which is the default. Needed for special use cases.
OPTIMIZE_MEMORY	Often frames change just a small area of the animation canvas. This flag indicates to the loader to try using less memory by storing frame data not as canvas-sized images but use the sizes defined in the GIF file. The drawbacks are higher cpu usage during playback and maybe minor artifacts when resized.
LOG_FLAG	This flag can be used to print informations about the decoding process to the console.
DEBUG_FLAG	This flag can be used to print even more informations about the decoding process to the console.

11.9.3 Constructor & Destructor Documentation

11.9.3.1 Fl_Anim_GIF_Image() [1/2]

```
Fl_Anim_GIF_Image::Fl_Anim_GIF_Image (
    const char * filename,
    Fl_Widget * canvas = 0,
    unsigned short flags = 0)
```

Load an animated GIF image from a file.

This constructor creates an animated image from a GIF-formatted file. Optionally it applies the [canvas\(\)](#) method after successful load. If [DONT_START](#) is not specified in the `flags` parameter it calls [start\(\)](#) after successful load.

Parameters

in	<i>filename</i>	path and name of GIF file in the file system
in	<i>canvas</i>	a widget that will show and animate the GIF, or NULL
in	<i>flags</i>	see Flags for details, or 0

Note

The GIF image must be decoupled from the canvas by calling `myGif->canvas (NULL) ;` before deleting the canvas.

11.9.3.2 Fl_Anim_GIF_Image() [2/2]

```
Fl_Anim_GIF_Image::Fl_Anim_GIF_Image (
    const char * imagename,
    const unsigned char * data,
    const size_t length,
    Fl_Widget * canvas = 0,
    unsigned short flags = 0)
```

Load an animated GIF image from memory.

This constructor creates an animated image from a GIF-formatted block in memory. Optionally it applies the [canvas\(\)](#) method after successful load. If [DONT_START](#) is not specified in the `flags` parameter it calls [start\(\)](#) after successful load.

`imagename` can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

Parameters

in	<i>imagename</i>	a name given to this image or <code>NULL</code>
in	<i>data</i>	pointer to the start of the GIF image in memory
in	<i>length</i>	length of the GIF image in memory
in	<i>canvas</i>	a widget that will show and animate the GIF, or <code>NULL</code>
in	<i>flags</i>	see Flags for details, or 0

Note

The GIF image must be decoupled from the canvas by calling `myGif->canvas (NULL)` ; before deleting the canvas.

11.9.3.3 ~Fl_Anim_GIF_Image()

```
Fl_Anim_GIF_Image::~Fl_Anim_GIF_Image ()
```

Release the image and all cached data.

Also removes the animation timer.

11.9.4 Member Function Documentation**11.9.4.1 canvas() [1/2]**

```
Fl_Widget * Fl_Anim_GIF_Image::canvas () const
```

Gets the current widget, that is used to display the frame images.

Returns

a pointer to a widget

11.9.4.2 canvas() [2/2]

```
void Fl_Anim_GIF_Image::canvas (
    Fl_Widget * canvas,
    unsigned short flags = 0)
```

Link the image back to a widget for automated animation.

This method sets current widget, that is used to display the frame images. The `flags` parameter specifies whether the canvas widget is resized to the animation dimensions and/or its [image\(\)](#) method will be used to set the current frame image during animation.

Parameters

in	<i>canvas</i>	a pointer to the widget that will show the animation
in	<i>flags</i>	see Flags

Note

The GIF image must be decoupled from the canvas by calling `myGif->canvas (NULL)` ; before deleting the canvas.

11.9.4.3 canvas_h()

```
int Fl_Anim_GIF_Image::canvas_h () const
```

Return the height of the animation canvas.

Returns

the width in pixel units

11.9.4.4 canvas_w()

```
int Fl_Anim_GIF_Image::canvas_w () const
```

Return the width of the animation canvas.

Returns

the width in pixel units

11.9.4.5 color_average()

```
void Fl_Anim_GIF_Image::color_average (
    Fl_Color c,
    float i) [virtual]
```

Applies a color average to all frames.

The `color_average()` method averages the colors in the image with the provided FLTK color value.

Parameters

in	<i>c</i>	blend color
in	<i>i</i>	a value between 0.0 and 1.0 where 0 results in the blend color, and 1 returns the original image

Reimplemented from [Fl_Image](#).

11.9.4.6 copy()

```
Fl_Image * Fl_Anim_GIF_Image::copy (
    int W,
    int H) const [virtual]
```

Copy and resize the animation frames.

The virtual `copy()` method makes a copy of the animated image and resizes all of its frame images to W x H using the current resize method.

Parameters

in	<i>W,H</i>	new size in FLTK pixel units
----	------------	------------------------------

Returns

the resized copy of the animation

Reimplemented from [Fl_Image](#).

11.9.4.7 delay() [1/2]

```
void Fl_Anim_GIF_Image::delay (
    int frame,
    double delay)
```

Set the delay of frame [0-`frames()` -1] in seconds.

Parameters

in	<i>frame</i>	index into frame list
in	<i>delay</i>	to next frame in seconds

11.9.4.8 delay() [2/2]

```
double Fl_Anim_GIF_Image::delay (
    int frame) const
```

Return the delay of frame [0-`frames()` -1] in seconds.

Parameters

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

Returns

delay to next frame in seconds

11.9.4.9 desaturate()

```
void Fl_Anim_GIF_Image::desaturate () [virtual]
```

Desaturate to all frames of the animation.

Reimplemented from [Fl_Image](#).

11.9.4.10 draw()

```
void Fl_Anim_GIF_Image::draw (
    int x,
    int y,
    int w,
    int h,
    int cx = 0,
    int cy = 0) [virtual]
```

Draw the current frame of the animation.

Parameters

in	<i>x,y,w,h</i>	target rectangle
in	<i>cx,cy</i>	source offset

Reimplemented from [Fl_Image](#).

11.9.4.11 frame() [1/2]

```
int Fl_Anim_GIF_Image::frame () const
```

Return the current frame.

Returns

the current frame index in the range for 0 to [frames\(\)](#) - 1.

-1 if the image has no frames.

11.9.4.12 frame() [2/2]

```
void Fl_Anim_GIF_Image::frame (
    int frame)
```

Set the current frame.

Parameters

in	<i>frame</i>	index into list of frames
----	--------------	---------------------------

11.9.4.13 frame_count()

```
int Fl_Anim_GIF_Image::frame_count (
    const char * name,
    const unsigned char * imgdata = NULL,
    size_t imglength = 0) [static]
```

Get the number of frames in a GIF file or in a GIF compressed data block.

The static [frame_count\(\)](#) method is just a convenience method for getting the number of images (frames) stored in a GIF file.

As this count is not readily available in the GIF header, the whole GIF file has be parsed (which is done here by using a temporary [Fl_Anim_GIF_Image](#) object for simplicity). So this call may be slow with large files.

If `imgdata` is `NULL`, the image will be read from the file. Otherwise, it will be read from memory.

Parameters

in	<i>name</i>	path and name of GIF file in the file system, ignored when reading from memeory
in	<i>imgdata</i>	pointer to the start of the GIF image in memory, or <code>NULL</code> to read from a file
in	<i>imglength</i>	length of the GIF image in memory, or 0

Returns

the number of frames in the animation

11.9.4.14 frame_h()

```
int Fl_Anim_GIF_Image::frame_h (
    int frame) const
```

Return the frame dimensions of a frame.

Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

Returns

height in FLTK pixle units

11.9.4.15 frame_uncache() [1/2]

```
bool Fl_Anim_GIF_Image::frame_uncache () const
```

Return the active [frame_uncache\(\)](#) setting.

Returns

true if caching is disabled

11.9.4.16 frame_uncache() [2/2]

```
void Fl_Anim_GIF_Image::frame_uncache (
    bool uncache)
```

Use [frame_uncache\(\)](#) to set or forbid frame image uncaching.

If frame uncaching is set, frame images are not offscreen cached for re-use and will be re-created every time they are displayed. This saves a lot of memory on the expense of cpu usage and should be carefully considered. Per default frame caching will be done.

Parameters

in	<i>uncache</i>	true to disable caching
----	----------------	-------------------------

11.9.4.17 frame_w()

```
int Fl_Anim_GIF_Image::frame_w (  
    int frame) const
```

Return the frame dimensions of a frame.

Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

Returns

width in FLTK pixle units

11.9.4.18 frame_x()

```
int Fl_Anim_GIF_Image::frame_x (  
    int frame) const
```

Return the frame position of a frame.

Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

Returns

x position in FLTK pixle units

11.9.4.19 frame_y()

```
int Fl_Anim_GIF_Image::frame_y (  
    int frame) const
```

Return the frame position of a frame.

Usefull only if loaded with 'optimize_mem' and the animation also has size optimized frames.

Parameters

in	<i>frame</i>	index into frame list
----	--------------	-----------------------

Returns

y position in FLTK pixle units

11.9.4.20 frames()

```
int Fl_Anim_GIF_Image::frames () const
```

Get the number of frames in the animation.

Returns

the number of frames

11.9.4.21 image() [1/2]

```
Fl_Image * Fl_Anim_GIF_Image::image () const
```

Return the current frame image.

Returns

a pointer to the image or NULL if this is not an animation.

11.9.4.22 image() [2/2]

```
Fl_Image * Fl_Anim_GIF_Image::image (
    int frame_) const
```

Return the image of the given frame index.

Parameters

in	<i>frame</i> ↔	index into list of frames
	—	

Returns

image data or NULL if the frame number is not valid.

11.9.4.23 is_animated()

```
bool Fl_Anim_GIF_Image::is_animated () const
```

Check if this is a valid animation with more than one frame.

The `is_animated()` method is just a convenience method for testing the valid flag and the frame count being greater 1.

Returns

true if the animation is valid and has multiple frames.

11.9.4.24 load()

```
bool Fl_Anim_GIF_Image::load (
    const char * name,
    const unsigned char * imgdata = NULL,
    size_t imglength = 0)
```

Load an animation from a file or from a memory block.

The `load()` method is either used from the constructor to load the image from the given file, or to re-load an existing animation from another file.

Parameters

in	<i>name</i>	path and name of GIF file in the file system, or the image name when reading from memory
in	<i>imgdata</i>	pointer to the start of the GIF image in memory, or NULL to read from a file
in	<i>imglength</i>	length of the GIF image in memory, or 0

Returns

true if the animation loaded correctly

11.9.4.25 name()

```
const char * Fl_Anim_GIF_Image::name () const
```

Return the name of the played file as specified in the constructor.
If read from a memory block, this returns the name of the animation.

Returns

pointer to a C string

11.9.4.26 next()

```
bool Fl_Anim_GIF_Image::next ()
```

Show the next frame if the animation is stopped.

Returns

true if the animation has frames

11.9.4.27 on_extension_data()

```
void Fl_Anim_GIF_Image::on_extension_data (
    Fl_GIF_Image::GIF_FRAME & f) [protected], [virtual]
```

Reimplemented from [Fl_GIF_Image](#).

11.9.4.28 on_frame_data()

```
void Fl_Anim_GIF_Image::on_frame_data (
    Fl_GIF_Image::GIF_FRAME & f) [protected], [virtual]
```

Reimplemented from [Fl_GIF_Image](#).

11.9.4.29 playing()

```
bool Fl_Anim_GIF_Image::playing () const [inline]
```

Return if the animation is currently running or stopped.

Returns

true if the animation is running

11.9.4.30 resize() [1/2]

```
Fl_Anim_GIF_Image & Fl_Anim_GIF_Image::resize (
    double scale)
```

Resizes the image to the specified size, replacing the current image.
If [DONT_RESIZE_CANVAS](#) is not set, the canvas widget will also be resized.

Parameters

<i>in</i>	<i>scale</i>	rescale factor in relation to current size
-----------	--------------	--

11.9.4.31 resize() [2/2]

```
Fl_Anim_GIF_Image & Fl_Anim_GIF_Image::resize (
    int w,
    int h)
```

Resizes the image to the specified size, replacing the current image.
If [DONT_RESIZE_CANVAS](#) is not set, the canvas widget will also be resized.

Parameters

in	<i>w,h</i>	new size of the animation frames
----	------------	----------------------------------

11.9.4.32 speed() [1/2]

```
double Fl_Anim_GIF_Image::speed () const
```

Get the animation speed factor.

Returns

the current speed factor

11.9.4.33 speed() [2/2]

```
void Fl_Anim_GIF_Image::speed (
    double speed)
```

Set the animation speed factor.

The [speed\(\)](#) method changes the playing speed to *speed* x original speed. E.g. to play at half speed call it with 0.5, for double speed with 2.

Parameters

in	<i>speed</i>	floating point speed factor
----	--------------	-----------------------------

11.9.4.34 start()

```
bool Fl_Anim_GIF_Image::start ()
```

The [start\(\)](#) method (re-)starts the playing of the frames.

Returns

true if the animation has frames

11.9.4.35 stop()

```
bool Fl_Anim_GIF_Image::stop ()
```

The [stop\(\)](#) method stops the playing of the frames.

Returns

true if the animation has frames

11.9.4.36 uncache()

```
void Fl_Anim_GIF_Image::uncache () [virtual]
```

Uncache all cached image data now.

Re-implemented from [Fl_Pixmap](#).

Reimplemented from [Fl_Image](#).

11.9.4.37 valid()

```
bool Fl_Anim_GIF_Image::valid () const
```

Check if animation is valid.

Returns

true if the class has successfully loaded and the image has at least one frame.

11.9.5 Member Data Documentation

11.9.5.1 loop

```
bool Fl_Anim_GIF_Image::loop = true [static]
```

The loop flag can be used to (dis-)allow loop count.

If set (which is the default), the animation will be stopped after the number of repeats specified in the GIF file (typically this count is set to 'forever' anyway). If cleared the animation will always be 'forever', regardless of what is specified in the GIF file.

11.9.5.2 min_delay

```
double Fl_Anim_GIF_Image::min_delay = 0. [static]
```

The min_delay value can be used to set a minimum value for the frame delay for playback.

This is to prevent CPU hogs caused by images with very low delay rates. This is a global value for all [Fl_Anim_GIF_Image](#) objects.

The documentation for this class was generated from the following files:

- [Fl_Anim_GIF_Image.H](#)
- [Fl_Anim_GIF_Image.cxx](#)

11.10 Fl_Bitmap Class Reference

The [Fl_Bitmap](#) class supports caching and drawing of mono-color (bitmap) images.

```
#include <Fl_Bitmap.H>
```

Inheritance diagram for [Fl_Bitmap](#):

Public Member Functions

- int **cache_h** ()
- int **cache_w** ()
- [Fl_Image](#) * **copy** () const
- [Fl_Image](#) * **copy** (int W, int H) const [FL_OVERRIDE](#)
Creates a resized copy of the image.
- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) [FL_OVERRIDE](#)
Draws the image to the current drawing surface with a bounding box.
- [Fl_Bitmap](#) (const char *bits, int bits_length, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- [Fl_Bitmap](#) (const char *bits, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- [Fl_Bitmap](#) (const uchar *bits, int bits_length, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- [Fl_Bitmap](#) (const uchar *bits, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- void **label** ([Fl_Menu_Item](#) *m) [FL_OVERRIDE](#)
This method is an obsolete way to set the image attribute of a menu item.

- void `label (FL_Widget *w) FL_OVERRIDE`
This method is an obsolete way to set the image attribute of a widget or menu item.
- void `uncache () FL_OVERRIDE`
If the image has been cached for display, delete the cache data.
- virtual `~FL_Bitmap ()`
The destructor frees all memory and server resources that are used by the bitmap.

Public Member Functions inherited from FL_Image

- virtual class `FL_Shared_Image * as_shared_image ()`
Returns whether an image is an `FL_Shared_Image` or not.
- virtual void `color_average (FL_Color c, float i)`
The `color_average()` method averages the colors in the image with the provided FLTK color value.
- `FL_Image * copy () const`
Creates a copy of the image in the same size.
- int `count () const`
Returns the number of data values associated with the image.
- int `d () const`
Returns the image depth.
- const char *const * `data () const`
Returns a pointer to the current image data array.
- int `data_h () const`
Returns the height of the image data.
- int `data_w () const`
Returns the width of the image data.
- virtual void `desaturate ()`
The `desaturate()` method converts an image to grayscale.
- void `draw (int X, int Y)`
Draws the image to the current drawing surface.
- int `fail () const`
Returns a value that is not 0 if there is currently no image available.
- `FL_Image (int W, int H, int D)`
The constructor creates an empty image with the specified width, height, and depth.
- int `h () const`
Returns the current image drawing height in FLTK units.
- void `inactive ()`
The `inactive()` method calls `color_average(FL_BACKGROUND_COLOR, 0.33f)` to produce an image that appears grayed out.
- int `ld () const`
Returns the current line data size in bytes.
- virtual void `release ()`
Releases an `FL_Image` - the same as 'delete this'.
- virtual void `scale (int width, int height, int proportional=1, int can_expand=0)`
Sets the drawing size of the image.
- int `w () const`
Returns the current image drawing width in FLTK units.
- virtual `~FL_Image ()`
The destructor is a virtual method that frees all memory used by the image.

Public Attributes

- int **alloc_array**
Non-zero if array points to bitmap data allocated internally.
- const **uchar** * **array**
pointer to raw bitmap data

Friends

- class **FI_Graphics_Driver**

Additional Inherited Members

Static Public Member Functions inherited from **FI_Image**

- static **FI_Labeltype** **define_FL_IMAGE_LABEL** ()
- static **FI_RGB_Scaling** **RGB_scaling** ()
Returns the currently used RGB image scaling method.
- static void **RGB_scaling** (**FI_RGB_Scaling**)
Sets the RGB image scaling method used for copy(int, int).
- static **FI_RGB_Scaling** **scaling_algorithm** ()
Gets what algorithm is used when resizing a source image to draw it.
- static void **scaling_algorithm** (**FI_RGB_Scaling** algorithm)
Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes inherited from **FI_Image**

- static const int **ERR_FILE_ACCESS** = -2
- static const int **ERR_FORMAT** = -3
- static const int **ERR_MEMORY_ACCESS** = -4
- static const int **ERR_NO_IMAGE** = -1
- static bool **register_images_done** = false
True after [fl_register_images\(\)](#) was called, false before.

Protected Member Functions inherited from **FI_Image**

- void **d** (int D)
Sets the current image depth.
- void **data** (const char *const *p, int c)
Sets the current data pointer and count of pointers in the array.
- void **draw_empty** (int X, int Y)
The protected method [draw_empty\(\)](#) draws a box with an X in it.
- int **draw_scaled** (int X, int Y, int W, int H)
Draw the image to the current drawing surface rescaled to a given width and height.
- void **h** (int H)
Sets the height of the image data.
- void **ld** (int LD)
Sets the current line data size in bytes.
- void **w** (int W)
Sets the width of the image data.

Static Protected Member Functions inherited from **FI_Image**

- static void **labeltype** (const **FI_Label** *lo, int lx, int ly, int lw, int lh, **FI_Align** la)
- static void **measure** (const **FI_Label** *lo, int &lw, int &lh)

11.10.1 Detailed Description

The [Fl_Bitmap](#) class supports caching and drawing of mono-color (bitmap) images. Images are drawn using the current color.

11.10.2 Constructor & Destructor Documentation

11.10.2.1 Fl_Bitmap() [1/4]

```
Fl_Bitmap::Fl_Bitmap (
    const uchar * bits,
    int W,
    int H) [inline]
```

The constructors create a new bitmap from the specified bitmap data.

See also

[Fl_Bitmap\(const uchar *bits, int bits_length, int W, int H\)](#)

11.10.2.2 Fl_Bitmap() [2/4]

```
Fl_Bitmap::Fl_Bitmap (
    const char * bits,
    int W,
    int H) [inline]
```

The constructors create a new bitmap from the specified bitmap data.

See also

[Fl_Bitmap\(const char *bits, int bits_length, int W, int H\)](#)

11.10.2.3 Fl_Bitmap() [3/4]

```
Fl_Bitmap::Fl_Bitmap (
    const uchar * bits,
    int bits_length,
    int W,
    int H)
```

The constructors create a new bitmap from the specified bitmap data.

If the provided array is too small to contain all the image data, the constructor will not generate the bitmap to avoid illegal memory read access and instead set `data` to `NULL` and `ld` to `ERR_MEMORY_ACCESS`.

Parameters

<i>bits</i>	bitmap data, one pixel per bit, rows are rounded to the next byte
<i>bits_length</i>	length of the <i>bits</i> array in bytes
<i>W</i>	image width in pixels
<i>H</i>	image height in pixels

See also

[Fl_Bitmap\(const char *bits, int bits_length, int W, int H\)](#), [Fl_Bitmap\(const uchar *bits, int W, int H\)](#)

11.10.2.4 Fl_Bitmap() [4/4]

```
Fl_Bitmap::Fl_Bitmap (
    const char * bits,
    int bits_length,
```

```

    int W,
    int H)

```

The constructors create a new bitmap from the specified bitmap data.

If the provided array is too small to contain all the image data, the constructor will not generate the bitmap to avoid illegal memory read access and instead set `data` to `NULL` and `ld` to `ERR_MEMORY_ACCESS`.

Parameters

<i>bits</i>	bitmap data, one pixel per bit, rows are rounded to the next byte
<i>bits_length</i>	length of the <i>bits</i> array in bytes
<i>W</i>	image width in pixels
<i>H</i>	image height in pixels

See also

[Fl_Bitmap\(const uchar *bits, int bits_length, int W, int H\)](#), [Fl_Bitmap\(const char *bits, int W, int H\)](#)

11.10.3 Member Function Documentation

11.10.3.1 copy()

```

Fl_Image * Fl_Bitmap::copy (
    int W,
    int H) const [virtual]

```

Creates a resized copy of the image.

It is recommended not to call this member function to reduce the size of an image to the size of the area where this image will be drawn, and to use [Fl_Image::scale\(\)](#) instead.

The new image should be released when you are done with it.

Note: since FLTK 1.4.0 you can use [Fl_Image::release\(\)](#) for all types of images (i.e. all subclasses of [Fl_Image](#)) instead of operator *delete* for [Fl_Image](#)'s and [Fl_Image::release\(\)](#) for [Fl_Shared_Image](#)'s.

The new image data will be converted to the requested size. RGB images are resized using the algorithm set by [Fl_Image::RGB_scaling\(\)](#).

For the new image the following equations are true:

- `w() == data_w() == W`
- `h() == data_h() == H`

Parameters

in	<i>W,H</i>	Requested width and height of the new image
----	------------	---

Note

The returned image can be safely cast to the same image type as that of the source image provided this type is one of [Fl_RGB_Image](#), [Fl_SVG_Image](#), [Fl_Pixmap](#), [Fl_Bitmap](#), [Fl_Tiled_Image](#), [Fl_Anim_GIF_Image](#) and [Fl_Shared_Image](#). Returned objects copied from images of other, derived, image classes belong to the parent class appearing in this list. For example, the copy of an [Fl_GIF_Image](#) is an object of class [Fl_Pixmap](#).

Since FLTK 1.4.0 this method is 'const'. If you derive your own class from [Fl_Image](#) or any subclass your overridden methods of '[Fl_Image::copy\(\) const](#)' and '[Fl_Image::copy\(int, int\) const](#)' **must** also be 'const' for inheritance to work properly. This is different than in FLTK 1.3.x and earlier where these methods have not been 'const'.

Reimplemented from [Fl_Image](#).

11.10.3.2 draw()

```
void Fl_Bitmap::draw (
    int X,
    int Y,
    int W,
    int H,
    int cx = 0,
    int cy = 0) [virtual]
```

Draws the image to the current drawing surface with a bounding box.

Arguments *X*, *Y*, *W*, *H* specify a bounding box for the image, with the origin (upper-left corner) of the image offset by the *cx* and *cy* arguments.

In other words: `fl_push_clip(X,Y,W,H)` is applied, the image is drawn with its upper-left corner at *X-cx*, *Y-cy* and its own width and height, `fl_pop_clip()` is applied.

Reimplemented from [FI_Image](#).

11.10.3.3 label() [1/2]

```
void Fl_Bitmap::label (
    Fl_Menu_Item * m) [virtual]
```

This method is an obsolete way to set the image attribute of a menu item.

Deprecated Please use [Fl_Menu_Item::image\(\)](#) instead.

Reimplemented from [FI_Image](#).

11.10.3.4 label() [2/2]

```
void Fl_Bitmap::label (
    Fl_Widget * widget) [virtual]
```

This method is an obsolete way to set the image attribute of a widget or menu item.

Deprecated Please use [Fl_Widget::image\(\)](#) or [Fl_Widget::deimage\(\)](#) instead.

Reimplemented from [FI_Image](#).

11.10.3.5 uncache()

```
void Fl_Bitmap::uncache () [virtual]
```

If the image has been cached for display, delete the cache data.

This allows you to change the data used for the image and then redraw it without recreating an image object.

Reimplemented from [FI_Image](#).

The documentation for this class was generated from the following files:

- [FI_Bitmap.H](#)
- [FI_Bitmap.cxx](#)

11.11 FI_BMP_Image Class Reference

The [FI_BMP_Image](#) class supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

```
#include <FI_BMP_Image.H>
```

Inheritance diagram for [FI_BMP_Image](#):

Public Member Functions

- [FI_BMP_Image](#) (const char *filename)
This constructor loads the named BMP image from the given BMP filename.
- [FI_BMP_Image](#) (const char *imagenam, const unsigned char *data, const long length=-1)
This constructor loads a BMP image from memory.

Public Member Functions inherited from [FI_RGB_Image](#)

- virtual [FI_SVG_Image](#) * [as_svg_image](#) ()
Returns whether an image is an [FI_SVG_Image](#) or not.
- int [cache_h](#) ()
- int [cache_w](#) ()
- void [color_average](#) ([FI_Color](#) c, float i) [FL_OVERRIDE](#)
The [color_average\(\)](#) method averages the colors in the image with the provided FLTK color value.
- [FI_Image](#) * [copy](#) () const
- [FI_Image](#) * [copy](#) (int W, int H) const [FL_OVERRIDE](#)
Creates a resized copy of the image.
- void [desaturate](#) () [FL_OVERRIDE](#)
The [desaturate\(\)](#) method converts an image to grayscale.
- void [draw](#) (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) [FL_OVERRIDE](#)
Draws the image to the current drawing surface with a bounding box.
- [FI_RGB_Image](#) (const [FI_Pixmap](#) *pixmap, [FI_Color](#) bg=[FL_GRAY](#))
The constructor creates a new RGBA image from the specified [FI_Pixmap](#).
- [FI_RGB_Image](#) (const uchar *bits, int bits_length, int W, int H, int D, int LD)
The constructor creates a new image from the specified data.
- [FI_RGB_Image](#) (const uchar *bits, int W, int H, int D=3, int LD=0)
The constructor creates a new image from the specified data.
- void [label](#) ([FI_Menu_Item](#) *m) [FL_OVERRIDE](#)
This method is an obsolete way to set the image attribute of a menu item.
- void [label](#) ([FI_Widget](#) *w) [FL_OVERRIDE](#)
This method is an obsolete way to set the image attribute of a widget or menu item.
- virtual void [normalize](#) ()
Makes sure the object is fully initialized.
- void [uncache](#) () [FL_OVERRIDE](#)
If the image has been cached for display, delete the cache data.
- ~[FI_RGB_Image](#) () [FL_OVERRIDE](#)
The destructor frees all memory and server resources that are used by the image.

Public Member Functions inherited from FI_Image

- virtual class FI_Shared_Image * **as_shared_image** ()
Returns whether an image is an FI_Shared_Image or not.
- FI_Image * **copy** () const
Creates a copy of the image in the same size.
- int **count** () const
Returns the number of data values associated with the image.
- int **d** () const
Returns the image depth.
- const char *const * **data** () const
Returns a pointer to the current image data array.
- int **data_h** () const
Returns the height of the image data.
- int **data_w** () const
Returns the width of the image data.
- void **draw** (int X, int Y)
Draws the image to the current drawing surface.
- int **fail** () const
Returns a value that is not 0 if there is currently no image available.
- FI_Image (int W, int H, int D)
The constructor creates an empty image with the specified width, height, and depth.
- int **h** () const
Returns the current image drawing height in FLTK units.
- void **inactive** ()
*The **inactive()** method calls **color_average(FI_BACKGROUND_COLOR, 0.33f)** to produce an image that appears grayed out.*
- int **ld** () const
Returns the current line data size in bytes.
- virtual void **release** ()
Releases an FI_Image - the same as 'delete this'.
- virtual void **scale** (int width, int height, int proportional=1, int can_expand=0)
Sets the drawing size of the image.
- int **w** () const
Returns the current image drawing width in FLTK units.
- virtual ~FI_Image ()
The destructor is a virtual method that frees all memory used by the image.

Protected Member Functions

- void **load_bmp_** (class FI_Image_Reader &rdr, int ico_height=0, int ico_width=0)

Protected Member Functions inherited from FI_Image

- void **d** (int D)
Sets the current image depth.
- void **data** (const char *const *p, int c)
Sets the current data pointer and count of pointers in the array.
- void **draw_empty** (int X, int Y)
*The protected method **draw_empty()** draws a box with an X in it.*
- int **draw_scaled** (int X, int Y, int W, int H)
Draw the image to the current drawing surface rescaled to a given width and height.
- void **h** (int H)

- *Sets the height of the image data.*
- void **ld** (int LD)
Sets the current line data size in bytes.
- void **w** (int W)
Sets the width of the image data.

Additional Inherited Members

Static Public Member Functions inherited from [FI_RGB_Image](#)

- static size_t **max_size** ()
Returns the maximum allowed image size in bytes when creating an [FI_RGB_Image](#) object.
- static void **max_size** (size_t size)
Sets the maximum allowed image size in bytes when creating an [FI_RGB_Image](#) object.

Static Public Member Functions inherited from [FI_Image](#)

- static [FI_Labeltype](#) **define_FL_IMAGE_LABEL** ()
- static [FI_RGB_Scaling](#) **RGB_scaling** ()
Returns the currently used RGB image scaling method.
- static void **RGB_scaling** ([FI_RGB_Scaling](#))
Sets the RGB image scaling method used for copy(int, int).
- static [FI_RGB_Scaling](#) **scaling_algorithm** ()
Gets what algorithm is used when resizing a source image to draw it.
- static void **scaling_algorithm** ([FI_RGB_Scaling](#) algorithm)
Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from [FI_RGB_Image](#)

- int **alloc_array**
If non-zero, the object's data array is delete[]'d when deleting the object.
- const [uchar](#) * **array**
Points to the start of the object's data array.

Static Public Attributes inherited from [FI_Image](#)

- static const int **ERR_FILE_ACCESS** = -2
- static const int **ERR_FORMAT** = -3
- static const int **ERR_MEMORY_ACCESS** = -4
- static const int **ERR_NO_IMAGE** = -1
- static bool **register_images_done** = false
True after [fl_register_images\(\)](#) was called, false before.

Static Protected Member Functions inherited from [FI_Image](#)

- static void **labeltype** (const [FI_Label](#) *lo, int lx, int ly, int lw, int lh, [FI_Align](#) la)
- static void **measure** (const [FI_Label](#) *lo, int &lw, int &lh)

11.11.1 Detailed Description

The [FI_BMP_Image](#) class supports loading, caching, and drawing of Windows Bitmap (BMP) image files.

11.11.2 Constructor & Destructor Documentation

11.11.2.1 FI_BMP_Image() [1/2]

```
FI_BMP_Image::FI_BMP_Image (
    const char * filename)
```

This constructor loads the named BMP image from the given BMP filename.

The destructor frees all memory and server resources that are used by the image.

Use [FI_Image::fail\(\)](#) to check if [FI_BMP_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the BMP format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

Parameters

in	<i>filename</i>	a full path and name pointing to a BMP file.
----	-----------------	--

See also

[FI_BMP_Image::FI_BMP_Image\(const char* imagename, const unsigned char *data, const long length = -1\);](#)

11.11.2.2 FI_BMP_Image() [2/2]

```
FI_BMP_Image::FI_BMP_Image (
    const char * imagename,
    const unsigned char * data,
    const long length = -1)
```

This constructor loads a BMP image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary data" chunks as a great way to add image data into the C++ source code. *imagename* can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

The destructor frees all memory and server resources that are used by the image.

The (new and optional) third parameter *length* **should** be used so buffer overruns (i.e. truncated images) can be checked. See note below.

If *length* is not used

- it defaults to -1 (unlimited size)
- buffer overruns will not be checked.

Note

The optional parameter *length* is available since FLTK 1.4.0. Not using it is deprecated and old code should be modified to use it. This parameter will likely become mandatory in a future FLTK version.

Use [FI_Image::fail\(\)](#) to check if [FI_BMP_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the image could not be read from memory, `ERR_FORMAT` if the BMP format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

Parameters

in	<i>imagename</i>	A name given to this image or NULL
in	<i>data</i>	Pointer to the start of the BMP image in memory.
in	<i>length</i>	Length of the BMP image in memory.

11.12 FL_Box Class Reference

This widget simply draws its box, and possibly its label.

```
#include <FL_Box.H>
```

Inheritance diagram for FL_Box:

Public Member Functions

- [FL_Box](#) ([FL_Boxtype](#) B, int X, int Y, int W, int H, const char *L)
Creates a new [FL_Box](#) widget with the given boxtype, coordinates, size, and label.
- [FL_Box](#) (int X, int Y, int W, int H, const char *L=0)
Creates a new [FL_Box](#) widget with the given coordinates, size, and label.
- int [handle](#) (int) [FL_OVERRIDE](#)
Handles the specified event.

Public Member Functions inherited from [FL_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FL_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FL_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FL_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FL_Gl_Window](#) pointer if this widget is an [FL_Gl_Window](#).
- virtual class [FL_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FL_Group](#) * [as_group](#) ()
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- virtual [FL_Group](#) const * [as_group](#) () const
- virtual [FL_Window](#) * [as_window](#) ()
Returns an [FL_Window](#) pointer if this widget is an [FL_Window](#).
- virtual [FL_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FL_Image](#) *img)

- Sets the image to use as part of the widget label when in the active state.*

 - void [bind_image](#) (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const

Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)

Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const

Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)

Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.
- unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()

Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)

Clears or sets the damage flags.
- void [clear_output](#) ()

Sets a widget to accept input.
- void [clear_visible](#) ()

Hides the widget.
- void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.
- [FI_Color](#) [color](#) () const

Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)

Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)

Sets the background and selection color of the widget.
- [FI_Color](#) [color2](#) () const

For back compatibility only.
- void [color2](#) (unsigned a)

For back compatibility only.
- int [contains](#) (const [FI_Widget](#) *w) const

Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)

Sets the current label.
- void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.
- uchar [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.

- void [damage](#) ([uchar](#) c)
Sets the damage bits for the widget.
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int [damage_resize](#) (int, int, int, int)
Internal use only.
- void [deactivate](#) ()
Deactivates the widget.
- [FL_Image](#) * [deimage](#) ()
Gets the image that is used as part of the widget label when in the inactive state.
- const [FL_Image](#) * [deimage](#) () const
Gets the image that is used as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- int [deimage_bound](#) () const
Returns whether the inactive image is managed by the widget.
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)

- Sets the current label pointer.*

 - void `label` (`FL_Labeltype` a, const char *b)

Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()

Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)

Set the gap between the label and the image in pixels.
- `FL_Color` `labelcolor` () const

Gets the label color.
- void `labelcolor` (`FL_Color` c)

Sets the label color.
- `FL_Font` `labelfont` () const

Gets the font to use.
- void `labelfont` (`FL_Font` f)

Sets the font to use.
- `FL_Fonsize` `labelsize` () const

Gets the font size in pixels.
- void `labelsize` (`FL_Fonsize` pix)

Sets the font size in pixels.
- `FL_Labeltype` `labeltype` () const

Gets the label type.
- void `labeltype` (`FL_Labeltype` a)

Sets the label type.
- void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `FL_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`FL_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- virtual void `resize` (int x, int y, int w, int h)

Changes the size or position of the widget.
- `FL_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`FL_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.

- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const

- Returns whether a widget and all its parents are visible.*
- int **w** () const
Gets the widget width.
- **FL_When** when () const
Returns the conditions under which the callback is called.
- void **when** (uchar i)
Sets the flags used to decide when a callback is called.
- **FL_Window** * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
Gets the widget position in its window.
- int **y** () const
Gets the widget position in its window.
- virtual ~**FL_Widget** ()
Destroys the widget.

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
Draws the widget.

Protected Member Functions inherited from **FL_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FL_Boxtype t, FL_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FL_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)

Internal use only.

- void `x` (int v)

Internal use only.

- void `y` (int v)

Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget` *widget, void *data)

The default callback for all widgets that don't set a callback.

- static unsigned int `label_shortcut` (const char *t)

Returns the Unicode value of the '&x' shortcut in a given text.

- static int `test_shortcut` (const char *, const bool require_alt=false)

Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `Fl_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
 ,

`USERFLAG1` = 1<<31 }

flags possible values enumeration.

11.12.1 Detailed Description

This widget simply draws its box, and possibly its label.

Putting it before some other widgets and making it big enough to surround them will let you draw a frame around them.

11.12.2 Constructor & Destructor Documentation

11.12.2.1 `Fl_Box()` [1/2]

```
Fl_Box::Fl_Box (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Creates a new `Fl_Box` widget with the given coordinates, size, and label.

This constructor sets `box()` to `FL_NO_BOX`, which means it is invisible.

However such widgets are useful as placeholders or `Fl_Group::resizable()` values. To change the box to something visible, use `box(Fl_Boxtype)`.

The destructor removes the box from its parent group.

Parameters

in	<i>X,Y</i>	the position of the widget relative to the enclosing window
in	<i>W,H</i>	size of the widget in pixels
in	<i>L</i>	optional text for the widget label (default: no label)

See also

[Fl_Box\(Fl_Boxtype b, int X, int Y, int W, int H, const char *L\)](#)

11.12.2.2 Fl_Box() [2/2]

```
Fl_Box::Fl_Box (
    Fl_Boxtype B,
    int X,
    int Y,
    int W,
    int H,
    const char * L)
```

Creates a new [Fl_Box](#) widget with the given boxtype, coordinates, size, and label.

This constructor sets [box\(\)](#) to the given [Fl_Boxtype](#) B.

You must also specify a label but it can be `nullptr` (0, NULL) if you don't want or need a visible label.

The destructor removes the box from its parent group.

Parameters

in	<i>B</i>	boxtype of the widget
in	<i>X,Y</i>	the position of the widget relative to the enclosing window
in	<i>W,H</i>	size of the widget in pixels
in	<i>L</i>	optional text for the widget label (see description)

11.12.3 Member Function Documentation

11.12.3.1 draw()

```
void Fl_Box::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

11.12.3.2 handle()

```
int Fl_Box::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

The documentation for this class was generated from the following files:

- [Fl_Box.H](#)
- [Fl_Box.cxx](#)

11.13 Fl_Browser Class Reference

The [Fl_Browser](#) widget displays a scrolling list of text lines, and manages all the storage for the text.

```
#include <Fl_Browser.H>
```

Inheritance diagram for Fl_Browser:

Public Types

- enum [Fl_Line_Position](#) { TOP , BOTTOM , MIDDLE }

For internal use only?

Public Types inherited from FI_Browser_

- enum {
[HORIZONTAL](#) = 1 , [VERTICAL](#) = 2 , [BOTH](#) = 3 , [ALWAYS_ON](#) = 4 ,
[HORIZONTAL_ALWAYS](#) = 5 , [VERTICAL_ALWAYS](#) = 6 , [BOTH_ALWAYS](#) = 7 }
 Values for [has_scrollbar\(\)](#).

Public Member Functions

- void [add](#) (const char *newtext, void *d=0)
 Adds a new line to the end of the browser.
- void [bottomline](#) (int line)
 Scrolls the browser so the bottom item in the browser is showing the specified *line*.
- void [clear](#) ()
 Removes all the lines in the browser.
- char [column_char](#) () const
 Gets the current column separator character.
- void [column_char](#) (char c)
 Sets the column separator to *c*.
- const int * [column_widths](#) () const
 Gets the current column width array.
- void [column_widths](#) (const int *arr)
 Sets the current array to *arr*.
- void * [data](#) (int line) const
 Returns the user [data\(\)](#) for specified *line*.
- void [data](#) (int line, void *d)
 Sets the user data for specified *line* to *d*.
- void [display](#) (int line, int val=1)
 For back compatibility.
- int [displayed](#) (int line) const
 Returns non-zero if *line* has been scrolled to a position where it is being displayed.
- [FI_Browser](#) (int X, int Y, int W, int H, const char *L=0)
 The constructor makes an empty browser.
- char [format_char](#) () const
 Gets the current format code prefix character, which by default is '@'.
- void [format_char](#) (char c)
 Sets the current format code prefix character to *c*.
- void [hide](#) () [FL_OVERRIDE](#)
 Hides the entire [FI_Browser](#) widget – opposite of [show\(\)](#).
- void [hide](#) (int line)
 Makes *line* invisible, preventing selection by the user.
- [FI_Image](#) * [icon](#) (int line) const
 Returns the icon currently defined for *line*.
- void [icon](#) (int line, [FI_Image](#) *icon)
 Set the image icon for *line* to the value *icon*.
- void [insert](#) (int line, const char *newtext, void *d=0)
 Insert a new entry whose label is *newtext* above given *line*, optional data *d*.
- void [lineposition](#) (int line, [FI_Line_Position](#) pos)
 Updates the browser so that *line* is shown at position *pos*.
- int [load](#) (const char *filename)
 Clears the browser and reads the file, adding each line from the file to the browser.
- void [make_visible](#) (int line)

- Make the item at the specified *line* [visible\(\)](#).

 - void [middleline](#) (int line)

Scrolls the browser so the middle item in the browser is showing the specified *line*.
 - void [move](#) (int to, int from)

Line *from* is removed and reinserted at *to*.
 - void [remove](#) (int line)

Remove entry for given *line* number, making the browser one line shorter.
 - void [remove_icon](#) (int line)

Removes the icon for *line*.
 - void [replace](#) (int a, const char *b)

For back compatibility only.
 - int [select](#) (int line, int val=1)

Sets the selection state of the item at *line* to the value *val*.
 - int [selected](#) (int line) const

Returns 1 if specified *line* is selected, 0 if not.
 - void [show](#) () [FL_OVERRIDE](#)

Shows the entire [FL_Browser](#) widget – opposite of [hide\(\)](#).
 - void [show](#) (int line)

Makes *line* visible, and available for selection by user.
 - int [size](#) () const

Returns how many lines are in the browser.
 - void [size](#) (int W, int H)
 - void [swap](#) (int a, int b)

Swaps two browser lines *a* and *b*.
 - const char * [text](#) (int line) const

Returns the label text for the specified *line*.
 - void [text](#) (int line, const char *newtext)

Sets the text for the specified *line* to *newtext*.
 - [FL_Fontsize](#) [textsize](#) () const

Gets the default text size (in pixels) for the lines in the browser.
 - void [textsize](#) ([FL_Fontsize](#) newSize)

Sets the default text size (in pixels) for the lines in the browser to *newSize*.
 - int [topline](#) () const

Returns the line that is currently visible at the top of the browser.
 - void [topline](#) (int line)

Scrolls the browser so the top item in the browser is showing the specified *line*.
 - int [value](#) () const

Returns the line number of the currently selected line, or 0 if none selected.
 - void [value](#) (int line)

Sets the browser's [value\(\)](#), which selects the specified *line*.
 - int [visible](#) (int line) const

Returns non-zero if the specified *line* is visible, 0 if hidden.
 - [~FL_Browser](#) ()

The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from [FL_Browser_](#)

- int [deselect](#) (int docallbacks=0)
Deselects all items in the list and returns 1 if the state changed or 0 if it did not.
- void [display](#) (void *item)
*Displays the *item*, scrolling the list as necessary.*
- int [handle](#) (int event) [FL_OVERRIDE](#)
*Handles the *event* within the normal widget bounding box.*
- [uchar](#) [has_scrollbar](#) () const
Returns the current scrollbar mode, see [FL_Browser_::has_scrollbar\(uchar\)](#)
- void [has_scrollbar](#) ([uchar](#) mode)
Sets whether the widget should have scrollbars or not (default [FL_Browser_::BOTH](#)).
- int [hposition](#) () const
*Gets the horizontal scroll position of the list as a pixel position *pos*.*
- void [hposition](#) (int)
*Sets the horizontal scroll position of the list to pixel position *pos*.*
- int [linespacing](#) () const
Return the height of additional spacing between browser lines.
- void [linespacing](#) (int pixels)
Add some space between browser lines.
- int [position](#) () const
- void [position](#) (int pos)
- void [position](#) (int x, int y)
- void [resize](#) (int X, int Y, int W, int H) [FL_OVERRIDE](#)
Repositions and/or resizes the browser.
- void [scrollbar_left](#) ()
Moves the vertical scrollbar to the lefthand side of the list.
- void [scrollbar_right](#) ()
Moves the vertical scrollbar to the righthand side of the list.
- int [scrollbar_size](#) () const
Gets the current size of the scrollbars' troughs, in pixels.
- void [scrollbar_size](#) (int newSize)
*Sets the pixel size of the scrollbars' troughs to *newSize*, in pixels.*
- int [scrollbar_width](#) () const
Returns the global value [Fl::scrollbar_size\(\)](#).
- void [scrollbar_width](#) (int width)
Sets the global [Fl::scrollbar_size\(\)](#), and forces this instance of the widget to use it.
- int [select](#) (void *item, int val=1, int docallbacks=0)
*Sets the selection state of *item* to *val*, and returns 1 if the state changed or 0 if it did not.*
- int [select_only](#) (void *item, int docallbacks=0)
*Selects *item* and returns 1 if the state changed or 0 if it did not.*
- void [sort](#) (int flags=0)
*Sort the items in the browser based on *flags*.*
- [FL_Color](#) [textcolor](#) () const
Gets the default text color for the lines in the browser.
- void [textcolor](#) ([FL_Color](#) col)
*Sets the default text color for the lines in the browser to color *col*.*
- [FL_Font](#) [textfont](#) () const
Gets the default text font for the lines in the browser.
- void [textfont](#) ([FL_Font](#) font)
*Sets the default text font for the lines in the browser to *font*.*

- **FL_Fonsize** **textsize** () const
Gets the default text size (in pixels) for the lines in the browser.
- void **textsize** (**FL_Fonsize** newSize)
*Sets the default text size (in pixels) for the lines in the browser to *size*.*
- int **vposition** () const
*Gets the vertical scroll position of the list as a pixel position *pos*.*
- void **vposition** (int pos)
*Sets the vertical scroll position of the list to pixel position *pos*.*

Public Member Functions inherited from **FL_Group**

- **FL_Widget** *& **_ddfdesign_kludge** ()
This is for forms compatibility only.
- void **add** (**FL_Widget** &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** (**FL_Widget** *o)
*See void **FL_Group::add(FL_Widget &w)***
- void **add_resizable** (**FL_Widget** &o)
Adds a widget to the group and makes it the resizable widget.
- **FL_Widget** *const * **array** () const
Returns a pointer to the array of children.
- **FL_Group** const * **as_group** () const **FL_OVERRIDE**
- **FL_Group** * **as_group** () **FL_OVERRIDE**
*Returns an **FL_Group** pointer if this widget is an **FL_Group**.*
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- **FL_Widget** * **child** (int n) const
*Returns the *n*'th child.*
- int **children** () const
Returns how many child widgets the group has.
- void **clear** ()
Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()
Returns the current clipping mode.
- void **clip_children** (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete_child** (int n)
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()
*Exactly the same as *current(this->parent())*.*
- int **find** (const **FL_Widget** &o) const
*See int **FL_Group::find(const FL_Widget *w)** const.*
- int **find** (const **FL_Widget** *) const
Searches the child array for the widget and returns the index.
- **FL_Group** (int, int, int, const char * = 0)
*Creates a new **FL_Group** widget using the given position, size, and label string.*
- void **focus** (**FL_Widget** *W)
- void **forms_end** ()
This is for forms compatibility only.
- int **handle** (int) **FL_OVERRIDE**
Handles the specified event.

- void `init_sizes` ()
Resets the internal array of widget sizes and positions.
- void `insert` (FL_Widget &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void `insert` (FL_Widget &o, FL_Widget *before)
This does insert(w, find(before)).
- void `remove` (FL_Widget &)
Removes a widget from the group but does not delete it.
- void `remove` (FL_Widget *o)
Removes the widget o from the group.
- void `remove` (int index)
Removes the widget at index from the group but does not delete it.
- FL_Widget * `resizable` () const
Returns the group's resizable widget.
- void `resizable` (FL_Widget &o)
Sets the group's resizable widget.
- void `resizable` (FL_Widget *o)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void `resize` (int, int, int, int) FL_OVERRIDE
Resizes the FL_Group widget and all of its children.
- virtual ~FL_Group ()
The destructor also deletes all the children.

Public Member Functions inherited from FL_Widget

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
Activates the widget.
- unsigned int `active` () const
Returns whether the widget is active.
- int `active_r` () const
Returns whether the widget and all of its parents are active.
- FL_Align `align` () const
Gets the label alignment.
- void `align` (FL_Align alignment)
Sets the label alignment.
- long `argument` () const
Gets the current user data (long) argument that is passed to the callback function.
- void `argument` (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class FL_Gl_Window * `as_gl_window` ()
Returns an FL_Gl_Window pointer if this widget is an FL_Gl_Window.
- virtual class FL_Gl_Window const * `as_gl_window` () const
- virtual FL_Window * `as_window` ()
Returns an FL_Window pointer if this widget is an FL_Window.
- virtual FL_Window const * `as_window` () const
- void `bind_deimage` (FL_Image *img)
Sets the image to use as part of the widget label when in the inactive state.
- void `bind_deimage` (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void [bind_image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FL_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FL_Boxtype](#) new_box)
Sets the box type for the widget.
- [FL_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FL_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FL_Callback](#) *cb, [FL_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FL_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FL_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FL_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()
Marks the value of the widget as unchanged.
- void [clear_damage](#) ([uchar](#) c=0)
Clears or sets the damage flags.
- void [clear_output](#) ()
Sets a widget to accept input.
- void [clear_visible](#) ()
Hides the widget.
- void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
- [FL_Color](#) [color](#) () const
Gets the background color of the widget.
- void [color](#) ([FL_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)
Sets the background and selection color of the widget.
- [FL_Color](#) [color2](#) () const
For back compatibility only.
- void [color2](#) (unsigned a)
For back compatibility only.
- int [contains](#) (const [FL_Widget](#) *w) const
Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)
Sets the current label.
- void [copy_tooltip](#) (const char *text)
Sets the current tooltip text.
- [uchar](#) [damage](#) () const

- Returns non-zero if [draw\(\)](#) needs to be called.*

 - void [damage](#) ([uchar](#) c)
 - Sets the damage bits for the widget.*
 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
 - Sets the damage bits for an area inside the widget.*
 - int [damage_resize](#) (int, int, int, int)
 - Internal use only.*
 - void [deactivate](#) ()
 - Deactivates the widget.*
 - [FL_Image](#) * [deimage](#) ()
 - Gets the image that is used as part of the widget label when in the inactive state.*
 - const [FL_Image](#) * [deimage](#) () const
 - Gets the image that is used as part of the widget label when in the inactive state.*
 - void [deimage](#) ([FL_Image](#) &img)
 - Sets the image to use as part of the widget label when in the inactive state.*
 - void [deimage](#) ([FL_Image](#) *img)
 - Sets the image to use as part of the widget label when in the inactive state.*
 - int [deimage_bound](#) () const
 - Returns whether the inactive image is managed by the widget.*
 - void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
 - Calls the widget callback function with default arguments.*
 - void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
 - Calls the widget callback function with arbitrary arguments.*
 - void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
 - Calls the widget callback function with arbitrary arguments.*
 - void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
 - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
 - int [h](#) () const
 - Gets the widget height.*
 - int [horizontal_label_margin](#) ()
 - Get the spacing between the label and the horizontal edge of the widget.*
 - void [horizontal_label_margin](#) (int px)
 - Set the spacing between the label and the horizontal edge of the widget.*
 - [FL_Image](#) * [image](#) ()
 - Gets the image that is used as part of the widget label when in the active state.*
 - const [FL_Image](#) * [image](#) () const
 - Gets the image that is used as part of the widget label when in the active state.*
 - void [image](#) ([FL_Image](#) &img)
 - Sets the image to use as part of the widget label when in the active state.*
 - void [image](#) ([FL_Image](#) *img)
 - Sets the image to use as part of the widget label when in the active state.*
 - int [image_bound](#) () const
 - Returns whether the image is managed by the widget.*
 - int [inside](#) (const [FL_Widget](#) *wgt) const
 - Checks if this widget is a child of wgt.*
 - int [is_label_copied](#) () const
 - Returns whether the current label was assigned with [copy_label\(\)](#).*
 - const char * [label](#) () const
 - Gets the current label text.*
 - void [label](#) (const char *text)
 - Sets the current label pointer.*

- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- [FL_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([FL_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()

- Makes the widget visible.*

 - void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [FI_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [FI_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([FI_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const

Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const

Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)

Modifies keyboard focus navigation.
- int [visible_r](#) () const

Returns whether a widget and all its parents are visible.
- int [w](#) () const

Gets the widget width.
- [FI_When](#) [when](#) () const

Returns the conditions under which the callback is called.

- void `when` (`uchar` `i`)
Sets the flags used to decide when a callback is called.
- `FL_Window` * `window` () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int `x` () const
Gets the widget position in its window.
- int `y` () const
Gets the widget position in its window.
- virtual `~FL_Widget` ()
Destroys the widget.

Protected Member Functions

- `FL_BLINE` * `_remove` (int `line`)
Removes the item at the specified `line`.
- `FL_BLINE` * `find_line` (int `line`) const
Returns the item for specified `line`.
- int `full_height` () const `FL_OVERRIDE`
The height of the entire list of all `visible()` items in pixels.
- int `incr_height` () const `FL_OVERRIDE`
The default 'average' item height (including inter-item spacing) in pixels.
- void `insert` (int `line`, `FL_BLINE` *`item`)
Insert specified `item` above `line`.
- void * `item_at` (int `line`) const `FL_OVERRIDE`
Return the item at specified `line`.
- void `item_draw` (void *`item`, int `X`, int `Y`, int `W`, int `H`) const `FL_OVERRIDE`
Draws `item` at the position specified by `X Y W H`.
- void * `item_first` () const `FL_OVERRIDE`
Returns the very first item in the list.
- int `item_height` (void *`item`) const `FL_OVERRIDE`
Returns height of `item` in pixels.
- void * `item_last` () const `FL_OVERRIDE`
Returns the very last item in the list.
- void * `item_next` (void *`item`) const `FL_OVERRIDE`
Returns the next item after `item`.
- void * `item_prev` (void *`item`) const `FL_OVERRIDE`
Returns the previous item before `item`.
- void `item_select` (void *`item`, int `val`) `FL_OVERRIDE`
Change the selection state of `item` to the value `val`.
- int `item_selected` (void *`item`) const `FL_OVERRIDE`
See if `item` is selected.
- void `item_swap` (void *`a`, void *`b`) `FL_OVERRIDE`
Swap the items `a` and `b`.
- const char * `item_text` (void *`item`) const `FL_OVERRIDE`
Returns the label text for `item`.
- int `item_width` (void *`item`) const `FL_OVERRIDE`
Returns width of `item` in pixels.
- int `lineno` (void *`item`) const
Returns line number corresponding to `item`, or zero if not found.
- void `swap` (`FL_BLINE` *`a`, `FL_BLINE` *`b`)
Swap the two items `a` and `b`.

Protected Member Functions inherited from FI_Browser_

- void **bbox** (int &X, int &Y, int &W, int &H) const
Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- void **deleting** (void *item)
*This method should be used when *item* is being deleted from the list.*
- int **displayed** (void *item) const
*Returns non-zero if *item* has been scrolled to a position where it is being displayed.*
- void **draw** () **FL_OVERRIDE**
Draws the list within the normal widget bounding box.
- void * **find_item** (int ypos)
*This method returns the item under mouse y position *ypos*.*
- **FI_Browser_** (int X, int Y, int W, int H, const char *L=0)
The constructor makes an empty browser.
- virtual int **full_width** () const
This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- void **inserting** (void *a, void *b)
This method should be used when an item is in the process of being inserted into the list.
- virtual int **item_quick_height** (void *item) const
*This method may be provided by the subclass to return the height of the *item*, in pixels.*
- int **leftedge** () const
This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
- void **new_list** ()
This method should be called when the list data is completely replaced or cleared.
- void **redraw_line** (void *item)
*This method should be called when the contents of *item* has changed, but not its height.*
- void **redraw_lines** ()
This method will cause the entire list to be redrawn.
- void **replacing** (void *a, void *b)
*This method should be used when item *a* is being replaced by item *b*.*
- void * **selection** () const
Returns the item currently selected, or NULL if there is no selection.
- void **swapping** (void *a, void *b)
*This method should be used when two items *a* and *b* are being swapped.*
- void * **top** () const
Returns the item that appears at the top of the list.

Protected Member Functions inherited from FI_Group

- **FI_Rect** * **bounds** ()
Returns the internal array of widget sizes and positions.
- void **draw** () **FL_OVERRIDE**
Draws the widget.
- void **draw_child** (**FI_Widget** &widget) const
Forces a child to redraw.
- void **draw_children** ()
Draws all children of the group.
- void **draw_outside_label** (const **FI_Widget** &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int **on_insert** (**FI_Widget** *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int **on_move** (int, int)

- *Allow derived groups to act when a widget is moved within the group.*
- virtual void **on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.
- int * **sizes** ()
Returns the internal array of widget sizes and positions.
- void **update_child** (FI_Widget &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from FI_Group

- static FI_Group * **current** ()
Returns the currently active group.
- static void **current** (FI_Group *g)
Sets the current group.

Static Public Member Functions inherited from FI_Widget

- static void [default_callback](#) (FI_Widget *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from FI_Browser_

- [FI_Scrollbar](#) [hscrollbar](#)
Horizontal scrollbar.
- [FI_Scrollbar](#) [scrollbar](#)
Vertical scrollbar.

Protected Types inherited from FI_Widget

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,
[FORCE_POSITION](#) = 1<<4 , [NON_MODAL](#) = 1<<5 , [SHORTCUT_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7
, [OVERRIDE](#) = 1<<8 , [VISIBLE_FOCUS](#) = 1<<9 , [COPIED_LABEL](#) = 1<<10 , [CLIP_CHILDREN](#) = 1<<11
, [MENU_WINDOW](#) = 1<<12 , [TOOLTIP_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO_OVERLAY](#) = 1<<15
, [GROUP_RELATIVE](#) = 1<<16 , [COPIED_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC_USE_ACCENTS_MENU](#)
= 1<<19 ,
[NEEDS_KEYBOARD](#) = 1<<20 , [IMAGE_BOUND](#) = 1<<21 , [DEIMAGE_BOUND](#) = 1<<22 ,
[AUTO_DELETE_USER_DATA](#) = 1<<23 ,
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,
[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

11.13.1 Detailed Description

The [FI_Browser](#) widget displays a scrolling list of text lines, and manages all the storage for the text. This is not a text editor or spreadsheet! But it is useful for showing a vertical list of named objects to the user.

Figure 11.2 FI_Hold_Browser

Figure 11.3 FI_Multi_Browser

Each line in the browser is identified by number. *The numbers start at one* (this is so that zero can be reserved for "no line" in the selective browsers). *Unless otherwise noted, the methods do not check to see if the passed line number is in range and legal. It must always be greater than zero and \leq [size\(\)](#).*

Each line contains a null-terminated string of text and a void * data pointer. The text string is displayed, the void * pointer can be used by the callbacks to reference the object the text describes.

The base class does nothing when the user clicks on it. The subclasses [Fl_Select_Browser](#), [Fl_Hold_Browser](#), and [Fl_Multi_Browser](#) react to user clicks to select lines in the browser and do callbacks.

The base class [Fl_Browser_](#) provides the scrolling and selection mechanisms of this and all the subclasses, but the dimensions and appearance of each item are determined by the subclass. You can use [Fl_Browser_](#) to display information other than text, or text that is dynamically produced from your own data structures. If you find that loading the browser is a lot of work or is inefficient, you may want to make a subclass of [Fl_Browser_](#).

Some common coding patterns used for working with [Fl_Browser](#):

```
// How to loop through all the items in the browser
for ( int t=1; t<=browser->size(); t++ ) { // index 1 based..!
    printf("item %d, label='%s'\n", t, browser->text(t));
}
```

Note: If you are *subclassing* [Fl_Browser](#), it's more efficient to use the protected methods [item_first\(\)](#) and [item_next\(\)](#), since [Fl_Browser](#) internally uses linked lists to manage the browser's items. For more info, see [find_item\(int\)](#).

11.13.2 Constructor & Destructor Documentation

11.13.2.1 Fl_Browser()

```
Fl_Browser::Fl_Browser (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

The constructor makes an empty browser.

Parameters

in	<i>X,Y,W,H</i>	position and size.
in	<i>L</i>	label string, may be NULL.

11.13.3 Member Function Documentation

11.13.3.1 _remove()

```
FL_BLINE * Fl_Browser::_remove (
    int line) [protected]
```

Removes the item at the specified [line](#).

Caveat: See efficiency note in [find_line\(\)](#). You must call [redraw\(\)](#) to make any changes visible.

Parameters

in	<i>line</i>	The line number to be removed. (1 based) Must be in range!
----	-------------	--

Returns

Pointer to browser item that was removed (and is no longer valid).

See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

11.13.3.2 add()

```
void Fl_Browser::add (
    const char * newtext,
    void * d = 0)
```

Adds a new line to the end of the browser.

The text string `newtext` may contain format characters; see [format_char\(\)](#) for details. `newtext` is copied using the `strdup()` function, and can be `NULL` to make a blank line.

The optional `void*` argument `d` will be the [data\(\)](#) for the new item.

Parameters

in	<i>newtext</i>	The label text used for the added item
in	<i>d</i>	Optional user data() for the item (0 if unspecified)

See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

11.13.3.3 bottomline()

```
void Fl_Browser::bottomline (
    int line) [inline]
```

Scrolls the browser so the bottom item in the browser is showing the specified `line`.

Parameters

in	<i>line</i>	The line to be displayed at the bottom.
----	-------------	---

See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

11.13.3.4 clear()

```
void Fl_Browser::clear ()
```

Removes all the lines in the browser.

See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

11.13.3.5 column_char() [1/2]

```
char Fl_Browser::column_char () const [inline]
```

Gets the current column separator character.

The default is `'\t'` (tab).

See also

[column_char\(\)](#), [column_widths\(\)](#)

11.13.3.6 column_char() [2/2]

```
void Fl_Browser::column_char (
    char c) [inline]
```

Sets the column separator to `c`.

This will only have an effect if you also set [column_widths\(\)](#). The default is `'\t'` (tab).

See also

[column_char\(\)](#), [column_widths\(\)](#)

11.13.3.7 column_widths() [1/2]

```
const int * Fl_Browser::column_widths () const [inline]
```

Gets the current column width array.

This array is zero-terminated and specifies the widths in pixels of each column. The text is split at each [column_char\(\)](#) and each part is formatted into it's own column. After the last column any remaining text is formatted into the space between the last column and the right edge of the browser, even if the text contains instances of [column_char\(\)](#) . The default value is a one-element array of just a zero, which means there are no columns.

Example:

```
Fl_Browser *b = new Fl_Browser(..);
static int widths[] = { 50, 50, 50, 70, 70, 40, 40, 70, 70, 50, 0 }; // widths for each column
b->column_widths(widths); // assign array to widget
b->column_char('\t'); // use tab as the column character
b->add("USER\tPID\tCPU\tMEM\tVSZ\tRSS\tTTY\tSTAT\tSTART\tTIME\tCOMMAND");
b->add("root\t2888\t0.0\t0.0\t1352\t0\ttty3\tSW\tAug15\t0:00\t@b@f/sbin/mingetty tty3");
b->add("root\t13115\t0.0\t0.0\t1352\t0\ttty2\tSW\tAug30\t0:00\t@b@f/sbin/mingetty tty2");
[...]
```

See also

[column_char\(\)](#), [column_widths\(\)](#)

11.13.3.8 column_widths() [2/2]

```
void Fl_Browser::column_widths (
    const int * arr) [inline]
```

Sets the current array to *arr*.

Make sure the last entry is zero.

See also

[column_char\(\)](#), [column_widths\(\)](#)

11.13.3.9 data() [1/2]

```
void * Fl_Browser::data (
    int line) const
```

Returns the user [data\(\)](#) for specified *line*.

Return value can be NULL if *line* is out of range or no user [data\(\)](#) was defined. The parameter *line* is 1 based (1 will be the first item in the list).

Parameters

<i>in</i>	<i>line</i>	The line number of the item whose data() is returned. (1 based)
-----------	-------------	---

Returns

The user data pointer (can be NULL)

11.13.3.10 data() [2/2]

```
void Fl_Browser::data (
    int line,
    void * d)
```

Sets the user data for specified *line* to *d*.

Does nothing if *line* is out of range.

Parameters

<i>in</i>	<i>line</i>	The line of the item whose data() is to be changed. (1 based)
<i>in</i>	<i>d</i>	The new data to be assigned to the item. (can be NULL)

11.13.3.11 display()

```
void Fl_Browser::display (
    int line,
    int val = 1)
```

For back compatibility.

This calls `show(line)` if `val` is true, and `hide(line)` otherwise. If `val` is not specified, the default is 1 (makes the line visible).

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make_visible\(\)](#)

11.13.3.12 displayed()

```
int Fl_Browser::displayed (
    int line) const [inline]
```

Returns non-zero if `line` has been scrolled to a position where it is being displayed.

Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the [hide\(\)](#)/[show\(\)](#) status of the widget or item.

Parameters

<code>in</code>	<i>line</i>	The line to be checked
-----------------	-------------	------------------------

Returns

1 if visible, 0 if not visible.

See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

11.13.3.13 find_line()

```
FL_BLINE * Fl_Browser::find_line (
    int line) const [protected]
```

Returns the item for specified `line`.

Note: This call is slow. It's fine for e.g. responding to user clicks, but slow if called often, such as in a tight sorting loop. Finding an item 'by line' involves a linear lookup on the internal linked list. The performance hit can be significant if the browser's contents is large, and the method is called often (e.g. during a sort). If you're writing a subclass, use the protected methods [item_first\(\)](#), [item_next\(\)](#), etc. to access the internal linked list more efficiently.

Parameters

<code>in</code>	<i>line</i>	The line number of the item to return. (1 based)
-----------------	-------------	--

Return values

<i>item</i>	that was found.
<i>NULL</i>	if line is out of range.

See also

[item_at\(\)](#), [find_line\(\)](#), [lineno\(\)](#)

11.13.3.14 format_char() [1/2]

```
char Fl_Browser::format_char () const [inline]
```

Gets the current format code prefix character, which by default is '@'.

A string of formatting codes at the start of each column are stripped off and used to modify how the rest of the line is printed:

- '@.' Print rest of line, don't look for more '@' signs
- '@@' Doubling the format character prints the format character once, followed by the rest of line
- '@l' Use a LARGE (24 point) font
- '@m' Use a medium large (18 point) font
- '@s' Use a small (11 point) font
- '@b' Use a **bold** font (adds FL_BOLD to font)
- '@i' Use an *italic* font (adds FL_ITALIC to font)
- '@f' or '@t' Use a fixed-pitch font (sets font to FL_COURIER)
- '@c' Center the line horizontally
- '@r' Right-justify the text
- '@N' Use fl_inactive_color() to draw the text
- '@B0', '@B1', ... '@B255' Fill the background with fl_color(n)
- '@C0', '@C1', ... '@C255' Use fl_color(n) to draw the text
- '@F0', '@F1', ... Use fl_font(n) to draw the text
- '@S1', '@S2', ... Use point size n to draw the text
- '@u' or '@_' Underline the text.
- '@-' draw an engraved line through the middle.

Notice that the '@.' command can be used to reliably terminate the parsing. To print a random string in a random color, use `sprintf("@C%d@.%s", color, string)` and it will work even if the string starts with a digit or has the format character in it.

11.13.3.15 format_char() [2/2]

```
void Fl_Browser::format_char (
    char c) [inline]
```

Sets the current format code prefix character to c.

The default prefix is '@'. Set the prefix to 0 to disable formatting.

See also

[format_char\(\)](#) for list of '@' codes

11.13.3.16 full_height()

```
int Fl_Browser::full_height () const [protected], [virtual]
```

The height of the entire list of all [visible\(\)](#) items in pixels.

This returns the accumulated height of *all* the items in the browser that are not hidden with [hide\(\)](#), including items scrolled off screen.

Returns

The accumulated size of all the visible items in pixels.

See also

[item_height\(\)](#), [item_width\(\)](#),
[incr_height\(\)](#), [full_height\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.17 hide() [1/2]

```
void Fl_Browser::hide () [inline], [virtual]
```

Hides the entire [Fl_Browser](#) widget – opposite of [show\(\)](#).

Reimplemented from [Fl_Widget](#).

11.13.3.18 hide() [2/2]

```
void Fl_Browser::hide (
    int line)
```

Makes *line* invisible, preventing selection by the user.

The line can still be selected under program control. This changes the [full_height\(\)](#) if the state was changed. When a line is made invisible, lines below it are moved up in the display. [redraw\(\)](#) is called automatically if a change occurred.

Parameters

in	<i>line</i>	The line to be hidden. (1 based)
----	-------------	----------------------------------

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make_visible\(\)](#)

11.13.3.19 icon() [1/2]

```
Fl_Image * Fl_Browser::icon (
    int line) const
```

Returns the icon currently defined for *line*.

If no icon is defined, NULL is returned.

Parameters

in	<i>line</i>	The line whose icon is returned.
----	-------------	----------------------------------

Returns

The icon defined, or NULL if none.

11.13.3.20 icon() [2/2]

```
void Fl_Browser::icon (
    int line,
    Fl_Image * icon)
```

Set the image icon for *line* to the value *icon*.

Caller is responsible for keeping the icon allocated. The *line* is automatically redrawn.

Parameters

in	<i>line</i>	The line to be modified. If out of range, nothing is done.
in	<i>icon</i>	The image icon to be assigned to the <i>line</i> . If NULL, any previous icon is removed.

11.13.3.21 incr_height()

```
int Fl_Browser::incr_height () const [protected], [virtual]
```

The default 'average' item height (including inter-item spacing) in pixels.

This currently returns `textsize() + 2`.

Returns

The value in pixels.

See also

[item_height\(\)](#), [item_width\(\)](#),
[incr_height\(\)](#), [full_height\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.22 insert() [1/2]

```
void Fl_Browser::insert (
    int line,
    const char * newtext,
    void * d = 0)
```

Insert a new entry whose label is `newtext` *above* given `line`, optional data `d`.

Text may contain format characters; see [format_char\(\)](#) for details. `newtext` is copied using the `strdup()` function, and can be NULL to make a blank line.

The optional void * argument `d` will be the [data\(\)](#) of the new item.

Parameters

in	<i>line</i>	Line position for insert. (1 based) If <code>line > size()</code> , the entry will be added at the end.
in	<i>newtext</i>	The label text for the new line.
in	<i>d</i>	Optional pointer to user data to be associated with the new line.

11.13.3.23 insert() [2/2]

```
void Fl_Browser::insert (
    int line,
    FL_BLINE * item) [protected]
```

Insert specified `item` *above* `line`.

If `line > size()` then the line is added to the end.

Caveat: See efficiency note in [find_line\(\)](#).

Parameters

in	<i>line</i>	The new line will be inserted above this line (1 based).
in	<i>item</i>	The item to be added.

11.13.3.24 item_at()

```
void * Fl_Browser::item_at (
    int line) const [inline], [protected], [virtual]
```

Return the item at specified `line`.

Parameters

in	<i>line</i>	The line of the item to return. (1 based)
----	-------------	---

Returns

The item, or NULL if line out of range.

See also

[item_at\(\)](#), [find_line\(\)](#), [lineno\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.25 item_draw()

```
void Fl_Browser::item_draw (
    void * item,
    int X,
    int Y,
    int W,
    int H) const [protected], [virtual]
```

Draws *item* at the position specified by X Y W H.

The W and H values are used for clipping. Should only be called within the context of an FLTK [draw\(\)](#).

Parameters

in	<i>item</i>	The item to be drawn
in	<i>X,Y,W,H</i>	position and size.

Implements [Fl_Browser_](#).

11.13.3.26 item_first()

```
void * Fl_Browser::item_first () const [protected], [virtual]
```

Returns the very first item in the list.

Example of use:

```
// Walk the browser from beginning to end
for ( void *i=item_first(); i; i=item_next(i) ) {
    printf("item label='%s'\n", item_text(i));
}
```

Returns

The first item, or NULL if list is empty.

See also

[item_first\(\)](#), [item_last\(\)](#), [item_next\(\)](#), [item_prev\(\)](#)

Implements [Fl_Browser_](#).

11.13.3.27 item_height()

```
int Fl_Browser::item_height (
    void * item) const [protected], [virtual]
```

Returns height of *item* in pixels.

This takes into account embedded @ codes within the [text\(\)](#) label.

Parameters

in	<i>item</i>	The item whose height is returned.
----	-------------	------------------------------------

Returns

The height of the item in pixels.

See also

[item_height\(\)](#), [item_width\(\)](#),
[incr_height\(\)](#), [full_height\(\)](#)

Implements [Fl_Browser_](#).

11.13.3.28 item_last()

```
void * Fl_Browser::item_last () const [protected], [virtual]
```

Returns the very last item in the list.

Example of use:

```
// Walk the browser in reverse, from end to start
for ( void *i=item_last(); i; i=item_prev(i) ) {
    printf("item label='%s'\n", item_text(i));
}
```

Returns

The last item, or NULL if list is empty.

See also

[item_first\(\)](#), [item_last\(\)](#), [item_next\(\)](#), [item_prev\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.29 item_next()

```
void * Fl_Browser::item_next (
    void * item) const [protected], [virtual]
```

Returns the next item after *item*.

Parameters

<i>in</i>	<i>item</i>	The 'current' item
-----------	-------------	--------------------

Returns

The next item after *item*, or NULL if there are none after this one.

See also

[item_first\(\)](#), [item_last\(\)](#), [item_next\(\)](#), [item_prev\(\)](#)

Implements [Fl_Browser_](#).

11.13.3.30 item_prev()

```
void * Fl_Browser::item_prev (
    void * item) const [protected], [virtual]
```

Returns the previous item before *item*.

Parameters

<i>in</i>	<i>item</i>	The 'current' item
-----------	-------------	--------------------

Returns

The previous item before *item*, or NULL if there are none before this one.

See also

[item_first\(\)](#), [item_last\(\)](#), [item_next\(\)](#), [item_prev\(\)](#)

Implements [Fl_Browser_](#).

11.13.3.31 item_select()

```
void Fl_Browser::item_select (
    void * item,
    int val) [protected], [virtual]
```

Change the selection state of *item* to the value *val*.

Parameters

in	<i>item</i>	The item to be changed.
in	<i>val</i>	The new selection state: 1 selects, 0 de-selects.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item_select\(\)](#), [item_selected\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.32 item_selected()

```
int Fl_Browser::item_selected (
    void * item) const [protected], [virtual]
```

See if *item* is selected.

Parameters

in	<i>item</i>	The item whose selection state is to be checked.
----	-------------	--

Returns

1 if selected, 0 if not.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item_select\(\)](#), [item_selected\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.33 item_swap()

```
void Fl_Browser::item_swap (
    void * a,
    void * b) [inline], [protected], [virtual]
```

Swap the items *a* and *b*.

You must call [redraw\(\)](#) to make any changes visible.

Parameters

in	<i>a,b</i>	the items to be swapped.
----	------------	--------------------------

See also

[swap\(int,int\)](#), [item_swap\(\)](#)

Reimplemented from [Fl_Browser_](#).

11.13.3.34 item_text()

```
const char * Fl_Browser::item_text (
    void * item) const [protected], [virtual]
```

Returns the label text for *item*.

Parameters

in	<i>item</i>	The item whose label text is returned.
----	-------------	--

Returns

The item's text string. (Can be NULL)

Reimplemented from [Fl_Browser_](#).

11.13.3.35 item_width()

```
int Fl_Browser::item_width (
    void * item) const [protected], [virtual]
```

Returns width of *item* in pixels.

This takes into account embedded @ codes within the [text\(\)](#) label.

Parameters

in	<i>item</i>	The item whose width is returned.
----	-------------	-----------------------------------

Returns

The width of the item in pixels.

See also

[item_height\(\)](#), [item_width\(\)](#),
[incr_height\(\)](#), [full_height\(\)](#)

Implements [Fl_Browser_](#).

11.13.3.36 lineno()

```
int Fl_Browser::lineno (
    void * item) const [protected]
```

Returns line number corresponding to *item*, or zero if not found.

Caveat: See efficiency note in [find_line\(\)](#).

Parameters

in	<i>item</i>	The item to be found
----	-------------	----------------------

Returns

The line number of the item, or 0 if not found.

See also

[item_at\(\)](#), [find_line\(\)](#), [lineno\(\)](#)

11.13.3.37 lineposition()

```
void Fl_Browser::lineposition (
    int line,
    Fl\_Line\_Position pos)
```

Updates the browser so that *line* is shown at position *pos*.

Parameters

in	<i>line</i>	line number. (1 based)
in	<i>pos</i>	position.

See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#)

11.13.3.38 load()

```
int Fl_Browser::load (
    const char * filename)
```

Clears the browser and reads the file, adding each line from the file to the browser.

If the filename is NULL or a zero-length string then this just clears the browser. This returns zero if there was any error in opening or reading the file, in which case `errno` is set to the system error. The [data\(\)](#) of each line is set to NULL.

Parameters

in	<i>filename</i>	The filename to load
----	-----------------	----------------------

Returns

1 if OK, 0 on error (`errno` has reason)

See also

[add\(\)](#)

11.13.3.39 make_visible()

```
void Fl_Browser::make_visible (
    int line) [inline]
```

Make the item at the specified `line` [visible\(\)](#).

Functionally similar to [show\(int line\)](#). If `line` is out of range, redisplay top or bottom of list as appropriate.

Parameters

in	<i>line</i>	The line to be made visible.
----	-------------	------------------------------

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make_visible\(\)](#)

11.13.3.40 middleline()

```
void Fl_Browser::middleline (
    int line) [inline]
```

Scrolls the browser so the middle item in the browser is showing the specified `line`.

Parameters

in	<i>line</i>	The line to be displayed in the middle.
----	-------------	---

See also

[topline\(\)](#), [middleline\(\)](#), [bottomline\(\)](#), [displayed\(\)](#), [lineposition\(\)](#)

11.13.3.41 move()

```
void Fl_Browser::move (
    int to,
    int from)
```

Line `from` is removed and reinserted at `to`.

Note: `to` is calculated *after* line `from` gets removed.

Parameters

in	<i>to</i>	Destination line number (calculated <i>after</i> line <code>from</code> is removed)
in	<i>from</i>	Line number of item to be moved

11.13.3.42 remove()

```
void Fl_Browser::remove (
    int line)
```

Remove entry for given `line` number, making the browser one line shorter.

You must call [redraw\(\)](#) to make any changes visible.

Parameters

in	<i>line</i>	Line to be removed. (1 based) If <code>line</code> is out of range, no action is taken.
----	-------------	--

See also

[add\(\)](#), [insert\(\)](#), [remove\(\)](#), [swap\(int,int\)](#), [clear\(\)](#)

11.13.3.43 remove_icon()

```
void Fl_Browser::remove_icon (
    int line)
```

Removes the icon for `line`.

It's ok to remove an icon if none has been defined.

Parameters

in	<i>line</i>	The line whose icon is to be removed.
----	-------------	---------------------------------------

11.13.3.44 select()

```
int Fl_Browser::select (
    int line,
    int val = 1)
```

Sets the selection state of the item at `line` to the value `val`.

If `val` is not specified, the default is 1 (selects the item).

Parameters

in	<i>line</i>	The line number of the item to be changed. (1 based)
in	<i>val</i>	The new selection state (1=select, 0=de-select).

Returns

1 if the state changed, 0 if not.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item_select\(\)](#), [item_selected\(\)](#)

11.13.3.45 selected()

```
int Fl_Browser::selected (
    int line) const
```

Returns 1 if specified `line` is selected, 0 if not.

Parameters

<code>in</code>	<i>line</i>	The line being checked (1 based)
-----------------	-------------	----------------------------------

Returns

1 if item selected, 0 if not.

See also

[select\(\)](#), [selected\(\)](#), [value\(\)](#), [item_select\(\)](#), [item_selected\(\)](#)

11.13.3.46 show() [1/2]

```
void Fl_Browser::show () [inline], [virtual]
```

Shows the entire [Fl_Browser](#) widget – opposite of [hide\(\)](#).
Reimplemented from [Fl_Widget](#).

11.13.3.47 show() [2/2]

```
void Fl_Browser::show (
    int line)
```

Makes `line` visible, and available for selection by user.

Opposite of [hide\(int\)](#). This changes the [full_height\(\)](#) if the state was changed. [redraw\(\)](#) is called automatically if a change occurred.

Parameters

<code>in</code>	<i>line</i>	The line to be shown. (1 based)
-----------------	-------------	---------------------------------

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make_visible\(\)](#)

11.13.3.48 size()

```
int Fl_Browser::size () const [inline]
```

Returns how many lines are in the browser.

The last line number is equal to this. Returns 0 if browser is empty.

11.13.3.49 swap() [1/2]

```
void Fl_Browser::swap (
    FL_BLINE * a,
    FL_BLINE * b) [protected]
```

Swap the two items `a` and `b`.

Uses [swapping\(\)](#) to ensure list updates correctly.

Parameters

in	<i>a,b</i>	The two items to be swapped.
----	------------	------------------------------

See also

[swap\(int,int\)](#), [item_swap\(\)](#)

11.13.3.50 swap() [2/2]

```
void Fl_Browser::swap (
    int a,
    int b)
```

Swaps two browser lines *a* and *b*.

You must call [redraw\(\)](#) to make any changes visible.

Parameters

in	<i>a,b</i>	The two lines to be swapped. (both 1 based)
----	------------	---

See also

[swap\(int,int\)](#), [item_swap\(\)](#)

11.13.3.51 text() [1/2]

```
const char * Fl_Browser::text (
    int line) const
```

Returns the label text for the specified *line*.

Return value can be NULL if *line* is out of range or unset. The parameter *line* is 1 based.

Parameters

in	<i>line</i>	The line number of the item whose text is returned. (1 based)
----	-------------	---

Returns

The text string (can be NULL)

11.13.3.52 text() [2/2]

```
void Fl_Browser::text (
    int line,
    const char * newtext)
```

Sets the text for the specified *line* to *newtext*.

Text may contain format characters; see [format_char\(\)](#) for details. *newtext* is copied using the `strdup()` function, and can be NULL to make a blank line.

Does nothing if *line* is out of range.

Parameters

in	<i>line</i>	The line of the item whose text will be changed. (1 based)
in	<i>newtext</i>	The new string to be assigned to the item.

11.13.3.53 `textsize()`

```
void Fl_Browser::textsize (
    Fl_Fontsize newSize)
```

Sets the default text size (in pixels) for the lines in the browser to `newSize`.

This method recalculates all item heights and caches the total height internally for optimization of later item changes.

This can be slow if there are many items in the browser.

It returns immediately (w/o recalculation) if `newSize` equals the current `textsize()`.

You *may* need to call `redraw()` to see the effect and to have the scrollbar positions recalculated.

You should set the text size *before* populating the browser with items unless you really need to *change* the size later.

11.13.3.54 `topline()` [1/2]

```
int Fl_Browser::topline () const
```

Returns the line that is currently visible at the top of the browser.

If there is no vertical scrollbar then this will always return 1.

Returns

The `lineno()` of the `top()` of the browser.

11.13.3.55 `topline()` [2/2]

```
void Fl_Browser::topline (
    int line) [inline]
```

Scrolls the browser so the top item in the browser is showing the specified `line`.

Parameters

<code>in</code>	<code>line</code>	The line to be displayed at the top.
-----------------	-------------------	--------------------------------------

See also

`topline()`, `middleline()`, `bottomline()`, `displayed()`, `lineposition()`

11.13.3.56 `value()` [1/2]

```
int Fl_Browser::value () const
```

Returns the line number of the currently selected line, or 0 if none selected.

Returns

The line number of current selection, or 0 if none selected.

See also

`select()`, `selected()`, `value()`, `item_select()`, `item_selected()`

11.13.3.57 `value()` [2/2]

```
void Fl_Browser::value (
    int line) [inline]
```

Sets the browser's `value()`, which selects the specified `line`.

This is the same as calling `select(line)`.

See also

`select()`, `selected()`, `value()`, `item_select()`, `item_selected()`

11.13.3.58 visible()

```
int Fl_Browser::visible (
    int line) const
```

Returns non-zero if the specified `line` is visible, 0 if hidden.

Use [show\(int\)](#), [hide\(int\)](#), or [make_visible\(int\)](#) to change an item's visible state.

Parameters

<code>in</code>	<code>line</code>	The line in the browser to be tested. (1 based)
-----------------	-------------------	---

See also

[show\(int\)](#), [hide\(int\)](#), [display\(\)](#), [visible\(\)](#), [make_visible\(\)](#)

The documentation for this class was generated from the following files:

- `Fl_Browser.H`
- `Fl_Browser.cxx`
- `Fl_Browser_load.cxx`

11.14 Fl_Browser_ Class Reference

This is the base class for browsers.

```
#include <Fl_Browser_.H>
```

Inheritance diagram for `Fl_Browser_`:

Public Types

- enum {
[HORIZONTAL](#) = 1 , [VERTICAL](#) = 2 , [BOTH](#) = 3 , [ALWAYS_ON](#) = 4 ,
[HORIZONTAL_ALWAYS](#) = 5 , [VERTICAL_ALWAYS](#) = 6 , [BOTH_ALWAYS](#) = 7 }
 Values for [has_scrollbar\(\)](#).

Public Member Functions

- int [deselect](#) (int docallbacks=0)
Deselects all items in the list and returns 1 if the state changed or 0 if it did not.
- void [display](#) (void *item)
Displays the item, scrolling the list as necessary.
- int [handle](#) (int event) [FL_OVERRIDE](#)
Handles the event within the normal widget bounding box.
- uchar [has_scrollbar](#) () const

- Returns the current scrollbar mode, see [FI_Browser_::has_scrollbar\(uchar\)](#)*

 - void [has_scrollbar](#) ([uchar](#) mode)

Sets whether the widget should have scrollbars or not (default [FI_Browser_::BOTH](#)).

- int [hposition](#) () const

*Gets the horizontal scroll position of the list as a pixel position *pos*.*

- void [hposition](#) (int)

*Sets the horizontal scroll position of the list to pixel position *pos*.*

- int [linespacing](#) () const

Return the height of additional spacing between browser lines.

- void [linespacing](#) (int pixels)

Add some space between browser lines.

- int [position](#) () const
- void [position](#) (int pos)
- void [position](#) (int *x*, int *y*)
- void [resize](#) (int *X*, int *Y*, int *W*, int *H*) [FL_OVERRIDE](#)

Repositions and/or resizes the browser.

- void [scrollbar_left](#) ()

Moves the vertical scrollbar to the lefthand side of the list.

- void [scrollbar_right](#) ()

Moves the vertical scrollbar to the righthand side of the list.

- int [scrollbar_size](#) () const

Gets the current size of the scrollbars' troughs, in pixels.

- void [scrollbar_size](#) (int newSize)

*Sets the pixel size of the scrollbars' troughs to *newSize*, in pixels.*

- int [scrollbar_width](#) () const

Returns the global value [FI::scrollbar_size\(\)](#).

- void [scrollbar_width](#) (int width)

Sets the global [FI::scrollbar_size\(\)](#), and forces this instance of the widget to use it.

- int [select](#) (void *item, int val=1, int docallbacks=0)

*Sets the selection state of *item* to *val*, and returns 1 if the state changed or 0 if it did not.*

- int [select_only](#) (void *item, int docallbacks=0)

*Selects *item* and returns 1 if the state changed or 0 if it did not.*

- void [sort](#) (int flags=0)

*Sort the items in the browser based on *flags*.*

- [FI_Color](#) [textcolor](#) () const

Gets the default text color for the lines in the browser.

- void [textcolor](#) ([FI_Color](#) col)

*Sets the default text color for the lines in the browser to color *col*.*

- [FI_Font](#) [textfont](#) () const

Gets the default text font for the lines in the browser.

- void [textfont](#) ([FI_Font](#) font)

*Sets the default text font for the lines in the browser to *font*.*

- [FI_Fontsize](#) [textsize](#) () const

Gets the default text size (in pixels) for the lines in the browser.

- void [textsize](#) ([FI_Fontsize](#) newSize)

*Sets the default text size (in pixels) for the lines in the browser to *size*.*

- int [vposition](#) () const

*Gets the vertical scroll position of the list as a pixel position *pos*.*

- void [vposition](#) (int pos)

*Sets the vertical scroll position of the list to pixel position *pos*.*

Public Member Functions inherited from [FL_Group](#)

- [FL_Widget](#) *[_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void **add** ([FL_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** ([FL_Widget](#) *o)
See void [FL_Group::add\(FL_Widget &w\)](#)
- void **add_resizable** ([FL_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FL_Widget](#) *const * **array** () const
Returns a pointer to the array of children.
- [FL_Group](#) const * **as_group** () const [FL_OVERRIDE](#)
- [FL_Group](#) * **as_group** () [FL_OVERRIDE](#)
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL_Widget](#) * **child** (int n) const
Returns the n'th child.
- int **children** () const
Returns how many child widgets the group has.
- void **clear** ()
Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()
Returns the current clipping mode.
- void **clip_children** (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete_child** (int n)
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL_Widget](#) &o) const
*See int [FL_Group::find\(const FL_Widget *w\)](#) const.*
- int **find** (const [FL_Widget](#) *) const
Searches the child array for the widget and returns the index.
- [FL_Group](#) (int, int, int, int, const char *==0)
Creates a new [FL_Group](#) widget using the given position, size, and label string.
- void **focus** ([FL_Widget](#) *W)
- void **forms_end** ()
This is for forms compatibility only.
- int **handle** (int) [FL_OVERRIDE](#)
Handles the specified event.
- void **init_sizes** ()
Resets the internal array of widget sizes and positions.
- void **insert** ([FL_Widget](#) &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** ([FL_Widget](#) &o, [FL_Widget](#) *before)
*This does *insert(w, find(before))*.*
- void **remove** ([FL_Widget](#) &)
Removes a widget from the group but does not delete it.
- void **remove** ([FL_Widget](#) *o)

- Removes the widget `o` from the group.*
- void `remove` (int index)
Removes the widget at `index` from the group but does not delete it.
- `FL_Widget * resizable` () const
Returns the group's resizable widget.
- void `resizable` (`FL_Widget &o`)
Sets the group's resizable widget.
- void `resizable` (`FL_Widget *o`)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void `resize` (int, int, int, int) `FL_OVERRIDE`
Resizes the `FL_Group` widget and all of its children.
- virtual `~FL_Group` ()
The destructor also deletes all the children.

Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
Activates the widget.
- unsigned int `active` () const
Returns whether the widget is active.
- int `active_r` () const
Returns whether the widget and all of its parents are active.
- `FL_Align align` () const
Gets the label alignment.
- void `align` (`FL_Align alignment`)
Sets the label alignment.
- long `argument` () const
Gets the current user data (long) argument that is passed to the callback function.
- void `argument` (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class `FL_Gl_Window * as_gl_window` ()
Returns an `FL_Gl_Window` pointer if this widget is an `FL_Gl_Window`.
- virtual class `FL_Gl_Window` const * `as_gl_window` () const
- virtual `FL_Window * as_window` ()
Returns an `FL_Window` pointer if this widget is an `FL_Window`.
- virtual `FL_Window` const * `as_window` () const
- void `bind_deimage` (`FL_Image *img`)
Sets the image to use as part of the widget label when in the inactive state.
- void `bind_deimage` (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void `bind_image` (`FL_Image *img`)
Sets the image to use as part of the widget label when in the active state.
- void `bind_image` (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FL_Boxtype box` () const
Gets the box type of the widget.
- void `box` (`FL_Boxtype new_box`)
Sets the box type for the widget.
- `FL_Callback_p callback` () const

- Gets the current callback function for the widget.*
- void `callback` (`FI_Callback` *cb)
- Sets the current callback function for the widget.*
- void `callback` (`FI_Callback` *cb, `FI_Callback_User_Data` *p, bool auto_free)
- Sets the current callback function and managed user data for the widget.*
- void `callback` (`FI_Callback` *cb, void *p)
- Sets the current callback function and data for the widget.*
- void `callback` (`FI_Callback0` *cb)
- Sets the current callback function for the widget.*
- void `callback` (`FI_Callback1` *cb, long p=0)
- Sets the current callback function for the widget.*
- unsigned int `changed` () const
- Checks if the widget value changed since the last callback.*
- void `clear_active` ()
- Marks the widget as inactive without sending events or changing focus.*
- void `clear_changed` ()
- Marks the value of the widget as unchanged.*
- void `clear_damage` (`uchar` c=0)
- Clears or sets the damage flags.*
- void `clear_output` ()
- Sets a widget to accept input.*
- void `clear_visible` ()
- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const
- Gets the background color of the widget.*
- void `color` (`FI_Color` bg)
- Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)
- Sets the background and selection color of the widget.*
- `FI_Color` `color2` () const
- For back compatibility only.*
- void `color2` (unsigned a)
- For back compatibility only.*
- int `contains` (const `FI_Widget` *w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char *new_label)
- Sets the current label.*
- void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*
- `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)
- Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*

- [FL_Image](#) * [deimage](#) ()
Gets the image that is used as part of the widget label when in the inactive state.
- const [FL_Image](#) * [deimage](#) () const
Gets the image that is used as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- int [deimage_bound](#) () const
Returns whether the inactive image is managed by the widget.
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const

- Gets the label color.*

 - void [labelcolor](#) ([Fl_Color](#) c)
- Sets the label color.*

 - [Fl_Font](#) [labelfont](#) () const
- Gets the font to use.*

 - void [labelfont](#) ([Fl_Font](#) f)
- Sets the font to use.*

 - [Fl_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

 - void [labelsize](#) ([Fl_Fontsize](#) pix)
- Sets the font size in pixels.*

 - [Fl_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

 - void [labeltype](#) ([Fl_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

 - bool [needs_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

 - void [needs_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

 - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

 - [Fl_Group](#) * [parent](#) () const
- Returns a pointer to the parent widget.*

 - void [parent](#) ([Fl_Group](#) *p)
- Internal use only - "for hacks only".*

 - void [position](#) (int X, int Y)
- Repositions the window or widget.*

 - void [redraw](#) ()
- Schedules the drawing of the widget.*

 - void [redraw_label](#) ()
- Schedules the drawing of the label.*

 - [Fl_Color](#) [selection_color](#) () const
- Gets the selection color.*

 - void [selection_color](#) ([Fl_Color](#) a)
- Sets the selection color.*

 - void [set_active](#) ()
- Marks the widget as active without sending events or changing focus.*

 - void [set_changed](#) ()
- Marks the value of the widget as changed.*

 - void [set_output](#) ()
- Sets a widget to output only.*

 - void [set_visible](#) ()
- Makes the widget visible.*

 - void [set_visible_focus](#) ()
- Enables keyboard focus navigation with this widget.*

 - int [shortcut_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

 - void [shortcut_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

- virtual void **show** ()
Makes a widget visible.
- void **size** (int W, int H)
Changes the size of the widget.
- int **take_focus** ()
Gives the widget the keyboard focus.
- unsigned int **takeevents** () const
Returns if the widget is able to take events.
- int **test_shortcut** ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * **tooltip** () const
Gets the current tooltip text.
- void **tooltip** (const char *text)
Sets the current tooltip text.
- **FL_Window** * **top_window** () const
Returns a pointer to the top-level window for the widget.
- **FL_Window** * **top_window_offset** (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- **uchar** **type** () const
Gets the widget type.
- void **type** (**uchar** t)
Sets the widget type.
- int **use_accents_menu** ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * **user_data** () const
Gets the user data for this widget.
- void **user_data** (**FL_Callback_User_Data** *v, bool auto_free)
Sets the user data for this widget.
- void **user_data** (void *v)
Sets the user data for this widget.
- int **vertical_label_margin** ()
Get the spacing between the label and the vertical edge of the widget.
- void **vertical_label_margin** (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int **visible** () const
Returns whether a widget is visible.
- unsigned int **visible_focus** () const
Checks whether this widget has a visible focus.
- void **visible_focus** (int v)
Modifies keyboard focus navigation.
- int **visible_r** () const
Returns whether a widget and all its parents are visible.
- int **w** () const
Gets the widget width.
- **FL_When** **when** () const
Returns the conditions under which the callback is called.
- void **when** (**uchar** i)
Sets the flags used to decide when a callback is called.
- **FL_Window** * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const

- Gets the widget position in its window.*
 • `int y () const`
Gets the widget position in its window.
- `virtual ~FI_Widget ()`
Destroys the widget.

Public Attributes

- `FI_Scrollbar hscrollbar`
Horizontal scrollbar.
- `FI_Scrollbar scrollbar`
Vertical scrollbar.

Protected Member Functions

- `void bbox (int &X, int &Y, int &W, int &H) const`
Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- `void deleting (void *item)`
*This method should be used when *item* is being deleted from the list.*
- `int displayed (void *item) const`
*Returns non-zero if *item* has been scrolled to a position where it is being displayed.*
- `void draw () FL_OVERRIDE`
Draws the list within the normal widget bounding box.
- `void * find_item (int ypos)`
*This method returns the item under mouse y position *ypos*.*
- `FI_Browser_ (int X, int Y, int W, int H, const char *L=0)`
The constructor makes an empty browser.
- `virtual int full_height () const`
This method may be provided by the subclass to indicate the full height of the item list, in pixels.
- `virtual int full_width () const`
This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- `virtual int incr_height () const`
This method may be provided to return the average height of all items to be used for scrolling.
- `void inserting (void *a, void *b)`
This method should be used when an item is in the process of being inserted into the list.
- `virtual void * item_at (int index) const`
*This method must be provided by the subclass to return the item for the specified *index*.*
- `virtual void item_draw (void *item, int X, int Y, int W, int H) const =0`
*This method must be provided by the subclass to draw the *item* in the area indicated by *X, Y, W, H*.*
- `virtual void * item_first () const =0`
This method must be provided by the subclass to return the first item in the list.
- `virtual int item_height (void *item) const =0`
*This method must be provided by the subclass to return the height of *item* in pixels.*
- `virtual void * item_last () const`
This method must be provided by the subclass to return the last item in the list.
- `virtual void * item_next (void *item) const =0`
*This method must be provided by the subclass to return the item in the list after *item*.*
- `virtual void * item_prev (void *item) const =0`
*This method must be provided by the subclass to return the item in the list before *item*.*
- `virtual int item_quick_height (void *item) const`
*This method may be provided by the subclass to return the height of the *item*, in pixels.*
- `virtual void item_select (void *item, int val=1)`

This method must be implemented by the subclass if it supports multiple selections; sets the selection state to `val` for the `item`.

- virtual int `item_selected` (void *item) const

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for `item`.

- virtual void `item_swap` (void *a, void *b)

This optional method should be provided by the subclass to efficiently swap browser items `a` and `b`, such as for sorting.

- virtual const char * `item_text` (void *item) const

This optional method returns a string (label) that may be used for sorting.

- virtual int `item_width` (void *item) const =0

This method must be provided by the subclass to return the width of the `item` in pixels.

- int `leftedge` () const

This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

- void `new_list` ()

This method should be called when the list data is completely replaced or cleared.

- void `redraw_line` (void *item)

This method should be called when the contents of `item` has changed, but not its height.

- void `redraw_lines` ()

This method will cause the entire list to be redrawn.

- void `replacing` (void *a, void *b)

This method should be used when item `a` is being replaced by item `b`.

- void * `selection` () const

Returns the item currently selected, or NULL if there is no selection.

- void `swapping` (void *a, void *b)

This method should be used when two items `a` and `b` are being swapped.

- void * `top` () const

Returns the item that appears at the top of the list.

Protected Member Functions inherited from FI_Group

- `FI_Rect` * `bounds` ()

Returns the internal array of widget sizes and positions.

- void `draw` () `FL_OVERRIDE`

Draws the widget.

- void `draw_child` (`FI_Widget` &widget) const

Forces a child to redraw.

- void `draw_children` ()

Draws all children of the group.

- void `draw_outside_label` (const `FI_Widget` &widget) const

Parents normally call this to draw outside labels of child widgets.

- virtual int `on_insert` (`FI_Widget` *, int)

Allow derived groups to act when a widget is added as a child.

- virtual int `on_move` (int, int)

Allow derived groups to act when a widget is moved within the group.

- virtual void `on_remove` (int)

Allow derived groups to act when a child widget is removed from the group.

- int * `sizes` ()

Returns the internal array of widget sizes and positions.

- void `update_child` (`FI_Widget` &widget) const

Draws a child only if it needs it.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from [FI_Group](#)

- static [FI_Group](#) * **current** ()
Returns the currently active group.
- static void **current** ([FI_Group](#) *g)
Sets the current group.

Static Public Member Functions inherited from [FI_Widget](#)

- static void **default_callback** ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from FI_Widget

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }

flags possible values enumeration.

11.14.1 Detailed Description

This is the base class for browsers.

To be useful it must be subclassed and several virtual functions defined. The Forms-compatible browser and the file chooser's browser are subclassed off of this.

This has been designed so that the subclass has complete control over the storage of the data, although because `next()` and `prev()` functions are used to index, it works best as a linked list or as a large block of characters in which the line breaks must be searched for.

A great deal of work has been done so that the "height" of a data object does not need to be determined until it is drawn. This is useful if actually figuring out the size of an object requires accessing image data or doing `stat()` on a file or doing some other slow operation.

Callbacks are called when the value changes with `FL_REASON_CHANGED`. If `FL_WHEN_RELEASE` is set, callbacks are called when the mouse button is released with `FL_REASON_CHANGED` or `FL_REASON_RESELECTED` if the selection did not change. If `FL_WHEN_ENTER_KEY` is set, callbacks are also called when key presses or double clicks change the selection.

Keyboard navigation of browser items

The keyboard navigation of browser items is only possible if `visible_focus()` is enabled. If disabled, the widget rejects keyboard focus; Tab and Shift-Tab focus navigation will skip the widget.

In 'Select' and 'Normal' mode, the widget rejects keyboard focus; no navigation keys are supported (other than scrollbar positioning).

In 'Hold' mode, the widget accepts keyboard focus, and Up/Down arrow keys can navigate the selected item.

In 'Multi' mode, the widget accepts keyboard focus, and Up/Down arrow keys navigate the focus box; Space toggles the current item's selection, Enter selects only the current item (deselects all others). If Shift (or Ctrl) is combined with Up/Down arrow keys, the current item's selection state is extended to the next item. In this way one can extend a selection or de-selection.

11.14.2 Member Enumeration Documentation

11.14.2.1 anonymous enum

anonymous enum

Values for `has_scrollbar()`.

Anonymous enum bit flags for `has_scrollbar()`.

- bit 0: horizontal
- bit 1: vertical
- bit 2: 'always' (to be combined with bits 0 and 1)
- bit 3-31: reserved for future use

Enumerator

HORIZONTAL	Only show horizontal scrollbar.
VERTICAL	Only show vertical scrollbar.
BOTH	Show both scrollbars. (default)
ALWAYS_ON	Specified scrollbar(s) should 'always' be shown (to be used with HORIZONTAL/VERTICAL)
HORIZONTAL_ALWAYS	Horizontal scrollbar always on.
VERTICAL_ALWAYS	Vertical scrollbar always on.
BOTH_ALWAYS	Both scrollbars always on.

11.14.3 Constructor & Destructor Documentation

11.14.3.1 Fl_Browser_()

```
Fl_Browser_::Fl_Browser_ (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0) [protected]
```

The constructor makes an empty browser.

Parameters

in	<i>X,Y,W,H</i>	position and size.
in	<i>L</i>	The label string, may be NULL.

11.14.4 Member Function Documentation

11.14.4.1 bbox()

```
void Fl_Browser_::bbox (
    int & X,
    int & Y,
    int & W,
    int & H) const [protected]
```

Returns the bounding box for the interior of the list's display window, inside the scrollbars.

Parameters

out	<i>X,Y,W,H</i>	The returned bounding box. (The original contents of these parameters are overwritten)
-----	----------------	---

11.14.4.2 deleting()

```
void Fl_Browser_::deleting (
    void * item) [protected]
```

This method should be used when *item* is being deleted from the list.

It allows the [Fl_Browser_](#) to discard any cached data it has on the item. This method does not actually delete the item, but handles the follow up bookkeeping after the item has just been deleted.

Parameters

in	<i>item</i>	The item being deleted.
----	-------------	-------------------------

11.14.4.3 deselect()

```
int Fl_Browser_::deselect (
    int docallbacks = 0)
```

Deselects all items in the list and returns 1 if the state changed or 0 if it did not.

If the optional `docallbacks` parameter is non-zero, `deselect` tries to call the callback function for the widget.

Parameters

in	<i>docallbacks</i>	If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).
----	--------------------	---

11.14.4.4 display()

```
void Fl_Browser_::display (
    void * item)
```

Displays the `item`, scrolling the list as necessary.

Parameters

in	<i>item</i>	The item to be displayed.
----	-------------	---------------------------

See also

[display\(\)](#), [displayed\(\)](#)

11.14.4.5 displayed()

```
int Fl_Browser_::displayed (
    void * item) const [protected]
```

Returns non-zero if `item` has been scrolled to a position where it is being displayed.

Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the [hide\(\)/show\(\)](#) status of the widget or item.

Parameters

in	<i>item</i>	The item to check
----	-------------	-------------------

Returns

1 if visible, 0 if not visible.

See also

[display\(\)](#), [displayed\(\)](#)

11.14.4.6 draw()

```
void Fl_Browser_::draw (
    void ) [protected], [virtual]
```

Draws the list within the normal widget bounding box.

Implements [Fl_Widget](#).

11.14.4.7 find_item()

```
void * Fl_Browser_::find_item (
    int ypos) [protected]
```

This method returns the item under mouse y position `ypos`.

NULL is returned if no item is displayed at that position.

Parameters

in	<i>ypos</i>	The y position (eg. Fl::event_y()) to find an item under.
----	-------------	--

Returns

The item, or NULL if not found

11.14.4.8 full_height()

```
int Fl_Browser_::full_height () const [protected], [virtual]
```

This method may be provided by the subclass to indicate the full height of the item list, in pixels.

The default implementation computes the full height from the item heights. Includes the items that are scrolled off screen.

Returns

The height of the entire list, in pixels.

Reimplemented in [Fl_Browser](#).

11.14.4.9 full_width()

```
int Fl_Browser_::full_width () const [protected], [virtual]
```

This method may be provided by the subclass to indicate the full width of the item list, in pixels.

The default implementation computes the full width from the item widths.

Returns

The maximum width of all the items, in pixels.

11.14.4.10 handle()

```
int Fl_Browser_::handle (
    int event) [virtual]
```

Handles the *event* within the normal widget bounding box.

Parameters

in	<i>event</i>	The event to process.
----	--------------	-----------------------

Returns

1 if event was processed, 0 if not.

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Check_Browser](#).

11.14.4.11 has_scrollbar()

```
void Fl_Browser_::has_scrollbar (
    uchar mode) [inline]
```

Sets whether the widget should have scrollbars or not (default [Fl_Browser_::BOTH](#)).

By default you can scroll in both directions, and the scrollbars disappear if the data will fit in the widget.

[has_scrollbar\(\)](#) changes this based on the value of *mode*:

- 0 - No scrollbars.
- [Fl_Browser_::HORIZONTAL](#) - Only a horizontal scrollbar.

- [Fl_Browser_::VERTICAL](#) - Only a vertical scrollbar.
- [Fl_Browser_::BOTH](#) - The default is both scrollbars.
- [Fl_Browser_::HORIZONTAL_ALWAYS](#) - Horizontal scrollbar always on, vertical always off.
- [Fl_Browser_::VERTICAL_ALWAYS](#) - Vertical scrollbar always on, horizontal always off.
- [Fl_Browser_::BOTH_ALWAYS](#) - Both always on.

11.14.4.12 hposition() [1/2]

```
int Fl_Browser_::hposition () const [inline]
```

Gets the horizontal scroll position of the list as a pixel position `pos`.

The position returned is how many pixels of the list are scrolled off the left edge of the screen. Example: A position of '18' indicates the left 18 pixels of the list are scrolled off the left edge of the screen.

See also

[position\(\)](#), [hposition\(\)](#)

11.14.4.13 hposition() [2/2]

```
void Fl_Browser_::hposition (
    int pos)
```

Sets the horizontal scroll position of the list to pixel position `pos`.

The position is how many pixels of the list are scrolled off the left edge of the screen. Example: A position of '18' scrolls the left 18 pixels of the list off the left edge of the screen.

Parameters

<code>in</code>	<code>pos</code>	The horizontal position (in pixels) to scroll the browser to.
-----------------	------------------	---

See also

[vposition\(\)](#), [hposition\(\)](#)

11.14.4.14 incr_height()

```
int Fl_Browser_::incr_height () const [protected], [virtual]
```

This method may be provided to return the average height of all items to be used for scrolling.

The default implementation uses the height of the first item.

Returns

The average height of items, in pixels.

Reimplemented in [Fl_Browser](#).

11.14.4.15 inserting()

```
void Fl_Browser_::inserting (
    void * a,
    void * b) [protected]
```

This method should be used when an item is in the process of being inserted into the list.

It allows the [Fl_Browser_](#) to update its cache data as needed, scheduling a redraw for the affected lines. This method does not actually insert items, but handles the follow up bookkeeping after items have been inserted.

Parameters

in	<i>a</i>	The starting item position
in	<i>b</i>	The new item being inserted

11.14.4.16 item_at()

```
virtual void * Fl_Browser_::item_at (
    int index) const [inline], [protected], [virtual]
```

This method must be provided by the subclass to return the item for the specified *index*.

Parameters

in	<i>index</i>	The index of the item to be returned
----	--------------	--------------------------------------

Returns

The item at the specified *index*.

Reimplemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.17 item_draw()

```
virtual void Fl_Browser_::item_draw (
    void * item,
    int X,
    int Y,
    int W,
    int H) const [protected], [pure virtual]
```

This method must be provided by the subclass to draw the *item* in the area indicated by *X*, *Y*, *W*, *H*.

Implemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.18 item_first()

```
virtual void * Fl_Browser_::item_first () const [protected], [pure virtual]
```

This method must be provided by the subclass to return the first item in the list.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Implemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.19 item_height()

```
virtual int Fl_Browser_::item_height (
    void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the height of *item* in pixels.

Allow for two additional pixels for the list selection box.

Parameters

in	<i>item</i>	The item whose height is returned.
----	-------------	------------------------------------

Returns

The height of the specified *item* in pixels.

See also

[item_height\(\)](#), [item_width\(\)](#), [item_quick_height\(\)](#)

Implemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.20 item_last()

```
virtual void * Fl_Browser_::item_last () const [inline], [protected], [virtual]
```

This method must be provided by the subclass to return the last item in the list.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Reimplemented in [Fl_Browser](#).

11.14.4.21 item_next()

```
virtual void * Fl_Browser_::item_next (
    void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the item in the list after *item*.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Implemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.22 item_prev()

```
virtual void * Fl_Browser_::item_prev (
    void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the item in the list before *item*.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Implemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.23 item_quick_height()

```
int Fl_Browser_::item_quick_height (
    void * item) const [protected], [virtual]
```

This method may be provided by the subclass to return the height of the *item*, in pixels.

Allow for two additional pixels for the list selection box. This method differs from *item_height* in that it is only called for selection and scrolling operations. The default implementation calls *item_height*.

Parameters

<i>in</i>	<i>item</i>	The item whose height to return.
-----------	-------------	----------------------------------

Returns

The height, in pixels.

11.14.4.24 item_select()

```
void Fl_Browser_::item_select (
    void * item,
    int val = 1) [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; sets the selection state to *val* for the *item*.

Sets the selection state for *item*, where optional *val* is 1 (select, the default) or 0 (de-select).

Parameters

in	<i>item</i>	The item to be selected
in	<i>val</i>	The optional selection state; 1=select, 0=de-select. The default is to select the item (1).

Reimplemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.25 item_selected()

```
int Fl_Browser_::item_selected (
    void * item) const [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for *item*.

The method should return 1 if *item* is selected, or 0 otherwise.

Parameters

in	<i>item</i>	The item to test.
----	-------------	-------------------

Reimplemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.26 item_swap()

```
virtual void Fl_Browser_::item_swap (
    void * a,
    void * b) [inline], [protected], [virtual]
```

This optional method should be provided by the subclass to efficiently swap browser items *a* and *b*, such as for sorting.

Parameters

in	<i>a,b</i>	The two items to be swapped.
----	------------	------------------------------

Reimplemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.27 item_text()

```
virtual const char * Fl_Browser_::item_text (
    void * item) const [inline], [protected], [virtual]
```

This optional method returns a string (label) that may be used for sorting.

Parameters

in	<i>item</i>	The item whose label text is returned.
----	-------------	--

Returns

The item's text label. (Can be NULL if blank)

Reimplemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.28 item_width()

```
virtual int Fl_Browser_::item_width (
    void * item) const [protected], [pure virtual]
```

This method must be provided by the subclass to return the width of the *item* in pixels.

Allow for two additional pixels for the list selection box.

Parameters

<i>in</i>	<i>item</i>	The item whose width is returned.
-----------	-------------	-----------------------------------

Returns

The width of the item in pixels.

Implemented in [Fl_Browser](#), and [Fl_Check_Browser](#).

11.14.4.29 leftedge()

```
int Fl_Browser_::leftedge () const [protected]
```

This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.

Returns

The X position of the left edge of the list, in pixels.

See also

[Fl_Browser_::bbox\(\)](#)

11.14.4.30 linespacing() [1/2]

```
int Fl_Browser_::linespacing () const [inline]
```

Return the height of additional spacing between browser lines.

Returns

spacing height in pixel units.

11.14.4.31 linespacing() [2/2]

```
void Fl_Browser_::linespacing (
    int pixels) [inline]
```

Add some space between browser lines.

Parameters

<i>in</i>	<i>pixels</i>	number of additional pixels between lines.
-----------	---------------	--

11.14.4.32 new_list()

```
void Fl_Browser_::new_list () [protected]
```

This method should be called when the list data is completely replaced or cleared.

It informs the [Fl_Browser_](#) widget that any cached information it has concerning the items is invalid. This method does not clear the list, it just handles the follow up bookkeeping after the list has been cleared.

11.14.4.33 position() [1/2]

```
int Fl_Browser_::position () const [inline]
```

Deprecated "since 1.4.0 - use vposition() instead"

11.14.4.34 position() [2/2]

```
void Fl_Browser_::position (
    int pos) [inline]
```

Deprecated "since 1.4.0 - use `vposition(pos)` instead"

11.14.4.35 redraw_line()

```
void Fl_Browser_::redraw_line (
    void * item) [protected]
```

This method should be called when the contents of `item` has changed, but not its height.

Parameters

in	<i>item</i>	The item that needs to be redrawn.
----	-------------	------------------------------------

See also

[redraw_lines\(\)](#), [redraw_line\(\)](#)

11.14.4.36 redraw_lines()

```
void Fl_Browser_::redraw_lines () [inline], [protected]
```

This method will cause the entire list to be redrawn.

See also

[redraw_lines\(\)](#), [redraw_line\(\)](#)

11.14.4.37 replacing()

```
void Fl_Browser_::replacing (
    void * a,
    void * b) [protected]
```

This method should be used when item `a` is being replaced by item `b`.

It allows the `Fl_Browser_` to update its cache data as needed, schedules a redraw for the item being changed, and tries to maintain the selection. This method does not actually replace the item, but handles the follow up bookkeeping after the item has just been replaced.

Parameters

in	<i>a</i>	Item being replaced
in	<i>b</i>	Item to replace 'a'

11.14.4.38 resize()

```
void Fl_Browser_::resize (
    int X,
    int Y,
    int W,
    int H) [virtual]
```

Repositions and/or resizes the browser.

Parameters

in	<i>X,Y,W,H</i>	The new position and size for the browser, in pixels.
----	----------------	---

Reimplemented from [Fl_Widget](#).

11.14.4.39 scrollbar_left()

```
void Fl_Browser_::scrollbar_left () [inline]
```

Moves the vertical scrollbar to the lefthand side of the list.

For back compatibility.

11.14.4.40 scrollbar_right()

```
void Fl_Browser_::scrollbar_right () [inline]
```

Moves the vertical scrollbar to the righthand side of the list.

For back compatibility.

11.14.4.41 scrollbar_size() [1/2]

```
int Fl_Browser_::scrollbar_size () const [inline]
```

Gets the current size of the scrollbars' troughs, in pixels.

If this value is zero (default), this widget will use the [Fl::scrollbar_size\(\)](#) value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar_size\(\)](#) is being used.

See also

[Fl::scrollbar_size\(int\)](#)

11.14.4.42 scrollbar_size() [2/2]

```
void Fl_Browser_::scrollbar_size (
    int newSize) [inline]
```

Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.

Normally you should not need this method, and should use [Fl::scrollbar_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, is the default behavior, and is normally what you want.

Only use THIS method if you really need to override the global scrollbar size. The need for this should be rare.

Setting `newSize` to the special value of 0 causes the widget to track the global [Fl::scrollbar_size\(\)](#), which is the default.

Parameters

<code>in</code>	<code>newSize</code>	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()
-----------------	----------------------	---

See also

[Fl::scrollbar_size\(\)](#)

11.14.4.43 scrollbar_width() [1/2]

```
int Fl_Browser_::scrollbar_width () const [inline]
```

Returns the global value [Fl::scrollbar_size\(\)](#).

Deprecated Use [scrollbar_size\(\)](#) instead.

Todo This method should eventually be removed in 1.4+

11.14.4.44 scrollbar_width() [2/2]

```
void Fl_Browser_::scrollbar_width (
    int width) [inline]
```

Sets the global [Fl::scrollbar_size\(\)](#), and forces this instance of the widget to use it.

Deprecated Use [scrollbar_size\(\)](#) instead.

Todo This method should eventually be removed in 1.4+

11.14.4.45 select()

```
int Fl_Browser_::select (
    void * item,
    int val = 1,
    int docallbacks = 0)
```

Sets the selection state of *item* to *val*, and returns 1 if the state changed or 0 if it did not.

If *docallbacks* is non-zero, *select* tries to call the callback function for the widget.

Parameters

in	<i>item</i>	The item whose selection state is to be changed
in	<i>val</i>	The new selection state (1=select, 0=de-select)
in	<i>docallbacks</i>	If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).

Returns

1 if state was changed, 0 if not.

11.14.4.46 select_only()

```
int Fl_Browser_::select_only (
    void * item,
    int docallbacks = 0)
```

Selects *item* and returns 1 if the state changed or 0 if it did not.

Any other items in the list are deselected.

Parameters

in	<i>item</i>	The <i>item</i> to select.
in	<i>docallbacks</i>	If non-zero, invokes widget callback if item changed. If 0, doesn't do callback (default).

11.14.4.47 selection()

```
void * Fl_Browser_::selection () const [inline], [protected]
```

Returns the item currently selected, or NULL if there is no selection.

For multiple selection browsers this call returns the currently focused item, even if it is not selected. To find all selected items, call [Fl_Multi_Browser::selected\(\)](#) for every item in question.

11.14.4.48 sort()

```
void Fl_Browser_::sort (
    int flags = 0)
```

Sort the items in the browser based on *flags*.

[item_swap\(void*, void*\)](#) and [item_text\(void*\)](#) must be implemented for this call.

Parameters

in	<i>flags</i>	FL_SORT_ASCENDING – sort in ascending order FL_SORT_DESCENDING – sort in descending order FL_SORT_CASEINSENSITIVE – add this to sort case-insensitively Values other than the above will cause undefined behavior Other flags may appear in the future.
----	--------------	---

11.14.4.49 swapping()

```
void Fl_Browser_::swapping (
    void * a,
    void * b) [protected]
```

This method should be used when two items *a* and *b* are being swapped.

It allows the [Fl_Browser_](#) to update its cache data as needed, schedules a redraw for the two items, and tries to maintain the current selection. This method does not actually swap items, but handles the follow up bookkeeping after items have been swapped.

Parameters

in	<i>a,b</i>	Items being swapped.
----	------------	----------------------

11.14.4.50 textfont()

```
Fl_Font Fl_Browser_::textfont () const [inline]
```

Gets the default text font for the lines in the browser.

See also

[textfont\(\)](#), [textsize\(\)](#), [textcolor\(\)](#)

11.14.4.51 vposition() [1/2]

```
int Fl_Browser_::vposition () const [inline]
```

Gets the vertical scroll position of the list as a pixel position *pos*.

The position returned is how many pixels of the list are scrolled off the top edge of the screen. Example: A position of '3' indicates the top 3 pixels of the list are scrolled off the top edge of the screen.

See also

[position\(\)](#), [hposition\(\)](#)

11.14.4.52 vposition() [2/2]

```
void Fl_Browser_::vposition (
    int pos)
```

Sets the vertical scroll position of the list to pixel position *pos*.

The position is how many pixels of the list are scrolled off the top edge of the screen. Example: A position of '3' scrolls the top three pixels of the list off the top edge of the screen.

Parameters

in	<i>pos</i>	The vertical position (in pixels) to scroll the browser to.
----	------------	---

See also

[vposition\(\)](#), [hposition\(\)](#)

11.14.5 Member Data Documentation

11.14.5.1 hscrollbar

`Fl_Scrollbar Fl_Browser_::hscrollbar`

Horizontal scrollbar.

Public, so that it can be accessed directly.

11.14.5.2 scrollbar

`Fl_Scrollbar Fl_Browser_::scrollbar`

Vertical scrollbar.

Public, so that it can be accessed directly.

Use `scrollbar_left()` or `scrollbar_right()` to change what side the vertical scrollbar is drawn on.

Use `scrollbar.align(int)` (see `Fl_Widget::align(Fl_Align)`) to change what side either of the scrollbars is drawn on.

If the `FL_ALIGN_LEFT` bit is on, the vertical scrollbar is on the left. If the `FL_ALIGN_TOP` bit is on, the horizontal scrollbar is on the top. Note that only the alignment flags in scrollbar are considered. The flags in hscrollbar however are ignored.

The documentation for this class was generated from the following files:

- `Fl_Browser_.H`
- `Fl_Browser_.cxx`

11.15 Fl_Button Class Reference

Buttons generate callbacks when they are clicked by the user.

```
#include <Fl_Button.H>
```

Inheritance diagram for `Fl_Button`:

Public Member Functions

- `int clear()`
Same as `value(0)`.
- `uchar compact()`
Return true if buttons are rendered as compact buttons.
- `void compact(uchar v)`
Decide if buttons should be rendered in compact mode.
- `Fl_Boxtype down_box() const`
Returns the current down box type, which is drawn when `value()` is non-zero.
- `void down_box(Fl_Boxtype b)`
Sets the down box type.
- `Fl_Color down_color() const`
(for backwards compatibility)
- `void down_color(unsigned c)`
(for backwards compatibility)
- `Fl_Button(int X, int Y, int W, int H, const char *L=0)`
The constructor creates the button using the given position, size, and label.

- int `handle` (int) `FL_OVERRIDE`
Handles the specified event.
- int `set` ()
Same as `value (1)`.
- void `setonly` ()
Turns on this button and turns off all other radio buttons in the group (calling `value (1)` or `set ()` does not do this).
- int `shortcut` () const
Returns the current shortcut key for the button.
- void `shortcut` (const char *s)
(for backwards compatibility)
- void `shortcut` (int s)
Sets the shortcut key to `s`.
- char `value` () const
Returns the current value of the button (0 or 1).
- int `value` (int v)
Sets the current value of the button.

Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
Activates the widget.
- unsigned int `active` () const
Returns whether the widget is active.
- int `active_r` () const
Returns whether the widget and all of its parents are active.
- `FL_Align` `align` () const
Gets the label alignment.
- void `align` (`FL_Align` alignment)
Sets the label alignment.
- long `argument` () const
Gets the current user data (long) argument that is passed to the callback function.
- void `argument` (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class `FL_Gl_Window` * `as_gl_window` ()
Returns an `FL_Gl_Window` pointer if this widget is an `FL_Gl_Window`.
- virtual class `FL_Gl_Window` const * `as_gl_window` () const
- virtual `FL_Group` * `as_group` ()
Returns an `FL_Group` pointer if this widget is an `FL_Group`.
- virtual `FL_Group` const * `as_group` () const
- virtual `FL_Window` * `as_window` ()
Returns an `FL_Window` pointer if this widget is an `FL_Window`.
- virtual `FL_Window` const * `as_window` () const
- void `bind_deimage` (`FL_Image` *img)
Sets the image to use as part of the widget label when in the inactive state.
- void `bind_deimage` (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void `bind_image` (`FL_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- void `bind_image` (int f)

- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

 - [FI_Boxtype box](#) () const
Gets the box type of the widget.
 - void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
 - [FI_Callback_p callback](#) () const
Gets the current callback function for the widget.
 - void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
 - void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
 - void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
 - void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
 - void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
 - unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
 - void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
 - void [clear_changed](#) ()
Marks the value of the widget as unchanged.
 - void [clear_damage](#) ([uchar](#) c=0)
Clears or sets the damage flags.
 - void [clear_output](#) ()
Sets a widget to accept input.
 - void [clear_visible](#) ()
Hides the widget.
 - void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
 - [FI_Color color](#) () const
Gets the background color of the widget.
 - void [color](#) ([FI_Color](#) bg)
Sets the background color of the widget.
 - void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)
Sets the background and selection color of the widget.
 - [FI_Color color2](#) () const
For back compatibility only.
 - void [color2](#) (unsigned a)
For back compatibility only.
 - int [contains](#) (const [FI_Widget](#) *w) const
Checks if w is a child of this widget.
 - void [copy_label](#) (const char *new_label)
Sets the current label.
 - void [copy_tooltip](#) (const char *text)
Sets the current tooltip text.
 - [uchar damage](#) () const
Returns non-zero if [draw\(\)](#) needs to be called.
 - void [damage](#) ([uchar](#) c)
Sets the damage bits for the widget.

- void **damage** (uchar c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int **damage_resize** (int, int, int, int)
Internal use only.
- void **deactivate** ()
Deactivates the widget.
- **FL_Image** * **deimage** ()
Gets the image that is used as part of the widget label when in the inactive state.
- const **FL_Image** * **deimage** () const
Gets the image that is used as part of the widget label when in the inactive state.
- void **deimage** (**FL_Image** &img)
Sets the image to use as part of the widget label when in the inactive state.
- void **deimage** (**FL_Image** *img)
Sets the image to use as part of the widget label when in the inactive state.
- int **deimage_bound** () const
Returns whether the inactive image is managed by the widget.
- void **do_callback** (**FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
Calls the widget callback function with default arguments.
- void **do_callback** (**FL_Widget** *widget, long arg, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
Calls the widget callback function with arbitrary arguments.
- void **do_callback** (**FL_Widget** *widget, void *arg=0, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
Calls the widget callback function with arbitrary arguments.
- void **draw_label** (int, int, int, int, **FL_Align**) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int **h** () const
Gets the widget height.
- virtual void **hide** ()
Makes a widget invisible.
- int **horizontal_label_margin** ()
Get the spacing between the label and the horizontal edge of the widget.
- void **horizontal_label_margin** (int px)
Set the spacing between the label and the horizontal edge of the widget.
- **FL_Image** * **image** ()
Gets the image that is used as part of the widget label when in the active state.
- const **FL_Image** * **image** () const
Gets the image that is used as part of the widget label when in the active state.
- void **image** (**FL_Image** &img)
Sets the image to use as part of the widget label when in the active state.
- void **image** (**FL_Image** *img)
Sets the image to use as part of the widget label when in the active state.
- int **image_bound** () const
Returns whether the image is managed by the widget.
- int **inside** (const **FL_Widget** *wgt) const
Checks if this widget is a child of wgt.
- int **is_label_copied** () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * **label** () const
Gets the current label text.
- void **label** (const char *text)
Sets the current label pointer.
- void **label** (**FL_Labeltype** a, const char *b)

- Shortcut to set the label text and type in one call.*

 - `int label_image_spacing ()`
Return the gap size between the label and the image.
 - `void label_image_spacing (int gap)`
Set the gap between the label and the image in pixels.
 - `FI_Color labelcolor () const`
Gets the label color.
 - `void labelcolor (FI_Color c)`
Sets the label color.
 - `FI_Font labelfont () const`
Gets the font to use.
 - `void labelfont (FI_Font f)`
Sets the font to use.
 - `FI_Fonsize labelsiz () const`
Gets the font size in pixels.
 - `void labelsiz (FI_Fonsize pix)`
Sets the font size in pixels.
 - `FI_Labeltype labeltype () const`
Gets the label type.
 - `void labeltype (FI_Labeltype a)`
Sets the label type.
 - `void measure_label (int &ww, int &hh) const`
Sets width ww and height hh accordingly with the label size.
 - `bool needs_keyboard () const`
Returns whether this widget needs a keyboard.
 - `void needs_keyboard (bool needs)`
Sets whether this widget needs a keyboard.
 - `unsigned int output () const`
Returns if a widget is used for output only.
 - `FI_Group * parent () const`
Returns a pointer to the parent widget.
 - `void parent (FI_Group *p)`
Internal use only - "for hacks only".
 - `void position (int X, int Y)`
Repositions the window or widget.
 - `void redraw ()`
Schedules the drawing of the widget.
 - `void redraw_label ()`
Schedules the drawing of the label.
 - `virtual void resize (int x, int y, int w, int h)`
Changes the size or position of the widget.
 - `FI_Color selection_color () const`
Gets the selection color.
 - `void selection_color (FI_Color a)`
Sets the selection color.
 - `void set_active ()`
Marks the widget as active without sending events or changing focus.
 - `void set_changed ()`
Marks the value of the widget as changed.
 - `void set_output ()`
Sets a widget to output only.

- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [FI_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [FI_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([FI_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const

- Gets the widget width.*
- `FL_When` `when` () const
 - Returns the conditions under which the callback is called.*
- void `when` (uchar i)
 - Sets the flags used to decide when a callback is called.*
- `FL_Window` * `window` () const
 - Returns a pointer to the nearest parent window up the widget hierarchy.*
- int `x` () const
 - Gets the widget position in its window.*
- int `y` () const
 - Gets the widget position in its window.*
- virtual `~FL_Widget` ()
 - Destroys the widget.*

Protected Member Functions

- void `draw` () `FL_OVERRIDE`
 - Draws the widget.*
- void `simulate_key_action` ()

Protected Member Functions inherited from `FL_Widget`

- void `clear_flag` (unsigned int c)
 - Clears a flag in the flags mask.*
- void `draw_backdrop` () const
 - If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.*
- void `draw_box` () const
 - Draws the widget box according its box style.*
- void `draw_box` (`FL_Boxtype` t, `FL_Color` c) const
 - Draws a box of type t, of color c at the widget's position and size.*
- void `draw_box` (`FL_Boxtype` t, int x, int y, int w, int h, `FL_Color` c) const
 - Draws a box of type t, of color c at the position X,Y and size W,H.*
- void `draw_focus` () const
 - Draws a focus rectangle around the widget.*
- void `draw_focus` (`FL_Boxtype` t, int X, int Y, int W, int H) const
 - Draws a focus rectangle around the widget.*
- void `draw_focus` (`FL_Boxtype` t, int x, int y, int w, int h, `FL_Color` bg) const
 - Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const
 - Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const
 - Draws the label in an arbitrary bounding box.*
- `FL_Widget` (int x, int y, int w, int h, const char *label=0L)
 - Creates a widget at the given position and size.*
- unsigned int `flags` () const
 - Gets the widget flags mask.*
- void `h` (int v)
 - Internal use only.*
- void `set_flag` (unsigned int c)
 - Sets a flag in the flags mask.*
- void `w` (int v)
 - Internal use only.*

- void `x` (int v)
Internal use only.
- void `y` (int v)
Internal use only.

Static Protected Member Functions

- static void `key_release_timeout` (void *)

Static Protected Attributes

- static `FI_Widget_Tracker` * `key_release_tracker` = 0

Additional Inherited Members

Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `FI_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.15.1 Detailed Description

Buttons generate callbacks when they are clicked by the user.

You control exactly when and how by changing the values for `type(uchar)` and `when(uchar)`. Buttons can also generate callbacks in response to `FL_SHORTCUT` events. The button can either have an explicit `shortcut(int s)` value or a letter shortcut can be indicated in the `label()` with an '&' character before it. For the label shortcut it does not matter if *Alt* is held down, but if you have an input field in the same window, the user will have to hold down the *Alt* key so that the input field does not eat the event first as an `FL_KEYBOARD` event.

See also

`FI_Widget::shortcut_label(int)`

For an `FI_Button` object, the `type()` call returns one of:

- `FL_NORMAL_BUTTON` (0): `value()` remains unchanged after button press.

- `FL_TOGGLE_BUTTON`: `value()` is inverted after button press.
- `FL_RADIO_BUTTON`: `value()` is set to 1 after button press, and all other buttons in the current group with `type() == FL_RADIO_BUTTON` are set to zero.

For an `Fl_Button` object, the following `when()` values are useful, the default being `FL_WHEN_RELEASE`:

- 0: The callback is not done, instead `changed()` is turned on.
- `FL_WHEN_RELEASE`: The callback is done after the user successfully clicks the button, or when a shortcut is typed. The reason is `FL_REASON_RELEASED`.
- `FL_WHEN_CHANGED`: The callback is done each time the `value()` changes (when the user pushes and releases the button, and as the mouse is dragged around in and out of the button). The reason is set to `FL_REASON_CHANGED`.
- `FL_WHEN_NOT_CHANGED`: The callback is done when the mouse button is released, but the value did not change. The reason is set to `FL_REASON_SELECTED`.

11.15.2 Constructor & Destructor Documentation

11.15.2.1 `Fl_Button()`

```
Fl_Button::Fl_Button (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

The constructor creates the button using the given position, size, and label.

The default box type is `box(FL_UP_BOX)`.

You can control how the button is drawn when ON by setting `down_box()`. The default is `FL_NO_BOX` (0) which will select an appropriate box type using the normal (OFF) box type by using `fl_down(box())`.

Derived classes may handle this differently.

Calling `when()` will tell the button widget when to call the callback.

Setting `FL_WHEN_RELEASE` will call the callback only if the button value changed. It's called during `FL_RELEASE` and `FL_KEYBOARD` events with `FL_REASON_RELEASED` set as the callback reason.

Setting `FL_WHEN_CHANGED` will call the callback with `FL_REASON_CHANGED` every time the value of the button changes during `FL_DRAG`, `FL_RELEASE`, and `FL_KEYBOARD` events.

Setting `FL_WHEN_NOT_CHANGED` will trigger a callback during `FL_RELEASE` events, even if the value of the button did *not* change. For radio buttons, this is also true during `FL_KEYBOARD` events.

Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

11.15.3 Member Function Documentation

11.15.3.1 `clear()`

```
int Fl_Button::clear () [inline]
```

Same as `value(0)`.

See also

[value\(int v\)](#)

11.15.3.2 compact() [1/2]

```
uchar Fl_Button::compact () [inline]
```

Return true if buttons are rendered as compact buttons.

Returns

0 if compact mode is off, 1 if it is on

See also

compact(bool)

11.15.3.3 compact() [2/2]

```
void Fl_Button::compact (
    uchar v)
```

Decide if buttons should be rendered in compact mode.

Figure 11.4 compact button keypad using GTK+ Scheme

Figure 11.5 compact buttons in Gleam

In compact mode, the button's surrounding border is altered to visually signal that multiple buttons are functionally linked together. To ensure the correct rendering of buttons in compact mode, all buttons must be part of the same group, positioned close to each other, and aligned with the edges of the group. Any button outlines not in contact with the parent group's outline will be displayed as separators.

Parameters

in	v	switch compact mode on (1) or off (0)
----	---	---------------------------------------

11.15.3.4 down_box() [1/2]

```
Fl_Boxtype Fl_Button::down_box () const [inline]
```

Returns the current down box type, which is drawn when [value\(\)](#) is non-zero.

Return values

Fl_Boxtype	
----------------------------	--

11.15.3.5 down_box() [2/2]

```
void Fl_Button::down_box (
    Fl_Boxtype b) [inline]
```

Sets the down box type.

The default value of 0 causes FLTK to figure out the correct matching down version of [box\(\)](#).

Some derived classes (e.g. [Fl_Round_Button](#) and [Fl_Light_Button](#) use [down_box\(\)](#) for special purposes. See docs of these classes.

Parameters

in	<i>b</i>	down box type
----	----------	---------------

11.15.3.6 draw()

```
void Fl_Button::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

Reimplemented in [Fl_Light_Button](#), [Fl_Return_Button](#), and [Fl_Shortcut_Button](#).

11.15.3.7 handle()

```
int Fl_Button::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)Reimplemented from [Fl_Widget](#).Reimplemented in [Fl_Light_Button](#), [Fl_Repeat_Button](#), [Fl_Return_Button](#), and [Fl_Shortcut_Button](#).**11.15.3.8 set()**

```
int Fl_Button::set () [inline]
```

Same as `value(1)`.

See also

[value\(int v\)](#)**11.15.3.9 shortcut() [1/2]**

```
int Fl_Button::shortcut () const [inline]
```

Returns the current shortcut key for the button.

Return values

<i>int</i>	
------------	--

11.15.3.10 shortcut() [2/2]

```
void Fl_Button::shortcut (
    int s) [inline]
```

Sets the shortcut key to `s`.Setting this overrides the use of '&' in the [label\(\)](#). The value is a bitwise OR of a key and a set of shift flags, for example: `FL_ALT | 'a'`, or `FL_ALT | (FL_F + 10)`, or just `'a'`. A value of 0 disables the shortcut.The key can be any value returned by [Fl::event_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.The shift flags can be any set of values accepted by [Fl::event_state\(\)](#). If the bit is on, that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

Parameters

in	s	bitwise OR of key and shift flags
----	---	-----------------------------------

11.15.3.11 value()

```
int Fl_Button::value (
    int v)
```

Sets the current value of the button.

A non-zero value sets the button to 1 (ON), and zero sets it to 0 (OFF).

Parameters

in	v	button value.
----	---	---------------

The documentation for this class was generated from the following files:

- [Fl_Button.H](#)
- [Fl_Button.cxx](#)

11.16 Fl_Cairo_State Class Reference

Contains all the necessary info on the current cairo context.

```
#include <Fl_Cairo.H>
```

Public Member Functions

- `bool autolink () const`
Gets the autolink option. See [Fl::cairo_autolink_context\(bool\)](#)
- `void autolink (bool b)`
Sets the autolink option, only available with `--enable-cairoext`.
- `cairo_t * cc () const`
Gets the current cairo context.
- `void cc (cairo_t *c, bool own=true)`
Sets the current cairo context.
- `void * gc () const`
Gets the last gc attached to a cc.
- `void gc (void *c)`
Sets the gc c to keep track on.
- `void * window () const`
Gets the last window attached to a cc.
- `void window (void *w)`
Sets the window w to keep track on.

11.16.1 Detailed Description

Contains all the necessary info on the current cairo context.

A private internal & unique corresponding object is created to permit cairo context state handling while keeping it opaque. For internal use only.

Note

Only available when configure has the `--enable-cairo` or `--enable-cairoext` option or one or both of the CMake options `FLTK_OPTION_CAIRO_WINDOW` or `FLTK_OPTION_CAIRO_EXT` is set (ON)

11.16.2 Member Function Documentation

11.16.2.1 cc()

```
void Fl_Cairo_State::cc (
    cairo_t * c,
    bool own = true) [inline]
```

Sets the current cairo context.

`own == true` (the default) indicates that the cairo context `c` will be deleted by FLTK internally when another `cc` is set later.

`own == false` indicates `cc` deletion is handled externally by the user program.

The documentation for this class was generated from the following files:

- [Fl_Cairo.H](#)
- [Fl_Cairo.cxx](#)

11.17 Fl_Cairo_Window Class Reference

This defines an FLTK window with Cairo support.

```
#include <Fl_Cairo_Window.H>
```

Inheritance diagram for Fl_Cairo_Window:

Public Types

- typedef void(* **cairo_draw_cb**) ([Fl_Cairo_Window](#) *self, cairo_t *def)
The Cairo draw callback prototype you need to implement.

Public Types inherited from [Fl_Window](#)

- typedef struct HICON__ * **HICON**

Public Member Functions

- **Fl_Cairo_Window** (int W, int H, const char *L=0)
- **Fl_Cairo_Window** (int X, int Y, int W, int H, const char *L=0)
- void [set_draw_cb](#) ([cairo_draw_cb](#) cb)
You must provide a draw callback that implements your Cairo rendering.

Public Member Functions inherited from [Fl_Double_Window](#)

- [Fl_Double_Window](#) * [as_double_window](#) () **FL_OVERRIDE**
Return non-null if this is an [Fl_Double_Window](#) object.
- **Fl_Double_Window** (int W, int H, const char *l=0)
Creates a new [Fl_Double_Window](#) widget using the given position, size, and label (title) string.
- **Fl_Double_Window** (int X, int Y, int W, int H, const char *l=0)
*See [Fl_Double_Window::Fl_Double_Window\(int w, int h, const char *label = 0\)](#)*
- void [flush](#) () **FL_OVERRIDE**
Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).
- void [hide](#) () **FL_OVERRIDE**
Makes a widget invisible.
- void [resize](#) (int, int, int, int) **FL_OVERRIDE**
Changes the size or position of the widget.
- void [show](#) () **FL_OVERRIDE**
Makes a widget visible.
- void **show** (int a, char **b)
*Same as [Fl_Window::show\(int a, char **b\)](#)*
- ~[Fl_Double_Window](#) ()
The destructor also deletes all the children.

Public Member Functions inherited from [FL_Window](#)

- void [allow_expand_outside_parent](#) ()
Allow this subwindow to expand outside the area of its parent window.
- virtual class [FL_Overlay_Window](#) * [as_overlay_window](#) ()
Return non-null if this is an [FL_Overlay_Window](#) object.
- [FL_Window](#) const * [as_window](#) () const [FL_OVERRIDE](#)
- [FL_Window](#) * [as_window](#) () [FL_OVERRIDE](#)
Returns an [FL_Window](#) pointer if this widget is an [FL_Window](#).
- unsigned int **border** () const
Returns whether the window possesses a border.
- void [border](#) (int b)
Sets whether or not the window manager border is around the window.
- void [clear_border](#) ()
Fast inline function to turn the window manager border off.
- void [clear_modal_states](#) ()
Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void **copy_label** (const char *a)
Sets the window titlebar label to a copy of a character string.
- void [cursor](#) (const [FL_RGB_Image](#) *, int, int)
Changes the cursor for this window using the provided image as cursor's shape.
- void [cursor](#) ([FL_Cursor](#) c, [FL_Color](#), [FL_Color](#)=[FL_WHITE](#))
For back compatibility only.
- void [cursor](#) ([FL_Cursor](#))
Changes the cursor for this window.
- int [decorated_h](#) () const
Returns the window height including any window title bar and any frame added by the window manager.
- int [decorated_w](#) () const
Returns the window width including any frame added by the window manager.
- void [default_cursor](#) ([FL_Cursor](#) c, [FL_Color](#), [FL_Color](#)=[FL_WHITE](#))
For back compatibility only.
- void [default_cursor](#) ([FL_Cursor](#))
Sets the default window cursor.
- void **draw_backdrop** ()
Draw the background image if one is set and is aligned inside.
- [FL_Window](#) (int w, int h, const char *title=0)
Creates a window from the given width w, height h, and title.
- [FL_Window](#) (int x, int y, int w, int h, const char *title=0)
Creates a window from the given position (x, y), size (w, h) and title.
- void [free_position](#) ()
Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.
- void [fullscreen](#) ()
Makes the window completely fill one or more screens, without any window manager border visible.
- unsigned int **fullscreen_active** () const
Returns non zero if [FULLSCREEN](#) flag is set, 0 otherwise.
- void **fullscreen_off** ()
Turns off any side effects of [fullscreen\(\)](#)
- void **fullscreen_off** (int X, int Y, int W, int H)
Turns off any side effects of [fullscreen\(\)](#) and does [resize\(x,y,w,h\)](#).
- void [fullscreen_screens](#) (int top, int bottom, int left, int right)

Sets which screens should be used when this window is in fullscreen mode.

- `uchar get_size_range` (int *minw, int *minh, int *maxw=NULL, int *maxh=NULL, int *dw=NULL, int *dh=NULL, int *aspect=NULL)

Gets the allowable range to which the user can resize this window.

- int `handle` (int) `FL_OVERRIDE`

Handles the specified event.

- void `hide` () `FL_OVERRIDE`

Removes the window from the screen.

- void `hotspot` (const `FL_Widget` &p, int offscreen=0)

See void `FL_Window::hotspot`(int x, int y, int offscreen = 0)

- void `hotspot` (const `FL_Widget` *, int offscreen=0)

See void `FL_Window::hotspot`(int x, int y, int offscreen = 0)

- void `hotspot` (int x, int y, int offscreen=0)

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

- const void * `icon` () const

Gets the current icon window target dependent data.

- void `icon` (const `FL_RGB_Image` *)

Sets or resets a single window icon.

- void `icon` (const void *ic)

Platform-specific method to set the window icon usable on Windows and X11 only.

- void `iconize` ()

Iconifies the window.

- const char * `iconlabel` () const

See void `FL_Window::iconlabel`(const char)*

- void `iconlabel` (const char *)

Sets the icon label.

- void `icons` (const `FL_RGB_Image` *[], int)

Sets the window icons.

- void `icons` (HICON big_icon, HICON small_icon)

Sets the window icons using HICON handles (Windows platform only).

- const char * `label` () const

See void `FL_Window::label`(const char)*

- void `label` (const char *)

Sets the window title bar label.

- void `label` (const char *label, const char *iconlabel)

Sets the icon label.

- void `make_current` ()

Sets things up so that the drawing functions in <FL/fl_draw.H> will go into this window.

- void `maximize` ()

Maximizes a top-level window to its current screen.

- unsigned int `maximize_active` () const

Returns whether the window is currently maximized.

- unsigned int `menu_window` () const

Returns true if this window is a menu window.

- unsigned int `modal` () const

Returns true if this window is modal.

- unsigned int `non_modal` () const

Returns true if this window is modal or non-modal.

- `fl_uintptr_t os_id` ()

Returns a platform-specific identification of a shown window, or 0 if not shown.

- unsigned int **override** () const
Returns non zero if OVERRIDE flag is set, 0 otherwise.
- void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
Changes the size and position of the window.
- int **screen_num** ()
The number of the screen containing the mapped window.
- void **screen_num** (int screen_num)
Set the number of the screen where to map the window.
- void **set_menu_window** ()
Marks the window as a menu window.
- void **set_modal** ()
*A "modal" window, when **shown()**, will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).*
- void **set_non_modal** ()
*A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a **modal()** one in that it remains on top, but it has no effect on event delivery.*
- void **set_override** ()
Activates the flags NOBORDER|OVERRIDE.
- void **set_tooltip_window** ()
Marks the window as a tooltip window.
- const **FI_Image** * **shape** ()
Returns the image controlling the window shape or NULL.
- void **shape** (const **FI_Image** &b)
*Set the window's shape with an **FI_Image**.*
- void **shape** (const **FI_Image** *img)
Assigns a non-rectangular shape to the window.
- void **show** () **FL_OVERRIDE**
Puts the window on the screen.
- void **show** (int argc, char **argv)
*Puts the window on the screen with **show()** and parses command-line arguments.*
- int **shown** ()
*Returns non-zero if **show()** has been called (but not **hide()**).*
- void **size_range** (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
Sets the allowable range to which the user can resize this window.
- unsigned int **tooltip_window** () const
Returns true if this window is a tooltip window.
- void **un_maximize** ()
Returns a previously maximized top-level window to its previous size.
- void **wait_for_expose** ()
*Waits for the window to be displayed after calling **show()**.*
- int **x_root** () const
Gets the x position of the window on the screen.
- const char * **xclass** () const
Returns the xclass for this window, or a default.
- void **xclass** (const char *c)
Sets the xclass for this window.
- int **y_root** () const
Gets the y position of the window on the screen.
- virtual **~FI_Window** ()
The destructor also deletes all the children.

Public Member Functions inherited from FL_Group

- [FL_Widget](#) *[_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void **add** ([FL_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** ([FL_Widget](#) *o)
See void [FL_Group::add\(FL_Widget &w\)](#)
- void **add_resizable** ([FL_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FL_Widget](#) *const * **array** () const
Returns a pointer to the array of children.
- [FL_Group](#) const * **as_group** () const [FL_OVERRIDE](#)
- [FL_Group](#) * **as_group** () [FL_OVERRIDE](#)
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL_Widget](#) * **child** (int n) const
Returns the n'th child.
- int **children** () const
Returns how many child widgets the group has.
- void **clear** ()
Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()
Returns the current clipping mode.
- void **clip_children** (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete_child** (int n)
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL_Widget](#) &o) const
*See int [FL_Group::find\(const FL_Widget *w\)](#) const.*
- int **find** (const [FL_Widget](#) *) const
Searches the child array for the widget and returns the index.
- [FL_Group](#) (int, int, int, int, const char * = 0)
Creates a new [FL_Group](#) widget using the given position, size, and label string.
- void **focus** ([FL_Widget](#) *W)
- void **forms_end** ()
This is for forms compatibility only.
- void **init_sizes** ()
Resets the internal array of widget sizes and positions.
- void **insert** ([FL_Widget](#) &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** ([FL_Widget](#) &o, [FL_Widget](#) *before)
*This does *insert(w, find(before))*.*
- void **remove** ([FL_Widget](#) &)
Removes a widget from the group but does not delete it.
- void **remove** ([FL_Widget](#) *o)
Removes the widget o from the group.
- void **remove** (int index)

- Removes the widget at `index` from the group but does not delete it.*
- `FI_Widget * resizable () const`
 - Returns the group's resizable widget.*
- `void resizable (FI_Widget &o)`
 - Sets the group's resizable widget.*
- `void resizable (FI_Widget *o)`
 - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
- `virtual ~FI_Group ()`
 - The destructor also deletes all the children.*

Public Member Functions inherited from `FI_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
 - Activates the widget.*
- `unsigned int active () const`
 - Returns whether the widget is active.*
- `int active_r () const`
 - Returns whether the widget and all of its parents are active.*
- `FI_Align align () const`
 - Gets the label alignment.*
- `void align (FI_Align alignment)`
 - Sets the label alignment.*
- `long argument () const`
 - Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`
 - Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FI_GL_Window * as_gl_window ()`
 - Returns an `FI_GL_Window` pointer if this widget is an `FI_GL_Window`.*
- `virtual class FI_GL_Window const * as_gl_window () const`
- `void bind_deimage (FI_Image *img)`
 - Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`
 - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FI_Image *img)`
 - Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`
 - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FI_Boxtype box () const`
 - Gets the box type of the widget.*
- `void box (FI_Boxtype new_box)`
 - Sets the box type for the widget.*
- `FI_Callback_p callback () const`
 - Gets the current callback function for the widget.*
- `void callback (FI_Callback *cb)`
 - Sets the current callback function for the widget.*
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`
 - Sets the current callback function and managed user data for the widget.*
- `void callback (FI_Callback *cb, void *p)`
 - Sets the current callback function and data for the widget.*

- void `callback` (`Fl_Callback0` *cb)
Sets the current callback function for the widget.
- void `callback` (`Fl_Callback1` *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int `changed` () const
Checks if the widget value changed since the last callback.
- void `clear_active` ()
Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()
Marks the value of the widget as unchanged.
- void `clear_damage` (`uchar` c=0)
Clears or sets the damage flags.
- void `clear_output` ()
Sets a widget to accept input.
- void `clear_visible` ()
Hides the widget.
- void `clear_visible_focus` ()
Disables keyboard focus navigation with this widget.
- `Fl_Color` `color` () const
Gets the background color of the widget.
- void `color` (`Fl_Color` bg)
Sets the background color of the widget.
- void `color` (`Fl_Color` bg, `Fl_Color` sel)
Sets the background and selection color of the widget.
- `Fl_Color` `color2` () const
For back compatibility only.
- void `color2` (unsigned a)
For back compatibility only.
- int `contains` (const `Fl_Widget` *w) const
Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)
Sets the current label.
- void `copy_tooltip` (const char *text)
Sets the current tooltip text.
- `uchar` `damage` () const
Returns non-zero if `draw()` needs to be called.
- void `damage` (`uchar` c)
Sets the damage bits for the widget.
- void `damage` (`uchar` c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)
Internal use only.
- void `deactivate` ()
Deactivates the widget.
- `Fl_Image` * `deimage` ()
Gets the image that is used as part of the widget label when in the inactive state.
- const `Fl_Image` * `deimage` () const
Gets the image that is used as part of the widget label when in the inactive state.
- void `deimage` (`Fl_Image` &img)
Sets the image to use as part of the widget label when in the inactive state.
- void `deimage` (`Fl_Image` *img)

- Sets the image to use as part of the widget label when in the inactive state.*

 - `int deimage_bound () const`

Returns whether the inactive image is managed by the widget.
- `void do_callback (FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with default arguments.
- `void do_callback (FI_Widget *widget, long arg, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with arbitrary arguments.
- `void do_callback (FI_Widget *widget, void *arg=0, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, FI_Align) const`

Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`

Gets the widget height.
- `int horizontal_label_margin ()`

Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`

Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image * image ()`

Gets the image that is used as part of the widget label when in the active state.
- `const FI_Image * image () const`

Gets the image that is used as part of the widget label when in the active state.
- `void image (FI_Image &img)`

Sets the image to use as part of the widget label when in the active state.
- `void image (FI_Image *img)`

Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`

Returns whether the image is managed by the widget.
- `int inside (const FI_Widget *wgt) const`

Checks if this widget is a child of wgt.
- `int is_label_copied () const`

Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`

Gets the current label text.
- `void label (const char *text)`

Sets the current label pointer.
- `void label (FI_Labeltype a, const char *b)`

Shortcut to set the label text and type in one call.
- `int label_image_spacing ()`

Return the gap size between the label and the image.
- `void label_image_spacing (int gap)`

Set the gap between the label and the image in pixels.
- `FI_Color labelcolor () const`

Gets the label color.
- `void labelcolor (FI_Color c)`

Sets the label color.
- `FI_Font labelfont () const`

Gets the font to use.
- `void labelfont (FI_Font f)`

Sets the font to use.
- `FI_Fonsize labelsiz () const`

Gets the font size in pixels.

- void [labelsize](#) ([FL_Fontsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- [FL_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([FL_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

- Gets the current tooltip text.*
- void **tooltip** (const char *text)
 - Sets the current tooltip text.*
- **Fl_Window** * **top_window** () const
 - Returns a pointer to the top-level window for the widget.*
- **Fl_Window** * **top_window_offset** (int &xoff, int &yoff) const
 - Finds the x/y offset of the current widget relative to the top-level window.*
- **uchar** **type** () const
 - Gets the widget type.*
- void **type** (uchar t)
 - Sets the widget type.*
- int **use_accents_menu** ()
 - Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.*
- void * **user_data** () const
 - Gets the user data for this widget.*
- void **user_data** (**Fl_Callback_User_Data** *v, bool auto_free)
 - Sets the user data for this widget.*
- void **user_data** (void *v)
 - Sets the user data for this widget.*
- int **vertical_label_margin** ()
 - Get the spacing between the label and the vertical edge of the widget.*
- void **vertical_label_margin** (int px)
 - Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const
 - Returns whether a widget is visible.*
- unsigned int **visible_focus** () const
 - Checks whether this widget has a visible focus.*
- void **visible_focus** (int v)
 - Modifies keyboard focus navigation.*
- int **visible_r** () const
 - Returns whether a widget and all its parents are visible.*
- int **w** () const
 - Gets the widget width.*
- **Fl_When** **when** () const
 - Returns the conditions under which the callback is called.*
- void **when** (uchar i)
 - Sets the flags used to decide when a callback is called.*
- **Fl_Window** * **window** () const
 - Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const
 - Gets the widget position in its window.*
- int **y** () const
 - Gets the widget position in its window.*
- virtual **~Fl_Widget** ()
 - Destroys the widget.*

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
 - Overloaded to provide Cairo callback support.*

Protected Member Functions inherited from FI_Window

- void `default_size_range` ()
Protected method to calculate the default size range of a window.
- void `draw` () `FL_OVERRIDE`
Draws the widget.
- int `force_position` () const
Returns the internal state of the window's `FORCE_POSITION` flag.
- void `force_position` (int force)
Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void `free_icons` ()
Deletes all icons previously attached to the window.
- int `is_resizable` ()
Protected method to determine whether a window is resizable.

Protected Member Functions inherited from FI_Group

- `FI_Rect` * `bounds` ()
Returns the internal array of widget sizes and positions.
- void `draw_child` (`FI_Widget` &widget) const
Forces a child to redraw.
- void `draw_children` ()
Draws all children of the group.
- void `draw_outside_label` (const `FI_Widget` &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int `on_insert` (`FI_Widget` *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int `on_move` (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void `on_remove` (int)
Allow derived groups to act when a child widget is removed from the group.
- int * `sizes` ()
Returns the internal array of widget sizes and positions.
- void `update_child` (`FI_Widget` &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from FI_Widget

- void `clear_flag` (unsigned int c)
Clears a flag in the flags mask.
- void `draw_backdrop` () const
If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.
- void `draw_box` () const
Draws the widget box according its box style.
- void `draw_box` (`FI_Boxtype` t, `FI_Color` c) const
Draws a box of type t, of color c at the widget's position and size.
- void `draw_box` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void `draw_focus` () const
Draws a focus rectangle around the widget.
- void `draw_focus` (`FI_Boxtype` t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.

- void `draw_focus` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` bg) const
Draws a focus box for the widget at the given position and size.
- void `draw_label` () const
Draws the widget's label at the defined label position.
- void `draw_label` (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- `FI_Widget` (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int `flags` () const
Gets the widget flags mask.
- void `h` (int v)
Internal use only.
- void `set_flag` (unsigned int c)
Sets a flag in the flags mask.
- void `w` (int v)
Internal use only.
- void `x` (int v)
Internal use only.
- void `y` (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `FI_Window`

- static `FI_Window` * `current` ()
Returns the last window that was made current.
- static void `default_callback` (`FI_Window` *, void *v)
Back compatibility: Sets the default callback v for win to call on close event.
- static void `default_icon` (const `FI_RGB_Image` *)
Sets a single default window icon.
- static void `default_icons` (const `FI_RGB_Image` *[], int)
Sets the default window icons.
- static void `default_icons` (HICON big_icon, HICON small_icon)
Sets the default window icons (Windows platform only).
- static const char * `default_xclass` ()
Returns the default xclass.
- static void `default_xclass` (const char *)
Sets the default window xclass.
- static bool `is_a_rescale` ()
Returns true when a window is being rescaled.
- static char `show_next_window_iconic` ()
Returns the static flag whether the next window should be opened iconified.
- static void `show_next_window_iconic` (char stat)
Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from `FI_Group`

- static `FI_Group` * `current` ()
Returns the currently active group.
- static void `current` (`FI_Group` *g)
Sets the current group.

Static Public Member Functions inherited from Fl_Widget

- static void `default_callback` (`Fl_Widget *widget`, `void *data`)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (`const char *t`)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (`const char *`, `const bool require_alt=false`)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

Static Protected Attributes inherited from Fl_Window

- static `Fl_Window * current_`
Stores the last window that was made current.

11.17.1 Detailed Description

This defines an FLTK window with Cairo support.

This class overloads the virtual `draw()` method for you, so that the only thing you have to do is to provide your Cairo code. All Cairo context handling is achieved transparently.

The default coordinate system for Cairo drawing commands within `Fl_Cairo_Window` is FLTK's coordinate system, where the `x`, `y`, `w`, `h` values are relative to the top/left corner of the `Fl_Cairo_Window`, as one would expect with regular FLTK drawing commands, e.g.: (`0 x w-1`), (`0 y h-1`). **Example:**

```
static void my_cairo_draw_cb(Fl_Cairo_Window *window, cairo_t *cr) {
    // Draw an "X"
    const double xmax = (window->w() - 1);
    const double ymax = (window->h() - 1);
    cairo_set_line_width(cr, 1.00); // line width for drawing
    cairo_set_source_rgb(cr, 1.0, 0.5, 0.0); // orange
    cairo_move_to(cr, 0.0, 0.0); cairo_line_to(cr, xmax, ymax); // draw diagonal "\"
    cairo_move_to(cr, 0.0, ymax); cairo_line_to(cr, xmax, 0.0); // draw diagonal "/"
    cairo_stroke(cr); // stroke the lines
}
```

The FLTK coordinate system differs from the default native Cairo coordinate system which uses normalized (`0.0 ... 1.0`) values for `x` and `y`, e.g.: (`0 x 1.0`), (`0 y 1.0`). So beware of this when copy/pasting Cairo example programs that assume normalized values. If need be, you can revert to the Cairo coordinate system by simply calling `cairo_scale()` with the widget's `w()` and `h()` values. **Example:**

```
static void my_cairo_draw_cb(Fl_Cairo_Window *window, cairo_t *cr) {
    cairo_scale(cr, window->w(), window->h()); // use Cairo's default coordinate system
    [...use 0.0 to 1.0 values from here on...]
}
```

Note

Class [Fl_Cairo_Window](#) requires the FLTK library to have been built with CMake option `FLTK_OPTION_CAIRO_WINDOW` or configure `--enable-cairo`.

You can alternatively define your custom Cairo FLTK window, and thus at least override the [draw\(\)](#) method to provide custom Cairo support. In this case you will probably use [Fl::cairo_make_current\(Fl_Window*\)](#) to attach a context to your window. You should do this only when your window is the current window.

See also

[Fl_Window::current\(\)](#)

11.17.2 Member Function Documentation**11.17.2.1 draw()**

```
void Fl_Cairo_Window::draw (
    void ) [inline], [protected], [virtual]
```

Overloaded to provide Cairo callback support.

Implements [Fl_Widget](#).

11.17.2.2 set_draw_cb()

```
void Fl_Cairo_Window::set_draw_cb (
    cairo_draw_cb cb) [inline]
```

You must provide a draw callback that implements your Cairo rendering.

This method permits you to set your Cairo callback to `cb`.

The documentation for this class was generated from the following file:

- [Fl_Cairo_Window.H](#)

11.18 Fl_Callback_User_Data Class Reference

A class prototype that allows for additional data in callbacks.

```
#include <Fl_Widget.H>
```

Public Member Functions

- virtual [~Fl_Callback_User_Data \(\)](#)
Destructor.

Protected Member Functions

- [Fl_Callback_User_Data \(\)](#)
Protected constructor.

11.18.1 Detailed Description

A class prototype that allows for additional data in callbacks.

Users can derive this class and pass objects of such derived classes to widget callbacks. Widgets can take ownership of the callback data, deleting the data when the widget itself is deleted.

The destructor of this class is virtual, allowing for additional code to deallocate resources when the user data is deleted.

11.19 FI_Chart Class Reference

[Fl_Chart](#) displays simple charts.

```
#include <Fl_Chart.H>
```

Inheritance diagram for [Fl_Chart](#):

Public Member Functions

- void [add](#) (double val, const char *str=0, unsigned col=0)
Adds the data value val with optional label str and color col to the chart.
- [uchar autosize](#) () const
Gets whether the chart will automatically adjust the bounds of the chart.
- void [autosize](#) (uchar n)
Sets whether the chart will automatically adjust the bounds of the chart.
- void [bounds](#) (double *a, double *b) const
Gets the lower and upper bounds of the chart values.
- void [bounds](#) (double a, double b)
Sets the lower and upper bounds of the chart values.
- void [clear](#) ()
Removes all values from the chart.
- [Fl_Chart](#) (int X, int Y, int W, int H, const char *L=0)
Create a new Fl_Chart widget using the given position, size and label string.
- void [insert](#) (int ind, double val, const char *str=0, unsigned col=0)
Inserts a data value val at the given position ind.
- int [maxsize](#) () const
Gets the maximum number of data values for a chart.
- void [maxsize](#) (int m)
Sets the maximum number of data values for a chart.
- void [replace](#) (int ind, double val, const char *str=0, unsigned col=0)
Replaces a data value val at the given position ind.
- int [size](#) () const
Returns the number of data values in the chart.
- void [size](#) (int W, int H)
Sets the widget size (width, height).
- [Fl_Color textcolor](#) () const
Gets the chart's text color.
- void [textcolor](#) ([Fl_Color](#) n)

- Sets the chart's text color to n .*
- **FI_Font** **textfont** () const
 - Gets the chart's text font.*
- void **textfont** (FI_Font s)
 - Sets the chart's text font to s .*
- **FI_Fontsize** **textsize** () const
 - Gets the chart's text size.*
- void **textsize** (FI_Fontsize s)
 - Sets the chart's text size to s .*
- ~**FI_Chart** ()
 - Destroys the [FI_Chart](#) widget and all of its data.*

Public Member Functions inherited from **FI_Widget**

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
 - Activates the widget.*
- unsigned int **active** () const
 - Returns whether the widget is active.*
- int **active_r** () const
 - Returns whether the widget and all of its parents are active.*
- **FI_Align** **align** () const
 - Gets the label alignment.*
- void **align** (FI_Align alignment)
 - Sets the label alignment.*
- long **argument** () const
 - Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
 - Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI_Gl_Window** * **as_gl_window** ()
 - Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class **FI_Gl_Window** const * **as_gl_window** () const
- virtual **FI_Group** * **as_group** ()
 - Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).*
- virtual **FI_Group** const * **as_group** () const
- virtual **FI_Window** * **as_window** ()
 - Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).*
- virtual **FI_Window** const * **as_window** () const
- void **bind_deimage** (FI_Image *img)
 - Sets the image to use as part of the widget label when in the inactive state.*
- void **bind_deimage** (int f)
 - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind_image** (FI_Image *img)
 - Sets the image to use as part of the widget label when in the active state.*
- void **bind_image** (int f)
 - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI_Boxtype** **box** () const
 - Gets the box type of the widget.*
- void **box** (FI_Boxtype new_box)
 - Sets the box type for the widget.*

- [FI_Callback_p callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()
Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)
Clears or sets the damage flags.
- void [clear_output](#) ()
Sets a widget to accept input.
- void [clear_visible](#) ()
Hides the widget.
- void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
- [FI_Color color](#) () const
Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)
Sets the background and selection color of the widget.
- [FI_Color color2](#) () const
For back compatibility only.
- void [color2](#) (unsigned a)
For back compatibility only.
- int [contains](#) (const [FI_Widget](#) *w) const
Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)
Sets the current label.
- void [copy_tooltip](#) (const char *text)
Sets the current tooltip text.
- uchar [damage](#) () const
Returns non-zero if [draw\(\)](#) needs to be called.
- void [damage](#) (uchar c)
Sets the damage bits for the widget.
- void [damage](#) (uchar c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int [damage_resize](#) (int, int, int, int)
Internal use only.
- void [deactivate](#) ()

- Deactivates the widget.*

 - `FL_Image * deimage ()`
Gets the image that is used as part of the widget label when in the inactive state.
 - `const FL_Image * deimage () const`
Gets the image that is used as part of the widget label when in the inactive state.
 - `void deimage (FL_Image &img)`
Sets the image to use as part of the widget label when in the inactive state.
 - `void deimage (FL_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
 - `int deimage_bound () const`
Returns whether the inactive image is managed by the widget.
 - `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with default arguments.
 - `void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
 - `void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
 - `void draw_label (int, int, int, int, FL_Align) const`
Draws the label in an arbitrary bounding box with an arbitrary alignment.
 - `int h () const`
Gets the widget height.
 - `virtual int handle (int event)`
Handles the specified event.
 - `virtual void hide ()`
Makes a widget invisible.
 - `int horizontal_label_margin ()`
Get the spacing between the label and the horizontal edge of the widget.
 - `void horizontal_label_margin (int px)`
Set the spacing between the label and the horizontal edge of the widget.
 - `FL_Image * image ()`
Gets the image that is used as part of the widget label when in the active state.
 - `const FL_Image * image () const`
Gets the image that is used as part of the widget label when in the active state.
 - `void image (FL_Image &img)`
Sets the image to use as part of the widget label when in the active state.
 - `void image (FL_Image *img)`
Sets the image to use as part of the widget label when in the active state.
 - `int image_bound () const`
Returns whether the image is managed by the widget.
 - `int inside (const FL_Widget *wgt) const`
Checks if this widget is a child of wgt.
 - `int is_label_copied () const`
Returns whether the current label was assigned with `copy_label()`.
 - `const char * label () const`
Gets the current label text.
 - `void label (const char *text)`
Sets the current label pointer.
 - `void label (FL_Labeltype a, const char *b)`
Shortcut to set the label text and type in one call.
 - `int label_image_spacing ()`
Return the gap size between the label and the image.

- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FI_Color labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FI_Color](#) c)
Sets the label color.
- [FI_Font labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FI_Font](#) f)
Sets the font to use.
- [FI_Fonsize labelsiz](#)e () const
Gets the font size in pixels.
- void [labelsiz](#)e ([FI_Fonsize](#) pix)
Sets the font size in pixels.
- [FI_Labeltype labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FI_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FI_Group * parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FI_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
- [FI_Color selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([FI_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()

- Enables keyboard focus navigation with this widget.*

 - int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void `show` ()

Makes a widget visible.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the current tooltip text.
- `Fl_Window` * `top_window` () const

Returns a pointer to the top-level window for the widget.
- `Fl_Window` * `top_window_offset` (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- `uchar` `type` () const

Gets the widget type.
- void `type` (`uchar` t)

Sets the widget type.
- int `use_accents_menu` ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * `user_data` () const

Gets the user data for this widget.
- void `user_data` (`Fl_Callback_User_Data` *v, bool auto_free)

Sets the user data for this widget.
- void `user_data` (void *v)

Sets the user data for this widget.
- int `vertical_label_margin` ()

Get the spacing between the label and the vertical edge of the widget.
- void `vertical_label_margin` (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int `visible` () const

Returns whether a widget is visible.
- unsigned int `visible_focus` () const

Checks whether this widget has a visible focus.
- void `visible_focus` (int v)

Modifies keyboard focus navigation.
- int `visible_r` () const

Returns whether a widget and all its parents are visible.
- int `w` () const

Gets the widget width.
- `Fl_When` `when` () const

Returns the conditions under which the callback is called.

- void **when** (uchar i)
Sets the flags used to decide when a callback is called.
- **FL_Window** * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
Gets the widget position in its window.
- int **y** () const
Gets the widget position in its window.
- virtual ~**FL_Widget** ()
Destroys the widget.

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
*Draws the **FL_Chart** widget.*

Protected Member Functions inherited from **FL_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
*If **FL_ALIGN_IMAGE_BACKDROP** is set, the image or deimage will be drawn.*
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (**FL_Boxtype** t, **FL_Color** c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (**FL_Boxtype** t, int x, int y, int w, int h, **FL_Color** c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FL_Boxtype** t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FL_Boxtype** t, int x, int y, int w, int h, **FL_Color** bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FL_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Static Protected Member Functions

- static void `draw_barchart` (int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries`[], double `min`, double `max`, int `autosize`, int `maxnumb`, `FI_Color` `textcolor`)
Draws a bar chart.
- static void `draw_horbarchart` (int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries`[], double `min`, double `max`, int `autosize`, int `maxnumb`, `FI_Color` `textcolor`)
Draws a horizontal bar chart.
- static void `draw_linechart` (int `type`, int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries`[], double `min`, double `max`, int `autosize`, int `maxnumb`, `FI_Color` `textcolor`)
Draws a line chart.
- static void `draw_piechart` (int `x`, int `y`, int `w`, int `h`, int `numb`, `FL_CHART_ENTRY` `entries`[], int `special`, `FI_Color` `textcolor`)
Draws a pie chart.

Additional Inherited Members

Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` *`widget`, void *`data`)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *`t`)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *`t`, const bool `require_alt`=false)
Returns true if the given text `t` contains the entered '&x' shortcut.

Protected Types inherited from `FI_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
 ,
`OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
 ,
`MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
 ,
`GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
 = 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.19.1 Detailed Description

`FI_Chart` displays simple charts.

It is provided for Forms compatibility.

Figure 11.6 Fl_Chart

Todo Refactor `Fl_Chart::type()` information.

The type of an `Fl_Chart` object can be set using `type(uchar t)` to:

Chart Type	Description
FL_BAR_CHART	Each sample value is drawn as a vertical bar.
FL_FILLED_CHART	The chart is filled from the bottom of the graph to the sample values.
FL_HORBAR_CHART	Each sample value is drawn as a horizontal bar.
FL_LINE_CHART	The chart is drawn as a polyline with vertices at each sample value.
FL_PIE_CHART	A pie chart is drawn with each sample value being drawn as a proportionate slice in the circle.
FL_SPECIALPIE_CHART	Like <code>FL_PIE_CHART</code> , but the first slice is separated from the pie.
FL_SPIKE_CHART	Each sample value is drawn as a vertical line.

11.19.2 Constructor & Destructor Documentation

11.19.2.1 Fl_Chart()

```
Fl_Chart::Fl_Chart (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Create a new `Fl_Chart` widget using the given position, size and label string.

The default boxstyle is `FL_NO_BOX`.

Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

11.19.3 Member Function Documentation

11.19.3.1 add()

```
void Fl_Chart::add (
    double val,
    const char * str = 0,
    unsigned col = 0)
```

Adds the data value `val` with optional label `str` and color `col` to the chart.

Parameters

in	<i>val</i>	data value
in	<i>str</i>	optional data label
in	<i>col</i>	optional data color

11.19.3.2 autosize() [1/2]

```
uchar Fl_Chart::autosize () const [inline]
```

Gets whether the chart will automatically adjust the bounds of the chart.

Returns

non-zero if auto-sizing is enabled and zero if disabled.

11.19.3.3 autosize() [2/2]

```
void Fl_Chart::autosize (
    uchar n) [inline]
```

Sets whether the chart will automatically adjust the bounds of the chart.

Parameters

in	<i>n</i>	non-zero to enable automatic resizing, zero to disable.
----	----------	---

11.19.3.4 bounds() [1/2]

```
void Fl_Chart::bounds (
    double * a,
    double * b) const [inline]
```

Gets the lower and upper bounds of the chart values.

Parameters

out	<i>a,b</i>	are set to lower, upper
-----	------------	-------------------------

11.19.3.5 bounds() [2/2]

```
void Fl_Chart::bounds (
    double a,
    double b)
```

Sets the lower and upper bounds of the chart values.

Parameters

in	<i>a,b</i>	are used to set lower, upper
----	------------	------------------------------

11.19.3.6 draw()

```
void Fl_Chart::draw (
    void ) [protected], [virtual]
```

Draws the [Fl_Chart](#) widget.

Implements [Fl_Widget](#).

11.19.3.7 draw_barchart()

```
void Fl_Chart::draw_barchart (
    int x,
    int y,
    int w,
    int h,
    int numb,
    FL_CHART_ENTRY entries[],
    double min,
    double max,
    int autosize,
    int maxnumb,
    Fl_Color textcolor) [static], [protected]
```

Draws a bar chart.

x, *y*, *w*, *h* is the bounding box, *entries* the array of *numb* entries, and *min* and *max* the boundaries.

Parameters

in	<i>x,y,w,h</i>	Widget position and size
in	<i>numb</i>	Number of values
in	<i>entries</i>	Array of values
in	<i>min</i>	Lower boundary
in	<i>max</i>	Upper boundary
in	<i>autosize</i>	Whether the chart autosizes
in	<i>maxnumb</i>	Maximal number of entries
in	<i>textcolor</i>	Text color

11.19.3.8 draw_horbarchart()

```
void Fl_Chart::draw_horbarchart (
    int x,
    int y,
    int w,
    int h,
    int numb,
    FL_CHART_ENTRY entries[],
    double min,
    double max,
    int autosize,
    int maxnumb,
    Fl_Color textcolor) [static], [protected]
```

Draws a horizontal bar chart.

x, *y*, *w*, *h* is the bounding box, *entries* the array of *numb* entries, and *min* and *max* the boundaries.

Parameters

in	<i>x,y,w,h</i>	Widget position and size
in	<i>numb</i>	Number of values
in	<i>entries</i>	Array of values
in	<i>min</i>	Lower boundary
in	<i>max</i>	Upper boundary
in	<i>autosize</i>	Whether the chart autosizes
in	<i>maxnumb</i>	Maximal number of entries
in	<i>textcolor</i>	Text color

11.19.3.9 draw_linechart()

```
void Fl_Chart::draw_linechart (
    int type,
    int x,
    int y,
    int w,
    int h,
    int numb,
    FL_CHART_ENTRY entries[],
    double min,
    double max,
    int autosize,
    int maxnumb,
    Fl_Color textcolor) [static], [protected]
```

Draws a line chart.

`x`, `y`, `w`, `h` is the bounding box, `entries` the array of `numb` entries, and `min` and `max` the boundaries.

Parameters

in	<i>type</i>	Chart type
in	<i>x,y,w,h</i>	Widget position and size
in	<i>numb</i>	Number of values
in	<i>entries</i>	Array of values
in	<i>min</i>	Lower boundary
in	<i>max</i>	Upper boundary
in	<i>autosize</i>	Whether the chart autosizes
in	<i>maxnumb</i>	Maximal number of entries
in	<i>textcolor</i>	Text color

11.19.3.10 draw_piechart()

```
void Fl_Chart::draw_piechart (
    int x,
    int y,
    int w,
    int h,
    int numb,
    FL_CHART_ENTRY entries[],
    int special,
    Fl_Color textcolor) [static], [protected]
```

Draws a pie chart.

Parameters

in	<i>x,y,w,h</i>	bounding box
in	<i>numb</i>	number of chart entries
in	<i>entries</i>	array of chart entries
in	<i>special</i>	special (?)
in	<i>textcolor</i>	text color

11.19.3.11 insert()

```
void Fl_Chart::insert (
    int ind,
```

```
double val,
const char * str = 0,
unsigned col = 0)
```

Inserts a data value `val` at the given position `ind`.
Position 1 is the first data value.

Parameters

in	<i>ind</i>	insertion position
in	<i>val</i>	data value
in	<i>str</i>	optional data label
in	<i>col</i>	optional data color

11.19.3.12 maxsize()

```
void Fl_Chart::maxsize (
    int m)
```

Sets the maximum number of data values for a chart.
If you do not call this method then the chart will be allowed to grow to any size depending on available memory.

Parameters

in	<i>m</i>	maximum number of data values allowed.
----	----------	--

11.19.3.13 replace()

```
void Fl_Chart::replace (
    int ind,
    double val,
    const char * str = 0,
    unsigned col = 0)
```

Replaces a data value `val` at the given position `ind`.
Position 1 is the first data value.

Parameters

in	<i>ind</i>	insertion position
in	<i>val</i>	data value
in	<i>str</i>	optional data label
in	<i>col</i>	optional data color

11.19.3.14 size()

```
void Fl_Chart::size (
    int W,
    int H) [inline]
```

Sets the widget size (width, height).
This is the same as calling [Fl_Widget::size\(int W, int H\)](#);

Parameters

in	<i>W,H</i>	new width and height of the widget
----	------------	------------------------------------

The documentation for this class was generated from the following files:

- [Fl_Chart.H](#)
- [Fl_Chart.cxx](#)

11.20 FL_CHART_ENTRY Struct Reference

For internal use only.

```
#include <Fl_Chart.H>
```

Public Attributes

- unsigned **col**
For internal use only.
- char **str** [[FL_CHART_LABEL_MAX](#)+1]
For internal use only.
- float **val**
For internal use only.

11.20.1 Detailed Description

For internal use only.

The documentation for this struct was generated from the following file:

- [Fl_Chart.H](#)

11.21 Fl_Check_Browser Class Reference

The [Fl_Check_Browser](#) widget displays a scrolling list of text lines that may be selected and/or checked by the user.

```
#include <Fl_Check_Browser.H>
```

Inheritance diagram for [Fl_Check_Browser](#):

Public Member Functions

- int [add](#) (char *s)
Add a new unchecked line to the end of the browser.
- int [add](#) (char *s, int b)
Add a new line to the end of the browser.
- int [add](#) (const char *s)
*See int [Fl_Check_Browser::add\(char *s\)](#)*
- int [add](#) (const char *s, int b)
*See int [Fl_Check_Browser::add\(char *s\)](#)*
- void [check_all](#) ()
Sets all the items checked.
- void [check_none](#) ()
Sets all the items unchecked.
- int [checked](#) (int item) const
Gets the current status of item item.
- void [checked](#) (int item, int b)

- Sets the check status of item item to b.*

 - void **clear** ()

Remove every item from the browser.
 - **FI_Check_Browser** (int x, int y, int w, int h, const char *l=0)

The constructor makes an empty browser.
 - void * **item_at** (int index) const **FL_OVERRIDE**

This method must be provided by the subclass to return the item for the specified index.
 - void **item_swap** (int ia, int ib)
 - void **item_swap** (void *a, void *b) **FL_OVERRIDE**

This optional method should be provided by the subclass to efficiently swap browser items a and b, such as for sorting.
 - int **nchecked** () const

Returns how many items are currently checked.
 - int **nitems** () const

Returns how many lines are in the browser.
 - int **remove** (int item)

Remove line n and make the browser one line shorter.
 - void **set_checked** (int item)

Equivalent to FI_Check_Browser::checked(item, 1).
 - char * **text** (int item) const

Return a pointer to an internal buffer holding item item's text.
 - int **value** () const

Returns the index of the currently selected item.
 - ~**FI_Check_Browser** ()

The destructor deletes all list items and destroys the browser.

Public Member Functions inherited from **FI_Browser_**

- int **deselect** (int docallbacks=0)

Deselects all items in the list and returns 1 if the state changed or 0 if it did not.
- void **display** (void *item)

Displays the item, scrolling the list as necessary.
- **uchar** **has_scrollbar** () const

Returns the current scrollbar mode, see FI_Browser_::has_scrollbar(uchar)
- void **has_scrollbar** (uchar mode)

Sets whether the widget should have scrollbars or not (default FI_Browser_::BOTH).
- int **hposition** () const

Gets the horizontal scroll position of the list as a pixel position pos.
- void **hposition** (int)

Sets the horizontal scroll position of the list to pixel position pos.
- int **linespacing** () const

Return the height of additional spacing between browser lines.
- void **linespacing** (int pixels)

Add some space between browser lines.
- int **position** () const
- void **position** (int pos)
- void **position** (int x, int y)
- void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**

Repositions and/or resizes the browser.
- void **scrollbar_left** ()

Moves the vertical scrollbar to the lefthand side of the list.
- void **scrollbar_right** ()

- Moves the vertical scrollbar to the righthand side of the list.*
- `int scrollbar_size () const`
Gets the current size of the scrollbars' troughs, in pixels.
- `void scrollbar_size (int newSize)`
Sets the pixel size of the scrollbars' troughs to `newSize`, in pixels.
- `int scrollbar_width () const`
Returns the global value `FL::scrollbar_size()`.
- `void scrollbar_width (int width)`
Sets the global `FL::scrollbar_size()`, and forces this instance of the widget to use it.
- `int select (void *item, int val=1, int docallbacks=0)`
Sets the selection state of `item` to `val`, and returns 1 if the state changed or 0 if it did not.
- `int select_only (void *item, int docallbacks=0)`
Selects `item` and returns 1 if the state changed or 0 if it did not.
- `void sort (int flags=0)`
Sort the items in the browser based on `flags`.
- `FL_Color textcolor () const`
Gets the default text color for the lines in the browser.
- `void textcolor (FL_Color col)`
Sets the default text color for the lines in the browser to color `col`.
- `FL_Font textfont () const`
Gets the default text font for the lines in the browser.
- `void textfont (FL_Font font)`
Sets the default text font for the lines in the browser to `font`.
- `FL_Fontsize textsize () const`
Gets the default text size (in pixels) for the lines in the browser.
- `void textsize (FL_Fontsize newSize)`
Sets the default text size (in pixels) for the lines in the browser to `size`.
- `int vposition () const`
Gets the vertical scroll position of the list as a pixel position `pos`.
- `void vposition (int pos)`
Sets the vertical scroll position of the list to pixel position `pos`.

Public Member Functions inherited from `FL_Group`

- `FL_Widget *&_ddfdesign_kludge ()`
This is for forms compatibility only.
- `void add (FL_Widget &)`
The widget is removed from its current group (if any) and then added to the end of this group.
- `void add (FL_Widget *o)`
See void `FL_Group::add(FL_Widget &w)`
- `void add_resizable (FL_Widget &o)`
Adds a widget to the group and makes it the resizable widget.
- `FL_Widget *const * array () const`
Returns a pointer to the array of children.
- `FL_Group const * as_group () const FL_OVERRIDE`
- `FL_Group * as_group () FL_OVERRIDE`
Returns an `FL_Group` pointer if this widget is an `FL_Group`.
- `void begin ()`
Sets the current group so you can build the widget tree by just constructing the widgets.
- `FL_Widget * child (int n) const`
Returns the `n`'th child.

- int **children** () const
Returns how many child widgets the group has.
- void **clear** ()
Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()
Returns the current clipping mode.
- void **clip_children** (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete_child** (int n)
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()
*Exactly the same as *current(this->parent())*.*
- int **find** (const FL_Widget &o) const
*See int *FL_Group::find(const FL_Widget *w)* const.*
- int **find** (const FL_Widget *) const
Searches the child array for the widget and returns the index.
- **FL_Group** (int, int, int, int, const char *s=0)
*Creates a new *FL_Group* widget using the given position, size, and label string.*
- void **focus** (FL_Widget *W)
- void **forms_end** ()
This is for forms compatibility only.
- int **handle** (int) **FL_OVERRIDE**
Handles the specified event.
- void **init_sizes** ()
Resets the internal array of widget sizes and positions.
- void **insert** (FL_Widget &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** (FL_Widget &o, FL_Widget *before)
*This does *insert(w, find(before))*.*
- void **remove** (FL_Widget &)
Removes a widget from the group but does not delete it.
- void **remove** (FL_Widget *o)
*Removes the widget *o* from the group.*
- void **remove** (int index)
*Removes the widget at *index* from the group but does not delete it.*
- **FL_Widget * resizable** () const
Returns the group's resizable widget.
- void **resizable** (FL_Widget &o)
Sets the group's resizable widget.
- void **resizable** (FL_Widget *o)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void **resize** (int, int, int, int) **FL_OVERRIDE**
*Resizes the *FL_Group* widget and all of its children.*
- virtual **~FL_Group** ()
The destructor also deletes all the children.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

- Marks the widget as inactive without sending events or changing focus.*

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

 - void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*

 - void `clear_output` ()
- Sets a widget to accept input.*

 - void `clear_visible` ()
- Hides the widget.*

 - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

 - `FL_Color` `color` () const
- Gets the background color of the widget.*

 - void `color` (FL_Color bg)
- Sets the background color of the widget.*

 - void `color` (FL_Color bg, FL_Color sel)
- Sets the background and selection color of the widget.*

 - `FL_Color` `color2` () const
- For back compatibility only.*

 - void `color2` (unsigned a)
- For back compatibility only.*

 - int `contains` (const FL_Widget *w) const
- Checks if w is a child of this widget.*

 - void `copy_label` (const char *new_label)
- Sets the current label.*

 - void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*

 - uchar `damage` () const
- Returns non-zero if `draw()` needs to be called.*

 - void `damage` (uchar c)
- Sets the damage bits for the widget.*

 - void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int `damage_resize` (int, int, int, int)
- Internal use only.*

 - void `deactivate` ()
- Deactivates the widget.*

 - `FL_Image` * `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const `FL_Image` * `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void `deimage` (FL_Image &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `deimage` (FL_Image *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

 - void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with default arguments.*

 - void `do_callback` (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with arbitrary arguments.*

- void `do_callback` (`FL_Widget *widget`, void *arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FL_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FL_Image * image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FL_Image * image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FL_Image &img`)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FL_Image *img`)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FL_Widget *wgt`) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FL_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FL_Color labelcolor` () const
Gets the label color.
- void `labelcolor` (`FL_Color` c)
Sets the label color.
- `FL_Font labelfont` () const
Gets the font to use.
- void `labelfont` (`FL_Font` f)
Sets the font to use.
- `FL_Fonsize labelsz` () const
Gets the font size in pixels.
- void `labelsize` (`FL_Fonsize` pix)
Sets the font size in pixels.
- `FL_Labeltype labeltype` () const
Gets the label type.
- void `labeltype` (`FL_Labeltype` a)

- Sets the label type.*

 - void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `FI_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`FI_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- `FI_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`FI_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void `show` ()

Makes a widget visible.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the current tooltip text.

- `Fl_Window * top_window ()` const
Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type ()` const
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data ()` const
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible ()` const
Returns whether a widget is visible.
- `unsigned int visible_focus ()` const
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r ()` const
Returns whether a widget and all its parents are visible.
- `int w ()` const
Gets the widget width.
- `Fl_When when ()` const
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window ()` const
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x ()` const
Gets the widget position in its window.
- `int y ()` const
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Protected Member Functions

- `int handle (int) FL_OVERRIDE`
Handles the `event` within the normal widget bounding box.
- `void item_draw (void *, int, int, int, int) const FL_OVERRIDE`
This method must be provided by the subclass to draw the `item` in the area indicated by `X`, `Y`, `W`, `H`.
- `void * item_first () const FL_OVERRIDE`
This method must be provided by the subclass to return the first item in the list.

- `int item_height (void *) const FL_OVERRIDE`
This method must be provided by the subclass to return the height of `item` in pixels.
- `void * item_next (void *) const FL_OVERRIDE`
This method must be provided by the subclass to return the item in the list after `item`.
- `void * item_prev (void *) const FL_OVERRIDE`
This method must be provided by the subclass to return the item in the list before `item`.
- `void item_select (void *, int) FL_OVERRIDE`
This method must be implemented by the subclass if it supports multiple selections; sets the selection state to `val` for the `item`.
- `int item_selected (void *) const FL_OVERRIDE`
This method must be implemented by the subclass if it supports multiple selections; returns the selection state for `item`.
- `const char * item_text (void *item) const FL_OVERRIDE`
This optional method returns a string (label) that may be used for sorting.
- `int item_width (void *) const FL_OVERRIDE`
This method must be provided by the subclass to return the width of the `item` in pixels.

Protected Member Functions inherited from `FI_Browser_`

- `void bbox (int &X, int &Y, int &W, int &H) const`
Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- `void deleting (void *item)`
This method should be used when `item` is being deleted from the list.
- `int displayed (void *item) const`
Returns non-zero if `item` has been scrolled to a position where it is being displayed.
- `void draw () FL_OVERRIDE`
Draws the list within the normal widget bounding box.
- `void * find_item (int ypos)`
This method returns the item under mouse `y` position `ypos`.
- `FI_Browser_ (int X, int Y, int W, int H, const char *L=0)`
The constructor makes an empty browser.
- `virtual int full_height () const`
This method may be provided by the subclass to indicate the full height of the item list, in pixels.
- `virtual int full_width () const`
This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- `virtual int incr_height () const`
This method may be provided to return the average height of all items to be used for scrolling.
- `void inserting (void *a, void *b)`
This method should be used when an item is in the process of being inserted into the list.
- `virtual void * item_last () const`
This method must be provided by the subclass to return the last item in the list.
- `virtual int item_quick_height (void *item) const`
This method may be provided by the subclass to return the height of the `item`, in pixels.
- `int leftedge () const`
This method returns the `X` position of the left edge of the list area after adjusting for the scrollbar and border, if any.
- `void new_list ()`
This method should be called when the list data is completely replaced or cleared.
- `void redraw_line (void *item)`
This method should be called when the contents of `item` has changed, but not its height.
- `void redraw_lines ()`
This method will cause the entire list to be redrawn.

- void **replacing** (void *a, void *b)
This method should be used when item a is being replaced by item b.
- void * **selection** () const
Returns the item currently selected, or NULL if there is no selection.
- void **swapping** (void *a, void *b)
This method should be used when two items a and b are being swapped.
- void * **top** () const
Returns the item that appears at the top of the list.

Protected Member Functions inherited from **FI_Group**

- **FI_Rect** * **bounds** ()
Returns the internal array of widget sizes and positions.
- void **draw** () **FL_OVERRIDE**
Draws the widget.
- void **draw_child** (**FI_Widget** &widget) const
Forces a child to redraw.
- void **draw_children** ()
Draws all children of the group.
- void **draw_outside_label** (const **FI_Widget** &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int **on_insert** (**FI_Widget** *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int **on_move** (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void **on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.
- int * **sizes** ()
Returns the internal array of widget sizes and positions.
- void **update_child** (**FI_Widget** &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from **FI_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (**FI_Boxtype** t, **FI_Color** c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (**FI_Boxtype** t, int x, int y, int w, int h, **FI_Color** c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FI_Boxtype** t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FI_Boxtype** t, int x, int y, int w, int h, **FI_Color** bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const

- Draws the widget's label at the defined label position.*
- void [draw_label](#) (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int [x](#), int [y](#), int [w](#), int [h](#), const char *[label](#)=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void [h](#) (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void [w](#) (int v)
Internal use only.
- void [x](#) (int v)
Internal use only.
- void [y](#) (int v)
Internal use only.

Additional Inherited Members

Public Types inherited from [FI_Browser_](#)

- enum {
[HORIZONTAL](#) = 1 , [VERTICAL](#) = 2 , [BOTH](#) = 3 , [ALWAYS_ON](#) = 4 ,
[HORIZONTAL_ALWAYS](#) = 5 , [VERTICAL_ALWAYS](#) = 6 , [BOTH_ALWAYS](#) = 7 }
Values for [has_scrollbar\(\)](#).

Static Public Member Functions inherited from [FI_Group](#)

- static [FI_Group](#) * [current](#) ()
Returns the currently active group.
- static void [current](#) ([FI_Group](#) *g)
Sets the current group.

Static Public Member Functions inherited from [FI_Widget](#)

- static void [default_callback](#) ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from [FI_Browser_](#)

- [FI_Scrollbar](#) [hscrollbar](#)
Horizontal scrollbar.
- [FI_Scrollbar](#) [scrollbar](#)
Vertical scrollbar.

[USERFLAG1](#) = 1<<31 }

flags possible values enumeration.

11.21.1 Detailed Description

The [Fl_Check_Browser](#) widget displays a scrolling list of text lines that may be selected and/or checked by the user.

11.21.2 Member Function Documentation

11.21.2.1 [add\(\)](#) [1/2]

```
int Fl_Check_Browser::add (
    char * s)
```

Add a new unchecked line to the end of the browser.

See also

[add\(char *s, int b\)](#)

11.21.2.2 [add\(\)](#) [2/2]

```
int Fl_Check_Browser::add (
    char * s,
    int b)
```

Add a new line to the end of the browser.

The text is copied using the `strdup()` function. It may also be `NULL` to make a blank line. It can set the item checked if `b` is not 0.

11.21.2.3 [handle\(\)](#)

```
int Fl_Check_Browser::handle (
    int event) [protected], [virtual]
```

Handles the `event` within the normal widget bounding box.

Parameters

<code>in</code>	<code>event</code>	The event to process.
-----------------	--------------------	-----------------------

Returns

1 if event was processed, 0 if not.

Reimplemented from [Fl_Browser_](#).

11.21.2.4 item_at()

```
void * Fl_Check_Browser::item_at (
    int index) const [virtual]
```

This method must be provided by the subclass to return the item for the specified *index*.

Parameters

<i>in</i>	<i>index</i>	The <i>index</i> of the item to be returned
-----------	--------------	---

Returns

The item at the specified *index*.

Reimplemented from [Fl_Browser_](#).

11.21.2.5 item_draw()

```
void Fl_Check_Browser::item_draw (
    void * item,
    int X,
    int Y,
    int W,
    int H) const [protected], [virtual]
```

This method must be provided by the subclass to draw the *item* in the area indicated by *X*, *Y*, *W*, *H*.

Implements [Fl_Browser_](#).

11.21.2.6 item_first()

```
void * Fl_Check_Browser::item_first () const [protected], [virtual]
```

This method must be provided by the subclass to return the first item in the list.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Implements [Fl_Browser_](#).

11.21.2.7 item_height()

```
int Fl_Check_Browser::item_height (
    void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the height of *item* in pixels.

Allow for two additional pixels for the list selection box.

Parameters

<i>in</i>	<i>item</i>	The item whose height is returned.
-----------	-------------	------------------------------------

Returns

The height of the specified *item* in pixels.

See also

[item_height\(\)](#), [item_width\(\)](#), [item_quick_height\(\)](#)

Implements [Fl_Browser_](#).

11.21.2.8 item_next()

```
void * Fl_Check_Browser::item_next (
    void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the item in the list after *item*.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Implements [Fl_Browser_](#).

11.21.2.9 item_prev()

```
void * Fl_Check_Browser::item_prev (
    void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the item in the list before *item*.

See also

[item_first\(\)](#), [item_next\(\)](#), [item_last\(\)](#), [item_prev\(\)](#)

Implements [Fl_Browser_](#).

11.21.2.10 item_select()

```
void Fl_Check_Browser::item_select (
    void * item,
    int val) [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; sets the selection state to *val* for the *item*.

Sets the selection state for *item*, where optional *val* is 1 (select, the default) or 0 (de-select).

Parameters

in	<i>item</i>	The item to be selected
in	<i>val</i>	The optional selection state; 1=select, 0=de-select. The default is to select the item (1).

Reimplemented from [Fl_Browser_](#).

11.21.2.11 item_selected()

```
int Fl_Check_Browser::item_selected (
    void * item) const [protected], [virtual]
```

This method must be implemented by the subclass if it supports multiple selections; returns the selection state for *item*.

The method should return 1 if *item* is selected, or 0 otherwise.

Parameters

in	<i>item</i>	The item to test.
----	-------------	-------------------

Reimplemented from [Fl_Browser_](#).

11.21.2.12 item_swap()

```
void Fl_Check_Browser::item_swap (
    void * a,
    void * b) [virtual]
```

This optional method should be provided by the subclass to efficiently swap browser items *a* and *b*, such as for sorting.

Parameters

in	<i>a,b</i>	The two items to be swapped.
----	------------	------------------------------

Reimplemented from [Fl_Browser_](#).

11.21.2.13 item_text()

```
const char * Fl_Check_Browser::item_text (
    void * item) const [protected], [virtual]
```

This optional method returns a string (label) that may be used for sorting.

Parameters

in	<i>item</i>	The item whose label text is returned.
----	-------------	--

Returns

The item's text label. (Can be NULL if blank)

Reimplemented from [Fl_Browser_](#).

11.21.2.14 item_width()

```
int Fl_Check_Browser::item_width (
    void * item) const [protected], [virtual]
```

This method must be provided by the subclass to return the width of the *item* in pixels. Allow for two additional pixels for the list selection box.

Parameters

in	<i>item</i>	The item whose width is returned.
----	-------------	-----------------------------------

Returns

The width of the item in pixels.

Implements [Fl_Browser_](#).

11.21.2.15 nitems()

```
int Fl_Check_Browser::nitems () const [inline]
```

Returns how many lines are in the browser.

The last line number is equal to this.

11.21.2.16 remove()

```
int Fl_Check_Browser::remove (
    int item)
```

Remove line *n* and make the browser one line shorter.

Returns the number of lines left in the browser.

The documentation for this class was generated from the following files:

- `Fl_Check_Browser.H`
- `Fl_Check_Browser.cxx`

11.22 FI_Check_Button Class Reference

A button with a "checkmark" to show its status.

Inheritance diagram for FI_Check_Button:

Public Member Functions

- [FI_Check_Button](#) (int X, int Y, int W, int H, const char *L=0)
Creates a new [FI_Check_Button](#) widget using the given position, size, and label string.

Public Member Functions inherited from [FI_Light_Button](#)

- [FI_Light_Button](#) (int x, int y, int w, int h, const char *l=0)
Creates a new [FI_Light_Button](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL_OVERRIDE](#)
Handles the specified event.

Public Member Functions inherited from [FI_Button](#)

- int [clear](#) ()
Same as `value(0)`.
- uchar [compact](#) ()
Return true if buttons are rendered as compact buttons.
- void [compact](#) (uchar v)
Decide if buttons should be rendered in compact mode.
- [FI_Boxtype down_box](#) () const
Returns the current down box type, which is drawn when `value()` is non-zero.
- void [down_box](#) ([FI_Boxtype](#) b)
Sets the down box type.
- [FI_Color down_color](#) () const
(for backwards compatibility)
- void [down_color](#) (unsigned c)
(for backwards compatibility)
- [FI_Button](#) (int X, int Y, int W, int H, const char *L=0)
The constructor creates the button using the given position, size, and label.
- int [set](#) ()
Same as `value(1)`.
- void [setonly](#) ()
Turns on this button and turns off all other radio buttons in the group (calling `value(1)` or `set()` does not do this).
- int [shortcut](#) () const
Returns the current shortcut key for the button.
- void [shortcut](#) (const char *s)
(for backwards compatibility)

- void **shortcut** (int s)
Sets the shortcut key to s.
- char **value** () const
Returns the current value of the button (0 or 1).
- int **value** (int v)
Sets the current value of the button.

Public Member Functions inherited from FI_Widget

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- **FI_Align align** () const
Gets the label alignment.
- void **align** (FI_Align alignment)
Sets the label alignment.
- long **argument** () const
Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class **FI_Gl_Window** * **as_gl_window** ()
Returns an FI_Gl_Window pointer if this widget is an FI_Gl_Window.
- virtual class **FI_Gl_Window** const * **as_gl_window** () const
- virtual **FI_Group** * **as_group** ()
Returns an FI_Group pointer if this widget is an FI_Group.
- virtual **FI_Group** const * **as_group** () const
- virtual **FI_Window** * **as_window** ()
Returns an FI_Window pointer if this widget is an FI_Window.
- virtual **FI_Window** const * **as_window** () const
- void **bind_deimage** (FI_Image *img)
Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind_image** (FI_Image *img)
Sets the image to use as part of the widget label when in the active state.
- void **bind_image** (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- **FI_Boxtype box** () const
Gets the box type of the widget.
- void **box** (FI_Boxtype new_box)
Sets the box type for the widget.
- **FI_Callback_p callback** () const
Gets the current callback function for the widget.
- void **callback** (FI_Callback *cb)
Sets the current callback function for the widget.
- void **callback** (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)

- Sets the current callback function and managed user data for the widget.*

 - void [callback](#) ([FI_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.

 - void [callback](#) ([FI_Callback0](#) *cb)

Sets the current callback function for the widget.

 - void [callback](#) ([FI_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.

 - unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.

 - void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.

 - void [clear_changed](#) ()

Marks the value of the widget as unchanged.

 - void [clear_damage](#) ([uchar](#) c=0)

Clears or sets the damage flags.

 - void [clear_output](#) ()

Sets a widget to accept input.

 - void [clear_visible](#) ()

Hides the widget.

 - void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.

 - [FI_Color](#) [color](#) () const

Gets the background color of the widget.

 - void [color](#) ([FI_Color](#) bg)

Sets the background color of the widget.

 - void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)

Sets the background and selection color of the widget.

 - [FI_Color](#) [color2](#) () const

For back compatibility only.

 - void [color2](#) (unsigned a)

For back compatibility only.

 - int [contains](#) (const [FI_Widget](#) *w) const

Checks if w is a child of this widget.

 - void [copy_label](#) (const char *new_label)

Sets the current label.

 - void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.

 - [uchar](#) [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.

 - void [damage](#) ([uchar](#) c)

Sets the damage bits for the widget.

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

 - int [damage_resize](#) (int, int, int, int)

Internal use only.

 - void [deactivate](#) ()

Deactivates the widget.

 - [FI_Image](#) * [deimage](#) ()

Gets the image that is used as part of the widget label when in the inactive state.

 - const [FI_Image](#) * [deimage](#) () const

Gets the image that is used as part of the widget label when in the inactive state.

- void [deimage](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- int [deimage_bound](#) () const
Returns whether the inactive image is managed by the widget.
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const

- Gets the font to use.*

 - void [labelfont](#) ([FI_Font](#) f)
- Sets the font to use.*

 - [FI_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

 - void [labelsize](#) ([FI_Fontsize](#) pix)
- Sets the font size in pixels.*

 - [FI_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

 - void [labeltype](#) ([FI_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

 - bool [needs_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

 - void [needs_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

 - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

 - [FI_Group](#) * [parent](#) () const
- Returns a pointer to the parent widget.*

 - void [parent](#) ([FI_Group](#) *p)
- Internal use only - "for hacks only".*

 - void [position](#) (int X, int Y)
- Repositions the window or widget.*

 - void [redraw](#) ()
- Schedules the drawing of the widget.*

 - void [redraw_label](#) ()
- Schedules the drawing of the label.*

 - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

 - [FI_Color](#) [selection_color](#) () const
- Gets the selection color.*

 - void [selection_color](#) ([FI_Color](#) a)
- Sets the selection color.*

 - void [set_active](#) ()
- Marks the widget as active without sending events or changing focus.*

 - void [set_changed](#) ()
- Marks the value of the widget as changed.*

 - void [set_output](#) ()
- Sets a widget to output only.*

 - void [set_visible](#) ()
- Makes the widget visible.*

 - void [set_visible_focus](#) ()
- Enables keyboard focus navigation with this widget.*

 - int [shortcut_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

 - void [shortcut_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

 - virtual void [show](#) ()
- Makes a widget visible.*

- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)
Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const
Gets the widget position in its window.
- int [y](#) () const
Gets the widget position in its window.
- virtual [~Fl_Widget](#) ()
Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from [FI_Widget](#)

- static void [default_callback](#) ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [FI_Widget](#)

flags possible values enumeration.

Protected Member Functions inherited from [FI_Light_Button](#)

- void [draw](#) () [FL_OVERRIDE](#)
Draws the widget.

Protected Member Functions inherited from [FI_Button](#)

- void [simulate_key_action](#) ()

Protected Member Functions inherited from [FI_Widget](#)

- void [clear_flag](#) (unsigned int c)
Clears a flag in the flags mask.
- void [draw_backdrop](#) () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void [draw_box](#) () const
Draws the widget box according its box style.
- void [draw_box](#) ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void [draw_box](#) ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void [draw_focus](#) () const
Draws a focus rectangle around the widget.
- void [draw_focus](#) ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void [draw_focus](#) ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const

- Draws a focus box for the widget at the given position and size.*
- void `draw_label` () const
- Draws the widget's label at the defined label position.*
- void `draw_label` (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
- `Fl_Widget` (int `x`, int `y`, int `w`, int `h`, const char *`label`=0L)
- Creates a widget at the given position and size.*
- unsigned int `flags` () const
- Gets the widget flags mask.*
- void `h` (int `v`)
- Internal use only.*
- void `set_flag` (unsigned int `c`)
- Sets a flag in the flags mask.*
- void `w` (int `v`)
- Internal use only.*
- void `x` (int `v`)
- Internal use only.*
- void `y` (int `v`)
- Internal use only.*

- static void `key_release_timeout` (void *)

Static Protected Attributes inherited from `Fl_Button`

- static `Fl_Widget_Tracker` * `key_release_tracker` = 0

11.22.1 Detailed Description

A button with a "checkmark" to show its status.

Figure 11.7 `Fl_Check_Button`

Buttons generate callbacks when they are clicked by the user. You control exactly when and how by changing the values for `type()` and `when()`.

The `Fl_Check_Button` subclass displays its "ON" state by showing a "checkmark" rather than drawing itself pushed in.

11.22.2 Constructor & Destructor Documentation

11.22.2.1 `Fl_Check_Button()`

```
Fl_Check_Button::Fl_Check_Button (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Creates a new `Fl_Check_Button` widget using the given position, size, and label string.

The default box type is `FL_NO_BOX`, which draws the label w/o a box right of the checkmark.

The `selection_color()` sets the color of the checkmark. Default is `FL_FOREGROUND_COLOR` (usually black).

You can use `down_box()` to change the box type of the checkmark. Default is `FL_DOWN_BOX`.

Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

The documentation for this class was generated from the following files:

- `Fl_Check_Button.H`
- `Fl_Check_Button.cxx`

11.23 Fl_Choice Class Reference

A button that is used to pop up a menu.

```
#include <Fl_Choice.H>
```

Inheritance diagram for `Fl_Choice`:

Public Member Functions

- `Fl_Choice` (int *X*, int *Y*, int *W*, int *H*, const char **L*=0)
Create a new [Fl_Choice](#) widget using the given position, size and label string.
- int `handle` (int) [FL_OVERRIDE](#)
Handles the specified event.
- int `value` () const
Gets the index of the last item chosen by the user.
- int `value` (const [Fl_Menu_Item](#) **v*)
Sets the currently selected value using a pointer to menu item.
- int `value` (int *v*)
Sets the currently selected value using the index into the menu item array.

Public Member Functions inherited from [Fl_Menu_](#)

- int `add` (const char *)
This is a Forms (and SGI GL library) compatible add function, it adds many menu items, with '|' separating the menu items, and tab separating the menu item names from an optional shortcut string.
- int `add` (const char *, int [shortcut](#), [Fl_Callback](#) *, void **d*=0, int *e*=0)
Adds a new menu item.
- int `add` (const char **a*, const char **b*, [Fl_Callback](#) **c*, void **d*=0, int *e*=0)
See int [Fl_Menu_::add](#)(const char label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0)*
- void `clear` ()
Same as menu(NULL), set the array pointer to null, indicating a zero-length menu.
- int `clear_submenu` (int *index*)
*Clears the specified submenu pointed to by *index* of all menu items.*
- void `copy` (const [Fl_Menu_Item](#) **m*, void **user_data*=0)

- Sets the menu array pointer with a copy of m that will be automatically deleted.*

 - **Fl_Boxtype down_box** () const

This box type is used to surround the currently-selected items in the menus.
- void **down_box** (Fl_Boxtype b)

Sets the box type used to surround the currently-selected items in the menus.
- **Fl_Color down_color** () const

For back compatibility, same as [selection_color\(\)](#)
- void **down_color** (unsigned c)

For back compatibility, same as [selection_color\(\)](#)
- int **find_index** (const char *name) const

Find the menu item index for a given menu pathname, such as "Edit/Copy".
- int **find_index** (const Fl_Menu_Item *item) const

Find the index into the menu array for a given item.
- int **find_index** (Fl_Callback *cb) const

Find the index into the menu array for a given callback cb.
- const Fl_Menu_Item * **find_item** (const char *name)

Find the menu item for a given menu pathname, such as "Edit/Copy".
- const Fl_Menu_Item * **find_item** (Fl_Callback *)

Find the menu item for the given callback cb.
- const Fl_Menu_Item * **find_item_with_argument** (long)

Find the menu item for the given user argument v.
- const Fl_Menu_Item * **find_item_with_user_data** (void *)

Find the menu item for the given user data v.
- **Fl_Menu_** (int, int, int, int, const char *s=0)

Creates a new [Fl_Menu_](#) widget using the given position, size, and label string.
- void **global** ()

Make the shortcuts for this menu work no matter what window has the focus when you type it.
- int **insert** (int index, const char *, int shortcut, Fl_Callback *, void *d=0, int e=0)

Inserts a new menu item at the specified index position.
- int **insert** (int index, const char *a, const char *b, Fl_Callback *c, void *d=0, int e=0)

See [int Fl_Menu_::insert\(const char label, int shortcut, Fl_Callback*, void *user_data=0, int flags=0\)](#)*
- int **item_pathname** (char *name, int namelen, const Fl_Menu_Item *finditem=0) const

Get the menu 'pathname' for the specified menuitem.
- const Fl_Menu_Item * **menu** () const

Returns a pointer to the array of Fl_Menu_Items.
- void **menu** (const Fl_Menu_Item *m)

Sets the menu array pointer directly.
- **Fl_Boxtype menu_box** () const

Get the box type for the menu popup windows.
- void **menu_box** (Fl_Boxtype b)

Set the box type for the menu popup windows.
- const Fl_Menu_Item * **menu_end** ()

Finishes menu modifications and returns [menu\(\)](#).
- int **mode** (int i) const

Get the flags of item i.
- void **mode** (int i, int fl)

Set the flags of item i.
- const Fl_Menu_Item * **mvalue** () const

Return a pointer to the last menu item that was picked.
- const Fl_Menu_Item * **picked** (const Fl_Menu_Item *)

When user picks a menu item, call this.

- const [Fl_Menu_Item](#) * [prev_mvalue](#) () const
Return a pointer to the menu item that was picked before the current one was picked.
- void [remove](#) (int)
*Deletes item *i* from the menu.*
- void [replace](#) (int, const char *)
*Changes the text of item *i*.*
- void **setonly** ([Fl_Menu_Item](#) *item)
Turns the radio item "on" for the menu item and turns "off" adjacent radio items of the same group.
- void **shortcut** (int i, int s)
*Change the shortcut of item *i* to *s*.*
- int [size](#) () const
This returns the number of [Fl_Menu_Item](#) structures that make up the menu, correctly counting submenus.
- void **size** (int W, int H)
- const [Fl_Menu_Item](#) * [test_shortcut](#) ()
Returns the menu item with the entered shortcut (key value).
- const char * **text** () const
Returns the title of the last item chosen.
- const char * **text** (int i) const
*Returns the title of item *i*.*
- [Fl_Color](#) **textcolor** () const
Get the current color of menu item labels.
- void **textcolor** ([Fl_Color](#) c)
Sets the current color of menu item labels.
- [Fl_Font](#) **textfont** () const
Gets the current font of menu item labels.
- void **textfont** ([Fl_Font](#) c)
Sets the current font of menu item labels.
- [Fl_Fontsize](#) **textsize** () const
Gets the font size of menu item labels.
- void **textsize** ([Fl_Fontsize](#) c)
Sets the font size of menu item labels.
- int [value](#) () const
Return the index into the [menu\(\)](#) of the last item chosen by the user.
- int [value](#) (const [Fl_Menu_Item](#) *)
*Set the value of a menu to the menu item *m*.*
- int [value](#) (int i)
*Set the value of the menu to index *i*.*

Public Member Functions inherited from [Fl_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [Fl_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([Fl_Align](#) alignment)

- Sets the label alignment.*
- long [argument](#) () const
 - Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)
 - Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
 - Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
 - Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).*
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
 - Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).*
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
 - Sets the image to use as part of the widget label when in the inactive state.*
- void [bind_deimage](#) (int f)
 - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind_image](#) ([FI_Image](#) *img)
 - Sets the image to use as part of the widget label when in the active state.*
- void [bind_image](#) (int f)
 - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI_Boxtype](#) box () const
 - Gets the box type of the widget.*
- void [box](#) ([FI_Boxtype](#) new_box)
 - Sets the box type for the widget.*
- [FI_Callback_p](#) callback () const
 - Gets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb)
 - Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
 - Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, void *p)
 - Sets the current callback function and data for the widget.*
- void [callback](#) ([FI_Callback0](#) *cb)
 - Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
 - Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
 - Checks if the widget value changed since the last callback.*
- void [clear_active](#) ()
 - Marks the widget as inactive without sending events or changing focus.*
- void [clear_changed](#) ()
 - Marks the value of the widget as unchanged.*
- void [clear_damage](#) (uchar c=0)
 - Clears or sets the damage flags.*
- void [clear_output](#) ()
 - Sets a widget to accept input.*
- void [clear_visible](#) ()
 - Hides the widget.*
- void [clear_visible_focus](#) ()

- Disables keyboard focus navigation with this widget.*

 - [FL_Color](#) [color](#) () const

Gets the background color of the widget.

 - void [color](#) ([FL_Color](#) bg)

Sets the background color of the widget.

 - void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)

Sets the background and selection color of the widget.

 - [FL_Color](#) [color2](#) () const

For back compatibility only.

 - void [color2](#) (unsigned a)

For back compatibility only.

 - int [contains](#) (const [FL_Widget](#) *w) const

Checks if w is a child of this widget.

 - void [copy_label](#) (const char *new_label)

Sets the current label.

 - void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.

 - [uchar](#) [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.

 - void [damage](#) ([uchar](#) c)

Sets the damage bits for the widget.

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

 - int [damage_resize](#) (int, int, int, int)

Internal use only.

 - void [deactivate](#) ()

Deactivates the widget.

 - [FL_Image](#) * [deimage](#) ()

Gets the image that is used as part of the widget label when in the inactive state.

 - const [FL_Image](#) * [deimage](#) () const

Gets the image that is used as part of the widget label when in the inactive state.

 - void [deimage](#) ([FL_Image](#) &img)

Sets the image to use as part of the widget label when in the inactive state.

 - void [deimage](#) ([FL_Image](#) *img)

Sets the image to use as part of the widget label when in the inactive state.

 - int [deimage_bound](#) () const

Returns whether the inactive image is managed by the widget.

 - void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))

Calls the widget callback function with default arguments.

 - void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))

Calls the widget callback function with arbitrary arguments.

 - void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))

Calls the widget callback function with arbitrary arguments.

 - void [draw_label](#) (int, int, int, int, [FL_Align](#)) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.

 - int [h](#) () const

Gets the widget height.

 - virtual void [hide](#) ()

Makes a widget invisible.

 - int [horizontal_label_margin](#) ()

Get the spacing between the label and the horizontal edge of the widget.

- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize](#) [labelsiz](#)e () const
Gets the font size in pixels.
- void [labelsiz](#)e ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const

- Returns a pointer to the parent widget.*

 - void [parent](#) ([Fl_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)

Changes the size or position of the widget.
- [Fl_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.

- int **use_accents_menu** ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * **user_data** () const
Gets the user data for this widget.
- void **user_data** (FI_Callback_User_Data *v, bool auto_free)
Sets the user data for this widget.
- void **user_data** (void *v)
Sets the user data for this widget.
- int **vertical_label_margin** ()
Get the spacing between the label and the vertical edge of the widget.
- void **vertical_label_margin** (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int **visible** () const
Returns whether a widget is visible.
- unsigned int **visible_focus** () const
Checks whether this widget has a visible focus.
- void **visible_focus** (int v)
Modifies keyboard focus navigation.
- int **visible_r** () const
Returns whether a widget and all its parents are visible.
- int **w** () const
Gets the widget width.
- FI_When **when** () const
Returns the conditions under which the callback is called.
- void **when** (uchar i)
Sets the flags used to decide when a callback is called.
- FI_Window * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
Gets the widget position in its window.
- int **y** () const
Gets the widget position in its window.
- virtual ~**FI_Widget** ()
Destroys the widget.

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
Draws the widget.

Protected Member Functions inherited from FI_Menu_

- int **item_pathname_** (char *name, int namelen, const FI_Menu_Item *finditem, const FI_Menu_Item *menu=0) const

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const

- Draws the widget box according its box style.*
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from [FI_Widget](#)

- static void **default_callback** ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [FI_Widget](#)

- `Fl_Boxtype menu_box_`
- `Fl_Color textcolor_`
- `Fl_Font textfont_`
- `Fl_Fontsize textsize_`

11.23.1 Detailed Description

A button that is used to pop up a menu.

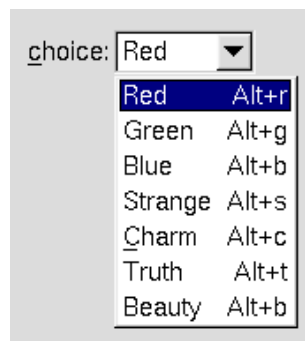

Figure 11.8 Fl_Choice

This is a button that, when pushed, pops up a menu (or hierarchy of menus) defined by an array of `Fl_Menu_Item` objects. Motif calls this an `OptionButton`.

The only difference between this and a `Fl_Menu_Button` is that the name of the most recent chosen menu item is displayed inside the box, while the label is displayed outside the box. However, since the use of this is most often to control a single variable rather than do individual callbacks, some of the `Fl_Menu_Button` methods are redescribed here in those terms.

When the user clicks a menu item, `value()` is set to that item and then:

- The item's callback is done if one has been set; the `Fl_Choice` is passed as the `Fl_Widget*` argument, along with any userdata configured for the callback.
- If the item does not have a callback, the `Fl_Choice` widget's callback is done instead, along with any userdata configured for it. The callback can determine which item was picked using `value()`, `mvalue()`, `item_pathname()`, etc.

All three mouse buttons pop up the menu. The Forms behavior of the first two buttons to increment/decrement the choice is not implemented. This could be added with a subclass, however.

The menu will also pop up in response to shortcuts indicated by putting a '&' character in the `label()`. See `Fl_Button::shortcut(int s)` for a description of this.

Typing the `shortcut()` of any of the items will do exactly the same as when you pick the item with the mouse. The '&' character in item names are only looked at when the menu is popped up, however.

The inherited `Fl_Widget::changed()` and related methods can be used as follows:

- `int Fl_Widget::changed() const` This value is true when the user picks a different value. *It is turned off by `value()` and just before doing a callback (the callback can turn it back on if desired).*
- `void Fl_Widget::set_changed()` This method sets the `changed()` flag.

- `void Fl_Widget::clear_changed()` This method clears the `changed()` flag.

The inherited `Fl_Menu_::down_box()` methods can be used as follows:

- `Fl_Boxtype Fl_Menu_::down_box() const` Gets the current down box, which is used when the menu is popped up. The default down box type is `FL_DOWN_BOX`.
- `void Fl_Menu_::down_box(Fl_Boxtype b)` Sets the current down box type to `b`.

Simple example:

```
#include <FL/Fl.H>
#include <FL/Fl_Window.H>
#include <FL/Fl_Choice.H>
int main() {
    Fl_Window *win = new Fl_Window(300,200);
    Fl_Choice *choice = new Fl_Choice(100,10,100,25,"Choice:");
    choice->add("Zero");
    choice->add("One");
    choice->add("Two");
    choice->add("Three");
    choice->value(2); // make "Two" selected by default (zero based!)
    win->end();
    win->show();
    return Fl::run();
}
```

11.23.2 Constructor & Destructor Documentation

11.23.2.1 Fl_Choice()

```
Fl_Choice::Fl_Choice (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Create a new `Fl_Choice` widget using the given position, size and label string.

The default boxtype is `FL_UP_BOX`.

The constructor sets `menu()` to `NULL`. See `Fl_Menu_` for the methods to set or change the menu.

Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

11.23.3 Member Function Documentation

11.23.3.1 draw()

```
void Fl_Choice::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call `redraw()` instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own `draw()` method*, e.g. for an embedded scrollbar, you can do it (because `draw()` is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw(); // calls Fl_Scrollbar::draw()
```

Implements `Fl_Widget`.

11.23.3.2 handle()

```
int Fl_Choice::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Scheme_Choice](#).

11.23.3.3 value() [1/3]

```
int Fl_Choice::value () const [inline]
```

Gets the index of the last item chosen by the user.
The index is -1 initially.

11.23.3.4 value() [2/3]

```
int Fl_Choice::value (
    const Fl_Menu_Item * v)
```

Sets the currently selected value using a pointer to menu item.

Changing the selected value causes a [redraw\(\)](#).

Parameters

in	<i>v</i>	pointer to menu item in the menu item array.
----	----------	--

Returns

non-zero if the new value is different to the old one.

11.23.3.5 value() [3/3]

```
int Fl_Choice::value (
    int v)
```

Sets the currently selected value using the index into the menu item array.

Changing the selected value causes a [redraw\(\)](#).

Parameters

in	v	index of value in the menu item array.
----	---	--

Returns

non-zero if the new value is different to the old one.

The documentation for this class was generated from the following files:

- `Fl_Choice.H`
- `Fl_Choice.cxx`

11.24 Fl_Clock Class Reference

This widget provides a round analog clock display.

```
#include <Fl_Clock.H>
```

Inheritance diagram for `Fl_Clock`:

Public Member Functions

- `Fl_Clock` (int X, int Y, int W, int H, const char *L=0)
Create an `Fl_Clock` widget using the given position, size, and label string.
- `Fl_Clock` (uchar t, int X, int Y, int W, int H, const char *L)
Create an `Fl_Clock` widget using the given clock type t, position, size, and label string.
- int `handle` (int) `FL_OVERRIDE`
Handles the specified event.
- `~Fl_Clock` ()
The destructor removes the clock.

Public Member Functions inherited from `Fl_Clock_Output`

- `Fl_Clock_Output` (int X, int Y, int W, int H, const char *L=0)
Create a new `Fl_Clock_Output` widget with the given position, size and label.
- int `hour` () const
Returns the displayed hour (0 to 23).
- int `minute` () const
Returns the displayed minute (0 to 59).
- int `second` () const
Returns the displayed second (0 to 60, 60=leap second).
- int `shadow` () const
Returns the shadow drawing mode of the hands.
- void `shadow` (int mode)
Sets the shadow drawing mode of the hands.

- `ulong value () const`
Returns the displayed time.
- `void value (int H, int m, int s)`
Set the displayed time.
- `void value (ulong v)`
Set the displayed time.

Public Member Functions inherited from `FI_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
Activates the widget.
- `unsigned int active () const`
Returns whether the widget is active.
- `int active_r () const`
Returns whether the widget and all of its parents are active.
- `FI_Align align () const`
Gets the label alignment.
- `void align (FI_Align alignment)`
Sets the label alignment.
- `long argument () const`
Gets the current user data (long) argument that is passed to the callback function.
- `void argument (long v)`
Sets the current user data (long) argument that is passed to the callback function.
- `virtual class FI_GL_Window * as_gl_window ()`
Returns an `FI_GL_Window` pointer if this widget is an `FI_GL_Window`.
- `virtual class FI_GL_Window const * as_gl_window () const`
- `virtual FI_Group * as_group ()`
Returns an `FI_Group` pointer if this widget is an `FI_Group`.
- `virtual FI_Group const * as_group () const`
- `virtual FI_Window * as_window ()`
Returns an `FI_Window` pointer if this widget is an `FI_Window`.
- `virtual FI_Window const * as_window () const`
- `void bind_deimage (FI_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void bind_deimage (int f)`
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- `void bind_image (FI_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `void bind_image (int f)`
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FI_Boxtype box () const`
Gets the box type of the widget.
- `void box (FI_Boxtype new_box)`
Sets the box type for the widget.
- `FI_Callback_p callback () const`
Gets the current callback function for the widget.
- `void callback (FI_Callback *cb)`
Sets the current callback function for the widget.
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`

- Sets the current callback function and managed user data for the widget.*

 - void [callback](#) ([FI_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.

 - void [callback](#) ([FI_Callback0](#) *cb)

Sets the current callback function for the widget.

 - void [callback](#) ([FI_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.

 - unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.

 - void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.

 - void [clear_changed](#) ()

Marks the value of the widget as unchanged.

 - void [clear_damage](#) ([uchar](#) c=0)

Clears or sets the damage flags.

 - void [clear_output](#) ()

Sets a widget to accept input.

 - void [clear_visible](#) ()

Hides the widget.

 - void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.

 - [FI_Color](#) [color](#) () const

Gets the background color of the widget.

 - void [color](#) ([FI_Color](#) bg)

Sets the background color of the widget.

 - void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)

Sets the background and selection color of the widget.

 - [FI_Color](#) [color2](#) () const

For back compatibility only.

 - void [color2](#) (unsigned a)

For back compatibility only.

 - int [contains](#) (const [FI_Widget](#) *w) const

Checks if w is a child of this widget.

 - void [copy_label](#) (const char *new_label)

Sets the current label.

 - void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.

 - [uchar](#) [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.

 - void [damage](#) ([uchar](#) c)

Sets the damage bits for the widget.

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

 - int [damage_resize](#) (int, int, int, int)

Internal use only.

 - void [deactivate](#) ()

Deactivates the widget.

 - [FI_Image](#) * [deimage](#) ()

Gets the image that is used as part of the widget label when in the inactive state.

 - const [FI_Image](#) * [deimage](#) () const

Gets the image that is used as part of the widget label when in the inactive state.

- void [deimage](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- int [deimage_bound](#) () const
Returns whether the inactive image is managed by the widget.
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const

- Gets the font to use.*

 - void [labelfont](#) ([FI_Font](#) f)

Sets the font to use.
- [FI_Fontsize](#) [labelsize](#) () const

Gets the font size in pixels.
- void [labelsize](#) ([FI_Fontsize](#) pix)

Sets the font size in pixels.
- [FI_Labeltype](#) [labeltype](#) () const

Gets the label type.
- void [labeltype](#) ([FI_Labeltype](#) a)

Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const

Returns if a widget is used for output only.
- [FI_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.
- void [parent](#) ([FI_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)

Changes the size or position of the widget.
- [FI_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([FI_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.

- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)
Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const
Gets the widget position in its window.
- int [y](#) () const
Gets the widget position in its window.
- virtual [~Fl_Widget](#) ()
Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from [FI_Widget](#)

- static void [default_callback](#) ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [FI_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,
[FORCE_POSITION](#) = 1<<4 , [NON_MODAL](#) = 1<<5 , [SHORTCUT_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7
, [OVERRIDE](#) = 1<<8 , [VISIBLE_FOCUS](#) = 1<<9 , [COPIED_LABEL](#) = 1<<10 , [CLIP_CHILDREN](#) = 1<<11
, [MENU_WINDOW](#) = 1<<12 , [TOOLTIP_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO_OVERLAY](#) = 1<<15
, [GROUP_RELATIVE](#) = 1<<16 , [COPIED_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC_USE_ACCENTS_MENU](#)
= 1<<19 ,

[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

Protected Member Functions inherited from [FI_Clock_Output](#)

- void [draw](#) () [FL_OVERRIDE](#)
Draw clock with current position and size.
- void [draw](#) (int X, int Y, int W, int H)
Draw clock with the given position and size.

Protected Member Functions inherited from [FI_Widget](#)

- void [clear_flag](#) (unsigned int c)
Clears a flag in the flags mask.
- void [draw_backdrop](#) () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void [draw_box](#) () const
Draws the widget box according its box style.
- void [draw_box](#) ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void [draw_box](#) ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void [draw_focus](#) () const
Draws a focus rectangle around the widget.
- void [draw_focus](#) ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void [draw_focus](#) ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void [draw_label](#) () const

- Draws the widget's label at the defined label position.*
- void [draw_label](#) (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FL_Widget](#) (int [x](#), int [y](#), int [w](#), int [h](#), const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void [h](#) (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void [w](#) (int v)
Internal use only.
- void [x](#) (int v)
Internal use only.
- void [y](#) (int v)
Internal use only.

11.24.1 Detailed Description

This widget provides a round analog clock display.

[FL_Clock](#) is provided for Forms compatibility. It installs a 1-second timeout callback using [Fl::add_timeout\(\)](#). You can choose the rounded or square type of the clock with [type\(\)](#). Please see [FL_Clock_Output](#) widget for applicable values.

Figure 11.9 FL_SQUARE_CLOCK type

Figure 11.10 FL_ROUND_CLOCK type

class [FL_Clock_Output](#)

11.24.2 Constructor & Destructor Documentation

11.24.2.1 `Fl_Clock()` [1/2]

```
Fl_Clock::Fl_Clock (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Create an [Fl_Clock](#) widget using the given position, size, and label string.

The default clock type is `FL_SQUARE_CLOCK` and the default boxtype is `FL_UP_BOX`.

Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

11.24.2.2 `Fl_Clock()` [2/2]

```
Fl_Clock::Fl_Clock (
    uchar t,
    int X,
    int Y,
    int W,
    int H,
    const char * L)
```

Create an [Fl_Clock](#) widget using the given clock type *t*, position, size, and label string.

The default clock type *t* is `FL_SQUARE_CLOCK`. You can set the clock type to `FL_ROUND_CLOCK` or any other valid clock type. See [Fl_Clock_Output](#) widget for applicable values.

The default boxtype is `FL_UP_BOX` for `FL_SQUARE_CLOCK` and `FL_NO_BOX` for `FL_ROUND_CLOCK`, if set by the constructor. If you change the clock type with [type\(\)](#) later you should also set the boxtype with [box\(\)](#).

Parameters

in	<i>t</i>	type of clock: <code>FL_ROUND_CLOCK</code> or <code>FL_SQUARE_CLOCK</code> (0)
in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

class [Fl_Clock_Output](#)

11.24.3 Member Function Documentation

11.24.3.1 `handle()`

```
int Fl_Clock::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses)

in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

<code>in</code>	<code>event</code>	the kind of event received
-----------------	--------------------	----------------------------

Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

11.25 Fl_Clock_Output Class Reference

This widget can be used to display a program-supplied time.

```
#include <Fl_Clock.H>
```

Inheritance diagram for `Fl_Clock_Output`:

Public Member Functions

- [Fl_Clock_Output](#) (int X, int Y, int W, int H, const char *L=0)
Create a new [Fl_Clock_Output](#) widget with the given position, size and label.
- int [hour](#) () const
Returns the displayed hour (0 to 23).
- int [minute](#) () const
Returns the displayed minute (0 to 59).
- int [second](#) () const
Returns the displayed second (0 to 60, 60=leap second).
- int [shadow](#) () const
Returns the shadow drawing mode of the hands.
- void [shadow](#) (int mode)
Sets the shadow drawing mode of the hands.
- [ulong value](#) () const

- *Returns the displayed time.*
- void **value** (int H, int m, int s)
- *Set the displayed time.*
- void **value** (ulong v)
- *Set the displayed time.*

Public Member Functions inherited from **FI_Widget**

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
- *Activates the widget.*
- unsigned int **active** () const
- *Returns whether the widget is active.*
- int **active_r** () const
- *Returns whether the widget and all of its parents are active.*
- **FI_Align align** () const
- *Gets the label alignment.*
- void **align** (**FI_Align** alignment)
- *Sets the label alignment.*
- long **argument** () const
- *Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
- *Sets the current user data (long) argument that is passed to the callback function.*
- virtual class **FI_Gl_Window** * **as_gl_window** ()
- *Returns an **FI_Gl_Window** pointer if this widget is an **FI_Gl_Window**.*
- virtual class **FI_Gl_Window** const * **as_gl_window** () const
- virtual **FI_Group** * **as_group** ()
- *Returns an **FI_Group** pointer if this widget is an **FI_Group**.*
- virtual **FI_Group** const * **as_group** () const
- virtual **FI_Window** * **as_window** ()
- *Returns an **FI_Window** pointer if this widget is an **FI_Window**.*
- virtual **FI_Window** const * **as_window** () const
- void **bind_deimage** (**FI_Image** *img)
- *Sets the image to use as part of the widget label when in the inactive state.*
- void **bind_deimage** (int f)
- *Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind_image** (**FI_Image** *img)
- *Sets the image to use as part of the widget label when in the active state.*
- void **bind_image** (int f)
- *Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- **FI_Boxtype box** () const
- *Gets the box type of the widget.*
- void **box** (**FI_Boxtype** new_box)
- *Sets the box type for the widget.*
- **FI_Callback_p callback** () const
- *Gets the current callback function for the widget.*
- void **callback** (**FI_Callback** *cb)
- *Sets the current callback function for the widget.*
- void **callback** (**FI_Callback** *cb, **FI_Callback_User_Data** *p, bool auto_free)
- *Sets the current callback function and managed user data for the widget.*

- void `callback` (`FI_Callback` *cb, void *p)
Sets the current callback function and data for the widget.
- void `callback` (`FI_Callback0` *cb)
Sets the current callback function for the widget.
- void `callback` (`FI_Callback1` *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int `changed` () const
Checks if the widget value changed since the last callback.
- void `clear_active` ()
Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()
Marks the value of the widget as unchanged.
- void `clear_damage` (`uchar` c=0)
Clears or sets the damage flags.
- void `clear_output` ()
Sets a widget to accept input.
- void `clear_visible` ()
Hides the widget.
- void `clear_visible_focus` ()
Disables keyboard focus navigation with this widget.
- `FI_Color` `color` () const
Gets the background color of the widget.
- void `color` (`FI_Color` bg)
Sets the background color of the widget.
- void `color` (`FI_Color` bg, `FI_Color` sel)
Sets the background and selection color of the widget.
- `FI_Color` `color2` () const
For back compatibility only.
- void `color2` (unsigned a)
For back compatibility only.
- int `contains` (const `FI_Widget` *w) const
Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)
Sets the current label.
- void `copy_tooltip` (const char *text)
Sets the current tooltip text.
- `uchar` `damage` () const
Returns non-zero if `draw()` needs to be called.
- void `damage` (`uchar` c)
Sets the damage bits for the widget.
- void `damage` (`uchar` c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)
Internal use only.
- void `deactivate` ()
Deactivates the widget.
- `FI_Image` * `deimage` ()
Gets the image that is used as part of the widget label when in the inactive state.
- const `FI_Image` * `deimage` () const
Gets the image that is used as part of the widget label when in the inactive state.
- void `deimage` (`FI_Image` &img)

- Sets the image to use as part of the widget label when in the inactive state.*

 - void `deimage` (`FL_Image` *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

 - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

 - void `do_callback` (`FL_Widget` *widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

 - void `do_callback` (`FL_Widget` *widget, void *arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

 - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

 - int `h` () const
- Gets the widget height.*

 - virtual int `handle` (int event)
- Handles the specified event.*

 - virtual void `hide` ()
- Makes a widget invisible.*

 - int `horizontal_label_margin` ()
- Get the spacing between the label and the horizontal edge of the widget.*

 - void `horizontal_label_margin` (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

 - `FL_Image` * `image` ()
- Gets the image that is used as part of the widget label when in the active state.*

 - const `FL_Image` * `image` () const
- Gets the image that is used as part of the widget label when in the active state.*

 - void `image` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the active state.*

 - void `image` (`FL_Image` *img)
- Sets the image to use as part of the widget label when in the active state.*

 - int `image_bound` () const
- Returns whether the image is managed by the widget.*

 - int `inside` (const `FL_Widget` *wgt) const
- Checks if this widget is a child of wgt.*

 - int `is_label_copied` () const
- Returns whether the current label was assigned with `copy_label()`.*

 - const char * `label` () const
- Gets the current label text.*

 - void `label` (const char *text)
- Sets the current label pointer.*

 - void `label` (`FL_Labeltype` a, const char *b)
- Shortcut to set the label text and type in one call.*

 - int `label_image_spacing` ()
- Return the gap size between the label and the image.*

 - void `label_image_spacing` (int gap)
- Set the gap between the label and the image in pixels.*

 - `FL_Color` `labelcolor` () const
- Gets the label color.*

 - void `labelcolor` (`FL_Color` c)
- Sets the label color.*

- [Fl_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([Fl_Font](#) f)
Sets the font to use.
- [Fl_Fontsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([Fl_Fontsize](#) pix)
Sets the font size in pixels.
- [Fl_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([Fl_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [Fl_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([Fl_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
- [Fl_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

- Makes a widget visible.*

 - void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const

Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const

Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)

Modifies keyboard focus navigation.
- int [visible_r](#) () const

Returns whether a widget and all its parents are visible.
- int [w](#) () const

Gets the widget width.
- [Fl_When](#) [when](#) () const

Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)

Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const

Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const

Gets the widget position in its window.

- int **y** () const
Gets the widget position in its window.
- virtual ~**FL_Widget** ()
Destroys the widget.

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
Draw clock with current position and size.
- void **draw** (int X, int Y, int W, int H)
Draw clock with the given position and size.

Protected Member Functions inherited from **FL_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (**FL_Boxtype** t, **FL_Color** c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (**FL_Boxtype** t, int x, int y, int w, int h, **FL_Color** c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FL_Boxtype** t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FL_Boxtype** t, int x, int y, int w, int h, **FL_Color** bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FL_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from [FL_Widget](#)

- static void [default_callback](#) ([FL_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [FL_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,
[FORCE_POSITION](#) = 1<<4 , [NON_MODAL](#) = 1<<5 , [SHORTCUT_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7
, [OVERRIDE](#) = 1<<8 , [VISIBLE_FOCUS](#) = 1<<9 , [COPIED_LABEL](#) = 1<<10 , [CLIP_CHILDREN](#) = 1<<11
, [MENU_WINDOW](#) = 1<<12 , [TOOLTIP_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO_OVERLAY](#) = 1<<15
, [GROUP_RELATIVE](#) = 1<<16 , [COPIED_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC_USE_ACCENTS_MENU](#)
= 1<<19 ,
[NEEDS_KEYBOARD](#) = 1<<20 , [IMAGE_BOUND](#) = 1<<21 , [DEIMAGE_BOUND](#) = 1<<22 ,
[AUTO_DELETE_USER_DATA](#) = 1<<23 ,
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,
[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

11.25.1 Detailed Description

This widget can be used to display a program-supplied time.

The time shown on the clock is not updated. To display the current time, use [FL_Clock](#) instead.

Figure 11.11 [FL_SQUARE_CLOCK](#) type

Figure 11.12 FL_ROUND_CLOCK type

Values for clock [type\(\)](#) (`#include <FL/Clock.H>`):

```
#define FL_SQUARE_CLOCK      0      // Square Clock variant
#define FL_ROUND_CLOCK      1      // Round Clock variant
#define FL_ANALOG_CLOCK FL_SQUARE_CLOCK // An analog clock is square
#define FL_DIGITAL_CLOCK FL_SQUARE_CLOCK // Not yet implemented
```

11.25.2 Constructor & Destructor Documentation

11.25.2.1 Fl_Clock_Output()

```
Fl_Clock_Output::Fl_Clock_Output (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Create a new [Fl_Clock_Output](#) widget with the given position, size and label.

The default clock type is `FL_SQUARE_CLOCK` and the default boxtype is `FL_UP_BOX`.

Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

11.25.3 Member Function Documentation

11.25.3.1 draw() [1/2]

```
void Fl_Clock_Output::draw (
    void ) [protected], [virtual]
```

Draw clock with current position and size.

Implements [Fl_Widget](#).

11.25.3.2 draw() [2/2]

```
void Fl_Clock_Output::draw (
    int X,
    int Y,
    int W,
    int H) [protected]
```

Draw clock with the given position and size.

Parameters

in	<i>X,Y,W,H</i>	position and size
----	----------------	-------------------

11.25.3.3 hour()

```
int Fl_Clock_Output::hour () const [inline]
```

Returns the displayed hour (0 to 23).

See also

[value\(\)](#), [minute\(\)](#), [second\(\)](#)

11.25.3.4 minute()

```
int Fl_Clock_Output::minute () const [inline]
```

Returns the displayed minute (0 to 59).

See also

[value\(\)](#), [hour\(\)](#), [second\(\)](#)

11.25.3.5 second()

```
int Fl_Clock_Output::second () const [inline]
```

Returns the displayed second (0 to 60, 60=leap second).

See also

[value\(\)](#), [hour\(\)](#), [minute\(\)](#)

11.25.3.6 shadow() [1/2]

```
int Fl_Clock_Output::shadow () const [inline]
```

Returns the shadow drawing mode of the hands.

Returns

shadow drawing mode of the hands

Return values

0	no shadows
1	draw shadows of hands (default)

11.25.3.7 shadow() [2/2]

```
void Fl_Clock_Output::shadow (
    int mode) [inline]
```

Sets the shadow drawing mode of the hands.

Enables (1) or disables (0) drawing the hands with shadows.

Values except 0 and 1 are reserved for future extensions and yield undefined behavior.

The default is to draw the shadows (1).

Parameters

in	mode	1 = shadows (default), 0 = no shadows
----	------	---------------------------------------

11.25.3.8 value() [1/3]

```
ulong Fl_Clock_Output::value () const [inline]
```

Returns the displayed time.

Returns the time in seconds since the UNIX epoch (January 1, 1970).

See also

[value\(ulong\)](#)

11.25.3.9 value() [2/3]

```
void Fl_Clock_Output::value (
    int H,
    int m,
    int s)
```

Set the displayed time.

Set the time in hours, minutes, and seconds.

Parameters

in	<i>H,m,s</i>	displayed time
----	--------------	----------------

See also

[hour\(\)](#), [minute\(\)](#), [second\(\)](#)

11.25.3.10 value() [3/3]

```
void Fl_Clock_Output::value (
    ulong v)
```

Set the displayed time.

Set the time in seconds since the UNIX epoch (January 1, 1970).

Parameters

in	<i>v</i>	seconds since epoch
----	----------	---------------------

See also

[value\(\)](#)

The documentation for this class was generated from the following files:

- Fl_Clock.H
- Fl_Clock.cxx

11.26 Fl_Color_Chooser Class Reference

The [Fl_Color_Chooser](#) widget provides a standard RGB color chooser.

```
#include <Fl_Color_Chooser.H>
```

Inheritance diagram for Fl_Color_Chooser:

Public Member Functions

- double **b** () const
Returns the current blue value.
- **FL_Color_Chooser** (int X, int Y, int W, int H, const char *L=0)
*Creates a new **FL_Color_Chooser** widget using the given position, size, and label string.*
- double **g** () const
Returns the current green value.
- int **handle** (int e) **FL_OVERRIDE**
Handles all events received by this widget.
- int **hsv** (double H, double S, double V)
Set the hsv values.
- double **hue** () const
Returns the current hue.
- int **mode** ()
*Returns which **FL_Color_Chooser** variant is currently active.*
- void **mode** (int newMode)
*Set which **FL_Color_Chooser** variant is currently active.*
- double **r** () const
Returns the current red value.
- int **rgb** (double R, double G, double B)
Sets the current rgb color values.
- double **saturation** () const
Returns the saturation.
- double **value** () const
Returns the value/brightness.

Public Member Functions inherited from **FL_Group**

- **FL_Widget** *& **_ddfdesign_kludge** ()
This is for forms compatibility only.
- void **add** (**FL_Widget** &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** (**FL_Widget** *o)
*See void **FL_Group::add(FL_Widget &w)***
- void **add_resizable** (**FL_Widget** &o)
Adds a widget to the group and makes it the resizable widget.
- **FL_Widget** *const * **array** () const
Returns a pointer to the array of children.
- **FL_Group** const * **as_group** () const **FL_OVERRIDE**
- **FL_Group** * **as_group** () **FL_OVERRIDE**
*Returns an **FL_Group** pointer if this widget is an **FL_Group**.*
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- **FL_Widget** * **child** (int n) const
Returns the n'th child.
- int **children** () const
Returns how many child widgets the group has.
- void **clear** ()
Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()
Returns the current clipping mode.

- void `clip_children` (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int `delete_child` (int n)
Removes the widget at `index` from the group and deletes it.
- void `end` ()
Exactly the same as `current(this->parent())`.
- int `find` (const `FL_Widget` &o) const
*See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const `FL_Widget` *) const
Searches the child array for the widget and returns the index.
- `FL_Group` (int, int, int, int, const char *s=0)
Creates a new `FL_Group` widget using the given position, size, and label string.
- void `focus` (`FL_Widget` *W)
- void `forms_end` ()
This is for forms compatibility only.
- int `handle` (int) `FL_OVERRIDE`
Handles the specified event.
- void `init_sizes` ()
Resets the internal array of widget sizes and positions.
- void `insert` (`FL_Widget` &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void `insert` (`FL_Widget` &o, `FL_Widget` *before)
This does `insert(w, find(before))`.
- void `remove` (`FL_Widget` &)
Removes a widget from the group but does not delete it.
- void `remove` (`FL_Widget` *o)
Removes the widget o from the group.
- void `remove` (int index)
Removes the widget at `index` from the group but does not delete it.
- `FL_Widget` * `resizable` () const
Returns the group's resizable widget.
- void `resizable` (`FL_Widget` &o)
Sets the group's resizable widget.
- void `resizable` (`FL_Widget` *o)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void `resize` (int, int, int, int) `FL_OVERRIDE`
Resizes the `FL_Group` widget and all of its children.
- virtual `~FL_Group` ()
The destructor also deletes all the children.

Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
Activates the widget.
- unsigned int `active` () const
Returns whether the widget is active.
- int `active_r` () const
Returns whether the widget and all of its parents are active.
- `FL_Align` `align` () const

- Gets the label alignment.*

 - void [align](#) ([FI_Align](#) alignment)

Sets the label alignment.
- long [argument](#) () const

Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)

Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()

Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Window](#) * [as_window](#) ()

Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)

Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)

Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const

Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)

Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const

Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)

Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.
- unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()

Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)

Clears or sets the damage flags.
- void [clear_output](#) ()

Sets a widget to accept input.
- void [clear_visible](#) ()

Hides the widget.
- void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.

- [FL_Color color](#) () const
Gets the background color of the widget.
- void [color](#) ([FL_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)
Sets the background and selection color of the widget.
- [FL_Color color2](#) () const
For back compatibility only.
- void [color2](#) (unsigned a)
For back compatibility only.
- int [contains](#) (const [FL_Widget](#) *w) const
Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)
Sets the current label.
- void [copy_tooltip](#) (const char *text)
Sets the current tooltip text.
- [uchar damage](#) () const
Returns non-zero if [draw\(\)](#) needs to be called.
- void [damage](#) ([uchar](#) c)
Sets the damage bits for the widget.
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int [damage_resize](#) (int, int, int, int)
Internal use only.
- void [deactivate](#) ()
Deactivates the widget.
- [FL_Image * deimage](#) ()
Gets the image that is used as part of the widget label when in the inactive state.
- const [FL_Image * deimage](#) () const
Gets the image that is used as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- int [deimage_bound](#) () const
Returns whether the inactive image is managed by the widget.
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)

- Set the spacing between the label and the horizontal edge of the widget.*

 - `FI_Image * image ()`

Gets the image that is used as part of the widget label when in the active state.

 - `const FI_Image * image () const`
- Gets the image that is used as part of the widget label when in the active state.*
- `void image (FI_Image &img)`
- Sets the image to use as part of the widget label when in the active state.*
- `void image (FI_Image *img)`
- Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`
- Returns whether the image is managed by the widget.*
- `int inside (const FI_Widget *wgt) const`
- Checks if this widget is a child of wgt.*
- `int is_label_copied () const`
- Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`
- Gets the current label text.*
- `void label (const char *text)`
- Sets the current label pointer.*
- `void label (FI_Labeltype a, const char *b)`
- Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`
- Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`
- Set the gap between the label and the image in pixels.*
- `FI_Color labelcolor () const`
- Gets the label color.*
- `void labelcolor (FI_Color c)`
- Sets the label color.*
- `FI_Font labelfont () const`
- Gets the font to use.*
- `void labelfont (FI_Font f)`
- Sets the font to use.*
- `FI_Fonsize labelsize () const`
- Gets the font size in pixels.*
- `void labelsize (FI_Fonsize pix)`
- Sets the font size in pixels.*
- `FI_Labeltype labeltype () const`
- Gets the label type.*
- `void labeltype (FI_Labeltype a)`
- Sets the label type.*
- `void measure_label (int &ww, int &hh) const`
- Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`
- Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`
- Sets whether this widget needs a keyboard.*
- `unsigned int output () const`
- Returns if a widget is used for output only.*
- `FI_Group * parent () const`
- Returns a pointer to the parent widget.*

- void [parent](#) (FI_Group *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- [FI_Color selection_color](#) () const
Gets the selection color.
- void [selection_color](#) (FI_Color a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [FI_Window * top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [FI_Window * top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar type](#) () const
Gets the widget type.
- void [type](#) (uchar t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

- Gets the user data for this widget.*
- void **user_data** ([Fl_Callback_User_Data](#) *v, bool auto_free)
 - Sets the user data for this widget.*
- void **user_data** (void *v)
 - Sets the user data for this widget.*
- int **vertical_label_margin** ()
 - Get the spacing between the label and the vertical edge of the widget.*
- void **vertical_label_margin** (int px)
 - Set the spacing between the label and the vertical edge of the widget.*
- unsigned int **visible** () const
 - Returns whether a widget is visible.*
- unsigned int **visible_focus** () const
 - Checks whether this widget has a visible focus.*
- void **visible_focus** (int v)
 - Modifies keyboard focus navigation.*
- int **visible_r** () const
 - Returns whether a widget and all its parents are visible.*
- int **w** () const
 - Gets the widget width.*
- [Fl_When](#) **when** () const
 - Returns the conditions under which the callback is called.*
- void **when** (uchar i)
 - Sets the flags used to decide when a callback is called.*
- [Fl_Window](#) * **window** () const
 - Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const
 - Gets the widget position in its window.*
- int **y** () const
 - Gets the widget position in its window.*
- virtual [~Fl_Widget](#) ()
 - Destroys the widget.*

Static Public Member Functions

- static void **hsv2rgb** (double H, double S, double V, double &R, double &G, double &B)
 - This static method converts HSV colors to RGB colorspace.*
- static void **rgb2hsv** (double R, double G, double B, double &H, double &S, double &V)
 - This static method converts RGB colors to HSV colorspace.*

Static Public Member Functions inherited from [Fl_Group](#)

- static [Fl_Group](#) * **current** ()
 - Returns the currently active group.*
- static void **current** ([Fl_Group](#) *g)
 - Sets the current group.*

Static Public Member Functions inherited from [Fl_Widget](#)

- static void **default_callback** ([Fl_Widget](#) *widget, void *data)
 - The default callback for all widgets that don't set a callback.*
- static unsigned int **label_shortcut** (const char *t)
 - Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test_shortcut** (const char *, const bool require_alt=false)
 - Returns true if the given text t contains the entered '&x' shortcut.*

Related Symbols

(Note that these are not member symbols.)

- int `fi_color_chooser` (const char *name, double &r, double &g, double &b, int cmode)
Pops up a window to let the user pick an arbitrary RGB color.
- int `fi_color_chooser` (const char *name, uchar &r, uchar &g, uchar &b, int cmode)
Pops up a window to let the user pick an arbitrary RGB color.

Additional Inherited Members

Protected Types inherited from FI_Widget

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`

`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

Protected Member Functions inherited from FI_Group

- `FI_Rect * bounds` ()
Returns the internal array of widget sizes and positions.
- void `draw` () `FL_OVERRIDE`
Draws the widget.
- void `draw_child` (FI_Widget &widget) const
Forces a child to redraw.
- void `draw_children` ()
Draws all children of the group.
- void `draw_outside_label` (const FI_Widget &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int `on_insert` (FI_Widget *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int `on_move` (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void `on_remove` (int)
Allow derived groups to act when a child widget is removed from the group.
- int * `sizes` ()
Returns the internal array of widget sizes and positions.
- void `update_child` (FI_Widget &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

11.26.1 Detailed Description

The [FI_Color_Chooser](#) widget provides a standard RGB color chooser.

Figure 11.13 `fl_color_chooser()`

You can place any number of the widgets into a panel of your own design. The diagram shows the widget as part of a color chooser dialog created by the `fl_color_chooser()` function. The `Fl_Color_Chooser` widget contains the hue box, value slider, and rgb input fields from the above diagram (it does not have the color chips or the Cancel or OK buttons). The callback is done every time the user changes the rgb value. It is not done if they move the hue control in a way that produces the *same* rgb value, such as when saturation or value is zero.

The `fl_color_chooser()` function pops up a window to let the user pick an arbitrary RGB color. They can pick the hue and saturation in the "hue box" on the left (hold down CTRL to just change the saturation), and the brightness using the vertical slider. Or they can type the 8-bit numbers into the RGB `Fl_Value_Input` fields, or drag the mouse across them to adjust them. The pull-down menu lets the user set the input fields to show RGB, HSV, or 8-bit RGB (0 to 255).

The user can press CTRL-C to copy the currently selected color value as text in RGB hex format with leading zeroes to the clipboard, for instance `FL_GREEN` would be '00FF00' (since FLTK 1.4.0).

`fl_color_chooser()` returns non-zero if the user picks ok, and updates the RGB values. If the user picks cancel or closes the window this returns zero and leaves RGB unchanged.

If you use the color chooser on an 8-bit screen, it will allocate all the available colors, leaving you no space to exactly represent the color the user picks! You can however use `fl_rectf()` to fill a region with a simulated color using dithering.

Callback reasons can be `FL_REASON_DRAGGED`, `FL_REASON_CHANGED`, or `FL_REASON_RESELECTED`.

11.26.2 Constructor & Destructor Documentation

11.26.2.1 Fl_Color_Chooser()

```
Fl_Color_Chooser::Fl_Color_Chooser (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Creates a new `Fl_Color_Chooser` widget using the given position, size, and label string.

The recommended dimensions are 200x95. The color is initialized to black.

Parameters

in	<code>X,Y,W,H</code>	position and size of the widget
in	<code>L</code>	widget label, default is no label

11.26.3 Member Function Documentation

11.26.3.1 b()

```
double Fl_Color_Chooser::b () const [inline]
```

Returns the current blue value.

$0 \leq b \leq 1$.

11.26.3.2 g()

```
double Fl_Color_Chooser::g () const [inline]
```

Returns the current green value.

$0 \leq g \leq 1$.

11.26.3.3 handle()

```
int Fl_Color_Chooser::handle (
    int e) [virtual]
```

Handles all events received by this widget.

This specific `handle()` method processes the standard 'copy' function as seen in other input widgets. It copies the current color value to the clipboard as a string in RGB format ('RRGGBB').

This format is independent of the [Fl_Color_Chooser](#) display format setting. No other formats are supplied. The keyboard events handled are:

- ctrl-c
- ctrl-x
- ctrl-Insert

All other events are processed by the parent class [Fl_Group](#).

This enables the **user** to choose a color value, press `ctrl-c` to copy the value to the clipboard and paste it into a color selection widget in another application window or any other text input (e.g. a preferences dialog or an editor).

Note

Keyboard event handling by the current focus widget has priority, hence moving the focus to one of the buttons or selecting text in one of the input widgets effectively disables this special method.

Parameters

in	e	current event
----	---	---------------

Returns

1 if event has been handled, 0 otherwise

See also

[Fl_Group::handle\(int\)](#)

Reimplemented from [Fl_Widget](#).

11.26.3.4 hsv()

```
int Fl_Color_Chooser::hsv (
    double H,
    double S,
    double V)
```

Set the hsv values.

The passed values are clamped (or for hue, modulus 6 is used) to get legal values. Does not do the callback.

Parameters

in	H,S,V	color components.
----	-------	-------------------

Returns

1 if a new hsv value was set, 0 if the hsv value was the previous one.

11.26.3.5 hsv2rgb()

```
void Fl_Color_Chooser::hsv2rgb (
    double H,
    double S,
    double V,
    double & R,
    double & G,
    double & B) [static]
```

This *static* method converts HSV colors to RGB colorspace.

Parameters

in	<i>H,S,V</i>	color components
out	<i>R,G,B</i>	color components

11.26.3.6 hue()

```
double Fl_Color_Chooser::hue () const [inline]
```

Returns the current hue.

$0 \leq \text{hue} < 6$. Zero is red, one is yellow, two is green, etc. *This value is convenient for the internal calculations - some other systems consider hue to run from zero to one, or from 0 to 360.*

11.26.3.7 mode() [1/2]

```
int Fl_Color_Chooser::mode () [inline]
```

Returns which [Fl_Color_Chooser](#) variant is currently active.

Returns

color modes are rgb(0), byte(1), hex(2), or hsv(3)

11.26.3.8 mode() [2/2]

```
void Fl_Color_Chooser::mode (
    int newMode)
```

Set which [Fl_Color_Chooser](#) variant is currently active.

Parameters

in	<i>newMode</i>	color modes are rgb(0), byte(1), hex(2), or hsv(3)
----	----------------	--

11.26.3.9 r()

```
double Fl_Color_Chooser::r () const [inline]
```

Returns the current red value.

$0 \leq r \leq 1$.

11.26.3.10 rgb()

```
int Fl_Color_Chooser::rgb (
    double R,
    double G,
    double B)
```

Sets the current rgb color values.

Does not do the callback. Does not clamp (but out of range values will produce psychedelic effects in the hue selector).

Parameters

in	<i>R,G,B</i>	color components.
----	--------------	-------------------

Returns

1 if a new rgb value was set, 0 if the rgb value was the previous one.

11.26.3.11 rgb2hsv()

```
void Fl_Color_Chooser::rgb2hsv (
    double R,
    double G,
    double B,
    double & H,
    double & S,
    double & V) [static]
```

This *static* method converts RGB colors to HSV colorspace.

Parameters

in	<i>R,G,B</i>	color components
out	<i>H,S,V</i>	color components

11.26.3.12 saturation()

```
double Fl_Color_Chooser::saturation () const [inline]
```

Returns the saturation.

0 <= saturation <= 1.

11.26.3.13 value()

```
double Fl_Color_Chooser::value () const [inline]
```

Returns the value/brightness.

0 <= value <= 1.

The documentation for this class was generated from the following files:

- [Fl_Color_Chooser.H](#)
- [Fl_Color_Chooser.cxx](#)

11.27 Fl_Copy_Surface Class Reference

Supports copying of graphical data to the clipboard.

```
#include <Fl_Copy_Surface.H>
```

Inheritance diagram for Fl_Copy_Surface:

Public Member Functions

- [Fl_Copy_Surface](#) (int *w*, int *h*)
the constructor
- int **h** ()
Returns the pixel height of the copy surface.
- bool **is_current** () [FL_OVERRIDE](#)
Is this surface the current drawing surface?
- void **origin** (int **x*, int **y*) [FL_OVERRIDE](#)

- Computes the coordinates of the current origin of graphics functions.*

 - void [origin](#) (int x, int y) [FL_OVERRIDE](#)

Sets the position of the origin of graphics in the drawable part of the drawing surface.
- int [printable_rect](#) (int *w, int *h) [FL_OVERRIDE](#)

Computes the width and height of the drawable area of the drawing surface.
- void [set_current](#) () [FL_OVERRIDE](#)

Make this surface the current drawing surface.
- int [w](#) ()

Returns the pixel width of the copy surface.
- [~Fl_Copy_Surface](#) ()

the destructor

Public Member Functions inherited from [Fl_Widget_Surface](#)

- void [draw](#) ([Fl_Widget](#) *widget, int delta_x=0, int delta_y=0)

Draws the widget on the drawing surface.
- void [draw_decorated_window](#) ([Fl_Window](#) *win, int x_offset=0, int y_offset=0)

Draws a window with its title bar and frame if any.
- void [print_window_part](#) ([Fl_Window](#) *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)

Draws a rectangular part of an on-screen window.

Public Member Functions inherited from [Fl_Surface_Device](#)

- [Fl_Graphics_Driver](#) * [driver](#) ()

Returns the graphics driver of this drawing surface.
- virtual [~Fl_Surface_Device](#) ()

The destructor.

Protected Member Functions

- void [translate](#) (int x, int y) [FL_OVERRIDE](#)

Translates the current graphics origin accounting for the current rotation.
- void [untranslate](#) () [FL_OVERRIDE](#)

Undoes the effect of a previous [translate\(\)](#) call.

Protected Member Functions inherited from [Fl_Widget_Surface](#)

- [Fl_Widget_Surface](#) ([Fl_Graphics_Driver](#) *d)

The constructor.

Protected Member Functions inherited from [Fl_Surface_Device](#)

- void [driver](#) ([Fl_Graphics_Driver](#) *graphics_driver)

Sets the graphics driver of this drawing surface.
- virtual void [end_current](#) ()

FLTK calls this each time a surface ceases to be the current drawing surface.
- [Fl_Surface_Device](#) ([Fl_Graphics_Driver](#) *graphics_driver)

Constructor that sets the graphics driver to use for the created surface.

Additional Inherited Members

Static Public Member Functions inherited from [Fl_Surface_Device](#)

- static [Fl_Surface_Device](#) * [pop_current](#) ()
Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void [push_current](#) ([Fl_Surface_Device](#) *new_current)
Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static [Fl_Surface_Device](#) * [surface](#) ()
The current drawing surface.

Protected Attributes inherited from [Fl_Widget_Surface](#)

- int [x_offset](#)
horizontal offset to the origin of graphics coordinates
- int [y_offset](#)
vertical offset to the origin of graphics coordinates

11.27.1 Detailed Description

Supports copying of graphical data to the clipboard.

After creation of an [Fl_Copy_Surface](#) object, make it the current drawing surface calling [Fl_Surface_Device::push_current\(\)](#), and all subsequent graphics requests will be recorded in the clipboard. It's possible to draw widgets (using [Fl_Copy_Surface::draw\(\)](#)) or to use any of the [Drawing functions](#) or the [Color & Font functions](#). Finally, delete the [Fl_Copy_Surface](#) object to load the clipboard with the graphical data.

[Fl_Gl_Window](#) 's can be copied to the clipboard as well.

Usage example:

```
Fl_Widget *g = ...; // a widget you want to copy to the clipboard
Fl_Copy_Surface *copy_surf = new Fl_Copy_Surface(g->w(), g->h()); // create an Fl_Copy_Surface object
Fl_Surface_Device::push_current(copy_surf); // direct graphics requests to the clipboard
fl_color(FL_WHITE); fl_rectf(0, 0, g->w(), g->h()); // draw a white background
copy_surf->draw(g); // draw the g widget in the clipboard
Fl_Surface_Device::pop_current(); // direct graphics requests back to their previous destination
delete copy_surf; // after this, the clipboard is loaded
```

Platform details:

- Windows: Transparent RGB images copy without transparency. The graphical data are copied to the clipboard in two formats: 1) as an 'enhanced metafile'; 2) as a color bitmap. Applications to which the clipboard content is pasted can use the format that suits them best.
- Mac OS: The graphical data are copied to the clipboard (a.k.a. pasteboard) in two 'flavors': 1) in vectorial form as PDF data; 2) in bitmap form as a TIFF image. Applications to which the clipboard content is pasted can use the flavor that suits them best.
- X11 and Wayland: the graphical data are copied to the clipboard as an image in BMP format.

11.27.2 Constructor & Destructor Documentation

11.27.2.1 [Fl_Copy_Surface\(\)](#)

```
Fl_Copy_Surface::Fl_Copy_Surface (
    int w,
    int h)
```

the constructor

Parameters

<i>w,h</i>	Width and height of the drawing surface in FLTK units
------------	---

11.27.3 Member Function Documentation

11.27.3.1 is_current()

```
bool Fl_Copy_Surface::is_current () [virtual]
```

Is this surface the current drawing surface?

Reimplemented from [Fl_Surface_Device](#).

11.27.3.2 origin() [1/2]

```
void Fl_Copy_Surface::origin (
    int * x,
    int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

Parameters

out	x,y	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-----	---

Reimplemented from [Fl_Widget_Surface](#).

11.27.3.3 origin() [2/2]

```
void Fl_Copy_Surface::origin (
    int x,
    int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. Origin() calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl_Paged_Device](#)).

Parameters

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---

Reimplemented from [Fl_Widget_Surface](#).

11.27.3.4 printable_rect()

```
int Fl_Copy_Surface::printable_rect (
    int * w,
    int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl_Paged_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

Returns

0 if OK, non-zero if any error

Reimplemented from [Fl_Widget_Surface](#).

11.27.3.5 set_current()

```
void Fl_Copy_Surface::set_current (
    void ) [virtual]
```

Make this surface the current drawing surface.

This surface will receive all future graphics requests.

Since FLTK 1.4.0 the preferred API to change the current drawing surface is [Fl_Surface_Device::push_current\(\)](#) / [Fl_Surface_Device::pop_current\(\)](#).

Note

It is recommended to use this function only as follows :

- The current drawing surface is the display;
- make current another surface, e.g., an [Fl_Printer](#) or an [Fl_Image_Surface](#) object, calling [set_current\(\)](#) on this object;
- draw to that surface;
- make the display current again with [Fl_Display_Device::display_device\(\)->set_current\(\)](#); don't do any other call to [set_current\(\)](#) before this one.

Other scenarios of drawing surface changes should be performed via [Fl_Surface_Device::push_current\(\)](#) and [Fl_Surface_Device::pop_current\(\)](#).

Reimplemented from [Fl_Surface_Device](#).

11.27.3.6 translate()

```
void Fl_Copy_Surface::translate (
    int x,
    int y) [protected], [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl_Widget_Surface](#).

11.27.3.7 untranslate()

```
void Fl_Copy_Surface::untranslate (
    void ) [protected], [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl_Widget_Surface](#).

The documentation for this class was generated from the following files:

- [Fl_Copy_Surface.H](#)
- [Fl_Copy_Surface.cxx](#)

11.28 Fl_Counter Class Reference

Controls a single floating point value with button (or keyboard) arrows.

```
#include <Fl_Counter.H>
```

Inheritance diagram for [Fl_Counter](#):

**Public Member Functions**

- [Fl_Counter](#) (int X, int Y, int W, int H, const char *L=0)
Creates a new [Fl_Counter](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL_OVERRIDE](#)
Handles the specified event.

- void **lstep** (double a)
Sets the increment for the large step buttons.
- double **step** () const
Returns the increment for normal step buttons.
- void **step** (double a)
Sets the increment for the normal step buttons.
- void **step** (double a, double b)
Sets the increments for the normal and large step buttons.
- **FI_Color** **textcolor** () const
Gets the font color.
- void **textcolor** (**FI_Color** s)
Sets the font color to s.
- **FI_Font** **textfont** () const
Gets the text font.
- void **textfont** (**FI_Font** s)
Sets the text font to s.
- **FI_Fonsize** **textsize** () const
Gets the font size.
- void **textsize** (**FI_Fonsize** s)
Sets the font size to s.
- **~FI_Counter** ()
Destroys the valuator.

Public Member Functions inherited from **FI_Valuator**

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.
- virtual int **format** (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double **increment** (double, int)
Adds n times the step value to the passed value.
- double **maximum** () const
Gets the maximum value for the valuator.
- void **maximum** (double a)
Sets the maximum value for the valuator.
- double **minimum** () const
Gets the minimum value for the valuator.
- void **minimum** (double a)
Sets the minimum value for the valuator.
- void **precision** (int digits)
Sets the step value to $1.0 / 10^{\text{digits}}$.
- void **range** (double a, double b)
Sets the minimum and maximum values for the valuator.
- double **round** (double)
Round the passed value to the nearest step increment.
- double **step** () const
Gets or sets the step value.
- void **step** (double a, int b)
*See double **FI_Valuator::step()** const.*

- void **step** (double s)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (int a)
See double [FI_Valuator::step\(\)](#) const.
- double **value** () const
Gets the floating point(double) value.
- int **value** (double)
Sets the current value.
- **~FI_Valuator** () **FL_OVERRIDE**
Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) **align** () const
Gets the label alignment.
- void **align** ([FI_Align](#) alignment)
Sets the label alignment.
- long **argument** () const
Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * **as_gl_window** ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * **as_gl_window** () const
- virtual [FI_Group](#) * **as_group** ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * **as_group** () const
- virtual [FI_Window](#) * **as_window** ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * **as_window** () const
- void **bind_deimage** ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind_image** ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void **bind_image** (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) **box** () const
Gets the box type of the widget.
- void **box** ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) **callback** () const

- Gets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
- Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, void *p)
- Sets the current callback function and data for the widget.*
- void [callback](#) ([FI_Callback0](#) *cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
- Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*
- void [clear_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*
- void [clear_changed](#) ()
- Marks the value of the widget as unchanged.*
- void [clear_damage](#) ([uchar](#) c=0)
- Clears or sets the damage flags.*
- void [clear_output](#) ()
- Sets a widget to accept input.*
- void [clear_visible](#) ()
- Hides the widget.*
- void [clear_visible_focus](#) ()
- Disables keyboard focus navigation with this widget.*
- [FI_Color](#) [color](#) () const
- Gets the background color of the widget.*
- void [color](#) ([FI_Color](#) bg)
- Sets the background color of the widget.*
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)
- Sets the background and selection color of the widget.*
- [FI_Color](#) [color2](#) () const
- For back compatibility only.*
- void [color2](#) (unsigned a)
- For back compatibility only.*
- int [contains](#) (const [FI_Widget](#) *w) const
- Checks if w is a child of this widget.*
- void [copy_label](#) (const char *new_label)
- Sets the current label.*
- void [copy_tooltip](#) (const char *text)
- Sets the current tooltip text.*
- [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*
- void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int [damage_resize](#) (int, int, int, int)
- Internal use only.*
- void [deactivate](#) ()
- Deactivates the widget.*

- `FI_Image * deimage ()`
Gets the image that is used as part of the widget label when in the inactive state.
- `const FI_Image * deimage () const`
Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (FI_Image &img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (FI_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
Returns whether the inactive image is managed by the widget.
- `void do_callback (FI_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with default arguments.
- `void do_callback (FI_Widget *widget, long arg, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void do_callback (FI_Widget *widget, void *arg=0, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, FI_Align) const`
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
Gets the widget height.
- `virtual void hide ()`
Makes a widget invisible.
- `int horizontal_label_margin ()`
Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`
Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image * image ()`
Gets the image that is used as part of the widget label when in the active state.
- `const FI_Image * image () const`
Gets the image that is used as part of the widget label when in the active state.
- `void image (FI_Image &img)`
Sets the image to use as part of the widget label when in the active state.
- `void image (FI_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`
Returns whether the image is managed by the widget.
- `int inside (const FI_Widget *wgt) const`
Checks if this widget is a child of wgt.
- `int is_label_copied () const`
Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`
Gets the current label text.
- `void label (const char *text)`
Sets the current label pointer.
- `void label (FI_Labeltype a, const char *b)`
Shortcut to set the label text and type in one call.
- `int label_image_spacing ()`
Return the gap size between the label and the image.
- `void label_image_spacing (int gap)`
Set the gap between the label and the image in pixels.
- `FI_Color labelcolor () const`

- Gets the label color.*

 - void [labelcolor](#) ([FI_Color](#) c)
- Sets the label color.*

 - [FI_Font](#) [labelfont](#) () const
- Gets the font to use.*

 - void [labelfont](#) ([FI_Font](#) f)
- Sets the font to use.*

 - [FI_Fontsize](#) [labelsizesize](#) () const
- Gets the font size in pixels.*

 - void [labelsizesize](#) ([FI_Fontsize](#) pix)
- Sets the font size in pixels.*

 - [FI_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

 - void [labeltype](#) ([FI_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

 - bool [needs_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

 - void [needs_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

 - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

 - [FI_Group](#) * [parent](#) () const
- Returns a pointer to the parent widget.*

 - void [parent](#) ([FI_Group](#) *p)
- Internal use only - "for hacks only".*

 - void [position](#) (int X, int Y)
- Repositions the window or widget.*

 - void [redraw](#) ()
- Schedules the drawing of the widget.*

 - void [redraw_label](#) ()
- Schedules the drawing of the label.*

 - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

 - [FI_Color](#) [selection_color](#) () const
- Gets the selection color.*

 - void [selection_color](#) ([FI_Color](#) a)
- Sets the selection color.*

 - void [set_active](#) ()
- Marks the widget as active without sending events or changing focus.*

 - void [set_changed](#) ()
- Marks the value of the widget as changed.*

 - void [set_output](#) ()
- Sets a widget to output only.*

 - void [set_visible](#) ()
- Makes the widget visible.*

 - void [set_visible_focus](#) ()
- Enables keyboard focus navigation with this widget.*

 - int [shortcut_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)
Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const

- Returns a pointer to the nearest parent window up the widget hierarchy.*
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~FL_Widget ()`
Destroys the widget.

Protected Member Functions

- `void arrow_widths (int &w1, int &w2)`
Compute sizes (widths) of arrow boxes.
- `void draw () FL_OVERRIDE`
Draws the widget.

Protected Member Functions inherited from FL_Valuator

- `FL_Valuator (int X, int Y, int W, int H, const char *L)`
Creates a new FL_Valuator widget using the given position, size, and label string.
- `void handle_drag (double newvalue)`
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- `void handle_push ()`
Stores the current value in the previous value.
- `void handle_release ()`
Called after an FL_WHEN_RELEASE event is received and before the callback.
- `int horizontal () const`
Tells if the valuator is an FL_HORIZONTAL one.
- `double previous_value () const`
Gets the previous floating point value before an event changed it.
- `void set_value (double v)`
Sets the current floating point value.
- `double softclamp (double)`
Clamps the value, but accepts v if the previous value is not already out of range.
- `virtual void value_damage ()`
Asks for partial redraw.

Protected Member Functions inherited from FL_Widget

- `void clear_flag (unsigned int c)`
Clears a flag in the flags mask.
- `void draw_backdrop () const`
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
Draws the widget box according its box style.
- `void draw_box (FL_Boxtype t, FL_Color c) const`
Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`
Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`
Draws a focus rectangle around the widget.

- void `draw_focus` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` bg) const
Draws a focus box for the widget at the given position and size.
- void `draw_label` () const
Draws the widget's label at the defined label position.
- void `draw_label` (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- `FI_Widget` (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int `flags` () const
Gets the widget flags mask.
- void `h` (int v)
Internal use only.
- void `set_flag` (unsigned int c)
Sets a flag in the flags mask.
- void `w` (int v)
Internal use only.
- void `x` (int v)
Internal use only.
- void `y` (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `FI_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.28.1 Detailed Description

Controls a single floating point value with button (or keyboard) arrows. Double arrows buttons achieve larger steps than simple arrows.

See also

[Fl_Spinner](#) for [value](#) input with vertical [step](#) arrows.

Figure 11.14 Fl_Counter

The type of an [Fl_Counter](#) object can be set using [Fl_Widget::type\(uchar\)](#) to:

- `FL_NORMAL_COUNTER`: Displays a counter with 4 arrow buttons.
- `FL_SIMPLE_COUNTER`: Displays a counter with only 2 arrow buttons.

11.28.2 Constructor & Destructor Documentation

11.28.2.1 Fl_Counter()

```
Fl_Counter::Fl_Counter (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Creates a new [Fl_Counter](#) widget using the given position, size, and label string. The default type is `FL_NORMAL_COUNTER`.

Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

11.28.3 Member Function Documentation

11.28.3.1 arrow_widths()

```
void Fl_Counter::arrow_widths (
    int & w1,
    int & w2) [protected]
```

Compute sizes (widths) of arrow boxes.

This method computes the two sizes of the arrow boxes of [Fl_Counter](#). You can override it in a subclass if you want to draw fancy arrows or change the layout. However, the basic layout is fixed and can't be changed w/o overriding the [draw\(\)](#) and [handle\(\)](#) methods.

Basic layout:

```
+-----+-----+-----+-----+
| « | < |   value   | > | » |
+-----+-----+-----+-----+
```

The returned value `w2` should be zero if the counter [type\(\)](#) is `FL_SIMPLE_COUNTER`.

Parameters

out	<i>w1</i>	width of single arrow box
-----	-----------	---------------------------

out	w2	width of double arrow box
-----	----	---------------------------

11.28.3.2 draw()

```
void Fl_Counter::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

11.28.3.3 handle()

```
int Fl_Counter::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	event	the kind of event received
----	-------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

11.28.3.4 lstep()

```
void Fl_Counter::lstep (
    double a) [inline]
```

Sets the increment for the large step buttons.

The default value is 1.0.

Parameters

in	<i>a</i>	large step increment.
----	----------	-----------------------

11.28.3.5 step() [1/2]

```
void Fl_Counter::step (
    double a) [inline]
```

Sets the increment for the normal step buttons.

Parameters

in	<i>a</i>	normal step increment.
----	----------	------------------------

11.28.3.6 step() [2/2]

```
void Fl_Counter::step (
    double a,
    double b) [inline]
```

Sets the increments for the normal and large step buttons.

Parameters

in	<i>a,b</i>	normal and large step increments.
----	------------	-----------------------------------

The documentation for this class was generated from the following files:

- Fl_Counter.H
- Fl_Counter.cxx

11.29 Fl_Device_Plugin Class Reference

This plugin socket allows the integration of new device drivers for special window or screen types.

```
#include <Fl_Device.H>
```

Inheritance diagram for Fl_Device_Plugin:

**Public Member Functions**

- **Fl_Device_Plugin** (const char *pluginName)
The constructor.
- virtual const char * **klass** ()
Returns the class name.
- virtual const char * **name** ()=0
Returns the plugin name.
- virtual int **print** (Fl_Widget *w)=0
Prints a widget.
- virtual Fl_RGB_Image * **rectangle_capture** (Fl_Widget *widget, int x, int y, int w, int h)=0
Captures a rectangle of a widget as an image.

Public Member Functions inherited from [Fl_Plugin](#)

- [Fl_Plugin](#) (const char *class, const char *name)
Create a plugin.
- virtual `~Fl_Plugin ()`
Clear the plugin and remove it from the database.

Static Public Member Functions

- static [Fl_Device_Plugin](#) * `opengl_plugin ()`
Returns the OpenGL plugin.

11.29.1 Detailed Description

This plugin socket allows the integration of new device drivers for special window or screen types.

This class is not intended for use outside the FLTK library. It is currently used to provide an automated printing service and screen capture for OpenGL windows, if linked with `fltk_gl`.

11.29.2 Member Function Documentation

11.29.2.1 `rectangle_capture()`

```
virtual Fl\_RGB\_Image * Fl\_Device\_Plugin::rectangle\_capture (  
    Fl\_Widget * widget,  
    int x,  
    int y,  
    int w,  
    int h) [pure virtual]
```

Captures a rectangle of a widget as an image.

Returns

The captured pixels as an RGB image

The documentation for this class was generated from the following files:

- [Fl_Device.H](#)
- `Fl_Device.cxx`

11.30 [Fl_Dial](#) Class Reference

The [Fl_Dial](#) widget provides a circular dial to control a single floating point value.

```
#include <Fl\_Dial.H>
```

Inheritance diagram for [Fl_Dial](#):

Public Member Functions

- short [angle1](#) () const
Sets Or gets the angles used for the minimum and maximum values.
- void **angle1** (short a)
See short [angle1\(\)](#) const.
- short **angle2** () const
See short [angle1\(\)](#) const.
- void **angle2** (short a)
See short [angle1\(\)](#) const.
- void **angles** (short a, short b)
See short [angle1\(\)](#) const.
- [FI_Dial](#) (int x, int y, int w, int h, const char *l=0)
Creates a new [FI_Dial](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL_OVERRIDE](#)
Allow subclasses to handle event based on current position and size.

Public Member Functions inherited from [FI_Valuator](#)

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.
- virtual int [format](#) (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double [increment](#) (double, int)
Adds n times the step value to the passed value.
- double **maximum** () const
Gets the maximum value for the valuator.
- void **maximum** (double a)
Sets the maximum value for the valuator.
- double **minimum** () const
Gets the minimum value for the valuator.
- void **minimum** (double a)
Sets the minimum value for the valuator.
- void [precision](#) (int digits)
Sets the step value to $1.0 / 10^{\text{digits}}$.
- void [range](#) (double a, double b)
Sets the minimum and maximum values for the valuator.
- double [round](#) (double)
Round the passed value to the nearest step increment.
- double [step](#) () const
Gets or sets the step value.
- void **step** (double a, int b)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (double s)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (int a)
See double [FI_Valuator::step\(\)](#) const.
- double [value](#) () const
Gets the floating point(double) value.
- int [value](#) (double)

Sets the current value.

- `~FI_Valuator ()` [FL_OVERRIDE](#)

Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
Activates the widget.
- `unsigned int active () const`
Returns whether the widget is active.
- `int active_r () const`
Returns whether the widget and all of its parents are active.
- `FI_Align align () const`
Gets the label alignment.
- `void align (FI_Align alignment)`
Sets the label alignment.
- `long argument () const`
Gets the current user data (long) argument that is passed to the callback function.
- `void argument (long v)`
Sets the current user data (long) argument that is passed to the callback function.
- `virtual class FI_GL_Window * as_gl_window ()`
Returns an [FI_GL_Window](#) pointer if this widget is an [FI_GL_Window](#).
- `virtual class FI_GL_Window const * as_gl_window () const`
- `virtual FI_Group * as_group ()`
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- `virtual FI_Group const * as_group () const`
- `virtual FI_Window * as_window ()`
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- `virtual FI_Window const * as_window () const`
- `void bind_deimage (FI_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void bind_deimage (int f)`
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- `void bind_image (FI_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `void bind_image (int f)`
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FI_Boxtype box () const`
Gets the box type of the widget.
- `void box (FI_Boxtype new_box)`
Sets the box type for the widget.
- `FI_Callback_p callback () const`
Gets the current callback function for the widget.
- `void callback (FI_Callback *cb)`
Sets the current callback function for the widget.
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`
Sets the current callback function and managed user data for the widget.
- `void callback (FI_Callback *cb, void *p)`
Sets the current callback function and data for the widget.

- void `callback` (`FI_Callback0` *cb)
Sets the current callback function for the widget.
- void `callback` (`FI_Callback1` *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int `changed` () const
Checks if the widget value changed since the last callback.
- void `clear_active` ()
Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()
Marks the value of the widget as unchanged.
- void `clear_damage` (`uchar` c=0)
Clears or sets the damage flags.
- void `clear_output` ()
Sets a widget to accept input.
- void `clear_visible` ()
Hides the widget.
- void `clear_visible_focus` ()
Disables keyboard focus navigation with this widget.
- `FI_Color` `color` () const
Gets the background color of the widget.
- void `color` (`FI_Color` bg)
Sets the background color of the widget.
- void `color` (`FI_Color` bg, `FI_Color` sel)
Sets the background and selection color of the widget.
- `FI_Color` `color2` () const
For back compatibility only.
- void `color2` (unsigned a)
For back compatibility only.
- int `contains` (const `FI_Widget` *w) const
Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)
Sets the current label.
- void `copy_tooltip` (const char *text)
Sets the current tooltip text.
- `uchar` `damage` () const
Returns non-zero if `draw()` needs to be called.
- void `damage` (`uchar` c)
Sets the damage bits for the widget.
- void `damage` (`uchar` c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)
Internal use only.
- void `deactivate` ()
Deactivates the widget.
- `FI_Image` * `deimage` ()
Gets the image that is used as part of the widget label when in the inactive state.
- const `FI_Image` * `deimage` () const
Gets the image that is used as part of the widget label when in the inactive state.
- void `deimage` (`FI_Image` &img)
Sets the image to use as part of the widget label when in the inactive state.
- void `deimage` (`FI_Image` *img)

- Sets the image to use as part of the widget label when in the inactive state.*

 - `int deimage_bound () const`

Returns whether the inactive image is managed by the widget.
- `void do_callback (FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with default arguments.
- `void do_callback (FI_Widget *widget, long arg, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with arbitrary arguments.
- `void do_callback (FI_Widget *widget, void *arg=0, FI_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, FI_Align) const`

Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`

Gets the widget height.
- `virtual void hide ()`

Makes a widget invisible.
- `int horizontal_label_margin ()`

Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`

Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image * image ()`

Gets the image that is used as part of the widget label when in the active state.
- `const FI_Image * image () const`

Gets the image that is used as part of the widget label when in the active state.
- `void image (FI_Image &img)`

Sets the image to use as part of the widget label when in the active state.
- `void image (FI_Image *img)`

Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`

Returns whether the image is managed by the widget.
- `int inside (const FI_Widget *wgt) const`

Checks if this widget is a child of wgt.
- `int is_label_copied () const`

Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`

Gets the current label text.
- `void label (const char *text)`

Sets the current label pointer.
- `void label (FI_Labeltype a, const char *b)`

Shortcut to set the label text and type in one call.
- `int label_image_spacing ()`

Return the gap size between the label and the image.
- `void label_image_spacing (int gap)`

Set the gap between the label and the image in pixels.
- `FI_Color labelcolor () const`

Gets the label color.
- `void labelcolor (FI_Color c)`

Sets the label color.
- `FI_Font labelfont () const`

Gets the font to use.
- `void labelfont (FI_Font f)`

Sets the font to use.

- [FL_Fonsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
- [FL_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([FL_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()

- Gives the widget the keyboard focus.*

 - unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const

Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const

Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)

Modifies keyboard focus navigation.
- int [visible_r](#) () const

Returns whether a widget and all its parents are visible.
- int [w](#) () const

Gets the widget width.
- [Fl_When](#) [when](#) () const

Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)

Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const

Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const

Gets the widget position in its window.
- int [y](#) () const

Gets the widget position in its window.
- virtual [~Fl_Widget](#) ()

Destroys the widget.

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
Draws dial at current position and size.
- void **draw** (int X, int Y, int W, int H)
Draws dial at given position and size.
- int **handle** (int event, int X, int Y, int W, int H)
Allows subclasses to handle event based on given position and size.

Protected Member Functions inherited from FI_Valuator

- **FI_Valuator** (int X, int Y, int W, int H, const char *L)
Creates a new FI_Valuator widget using the given position, size, and label string.
- void **handle_drag** (double newvalue)
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push** ()
Stores the current value in the previous value.
- void **handle_release** ()
Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)
Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void **value_damage** ()
Asks for partial redraw.

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.

- `Fl_Widget` (int `x`, int `y`, int `w`, int `h`, const char *`label`=0L)
Creates a widget at the given position and size.
- unsigned int `flags` () const
Gets the widget flags mask.
- void `h` (int `v`)
Internal use only.
- void `set_flag` (unsigned int `c`)
Sets a flag in the flags mask.
- void `w` (int `v`)
Internal use only.
- void `x` (int `v`)
Internal use only.
- void `y` (int `v`)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget` *`widget`, void *`data`)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *`t`)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool `require_alt`=false)
Returns true if the given text `t` contains the entered '&x' shortcut.

Protected Types inherited from `Fl_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.30.1 Detailed Description

The `Fl_Dial` widget provides a circular dial to control a single floating point value.

Figure 11.15 `Fl_Dial`

Use `type()` to set the type of the dial to:

- `FL_NORMAL_DIAL` - Draws a normal dial with a knob.
- `FL_LINE_DIAL` - Draws a dial with a line.
- `FL_FILL_DIAL` - Draws a dial with a filled arc.

11.30.2 Constructor & Destructor Documentation

11.30.2.1 Fl_Dial()

```
Fl_Dial::Fl_Dial (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0)
```

Creates a new [Fl_Dial](#) widget using the given position, size, and label string. The default type is `FL_NORMAL_DIAL`.

11.30.3 Member Function Documentation

11.30.3.1 angle1()

```
short Fl_Dial::angle1 () const [inline]
```

Sets Or gets the angles used for the minimum and maximum values.

The default values are 45 and 315 (0 degrees is straight down and the angles progress clockwise). Normally `angle1` is less than `angle2`, but if you reverse them the dial moves counter-clockwise.

11.30.3.2 draw() [1/2]

```
void Fl_Dial::draw (
    void ) [protected], [virtual]
```

Draws dial at current position and size.

Implements [Fl_Widget](#).

11.30.3.3 draw() [2/2]

```
void Fl_Dial::draw (
    int X,
    int Y,
    int W,
    int H) [protected]
```

Draws dial at given position and size.

Parameters

in	<i>X,Y,W,H</i>	position and size
----	----------------	-------------------

11.30.3.4 handle() [1/2]

```
int Fl_Dial::handle (
    int event,
    int X,
    int Y,
    int W,
    int H) [protected]
```

Allows subclasses to handle event based on given position and size.

Parameters

in	<i>event,X,Y,W,H</i>	event to handle, related position and size.
----	----------------------	---

11.30.3.5 handle() [2/2]

```
int Fl_Dial::handle (
    int e) [virtual]
```

Allow subclasses to handle event based on current position and size.

Reimplemented from [Fl_Widget](#).

The documentation for this class was generated from the following files:

- [Fl_Dial.H](#)
- [Fl_Dial.cxx](#)

11.31 Fl_Display_Device Class Reference

The computer's display.

```
#include <Fl_Device.H>
```

Inheritance diagram for [Fl_Display_Device](#):

**Static Public Member Functions**

- static [Fl_Display_Device](#) * **display_device** ()
Returns a pointer to the unique display device.

Static Public Member Functions inherited from [Fl_Surface_Device](#)

- static [Fl_Surface_Device](#) * **pop_current** ()
Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void **push_current** ([Fl_Surface_Device](#) *new_current)
Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static [Fl_Surface_Device](#) * **surface** ()
The current drawing surface.

Additional Inherited Members**Public Member Functions inherited from [Fl_Surface_Device](#)**

- [Fl_Graphics_Driver](#) * **driver** ()
Returns the graphics driver of this drawing surface.
- virtual bool **is_current** ()
Is this surface the current drawing surface?
- virtual void **set_current** (void)
Make this surface the current drawing surface.
- virtual **~Fl_Surface_Device** ()
The destructor.

Protected Member Functions inherited from [Fl_Surface_Device](#)

- void **driver** (Fl_Graphics_Driver *graphics_driver)
Sets the graphics driver of this drawing surface.
- virtual void **end_current** ()
FLTK calls this each time a surface ceases to be the current drawing surface.
- **Fl_Surface_Device** (Fl_Graphics_Driver *graphics_driver)
Constructor that sets the graphics driver to use for the created surface.

11.31.1 Detailed Description

The computer's display.

When FLTK begins to access the computer's display, it creates an object of class [Fl_Display_Device](#) and makes it the current drawing surface.

The documentation for this class was generated from the following files:

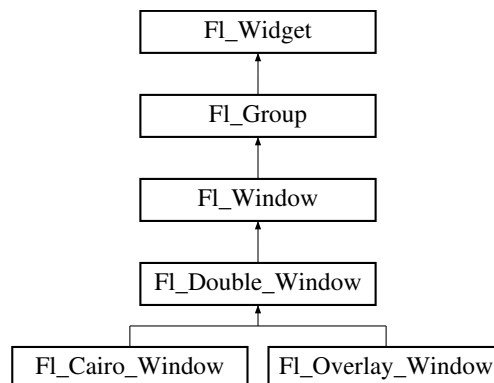

- [Fl_Device.H](#)
- [Fl_Device.cxx](#)

11.32 Fl_Double_Window Class Reference

The [Fl_Double_Window](#) provides a double-buffered window.

```
#include <Fl_Double_Window.H>
```

Inheritance diagram for [Fl_Double_Window](#):

Public Member Functions

- [Fl_Double_Window](#) * **as_double_window** () **FL_OVERRIDE**
Return non-null if this is an [Fl_Double_Window](#) object.
- **Fl_Double_Window** (int W, int H, const char *l=0)
Creates a new [Fl_Double_Window](#) widget using the given position, size, and label (title) string.
- **Fl_Double_Window** (int X, int Y, int W, int H, const char *l=0)
*See [Fl_Double_Window::Fl_Double_Window\(int w, int h, const char *label = 0\)](#)*
- void **flush** () **FL_OVERRIDE**
Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).
- void **hide** () **FL_OVERRIDE**
Makes a widget invisible.
- void **resize** (int, int, int, int) **FL_OVERRIDE**
Changes the size or position of the widget.
- void **show** () **FL_OVERRIDE**
Makes a widget visible.

- void **show** (int a, char **b)
Same as `FL_Window::show(int a, char **b)`
- `~FL_Double_Window` ()
The destructor also deletes all the children.

Public Member Functions inherited from `FL_Window`

- void `allow_expand_outside_parent` ()
Allow this subwindow to expand outside the area of its parent window.
- virtual class `FL_Overlay_Window * as_overlay_window` ()
Return non-null if this is an `FL_Overlay_Window` object.
- `FL_Window` const * `as_window` () const `FL_OVERRIDE`
- `FL_Window * as_window` () `FL_OVERRIDE`
Returns an `FL_Window` pointer if this widget is an `FL_Window`.
- unsigned int **border** () const
Returns whether the window possesses a border.
- void `border` (int b)
Sets whether or not the window manager border is around the window.
- void `clear_border` ()
Fast inline function to turn the window manager border off.
- void `clear_modal_states` ()
Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void **copy_label** (const char *a)
Sets the window titlebar label to a copy of a character string.
- void `cursor` (const `FL_RGB_Image` *, int, int)
Changes the cursor for this window using the provided image as cursor's shape.
- void `cursor` (`FL_Cursor` c, `FL_Color`, `FL_Color`=`FL_WHITE`)
For back compatibility only.
- void `cursor` (`FL_Cursor`)
Changes the cursor for this window.
- int `decorated_h` () const
Returns the window height including any window title bar and any frame added by the window manager.
- int `decorated_w` () const
Returns the window width including any frame added by the window manager.
- void `default_cursor` (`FL_Cursor` c, `FL_Color`, `FL_Color`=`FL_WHITE`)
For back compatibility only.
- void `default_cursor` (`FL_Cursor`)
Sets the default window cursor.
- void **draw_backdrop** ()
Draw the background image if one is set and is aligned inside.
- `FL_Window` (int w, int h, const char *title=0)
Creates a window from the given width w, height h, and title.
- `FL_Window` (int x, int y, int w, int h, const char *title=0)
Creates a window from the given position (x, y), size (w, h) and title.
- void `free_position` ()
Undoes the effect of a previous `resize()` or `show()` so that the next time `show()` is called the window manager is free to position the window.
- void `fullscreen` ()
Makes the window completely fill one or more screens, without any window manager border visible.
- unsigned int **fullscreen_active** () const
Returns non zero if `FULLSCREEN` flag is set, 0 otherwise.

- void **fullscreen_off** ()
Turns off any side effects of [fullscreen\(\)](#)
- void **fullscreen_off** (int X, int Y, int W, int H)
Turns off any side effects of [fullscreen\(\)](#) and does [resize\(x,y,w,h\)](#).
- void **fullscreen_screens** (int top, int bottom, int left, int right)
Sets which screens should be used when this window is in fullscreen mode.
- **uchar get_size_range** (int *minw, int *minh, int *maxw=NULL, int *maxh=NULL, int *dw=NULL, int *dh=NULL, int *aspect=NULL)
Gets the allowable range to which the user can resize this window.
- int **handle** (int) [FL_OVERRIDE](#)
Handles the specified event.
- void **hide** () [FL_OVERRIDE](#)
Removes the window from the screen.
- void **hotspot** (const [FL_Widget](#) &p, int offscreen=0)
See void [FL_Window::hotspot](#)(int x, int y, int offscreen = 0)
- void **hotspot** (const [FL_Widget](#) *, int offscreen=0)
See void [FL_Window::hotspot](#)(int x, int y, int offscreen = 0)
- void **hotspot** (int x, int y, int offscreen=0)
Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.
- const void * **icon** () const
Gets the current icon window target dependent data.
- void **icon** (const [FL_RGB_Image](#) *)
Sets or resets a single window icon.
- void **icon** (const void *ic)
Platform-specific method to set the window icon usable on Windows and X11 only.
- void **iconize** ()
Iconifies the window.
- const char * **iconlabel** () const
See void [FL_Window::iconlabel](#)(const char)*
- void **iconlabel** (const char *)
Sets the icon label.
- void **icons** (const [FL_RGB_Image](#) *[], int)
Sets the window icons.
- void **icons** (HICON big_icon, HICON small_icon)
Sets the window icons using HICON handles (Windows platform only).
- const char * **label** () const
See void [FL_Window::label](#)(const char)*
- void **label** (const char *)
Sets the window title bar label.
- void **label** (const char *label, const char *iconlabel)
Sets the icon label.
- void **make_current** ()
Sets things up so that the drawing functions in [<FL/fl_draw.H>](#) will go into this window.
- void **maximize** ()
Maximizes a top-level window to its current screen.
- unsigned int **maximize_active** () const
Returns whether the window is currently maximized.
- unsigned int **menu_window** () const
Returns true if this window is a menu window.
- unsigned int **modal** () const

- Returns true if this window is modal.*

 - unsigned int **non_modal** () const

Returns true if this window is modal or non-modal.
- [fl_uintptr_t os_id](#) ()

Returns a platform-specific identification of a shown window, or 0 if not shown.
- unsigned int **override** () const

Returns non zero if OVERRIDE flag is set, 0 otherwise.
- void [resize](#) (int X, int Y, int W, int H) [FL_OVERRIDE](#)

Changes the size and position of the window.
- int [screen_num](#) ()

The number of the screen containing the mapped window.
- void [screen_num](#) (int screen_num)

Set the number of the screen where to map the window.
- void [set_menu_window](#) ()

Marks the window as a menu window.
- void [set_modal](#) ()

A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).
- void [set_non_modal](#) ()

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.
- void **set_override** ()

Activates the flags NOBORDER|OVERRIDE.
- void [set_tooltip_window](#) ()

Marks the window as a tooltip window.
- const [Fl_Image](#) * [shape](#) ()

Returns the image controlling the window shape or NULL.
- void [shape](#) (const [Fl_Image](#) &b)

Set the window's shape with an [Fl_Image](#).
- void [shape](#) (const [Fl_Image](#) *img)

Assigns a non-rectangular shape to the window.
- void [show](#) () [FL_OVERRIDE](#)

Puts the window on the screen.
- void [show](#) (int argc, char **argv)

Puts the window on the screen with [show\(\)](#) and parses command-line arguments.
- int [shown](#) ()

Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#)).
- void [size_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)

Sets the allowable range to which the user can resize this window.
- unsigned int **tooltip_window** () const

Returns true if this window is a tooltip window.
- void [un_maximize](#) ()

Returns a previously maximized top-level window to its previous size.
- void [wait_for_expose](#) ()

Waits for the window to be displayed after calling [show\(\)](#).
- int **x_root** () const

Gets the x position of the window on the screen.
- const char * [xclass](#) () const

Returns the xclass for this window, or a default.
- void [xclass](#) (const char *c)

Sets the xclass for this window.

- `int y_root () const`
Gets the y position of the window on the screen.
- `virtual ~FL_Window ()`
The destructor also deletes all the children.

Public Member Functions inherited from FL_Group

- `FL_Widget *& _ddfdesign_kludge ()`
This is for forms compatibility only.
- `void add (FL_Widget &)`
The widget is removed from its current group (if any) and then added to the end of this group.
- `void add (FL_Widget *o)`
See void FL_Group::add(FL_Widget &w)
- `void add_resizable (FL_Widget &o)`
Adds a widget to the group and makes it the resizable widget.
- `FL_Widget *const * array () const`
Returns a pointer to the array of children.
- `FL_Group const * as_group () const FL_OVERRIDE`
- `FL_Group * as_group () FL_OVERRIDE`
Returns an FL_Group pointer if this widget is an FL_Group.
- `void begin ()`
Sets the current group so you can build the widget tree by just constructing the widgets.
- `FL_Widget * child (int n) const`
Returns the n'th child.
- `int children () const`
Returns how many child widgets the group has.
- `void clear ()`
Deletes all child widgets from memory recursively.
- `unsigned int clip_children ()`
Returns the current clipping mode.
- `void clip_children (int c)`
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- `virtual int delete_child (int n)`
Removes the widget at index from the group and deletes it.
- `void end ()`
Exactly the same as current(this->parent()).
- `int find (const FL_Widget &o) const`
*See int FL_Group::find(const FL_Widget *w) const.*
- `int find (const FL_Widget *) const`
Searches the child array for the widget and returns the index.
- `FL_Group (int, int, int, int, const char * = 0)`
Creates a new FL_Group widget using the given position, size, and label string.
- `void focus (FL_Widget *W)`
- `void forms_end ()`
This is for forms compatibility only.
- `void init_sizes ()`
Resets the internal array of widget sizes and positions.
- `void insert (FL_Widget &, int i)`
The widget is removed from its current group (if any) and then inserted into this group.
- `void insert (FL_Widget &o, FL_Widget *before)`
This does insert(w, find(before)).

- void `remove` (`FI_Widget` &)
Removes a widget from the group but does not delete it.
- void `remove` (`FI_Widget` *o)
Removes the widget o from the group.
- void `remove` (int index)
Removes the widget at index from the group but does not delete it.
- `FI_Widget` * `resizable` () const
Returns the group's resizable widget.
- void `resizable` (`FI_Widget` &o)
Sets the group's resizable widget.
- void `resizable` (`FI_Widget` *o)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual `~FI_Group` ()
The destructor also deletes all the children.

Public Member Functions inherited from `FI_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
Activates the widget.
- unsigned int `active` () const
Returns whether the widget is active.
- int `active_r` () const
Returns whether the widget and all of its parents are active.
- `FI_Align` align () const
Gets the label alignment.
- void `align` (`FI_Align` alignment)
Sets the label alignment.
- long `argument` () const
Gets the current user data (long) argument that is passed to the callback function.
- void `argument` (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class `FI_Gl_Window` * `as_gl_window` ()
Returns an FI_Gl_Window pointer if this widget is an FI_Gl_Window.
- virtual class `FI_Gl_Window` const * `as_gl_window` () const
- void `bind_deimage` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the inactive state.
- void `bind_deimage` (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void `bind_image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- void `bind_image` (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FI_Boxtype` box () const
Gets the box type of the widget.
- void `box` (`FI_Boxtype` new_box)
Sets the box type for the widget.
- `FI_Callback_p` callback () const
Gets the current callback function for the widget.
- void `callback` (`FI_Callback` *cb)

- Sets the current callback function for the widget.*

 - void `callback` (`FI_Callback` *cb, `FI_Callback_User_Data` *p, bool auto_free)

Sets the current callback function and managed user data for the widget.
- void `callback` (`FI_Callback` *cb, void *p)

Sets the current callback function and data for the widget.
- void `callback` (`FI_Callback0` *cb)

Sets the current callback function for the widget.
- void `callback` (`FI_Callback1` *cb, long p=0)

Sets the current callback function for the widget.
- unsigned int `changed` () const

Checks if the widget value changed since the last callback.
- void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()

Marks the value of the widget as unchanged.
- void `clear_damage` (`uchar` c=0)

Clears or sets the damage flags.
- void `clear_output` ()

Sets a widget to accept input.
- void `clear_visible` ()

Hides the widget.
- void `clear_visible_focus` ()

Disables keyboard focus navigation with this widget.
- `FI_Color` `color` () const

Gets the background color of the widget.
- void `color` (`FI_Color` bg)

Sets the background color of the widget.
- void `color` (`FI_Color` bg, `FI_Color` sel)

Sets the background and selection color of the widget.
- `FI_Color` `color2` () const

For back compatibility only.
- void `color2` (unsigned a)

For back compatibility only.
- int `contains` (const `FI_Widget` *w) const

Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)

Sets the current label.
- void `copy_tooltip` (const char *text)

Sets the current tooltip text.
- `uchar` `damage` () const

Returns non-zero if `draw()` needs to be called.
- void `damage` (`uchar` c)

Sets the damage bits for the widget.
- void `damage` (`uchar` c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)

Internal use only.
- void `deactivate` ()

Deactivates the widget.
- `FI_Image` * `deimage` ()

Gets the image that is used as part of the widget label when in the inactive state.

- `const FL_Image * deimage () const`
Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (FL_Image &img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (FL_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
Returns whether the inactive image is managed by the widget.
- `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with default arguments.
- `void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, FL_Align) const`
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
Gets the widget height.
- `int horizontal_label_margin ()`
Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`
Set the spacing between the label and the horizontal edge of the widget.
- `FL_Image * image ()`
Gets the image that is used as part of the widget label when in the active state.
- `const FL_Image * image () const`
Gets the image that is used as part of the widget label when in the active state.
- `void image (FL_Image &img)`
Sets the image to use as part of the widget label when in the active state.
- `void image (FL_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`
Returns whether the image is managed by the widget.
- `int inside (const FL_Widget *wgt) const`
Checks if this widget is a child of wgt.
- `int is_label_copied () const`
Returns whether the current label was assigned with [copy_label\(\)](#).
- `const char * label () const`
Gets the current label text.
- `void label (const char *text)`
Sets the current label pointer.
- `void label (FL_Labeltype a, const char *b)`
Shortcut to set the label text and type in one call.
- `int label_image_spacing ()`
Return the gap size between the label and the image.
- `void label_image_spacing (int gap)`
Set the gap between the label and the image in pixels.
- `FL_Color labelcolor () const`
Gets the label color.
- `void labelcolor (FL_Color c)`
Sets the label color.
- `FL_Font labelfont () const`

- Gets the font to use.*

 - void [labelfont](#) ([FI_Font](#) f)
- Sets the font to use.*

 - [FI_Fontsize](#) [labelsize](#) () const
- Gets the font size in pixels.*

 - void [labelsize](#) ([FI_Fontsize](#) pix)
- Sets the font size in pixels.*

 - [FI_Labeltype](#) [labeltype](#) () const
- Gets the label type.*

 - void [labeltype](#) ([FI_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

 - bool [needs_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

 - void [needs_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

 - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

 - [FI_Group](#) * [parent](#) () const
- Returns a pointer to the parent widget.*

 - void [parent](#) ([FI_Group](#) *p)
- Internal use only - "for hacks only".*

 - void [position](#) (int X, int Y)
- Repositions the window or widget.*

 - void [redraw](#) ()
- Schedules the drawing of the widget.*

 - void [redraw_label](#) ()
- Schedules the drawing of the label.*

 - [FI_Color](#) [selection_color](#) () const
- Gets the selection color.*

 - void [selection_color](#) ([FI_Color](#) a)
- Sets the selection color.*

 - void [set_active](#) ()
- Marks the widget as active without sending events or changing focus.*

 - void [set_changed](#) ()
- Marks the value of the widget as changed.*

 - void [set_output](#) ()
- Sets a widget to output only.*

 - void [set_visible](#) ()
- Makes the widget visible.*

 - void [set_visible_focus](#) ()
- Enables keyboard focus navigation with this widget.*

 - int [shortcut_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

 - void [shortcut_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

 - void [size](#) (int W, int H)
- Changes the size of the widget.*

 - int [take_focus](#) ()
- Gives the widget the keyboard focus.*

- unsigned int `takeevents` () const
Returns if the widget is able to take events.
- int `test_shortcut` ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const
Gets the current tooltip text.
- void `tooltip` (const char *text)
Sets the current tooltip text.
- `Fl_Window` * `top_window` () const
Returns a pointer to the top-level window for the widget.
- `Fl_Window` * `top_window_offset` (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- uchar `type` () const
Gets the widget type.
- void `type` (uchar t)
Sets the widget type.
- int `use_accents_menu` ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * `user_data` () const
Gets the user data for this widget.
- void `user_data` (`Fl_Callback_User_Data` *v, bool auto_free)
Sets the user data for this widget.
- void `user_data` (void *v)
Sets the user data for this widget.
- int `vertical_label_margin` ()
Get the spacing between the label and the vertical edge of the widget.
- void `vertical_label_margin` (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int `visible` () const
Returns whether a widget is visible.
- unsigned int `visible_focus` () const
Checks whether this widget has a visible focus.
- void `visible_focus` (int v)
Modifies keyboard focus navigation.
- int `visible_r` () const
Returns whether a widget and all its parents are visible.
- int `w` () const
Gets the widget width.
- `Fl_When` `when` () const
Returns the conditions under which the callback is called.
- void `when` (uchar i)
Sets the flags used to decide when a callback is called.
- `Fl_Window` * `window` () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int `x` () const
Gets the widget position in its window.
- int `y` () const
Gets the widget position in its window.
- virtual `~Fl_Widget` ()
Destroys the widget.

Additional Inherited Members**Public Types inherited from [FI_Window](#)**

- typedef struct HICON__ * **HICON**

Static Public Member Functions inherited from [FI_Window](#)

- static [FI_Window](#) * **current** ()
Returns the last window that was made current.
- static void **default_callback** ([FI_Window](#) *, void *v)
Back compatibility: Sets the default callback v for win to call on close event.
- static void **default_icon** (const [FI_RGB_Image](#) *)
Sets a single default window icon.
- static void **default_icons** (const [FI_RGB_Image](#) *[], int)
Sets the default window icons.
- static void **default_icons** (HICON big_icon, HICON small_icon)
Sets the default window icons (Windows platform only).
- static const char * **default_xclass** ()
Returns the default xclass.
- static void **default_xclass** (const char *)
Sets the default window xclass.
- static bool **is_a_rescale** ()
Returns true when a window is being rescaled.
- static char **show_next_window_iconic** ()
Returns the static flag whether the next window should be opened iconified.
- static void **show_next_window_iconic** (char stat)
Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from [FI_Group](#)

- static [FI_Group](#) * **current** ()
Returns the currently active group.
- static void **current** ([FI_Group](#) *g)
Sets the current group.

Static Public Member Functions inherited from [FI_Widget](#)

- static void **default_callback** ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [FI_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,

USERFLAG1 = 1<<31 }
```

flags possible values enumeration.

Protected Member Functions inherited from [Fl_Window](#)

- void [default_size_range](#) ()
Protected method to calculate the default size range of a window.
- void [draw](#) () [FL_OVERRIDE](#)
Draws the widget.
- int [force_position](#) () const
Returns the internal state of the window's `FORCE_POSITION` flag.
- void [force_position](#) (int force)
Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void [free_icons](#) ()
Deletes all icons previously attached to the window.
- int [is_resizable](#) ()
Protected method to determine whether a window is resizable.

Protected Member Functions inherited from [Fl_Group](#)

- [Fl_Rect](#) * [bounds](#) ()
Returns the internal array of widget sizes and positions.
- void [draw_child](#) ([Fl_Widget](#) &widget) const
Forces a child to redraw.
- void [draw_children](#) ()
Draws all children of the group.
- void [draw_outside_label](#) (const [Fl_Widget](#) &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int [on_insert](#) ([Fl_Widget](#) *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int [on_move](#) (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void [on_remove](#) (int)
Allow derived groups to act when a child widget is removed from the group.
- int * [sizes](#) ()
Returns the internal array of widget sizes and positions.
- void [update_child](#) ([Fl_Widget](#) &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from [Fl_Widget](#)

- void [clear_flag](#) (unsigned int c)
Clears a flag in the flags mask.
- void [draw_backdrop](#) () const
If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.
- void [draw_box](#) () const
Draws the widget box according its box style.

- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Static Protected Attributes inherited from FI_Window

- static FI_Window * **current_**
Stores the last window that was made current.

11.32.1 Detailed Description

The [FI_Double_Window](#) provides a double-buffered window. It will draw the window data into an off-screen pixmap, and then copy it to the on-screen window.

11.32.2 Constructor & Destructor Documentation

11.32.2.1 ~FI_Double_Window()

```
FI_Double_Window::~~FI_Double_Window ()
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code.

11.32.3 Member Function Documentation

11.32.3.1 as_double_window()

```
FI_Double_Window * FI_Double_Window::as_double_window () [inline], [virtual]
```

Return non-null if this is an [FI_Double_Window](#) object.

Reimplemented from [FI_Window](#).

11.32.3.2 flush()

```
void Fl_Double_Window::flush () [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Overlay_Window](#).

11.32.3.3 hide()

```
void Fl_Double_Window::hide () [virtual]
```

Makes a widget invisible.

See also

[show\(\)](#), [visible\(\)](#), [visible_r\(\)](#)

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Overlay_Window](#).

11.32.3.4 resize()

```
void Fl_Double_Window::resize (
    int x,
    int y,
    int w,
    int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

`position(X, Y)` is a shortcut for `resize(X, Y, w(), h())`, and `size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Overlay_Window](#).

11.32.3.5 show()

```
void Fl_Double_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like `FL_SHOW`.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send `FL_SHOW` or `FL_HIDE` events to the widget. *Do not change it if the parent is not visible, as this will send false `FL_SHOW` or `FL_HIDE` events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

11.33 Fl_End Class Reference

This is a dummy class that allows you to end a [Fl_Group](#) in a constructor list of a class:

```
#include <Fl_Group.H>
```

Public Member Functions

- [Fl_End\(\)](#)

All it does is calling [Fl_Group::current\(\)->end\(\)](#)

11.33.1 Detailed Description

This is a dummy class that allows you to end a [Fl_Group](#) in a constructor list of a class:

```
class MyClass {
    Fl_Group group;
    Fl_Button button_in_group;
    Fl_End end;
    Fl_Button button_outside_group;
    MyClass();
};

MyClass::MyClass() :
    group(10,10,100,100),
    button_in_group(20,20,60,30),
    end(),
    button_outside_group(10,120,60,30) {
    [...ctor code...]
}
```

The documentation for this class was generated from the following file:

- [Fl_Group.H](#)

11.34 Fl_EPS_File_Surface Class Reference

Encapsulated PostScript drawing surface.

```
#include <Fl_PostScript.H>
```

Inheritance diagram for [Fl_EPS_File_Surface](#):

Public Member Functions

- [int close\(\)](#)

Completes all EPS output.

- [FILE * file\(\)](#)

- Returns the underlying FILE pointer.*
- [FI_EPS_File_Surface](#) (int width, int height, FILE *eps_output, [FI_Color](#) background=FL_WHITE, [FI_PostScript_Close_Command](#) closef=NULL)
- Constructor.*

- [FI_Widget_Surface](#) ([FI_Graphics_Driver](#) *d)
- The constructor.*

Protected Member Functions inherited from [FI_Surface_Device](#)

- void **driver** ([FI_Graphics_Driver](#) *graphics_driver)
- Sets the graphics driver of this drawing surface.*
- virtual void [end_current](#) ()
- FLTK calls this each time a surface ceases to be the current drawing surface.*
- **FI_Surface_Device** ([FI_Graphics_Driver](#) *graphics_driver)
- Constructor that sets the graphics driver to use for the created surface.*

Additional Inherited Members

Static Public Member Functions inherited from Fl_Surface_Device

- static [Fl_Surface_Device](#) * [pop_current](#) ()
Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void [push_current](#) ([Fl_Surface_Device](#) *[new_current](#))
Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static [Fl_Surface_Device](#) * [surface](#) ()
The current drawing surface.

Protected Attributes inherited from Fl_Widget_Surface

- int [x_offset](#)
horizontal offset to the origin of graphics coordinates
- int [y_offset](#)
vertical offset to the origin of graphics coordinates

11.34.1 Detailed Description

Encapsulated PostScript drawing surface.

This drawing surface allows to store any FLTK graphics in vectorial form in an "Encapsulated PostScript" file.

Usage example:

```
Fl_Window *win = ...// Window to draw to an .eps file
int ww = win->decorated_w();
int wh = win->decorated_h();
FILE *eps = fl_fopen("/path/to/mywindow.eps", "w");
if (eps) {
    Fl_EPS_File_Surface *surface = new Fl_EPS_File_Surface(ww, wh, eps, win->color());
    Fl_Surface_Device::push_current(surface);
    surface->draw_decorated_window(win);
    Fl_Surface_Device::pop_current();
    delete surface; // the .eps file is not complete until the destructor was run
}
```

11.34.2 Constructor & Destructor Documentation

11.34.2.1 Fl_EPS_File_Surface()

```
Fl_EPS_File_Surface::Fl_EPS_File_Surface (
    int width,
    int height,
    FILE * eps_output,
    Fl_Color background = FL_WHITE,
    Fl_PostScript_Close_Command closef = NULL)
```

Constructor.

Parameters

<i>width,height</i>	Width and height of the EPS drawing area
<i>eps_output</i>	A writable FILE pointer where the Encapsulated PostScript data will be sent
<i>background</i>	Color expected to cover the background of the EPS drawing area. This parameter affects only the drawing of transparent Fl_RGB_Image objects: transparent areas of RGB images are blended with the <i>background</i> color. Under the X11 + pango platform, transparent RGB images are correctly blended to their background, thus this parameter has no effect.
<i>closef</i>	If not NULL, the destructor or close() will call <code>closef(eps_output)</code> after all EPS data has been sent. If NULL, <code>fclose(eps_output)</code> is called instead. This allows to close the FILE pointer by, e.g., <code>pclose</code> , or, using a function such as <code>"int keep_open(FILE*) {return 0;}"</code> , to keep it open after completion of all output to <i>eps_output</i> . Function <code>closef</code> should return non zero to indicate an error.

11.34.2.2 ~Fl_EPS_File_Surface()

```
Fl_EPS_File_Surface::~~Fl_EPS_File_Surface ()
```

Destructor.

By default, the destructor closes with function `fclose()` the underlying FILE. See the constructor for how to close it differently or to keep it open. Use `close()` before object destruction to receive the status code of output operations. If `close()` is not used and if EPS output results in error, the destructor displays an alert message with `fl_alert()`.

11.34.3 Member Function Documentation

11.34.3.1 close()

```
int Fl_EPS_File_Surface::close ()
```

Completes all EPS output.

The only operation possible with the `Fl_EPS_File_Surface` object after calling `close()` is its destruction.

Returns

The status code of output operations to the FILE object. 0 indicates success.

11.34.3.2 origin() [1/2]

```
void Fl_EPS_File_Surface::origin (
    int * x,
    int * y) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

Parameters

out	x,y	If non-null, *x and *y are set to the horizontal and vertical coordinates of the graphics origin.
-----	-----	---

Reimplemented from `Fl_Widget_Surface`.

11.34.3.3 origin() [2/2]

```
void Fl_EPS_File_Surface::origin (
    int x,
    int y) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous `printable_rect()` call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive `origin()` calls don't combine their effects. `Origin()` calls are not affected by `rotate()` calls (for classes derived from `Fl_Paged_Device`).

Parameters

in	x,y	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.
----	-----	---

Reimplemented from `Fl_Widget_Surface`.

11.34.3.4 printable_rect()

```
int Fl_EPS_File_Surface::printable_rect (
    int * w,
    int * h) [virtual]
```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to `origin()`. If the object is derived from class `Fl_Paged_Device`, values account for the user-selected paper type and print orientation and are changed by `scale()` calls.

Returns

0 if OK, non-zero if any error

Reimplemented from [Fl_Widget_Surface](#).

11.34.3.5 translate()

```
void Fl_EPS_File_Surface::translate (
    int x,
    int y) [virtual]
```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented from [Fl_Widget_Surface](#).

11.34.3.6 untranslate()

```
void Fl_EPS_File_Surface::untranslate (
    void ) [virtual]
```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented from [Fl_Widget_Surface](#).

The documentation for this class was generated from the following file:

- [Fl_PostScript.H](#)

11.35 Fl_File_Browser Class Reference

The [Fl_File_Browser](#) widget displays a list of filenames, optionally with file-specific icons.

```
#include <Fl_File_Browser.H>
```

Inheritance diagram for [Fl_File_Browser](#):

**Public Types**

- enum { **FILES** , **DIRECTORIES** }

Public Types inherited from [Fl_Browser](#)

- enum [Fl_Line_Position](#) { **TOP** , **BOTTOM** , **MIDDLE** }
- For internal use only?*

Public Types inherited from [Fl_Browser_](#)

- enum {
[HORIZONTAL](#) = 1 , [VERTICAL](#) = 2 , [BOTH](#) = 3 , [ALWAYS_ON](#) = 4 ,
[HORIZONTAL_ALWAYS](#) = 5 , [VERTICAL_ALWAYS](#) = 6 , [BOTH_ALWAYS](#) = 7 }
Values for [has_scrollbar\(\)](#).

Public Member Functions

- `const char * errmsg () const`
Returns OS error messages, or NULL if none.
- `void errmsg (const char *emsg)`
Sets OS error message to a string, which can be NULL.
- `int filetype () const`
Sets or gets the file browser type, FILES or DIRECTORIES.
- `void filetype (int t)`
Sets or gets the file browser type, FILES or DIRECTORIES.
- `const char * filter () const`
Sets or gets the filename filter.
- `void filter (const char *pattern)`
Sets or gets the filename filter.
- `FI_File_Browser (int, int, int, int, const char *=0)`
The constructor creates the FI_File_Browser widget at the specified position and size.
- `uchar iconsize () const`
Sets or gets the size of the icons.
- `void iconsize (uchar s)`
Sets or gets the size of the icons.
- `int load (const char *directory, FI_File_Sort_F *sort=fl_numericsort)`
Loads the specified directory into the browser.
- `FI_Fontsize textsize () const`
- `void textsize (FI_Fontsize s)`

Public Member Functions inherited from FI_Browser

- `void add (const char *newtext, void *d=0)`
Adds a new line to the end of the browser.
- `void bottomline (int line)`
Scrolls the browser so the bottom item in the browser is showing the specified line.
- `void clear ()`
Removes all the lines in the browser.
- `char column_char () const`
Gets the current column separator character.
- `void column_char (char c)`
Sets the column separator to c.
- `const int * column_widths () const`
Gets the current column width array.
- `void column_widths (const int *arr)`
Sets the current array to arr.
- `void * data (int line) const`
Returns the user data() for specified line.
- `void data (int line, void *d)`
Sets the user data for specified line to d.
- `void display (int line, int val=1)`
For back compatibility.
- `int displayed (int line) const`
Returns non-zero if line has been scrolled to a position where it is being displayed.
- `FI_Browser (int X, int Y, int W, int H, const char *L=0)`
The constructor makes an empty browser.
- `char format_char () const`

- Gets the current format code prefix character, which by default is '@'.*

 - void **format_char** (char c)

Sets the current format code prefix character to c.
- void **hide** () **FL_OVERRIDE**

Hides the entire FL_Browser widget – opposite of show().
- void **hide** (int line)

Makes line invisible, preventing selection by the user.
- **FL_Image** * **icon** (int line) const

Returns the icon currently defined for line.
- void **icon** (int line, **FL_Image** *icon)

Set the image icon for line to the value icon.
- void **insert** (int line, const char *newtext, void *d=0)

Insert a new entry whose label is newtext above given line, optional data d.
- void **lineposition** (int line, **FL_Line_Position** pos)

Updates the browser so that line is shown at position pos.
- int **load** (const char *filename)

Clears the browser and reads the file, adding each line from the file to the browser.
- void **make_visible** (int line)

Make the item at the specified line visible().
- void **middleline** (int line)

Scrolls the browser so the middle item in the browser is showing the specified line.
- void **move** (int to, int from)

Line from is removed and reinserted at to.
- void **remove** (int line)

Remove entry for given line number, making the browser one line shorter.
- void **remove_icon** (int line)

Removes the icon for line.
- void **replace** (int a, const char *b)

For back compatibility only.
- int **select** (int line, int val=1)

Sets the selection state of the item at line to the value val.
- int **selected** (int line) const

Returns 1 if specified line is selected, 0 if not.
- void **show** () **FL_OVERRIDE**

Shows the entire FL_Browser widget – opposite of hide().
- void **show** (int line)

Makes line visible, and available for selection by user.
- int **size** () const

Returns how many lines are in the browser.
- void **size** (int W, int H)
- void **swap** (int a, int b)

Swaps two browser lines a and b.
- const char * **text** (int line) const

Returns the label text for the specified line.
- void **text** (int line, const char *newtext)

Sets the text for the specified line to newtext.
- **FL_Fontsize** **textsize** () const

Gets the default text size (in pixels) for the lines in the browser.
- void **textsize** (**FL_Fontsize** newSize)

Sets the default text size (in pixels) for the lines in the browser to newSize.
- int **topline** () const

- Returns the line that is currently visible at the top of the browser.*
- void **topline** (int line)
 - Scrolls the browser so the top item in the browser is showing the specified line.*
- int **value** () const
 - Returns the line number of the currently selected line, or 0 if none selected.*
- void **value** (int line)
 - Sets the browser's value(), which selects the specified line.*
- int **visible** (int line) const
 - Returns non-zero if the specified line is visible, 0 if hidden.*
- **~FI_Browser** ()
 - The destructor deletes all list items and destroys the browser.*

Public Member Functions inherited from **FI_Browser_**

- int **deselect** (int docallbacks=0)
 - Deselects all items in the list and returns 1 if the state changed or 0 if it did not.*
- void **display** (void *item)
 - Displays the item, scrolling the list as necessary.*
- int **handle** (int event) **FL_OVERRIDE**
 - Handles the event within the normal widget bounding box.*
- **uchar has_scrollbar** () const
 - Returns the current scrollbar mode, see FI_Browser_::has_scrollbar(uchar)*
- void **has_scrollbar** (uchar mode)
 - Sets whether the widget should have scrollbars or not (default FI_Browser_::BOTH).*
- int **hposition** () const
 - Gets the horizontal scroll position of the list as a pixel position pos.*
- void **hposition** (int)
 - Sets the horizontal scroll position of the list to pixel position pos.*
- int **linespacing** () const
 - Return the height of additional spacing between browser lines.*
- void **linespacing** (int pixels)
 - Add some space between browser lines.*
- int **position** () const
- void **position** (int pos)
- void **position** (int x, int y)
- void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
 - Repositions and/or resizes the browser.*
- void **scrollbar_left** ()
 - Moves the vertical scrollbar to the lefthand side of the list.*
- void **scrollbar_right** ()
 - Moves the vertical scrollbar to the righthand side of the list.*
- int **scrollbar_size** () const
 - Gets the current size of the scrollbars' troughs, in pixels.*
- void **scrollbar_size** (int newSize)
 - Sets the pixel size of the scrollbars' troughs to newSize, in pixels.*
- int **scrollbar_width** () const
 - Returns the global value FI::scrollbar_size().*
- void **scrollbar_width** (int width)
 - Sets the global FI::scrollbar_size(), and forces this instance of the widget to use it.*
- int **select** (void *item, int val=1, int docallbacks=0)
 - Sets the selection state of item to val, and returns 1 if the state changed or 0 if it did not.*

- int [select_only](#) (void *item, int docallbacks=0)
Selects `item` and returns 1 if the state changed or 0 if it did not.
- void [sort](#) (int flags=0)
Sort the items in the browser based on `flags`.
- [FL_Color](#) [textcolor](#) () const
Gets the default text color for the lines in the browser.
- void [textcolor](#) ([FL_Color](#) col)
Sets the default text color for the lines in the browser to color `col`.
- [FL_Font](#) [textfont](#) () const
Gets the default text font for the lines in the browser.
- void [textfont](#) ([FL_Font](#) font)
Sets the default text font for the lines in the browser to `font`.
- [FL_Fonsize](#) [textsize](#) () const
Gets the default text size (in pixels) for the lines in the browser.
- void [textsize](#) ([FL_Fonsize](#) newSize)
Sets the default text size (in pixels) for the lines in the browser to `size`.
- int [vposition](#) () const
Gets the vertical scroll position of the list as a pixel position `pos`.
- void [vposition](#) (int pos)
Sets the vertical scroll position of the list to pixel position `pos`.

Public Member Functions inherited from [FL_Group](#)

- [FL_Widget](#) *& [_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void [add](#) ([FL_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void [add](#) ([FL_Widget](#) *o)
See void [FL_Group::add\(FL_Widget &w\)](#)
- void [add_resizable](#) ([FL_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FL_Widget](#) *const * [array](#) () const
Returns a pointer to the array of children.
- [FL_Group](#) const * [as_group](#) () const [FL_OVERRIDE](#)
- [FL_Group](#) * [as_group](#) () [FL_OVERRIDE](#)
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- void [begin](#) ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL_Widget](#) * [child](#) (int n) const
Returns the `n`'th child.
- int [children](#) () const
Returns how many child widgets the group has.
- void [clear](#) ()
Deletes all child widgets from memory recursively.
- unsigned int [clip_children](#) ()
Returns the current clipping mode.
- void [clip_children](#) (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int [delete_child](#) (int n)
Removes the widget at `index` from the group and deletes it.
- void [end](#) ()

- Exactly the same as `current(this->parent())`.*
- `int find (const FL_Widget &o) const`

*See `int FL_Group::find(const FL_Widget *w) const`.*
- `int find (const FL_Widget *) const`

Searches the child array for the widget and returns the index.
- `FL_Group (int, int, int, int, const char *s=0)`

Creates a new `FL_Group` widget using the given position, size, and label string.
- `void focus (FL_Widget *W)`
- `void forms_end ()`

This is for forms compatibility only.
- `int handle (int) FL_OVERRIDE`

Handles the specified event.
- `void init_sizes ()`

Resets the internal array of widget sizes and positions.
- `void insert (FL_Widget &, int i)`

The widget is removed from its current group (if any) and then inserted into this group.
- `void insert (FL_Widget &o, FL_Widget *before)`

This does `insert(w, find(before))`.
- `void remove (FL_Widget &)`

Removes a widget from the group but does not delete it.
- `void remove (FL_Widget *o)`

Removes the widget `o` from the group.
- `void remove (int index)`

Removes the widget at `index` from the group but does not delete it.
- `FL_Widget * resizable () const`

Returns the group's resizable widget.
- `void resizable (FL_Widget &o)`

Sets the group's resizable widget.
- `void resizable (FL_Widget *o)`

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- `void resize (int, int, int, int) FL_OVERRIDE`

Resizes the `FL_Group` widget and all of its children.
- `virtual ~FL_Group ()`

The destructor also deletes all the children.

Public Member Functions inherited from `FL_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`

Activates the widget.
- `unsigned int active () const`

Returns whether the widget is active.
- `int active_r () const`

Returns whether the widget and all of its parents are active.
- `FL_Align align () const`

Gets the label alignment.
- `void align (FL_Align alignment)`

Sets the label alignment.
- `long argument () const`

Gets the current user data (long) argument that is passed to the callback function.

- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()
Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)
Clears or sets the damage flags.
- void [clear_output](#) ()
Sets a widget to accept input.
- void [clear_visible](#) ()
Hides the widget.
- void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
- [FI_Color](#) [color](#) () const
Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)

- Sets the background and selection color of the widget.*
- [FL_Color](#) `color2` () const
 - For back compatibility only.*
- void `color2` (unsigned a)
 - For back compatibility only.*
- int `contains` (const [FL_Widget](#) *w) const
 - Checks if w is a child of this widget.*
- void `copy_label` (const char *new_label)
 - Sets the current label.*
- void `copy_tooltip` (const char *text)
 - Sets the current tooltip text.*
- [uchar](#) `damage` () const
 - Returns non-zero if [draw\(\)](#) needs to be called.*
- void `damage` ([uchar](#) c)
 - Sets the damage bits for the widget.*
- void `damage` ([uchar](#) c, int x, int y, int w, int h)
 - Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
 - Internal use only.*
- void `deactivate` ()
 - Deactivates the widget.*
- [FL_Image](#) * `deimage` ()
 - Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL_Image](#) * `deimage` () const
 - Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` ([FL_Image](#) &img)
 - Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` ([FL_Image](#) *img)
 - Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
 - Returns whether the inactive image is managed by the widget.*
- void `do_callback` ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
 - Calls the widget callback function with default arguments.*
- void `do_callback` ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
 - Calls the widget callback function with arbitrary arguments.*
- void `do_callback` ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
 - Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, [FL_Align](#)) const
 - Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int `h` () const
 - Gets the widget height.*
- int `horizontal_label_margin` ()
 - Get the spacing between the label and the horizontal edge of the widget.*
- void `horizontal_label_margin` (int px)
 - Set the spacing between the label and the horizontal edge of the widget.*
- [FL_Image](#) * `image` ()
 - Gets the image that is used as part of the widget label when in the active state.*
- const [FL_Image](#) * `image` () const
 - Gets the image that is used as part of the widget label when in the active state.*
- void `image` ([FL_Image](#) &img)
 - Sets the image to use as part of the widget label when in the active state.*

- void [image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FI_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FI_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FI_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FI_Color](#) c)
Sets the label color.
- [FI_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FI_Font](#) f)
Sets the font to use.
- [FI_Fonsize](#) [labelsiz](#) () const
Gets the font size in pixels.
- void [labelsiz](#) ([FI_Fonsize](#) pix)
Sets the font size in pixels.
- [FI_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FI_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FI_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FI_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()

- Schedules the drawing of the label.*

 - `Fl_Color selection_color ()` const

Gets the selection color.
- `void selection_color (Fl_Color a)`

Sets the selection color.
- `void set_active ()`

Marks the widget as active without sending events or changing focus.
- `void set_changed ()`

Marks the value of the widget as changed.
- `void set_output ()`

Sets a widget to output only.
- `void set_visible ()`

Makes the widget visible.
- `void set_visible_focus ()`

Enables keyboard focus navigation with this widget.
- `int shortcut_label ()` const

Returns whether the widget's label uses '&' to indicate shortcuts.
- `void shortcut_label (int value)`

Sets whether the widget's label uses '&' to indicate shortcuts.
- `void size (int W, int H)`

Changes the size of the widget.
- `int take_focus ()`

Gives the widget the keyboard focus.
- `unsigned int takeevents ()` const

Returns if the widget is able to take events.
- `int test_shortcut ()`

Returns true if the widget's label contains the entered '&x' shortcut.
- `const char * tooltip ()` const

Gets the current tooltip text.
- `void tooltip (const char *text)`

Sets the current tooltip text.
- `Fl_Window * top_window ()` const

Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const

Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type ()` const

Gets the widget type.
- `void type (uchar t)`

Sets the widget type.
- `int use_accents_menu ()`

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data ()` const

Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`

Sets the user data for this widget.
- `void user_data (void *v)`

Sets the user data for this widget.
- `int vertical_label_margin ()`

Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`

Set the spacing between the label and the vertical edge of the widget.

- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [FL_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) (uchar i)
Sets the flags used to decide when a callback is called.
- [FL_Window](#) * [window](#) () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const
Gets the widget position in its window.
- int [y](#) () const
Gets the widget position in its window.
- virtual [~FL_Widget](#) ()
Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from [FL_Group](#)

- static [FL_Group](#) * [current](#) ()
Returns the currently active group.
- static void [current](#) ([FL_Group](#) *g)
Sets the current group.

Static Public Member Functions inherited from [FL_Widget](#)

- static void [default_callback](#) ([FL_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Public Attributes inherited from [FL_Browser_](#)

- [FL_Scrollbar](#) [hscrollbar](#)
Horizontal scrollbar.
- [FL_Scrollbar](#) [scrollbar](#)
Vertical scrollbar.

Protected Types inherited from [FL_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,
[FORCE_POSITION](#) = 1<<4 , [NON_MODAL](#) = 1<<5 , [SHORTCUT_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7
, [OVERRIDE](#) = 1<<8 , [VISIBLE_FOCUS](#) = 1<<9 , [COPIED_LABEL](#) = 1<<10 , [CLIP_CHILDREN](#) = 1<<11
, [MENU_WINDOW](#) = 1<<12 , [TOOLTIP_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO_OVERLAY](#) = 1<<15
, [GROUP_RELATIVE](#) = 1<<16 , [COPIED_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC_USE_ACCENTS_MENU](#)
= 1<<19 ,
[NEEDS_KEYBOARD](#) = 1<<20 , [IMAGE_BOUND](#) = 1<<21 , [DEIMAGE_BOUND](#) = 1<<22 ,
[AUTO_DELETE_USER_DATA](#) = 1<<23 ,
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,
[USERFLAG1](#) = 1<<31 }

flags possible values enumeration.

Protected Member Functions inherited from [FL_Browser](#)

- FL_BLINE * [_remove](#) (int line)
Removes the item at the specified line.
- FL_BLINE * [find_line](#) (int line) const
Returns the item for specified line.
- void [insert](#) (int line, FL_BLINE *item)
Insert specified item above line.
- void * [item_at](#) (int line) const [FL_OVERRIDE](#)
Return the item at specified line.
- void * [item_first](#) () const [FL_OVERRIDE](#)
Returns the very first item in the list.
- void * [item_last](#) () const [FL_OVERRIDE](#)
Returns the very last item in the list.
- void * [item_next](#) (void *item) const [FL_OVERRIDE](#)
Returns the next item after item.
- void * [item_prev](#) (void *item) const [FL_OVERRIDE](#)
Returns the previous item before item.
- void [item_select](#) (void *item, int val) [FL_OVERRIDE](#)
Change the selection state of item to the value val.
- int [item_selected](#) (void *item) const [FL_OVERRIDE](#)
See if item is selected.
- void [item_swap](#) (void *a, void *b) [FL_OVERRIDE](#)
Swap the items a and b.
- const char * [item_text](#) (void *item) const [FL_OVERRIDE](#)
Returns the label text for item.
- int [lineno](#) (void *item) const
Returns line number corresponding to item, or zero if not found.
- void [swap](#) (FL_BLINE *a, FL_BLINE *b)
Swap the two items a and b.

Protected Member Functions inherited from FI_Browser_

- void **bbox** (int &X, int &Y, int &W, int &H) const
Returns the bounding box for the interior of the list's display window, inside the scrollbars.
- void **deleting** (void *item)
*This method should be used when *item* is being deleted from the list.*
- int **displayed** (void *item) const
*Returns non-zero if *item* has been scrolled to a position where it is being displayed.*
- void **draw** () **FL_OVERRIDE**
Draws the list within the normal widget bounding box.
- void * **find_item** (int ypos)
*This method returns the item under mouse y position *ypos*.*
- **FI_Browser_** (int X, int Y, int W, int H, const char *L=0)
The constructor makes an empty browser.
- virtual int **full_width** () const
This method may be provided by the subclass to indicate the full width of the item list, in pixels.
- void **inserting** (void *a, void *b)
This method should be used when an item is in the process of being inserted into the list.
- virtual int **item_quick_height** (void *item) const
*This method may be provided by the subclass to return the height of the *item*, in pixels.*
- int **leftedge** () const
This method returns the X position of the left edge of the list area after adjusting for the scrollbar and border, if any.
- void **new_list** ()
This method should be called when the list data is completely replaced or cleared.
- void **redraw_line** (void *item)
*This method should be called when the contents of *item* has changed, but not its height.*
- void **redraw_lines** ()
This method will cause the entire list to be redrawn.
- void **replacing** (void *a, void *b)
*This method should be used when item *a* is being replaced by item *b*.*
- void * **selection** () const
Returns the item currently selected, or NULL if there is no selection.
- void **swapping** (void *a, void *b)
*This method should be used when two items *a* and *b* are being swapped.*
- void * **top** () const
Returns the item that appears at the top of the list.

Protected Member Functions inherited from FI_Group

- **FI_Rect** * **bounds** ()
Returns the internal array of widget sizes and positions.
- void **draw** () **FL_OVERRIDE**
Draws the widget.
- void **draw_child** (**FI_Widget** &widget) const
Forces a child to redraw.
- void **draw_children** ()
Draws all children of the group.
- void **draw_outside_label** (const **FI_Widget** &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int **on_insert** (**FI_Widget** *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int **on_move** (int, int)

- *Allow derived groups to act when a widget is moved within the group.*
- virtual void **on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.
- int * **sizes** ()
Returns the internal array of widget sizes and positions.
- void **update_child** (FI_Widget &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

11.35.1 Detailed Description

The [FI_File_Browser](#) widget displays a list of filenames, optionally with file-specific icons.

11.35.2 Constructor & Destructor Documentation

11.35.2.1 Fl_File_Browser()

```
Fl_File_Browser::Fl_File_Browser (
    int X,
    int Y,
    int W,
    int H,
    const char * I = 0)
```

The constructor creates the [Fl_File_Browser](#) widget at the specified position and size.
The destructor destroys the widget and frees all memory that has been allocated.

11.35.3 Member Function Documentation

11.35.3.1 errmsg() [1/2]

```
const char * Fl_File_Browser::errmsg () const [inline]
```

Returns OS error messages, or NULL if none.
Use when advised.

11.35.3.2 errmsg() [2/2]

```
void Fl_File_Browser::errmsg (
    const char * emsg)
```

Sets OS error message to a string, which can be NULL.
Frees previous if any. void [errmsg\(const char *emsg\)](#);

11.35.3.3 filetype() [1/2]

```
int Fl_File_Browser::filetype () const [inline]
```

Sets or gets the file browser type, FILES or DIRECTORIES.
When set to FILES, both files and directories are shown. Otherwise only directories are shown.

11.35.3.4 filetype() [2/2]

```
void Fl_File_Browser::filetype (
    int t) [inline]
```

Sets or gets the file browser type, FILES or DIRECTORIES.
When set to FILES, both files and directories are shown. Otherwise only directories are shown.

11.35.3.5 filter() [1/2]

```
const char * Fl_File_Browser::filter () const [inline]
```

Sets or gets the filename filter.
The pattern matching uses the [fl_filename_match\(\)](#) function in FLTK.

11.35.3.6 filter() [2/2]

```
void Fl_File_Browser::filter (
    const char * pattern)
```

Sets or gets the filename filter.
The pattern matching uses the [fl_filename_match\(\)](#) function in FLTK.

11.35.3.7 iconsize() [1/2]

```
uchar Fl_File_Browser::iconsize () const [inline]
```

Sets or gets the size of the icons.
The default size is 20 pixels.

11.35.3.8 iconsize() [2/2]

```
void Fl_File_Browser::iconsize (
    uchar s) [inline]
```

Sets or gets the size of the icons.

The default size is 20 pixels.

11.35.3.9 load()

```
int Fl_File_Browser::load (
    const char * directory,
    Fl_File_Sort_F * sort = fl_numeric_sort)
```

Loads the specified directory into the browser.

If icons have been loaded then the correct icon is associated with each file in the list.

If directory is "", all mount points (unix) or drive letters (Windows) are listed.

The sort argument specifies a sort function to be used with [fl_filename_list\(\)](#).

Return value is the number of filename entries, or 0 if none. On error, 0 is returned, and [errmsg\(\)](#) has OS error string if non-NULL.

The documentation for this class was generated from the following files:

- [Fl_File_Browser.H](#)
- [Fl_File_Browser.cxx](#)

11.36 FI_File_Chooser Class Reference

The [Fl_File_Chooser](#) widget displays a standard file selection dialog that supports various selection modes.

Public Types

- enum [Type](#) { [SINGLE](#) = 0 , [MULTI](#) = 1 , [CREATE](#) = 2 , [DIRECTORY](#) = 4 }
- Determines the type of file chooser presented to the user.*

Public Member Functions

- [Fl_Widget](#) * [add_extra](#) ([Fl_Widget](#) *gr)
Adds an extra widget at the bottom of the [Fl_File_Chooser](#) window.
- void [callback](#) (void(*cb)([Fl_File_Chooser](#) *, void *), void *d=0)
Sets the file chooser callback cb and associated data d.
- [Fl_Color](#) [color](#) ()
Gets the background color of the [Fl_File_Browser](#) list.
- void [color](#) ([Fl_Color](#) c)
Sets the background color of the [Fl_File_Browser](#) list.
- int [count](#) ()
Returns the number of selected files.
- char * [directory](#) ()
Gets the current directory.
- void [directory](#) (const char *d)
Sets the current directory.
- const char * [filter](#) ()
Gets the current filename filter patterns.
- void [filter](#) (const char *p)
Sets the current filename filter patterns.
- int [filter_value](#) ()
Gets the current filename filter selection.
- void [filter_value](#) (int f)

- Sets the current filename filter selection.*
- `FL_File_Chooser` (const char *pathname, const char *pattern, int type_val, const char *title)
 - The constructor creates the `FL_File_Chooser` dialog shown.*
- int `h` () const
- void `hide` ()
 - Hides the `FL_File_Chooser` window.*
- uchar `iconsize` ()
 - Gets the size of the icons in the `FL_File_Browser`.*
- void `iconsize` (uchar s)
 - Sets the size of the icons in the `FL_File_Browser`.*
- const char * `label` ()
 - Gets the title bar text for the `FL_File_Chooser`.*
- void `label` (const char *l)
 - Sets the title bar text for the `FL_File_Chooser`.*
- const char * `ok_label` ()
 - Gets the label for the "ok" button in the `FL_File_Chooser`.*
- void `ok_label` (const char *l)
 - Sets the label for the "ok" button in the `FL_File_Chooser`.*
- void `position` (int x, int y)
- int `preview` () const
 - Returns the current state of the preview box.*
- void `preview` (int e)
 - Enable or disable the preview tile.*
- void `rescan` ()
 - Reloads the current directory in the `FL_File_Browser`.*
- void `rescan_keep_filename` ()
 - Rescan the current directory without clearing the filename, then select the file if it is in the list.*
- void `resize` (int x, int y, int w, int h)
- void `show` ()
 - Shows the `FL_File_Chooser` window.*
- int `shown` ()
 - Returns non-zero if the file chooser main window `show()` has been called, but not `hide()`.*
- void `size` (int w, int h)
- `FL_Color` `textcolor` ()
 - Gets the current `FL_File_Browser` text color.*
- void `textcolor` (`FL_Color` c)
 - Sets the current `FL_File_Browser` text color.*
- `FL_Font` `textfont` ()
 - Gets the current `FL_File_Browser` text font.*
- void `textfont` (`FL_Font` f)
 - Sets the current `FL_File_Browser` text font.*
- `FL_Fontsize` `textsize` ()
 - Gets the current `FL_File_Browser` text size.*
- void `textsize` (`FL_Fontsize` s)
 - Sets the current `FL_File_Browser` text size.*
- int `type` ()
 - Gets the current type of `FL_File_Chooser`.*
- void `type` (int t)
 - Sets the current type of `FL_File_Chooser`.*
- void * `user_data` () const
 - Gets the file chooser user data.*

- void **user_data** (void *d)
Sets the file chooser user data d.
- void **value** (const char *filename)
Sets the current value of the selected file.
- const char * **value** (int f=1)
Gets the current value of the selected file(s).
- int **visible** ()
Returns 1 if the [Fl_File_Chooser](#) window is visible.
- int **w** () const
- int **x** () const
- int **y** () const
- ~**Fl_File_Chooser** ()
Destroys the widget and frees all memory used by it.

Public Attributes

- [Fl_Button](#) * **newButton**
The "new directory" button is exported so that application developers can control the appearance and use.
- [Fl_Check_Button](#) * **previewButton**
The "preview" button is exported so that application developers can control the appearance and use.
- [Fl_Check_Button](#) * **showHiddenButton**
When checked, hidden files (i.e., filename begins with dot) are displayed.

Static Public Attributes

- static const char * **add_favorites_label** = "Add to Favorites"
[standard text may be customized at run-time]
- static const char * **all_files_label** = "All Files (*)"
[standard text may be customized at run-time]
- static const char * **custom_filter_label** = "Custom Filter"
[standard text may be customized at run-time]
- static const char * **existing_file_label** = "Please choose an existing file!"
[standard text may be customized at run-time]
- static const char * **favorites_label** = "Favorites"
[standard text may be customized at run-time]
- static const char * **filename_label** = "Filename:"
[standard text may be customized at run-time]
- static const char * **filesystems_label** = [Fl::system_driver\(\)](#)->filesystems_label()
[standard text may be customized at run-time]
- static const char * **hidden_label** = "Show hidden files"
[standard text may be customized at run-time]
- static const char * **manage_favorites_label** = "Manage Favorites"
[standard text may be customized at run-time]
- static const char * **new_directory_label** = "New Directory?"
[standard text may be customized at run-time]
- static const char * **new_directory_tooltip** = "Create a new directory."
[standard text may be customized at run-time]
- static const char * **preview_label** = "Preview"
[standard text may be customized at run-time]
- static const char * **save_label** = "Save"
[standard text may be customized at run-time]
- static const char * **show_label** = "Show:"
[standard text may be customized at run-time]
- static [Fl_File_Sort_F](#) * **sort** = [fl_numericsort](#)
the sort function that is used when loading the contents of a directory.

Protected Member Functions

- void **show_error_box** (int val)
Show error box if val=1, hide if val=0.

Related Symbols

(Note that these are not member symbols.)

- char * **fl_dir_chooser** (const char *message, const char *fname, int relative)
Shows a file chooser dialog and gets a directory.
- char * **fl_file_chooser** (const char *message, const char *pat, const char *fname, int relative)
Shows a file chooser dialog and gets a filename.
- void **fl_file_chooser_callback** (void(*cb)(const char *))
Set the file chooser callback.
- void **fl_file_chooser_ok_label** (const char *l)
Set the "OK" button label.

11.36.1 Detailed Description

The **FI_File_Chooser** widget displays a standard file selection dialog that supports various selection modes.

Figure 11.16 FI_File_Chooser

Features include:

- Multiple filter patterns can be specified, with parenthesis around filters, and tabs to separate each pattern, e.g.:

```
char pattern[] = "Image Files (*.bmp,gif,jpg,png,xbm,xpm)\\t"
                "Web Files (*.htm,html,php)\\t"
                "All Files (*)";
```
- If no "*" pattern is provided, then an entry for "All Files (*)" is automatically added.
- An optional file preview box is provided which can be toggled by programmer or user showing images, or the first 2048 bytes of printable text.

- Preview image loading functions can be registered to provide custom file previews.
- The favorites button shows up to 100 user-saved favorite directories, the user's home directory, and a filesystems item.
- A simple dialog is provided for managing saved directories.
- Shortcut keys are provided:

Shortcut	Description
Alt+a	Adds a directory to the favorites list
Alt+m	Manages the favorites list
Alt+f	Shows the filesystem list
Alt+h	Go to the home directory
Alt+0..9	going to any of the first 10 favorites

The [Fl_File_Chooser](#) widget transmits UTF-8 encoded filenames to its user. It is recommended to open files that may have non-ASCII names with the [fl_fopen\(\)](#) or [fl_open\(\)](#) utility functions that handle these names in a cross-platform way (whereas the standard `fopen()/open()` functions fail on the Windows platform to open files with a non-ASCII name).

The [Fl_File_Chooser](#) class also exports several static values that may be used to localize or customize the appearance of all file chooser dialogs:

Member	Default value
<code>add_favorites_label</code>	"Add to Favorites"
<code>all_files_label</code>	"All Files (*)"
<code>custom_filter_label</code>	"Custom Filter"
<code>existing_file_label</code>	"Please choose an existing file!"
<code>favorites_label</code>	"Favorites"
<code>filename_label</code>	"Filename:"
<code>filesystems_label</code>	"My Computer" (Windows) "File Systems" (all others)
<code>hidden_label</code>	"Show hidden files:"
<code>manage_favorites_label</code>	"Manage Favorites"
<code>new_directory_label</code>	"New Directory?"
<code>new_directory_tooltip</code>	"Create a new directory."
<code>preview_label</code>	"Preview"
<code>save_label</code>	"Save"
<code>show_label</code>	"Show:"
<code>sort</code>	<code>fl_numericsort</code>

The [Fl_File_Chooser::sort](#) member specifies the sort function that is used when loading the contents of a directory and can be customized at run-time.

The [Fl_File_Chooser](#) class also exports the [Fl_File_Chooser::newButton](#) and [Fl_File_Chooser::previewButton](#) widgets so that application developers can control their appearance and use.

11.36.2 Member Enumeration Documentation

11.36.2.1 Type

```
enum Fl_File_Chooser::Type
```

Determines the type of file chooser presented to the user.

Enumerator

SINGLE	Select a single, existing file.
MULTI	Select one or more existing files.
CREATE	When used alone, select a single, existing file or specify a new filename. Can be combined with DIRECTORY (e.g. CREATE DIRECTORY) to have the same effect for directories.
DIRECTORY	Select a single, existing directory. Can be combined with CREATE.

11.36.3 Constructor & Destructor Documentation

11.36.3.1 Fl_File_Chooser()

```
Fl_File_Chooser::Fl_File_Chooser (
    const char * pathname,
    const char * pattern,
    int type_val,
    const char * title)
```

The constructor creates the [Fl_File_Chooser](#) dialog shown.

- The `pathname` argument can be a directory name or a complete file name (in which case the corresponding file is highlighted in the list and in the filename input field.)
- The `pattern` argument can be a NULL string or "*" to list all files, or it can be a series of descriptions and filter strings separated by tab characters (\t). The format of filters is either "Description text (patterns)" or just "patterns". A file chooser that provides filters for HTML and image files might look like:

```
"HTML Files (*.html)\tImage Files (*.{bmp,gif,jpg,png})"
```

The file chooser will automatically add the "All Files (*)" pattern to the end of the string you pass if you do not provide one. The first filter in the string is the default filter. See the FLTK documentation on [fl_filename_match\(\)](#) for the kinds of pattern strings that are supported.

- The `type_val` argument can be one of the [Fl_File_Chooser::Type](#) values.
- The `title` argument is used to set the title bar text for the [Fl_File_Chooser](#) window.

11.36.4 Member Function Documentation

11.36.4.1 add_extra()

```
Fl_Widget * Fl_File_Chooser::add_extra (
    Fl_Widget * extra)
```

Adds an extra widget at the bottom of the [Fl_File_Chooser](#) window.

You can use any [Fl_Widget](#) or [Fl_Group](#). If you use an [Fl_Group](#), set its (x, y) coordinates to (0, 0) and position its children relative to (0, 0) inside the [Fl_Group](#) container widget. Make sure that all child widgets of the [Fl_Group](#) are entirely included inside the bounding box of their parents, i.e. the [Fl_Group](#) widget, and the [Fl_File_Chooser](#) window, respectively.

Note

The width of the [Fl_File_Chooser](#) window is an undocumented implementation detail and may change in the future.

If `extra` is NULL any previous extra widget is removed.

Parameters

<code>in</code>	<code>extra</code>	Custom widget or group to be added to the Fl_File_Chooser window.
-----------------	--------------------	---

Returns

Pointer to previous extra widget or NULL if not set previously.

Note

[Fl_File_Chooser](#) does **not** delete the extra widget in its destructor! The extra widget is removed from the [Fl_File_Chooser](#) window before the [Fl_File_Chooser](#) widget gets destroyed. To prevent memory leakage, don't forget to delete unused extra widgets.

11.36.4.2 filter()

```
void Fl_File_Chooser::filter (
    const char * p)
```

Sets the current filename filter patterns.

The filter patterns use [fl_filename_match\(\)](#). Multiple patterns can be used by separating them with tabs, like `"*.jpg\t*.png\t*.gif\t*"`. In addition, you can provide human-readable labels with the patterns inside parenthesis, like `"JPEG Files (*.jpg)\tPNG Files (*.png)\tGIF Files (*.gif)\tAll Files (*)"`.

Use `filter(NULL)` to show all files.

11.36.4.3 iconsize() [1/2]

```
uchar Fl_File_Chooser::iconsize ()
```

Gets the size of the icons in the [Fl_File_Browser](#).

By default the icon size is set to 1.5 times the [textsize\(\)](#).

11.36.4.4 iconsize() [2/2]

```
void Fl_File_Chooser::iconsize (
    uchar s)
```

Sets the size of the icons in the [Fl_File_Browser](#).

By default the icon size is set to 1.5 times the [textsize\(\)](#).

11.36.4.5 preview()

```
void Fl_File_Chooser::preview (
    int e)
```

Enable or disable the preview tile.

1 = enable preview, 0 = disable preview.

11.36.4.6 shown()

```
int Fl_File_Chooser::shown ()
```

Returns non-zero if the file chooser main window [show\(\)](#) has been called, but not [hide\(\)](#).

See also

[Fl_Window::shown\(\)](#)

11.36.4.7 value() [1/2]

```
void Fl_File_Chooser::value (
    const char * filename)
```

Sets the current value of the selected file.

If a relative path is provided in `filename` it is converted to an absolute path.

If `NULL` or an empty string is provided, the working directory is changed to the user's current directory and the filename is set to "".

After assigning the filename the entire string (if any) is selected, i.e.

- `insert_position()` is 0 (zero)
- `mark()` is `strlen(<expanded filename>)`.

Note

The selection of the entire string may not always be desired but it is kept for backwards compatibility.

Parameters

<code>in</code>	<code>filename</code>	relative or absolute filename, may be NULL or ""
-----------------	-----------------------	--

11.36.4.8 value() [2/2]

```
const char * Fl_File_Chooser::value (
    int f = 1)
```

Gets the current value of the selected file(s).

`f` is a 1-based index into a list of file names. The number of selected files is returned by `Fl_File_Chooser::count()`.

This sample code loops through all selected files:

```
// Get list of filenames user selected from a MULTI chooser
for ( int t=1; t<=chooser->count(); t++ ) {
    const char *filename = chooser->value(t);
    ...
}
```

11.36.5 Member Data Documentation**11.36.5.1 showHiddenButton**

`Fl_Check_Button*` `Fl_File_Chooser::showHiddenButton`

When checked, hidden files (i.e., filename begins with dot) are displayed.

The "showHiddenButton" button is exported so that application developers can control its appearance.

The documentation for this class was generated from the following files:

- `Fl_File_Chooser.H`
- `Fl_File_Chooser.cxx`
- `Fl_File_Chooser2.cxx`
- `fl_file_dir.cxx`

11.37 Fl_File_Icon Class Reference

The `Fl_File_Icon` class manages icon images that can be used as labels in other widgets and as icons in the `FileBrowser` widget.

```
#include <Fl_File_Icon.H>
```

Public Types

- enum {
 ANY , **PLAIN** , **FIFO** , **DEVICE** ,
 LINK , **DIRECTORY** }
- enum {
 END , **COLOR** , **LINE** , **CLOSEDLINE** ,
 POLYGON , **OUTLINEPOLYGON** , **VERTEX** }

Public Member Functions

- short * [add](#) (short d)
Adds a keyword value to the icon array, returning a pointer to it.
- short * [add_color](#) ([FI_Color](#) c)
Adds a color value to the icon array, returning a pointer to it.
- short * [add_vertex](#) (float x, float y)
Adds a vertex value to the icon array, returning a pointer to it.
- short * [add_vertex](#) (int x, int y)
Adds a vertex value to the icon array, returning a pointer to it.
- void **clear** ()
Clears all icon data from the icon.
- void [draw](#) (int x, int y, int w, int h, [FI_Color](#) ic, int active=1)
Draws an icon in the indicated area.
- [FI_File_Icon](#) (const char *p, int t, int nd=0, short *d=0)
Creates a new [FI_File_Icon](#) with the specified information.
- void [label](#) ([FI_Widget](#) *w)
Applies the icon to the widget, registering the [FI_File_Icon](#) label type as needed.
- void [load](#) (const char *f)
Loads the specified icon image.
- int [load_fti](#) (const char *fti)
Loads an SGI icon file.
- int [load_image](#) (const char *i)
Load an image icon file from an image filename.
- [FI_File_Icon](#) * [next](#) ()
Returns next file icon object.
- const char * **pattern** ()
Returns the filename matching pattern for the icon.
- int **size** ()
Returns the number of words of data used by the icon.
- int [type](#) ()
Returns the filetype associated with the icon, which can be one of the following:
- short * **value** ()
Returns the data array for the icon.
- ~[FI_File_Icon](#) ()
The destructor destroys the icon and frees all memory that has been allocated for it.

Static Public Member Functions

- static [FI_File_Icon](#) * [find](#) (const char *filename, int filetype=ANY)
Finds an icon that matches the given filename and file type.
- static [FI_File_Icon](#) * **first** ()
Returns a pointer to the first icon in the list.
- static void [labeltype](#) (const [FI_Label](#) *o, int x, int y, int w, int h, [FI_Align](#) a)
Draw the icon label.
- static void [load_system_icons](#) (void)
Loads all system-defined icons.

11.37.1 Detailed Description

The [FI_File_Icon](#) class manages icon images that can be used as labels in other widgets and as icons in the [FileBrowser](#) widget.

11.37.2 Constructor & Destructor Documentation

11.37.2.1 Fl_File_Icon()

```
Fl_File_Icon::Fl_File_Icon (
    const char * p,
    int t,
    int nd = 0,
    short * d = 0)
```

Creates a new [Fl_File_Icon](#) with the specified information.

Parameters

in	<i>p</i>	filename pattern
in	<i>t</i>	file type
in	<i>nd</i>	number of data values
in	<i>d</i>	data values

11.37.3 Member Function Documentation

11.37.3.1 add()

```
short * Fl_File_Icon::add (
    short d)
```

Adds a keyword value to the icon array, returning a pointer to it.

Parameters

in	<i>d</i>	data value
----	----------	------------

11.37.3.2 add_color()

```
short * Fl_File_Icon::add_color (
    Fl\_Color c) [inline]
```

Adds a color value to the icon array, returning a pointer to it.

Parameters

in	<i>c</i>	color value
----	----------	-------------

11.37.3.3 add_vertex() [1/2]

```
short * Fl_File_Icon::add_vertex (
    float x,
    float y) [inline]
```

Adds a vertex value to the icon array, returning a pointer to it.

The floating point version goes from 0.0 to 1.0. The origin (0.0) is in the lower-lefthand corner of the icon.

Parameters

in	<i>x,y</i>	vertex coordinates
----	------------	--------------------

11.37.3.4 add_vertex() [2/2]

```
short * Fl_File_Icon::add_vertex (
    int x,
    int y) [inline]
```

Adds a vertex value to the icon array, returning a pointer to it.

The integer version accepts coordinates from 0 to 10000. The origin (0.0) is in the lower-lefthand corner of the icon.

Parameters

in	<i>x,y</i>	vertex coordinates
----	------------	--------------------

11.37.3.5 draw()

```
void Fl_File_Icon::draw (
    int x,
    int y,
    int w,
    int h,
    Fl_Color ic,
    int active = 1)
```

Draws an icon in the indicated area.

Parameters

in	<i>x,y,w,h</i>	position and size
in	<i>ic</i>	icon color
in	<i>active</i>	status, default is active [non-zero]

11.37.3.6 find()

```
Fl_File_Icon * Fl_File_Icon::find (
    const char * filename,
    int filetype = ANY) [static]
```

Finds an icon that matches the given filename and file type.

Parameters

in	<i>filename</i>	name of file
in	<i>filetype</i>	enumerated file type

Returns

matching file icon or NULL

11.37.3.7 label()

```
void Fl_File_Icon::label (
    Fl_Widget * w)
```

Applies the icon to the widget, registering the [Fl_File_Icon](#) label type as needed.

Parameters

in	<i>w</i>	widget for which this icon will become the label
----	----------	--

11.37.3.8 labeltype()

```
void Fl_File_Icon::labeltype (
    const Fl_Label * o,
    int x,
    int y,
    int w,
    int h,
    Fl_Align a) [static]
```

Draw the icon label.

Parameters

in	<i>o</i>	label data
in	<i>x,y,w,h</i>	position and size of label
in	<i>a</i>	label alignment [not used]

11.37.3.9 load()

```
void Fl_File_Icon::load (
    const char * f)
```

Loads the specified icon image.

The format is deduced from the filename.

Parameters

in	<i>f</i>	filename
----	----------	----------

11.37.3.10 load_fti()

```
int Fl_File_Icon::load_fti (
    const char * fti)
```

Loads an SGI icon file.

Parameters

in	<i>fti</i>	icon filename
----	------------	---------------

Returns

0 on success, non-zero on error

11.37.3.11 load_image()

```
int Fl_File_Icon::load_image (
    const char * ifile)
```

Load an image icon file from an image filename.

Parameters

in	<i>ifile</i>	image filename
----	--------------	----------------

Returns

0 on success, non-zero on error

11.37.3.12 load_system_icons()

```
void Fl_File_Icon::load_system_icons (
    void ) [static]
```

Loads all system-defined icons.

This call is useful when using the FileChooser widget and should be used when the application starts:

```
Fl_File_Icon::load_system_icons();
```

11.37.3.13 next()

```
Fl_File_Icon * Fl_File_Icon::next () [inline]
```

Returns next file icon object.

See [Fl_File_Icon::first\(\)](#)

11.37.3.14 type()

```
int Fl_File_Icon::type () [inline]
```

Returns the filetype associated with the icon, which can be one of the following:

- `Fl_File_Icon::ANY`, any kind of file.
- `Fl_File_Icon::PLAIN`, plain files.
- `Fl_File_Icon::FIFO`, named pipes.
- `Fl_File_Icon::DEVICE`, character and block devices.
- `Fl_File_Icon::LINK`, symbolic links.
- `Fl_File_Icon::DIRECTORY`, directories.

The documentation for this class was generated from the following files:

- `Fl_File_Icon.H`
- `Fl_File_Icon.cxx`
- `Fl_File_Icon2.cxx`

11.38 Fl_File_Input Class Reference

This widget displays a pathname in a text input field.

```
#include <Fl_File_Input.H>
```

Inheritance diagram for `Fl_File_Input`:

Public Member Functions

- [Fl_Boxtype](#) **down_box** () const
Gets the box type used for the navigation bar.
- void **down_box** ([Fl_Boxtype](#) b)
Sets the box type to use for the navigation bar.

- [FI_Color errorcolor](#) () const
Gets the current error color.
- void [errorcolor](#) ([FI_Color](#) c)
Sets the current error color to c.
- [FI_File_Input](#) (int X, int Y, int W, int H, const char *L=0)
Creates a new [FI_File_Input](#) widget using the given position, size, and label string.
- int [handle](#) (int event) [FL_OVERRIDE](#)
Handle events in the widget.
- const char * [value](#) ()
Returns the current value, which is a pointer to an internal buffer and is valid only until the next event is handled.
- int [value](#) (const char *str)
Sets the value of the widget given a new string value.
- int [value](#) (const char *str, int len)
Sets the value of the widget given a new string value and its length.

Public Member Functions inherited from [FI_Input](#)

- [FI_Input](#) (int, int, int, int, const char *L=0)
Creates a new [FI_Input](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL_OVERRIDE](#)
Handles the specified event.

Public Member Functions inherited from [FI_Input_](#)

- int [append](#) (const char *t, int l=0, char keep_selection=0)
Append text at the end.
- bool [can_redo](#) () const
Check if there is a redo action available.
- bool [can_undo](#) () const
Check if the last operation can be undone.
- int [copy](#) (int clipboard)
Put the current selection into the clipboard.
- int [copy_cuts](#) ()
Copies the yank buffer to the clipboard.
- [FI_Color cursor_color](#) () const
Gets the color of the cursor.
- void [cursor_color](#) ([FI_Color](#) n)
Sets the color of the cursor.
- int [cut](#) ()
Deletes the current selection.
- int [cut](#) (int a, int b)
Deletes all characters between index a and b.
- int [cut](#) (int n)
Deletes the next n bytes rounded to characters before or after the cursor.
- double [dvalue](#) () const
Returns the widget text interpreted as a floating point number.
- [FI_Input_](#) (int, int, int, int, const char *L=0)
Creates a new [FI_Input_](#) widget.
- unsigned int [index](#) (int i) const
Returns the character at index i.
- int [input_type](#) () const

- Gets the input field type.*

 - void [input_type](#) (int t)

Sets the input field type.
- int [insert](#) (const char *t, int l=0)

Inserts text at the cursor position.
- int [insert_position](#) () const

Gets the position of the text cursor.
- int [insert_position](#) (int p)

Sets the cursor position and mark.
- int [insert_position](#) (int p, int m)

Sets the index for the cursor and mark.
- int [ivalue](#) () const

Returns the widget text interpreted as a signed integer.
- int [mark](#) () const

Gets the current selection mark.
- int [mark](#) (int m)

Sets the current selection mark.
- int [maximum_size](#) () const

Gets the maximum length of the input field in characters.
- void [maximum_size](#) (int m)

Sets the maximum length of the input field in characters.
- int [position](#) () const
- int [position](#) (int p)
- int [position](#) (int p, int m)
- int [readonly](#) () const

Gets the read-only state of the input field.
- void [readonly](#) (int b)

Sets the read-only state of the input field.
- int [redo](#) ()

Redo previous undo operation.
- int [replace](#) (int b, int e, const char *text, int llen=0)

Deletes text from b to e and inserts the new string text.
- void [resize](#) (int, int, int, int) [FL_OVERRIDE](#)

Changes the size of the widget.
- int [shortcut](#) () const

Return the shortcut key associated with this widget.
- void [shortcut](#) (int s)

Sets the shortcut key associated with this widget.
- int [size](#) () const

Returns the number of bytes in [value\(\)](#).
- void [size](#) (int W, int H)

Sets the width and height of this widget.
- int [static_value](#) (const char *)

Changes the widget text.
- int [static_value](#) (const char *, int)

Changes the widget text.
- int [tab_nav](#) () const

Gets whether the Tab key causes focus navigation in multiline input fields or not.
- void [tab_nav](#) (int val)

Sets whether the Tab key does focus navigation, or inserts tab characters into [FL_Multiline_Input](#).
- [FL_Color textcolor](#) () const

- Gets the color of the text in the input field.*

 - void [textcolor](#) ([FI_Color](#) n)

Sets the color of the text in the input field.

 - [FI_Font](#) [textfont](#) () const
- Gets the font of the text in the input field.*
- void [textfont](#) ([FI_Font](#) s)
- Sets the font of the text in the input field.*
- [FI_Fontsize](#) [textsize](#) () const
- Gets the size of the text in the input field.*
- void [textsize](#) ([FI_Fontsize](#) s)
- Sets the size of the text in the input field.*
- int [undo](#) ()
- Undoes previous changes to the text buffer.*
- const char * [value](#) () const
- Returns the text displayed in the widget.*
- int [value](#) (const char *)
- Changes the widget text.*
- int [value](#) (const char *, int)
- Changes the widget text.*
- int [value](#) (double value)
- Changes the widget text to a floating point number ("%g").*
- int [value](#) (int value)
- Changes the widget text to a signed integer number.*
- int [wrap](#) () const
- Gets the word wrapping state of the input field.*
- void [wrap](#) (int b)
- Sets the word wrapping state of the input field.*
- ~[FI_Input](#) ()
- Destroys the widget.*

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
 - void [_set_fullscreen](#) ()
 - void [activate](#) ()
- Activates the widget.*
- unsigned int [active](#) () const
- Returns whether the widget is active.*
- int [active_r](#) () const
- Returns whether the widget and all of its parents are active.*
- [FI_Align](#) [align](#) () const
- Gets the label alignment.*
- void [align](#) ([FI_Align](#) alignment)
- Sets the label alignment.*
- long [argument](#) () const
- Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
- Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const

- virtual [FI_Group](#) * [as_group](#) ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()
Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)
Clears or sets the damage flags.
- void [clear_output](#) ()
Sets a widget to accept input.
- void [clear_visible](#) ()
Hides the widget.
- void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
- [FI_Color](#) [color](#) () const
Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)
Sets the background and selection color of the widget.
- [FI_Color](#) [color2](#) () const

- For back compatibility only.*

 - void [color2](#) (unsigned a)
- For back compatibility only.*

 - int [contains](#) (const [FI_Widget](#) *w) const
- Checks if w is a child of this widget.*

 - void [copy_label](#) (const char *new_label)
- Sets the current label.*

 - void [copy_tooltip](#) (const char *text)
- Sets the current tooltip text.*

 - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

 - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int [damage_resize](#) (int, int, int, int)
- Internal use only.*

 - void [deactivate](#) ()
- Deactivates the widget.*

 - [FI_Image](#) * [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const [FI_Image](#) * [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void [deimage](#) ([FI_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void [deimage](#) ([FI_Image](#) *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int [deimage_bound](#) () const
- Returns whether the inactive image is managed by the widget.*

 - void [do_callback](#) ([FI_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with default arguments.*

 - void [do_callback](#) ([FI_Widget](#) *widget, long arg, [FI_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

 - void [do_callback](#) ([FI_Widget](#) *widget, void *arg=0, [FI_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

 - void [draw_label](#) (int, int, int, int, [FI_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

 - int [h](#) () const
- Gets the widget height.*

 - virtual void [hide](#) ()
- Makes a widget invisible.*

 - int [horizontal_label_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*

 - void [horizontal_label_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

 - [FI_Image](#) * [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*

 - const [FI_Image](#) * [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*

 - void [image](#) ([FI_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*

- void `image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FI_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FI_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FI_Color` c)
Sets the label color.
- `FI_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FI_Font` f)
Sets the font to use.
- `FI_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)
Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const
Gets the label type.
- void `labeltype` (`FI_Labeltype` a)
Sets the label type.
- void `measure_label` (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const
Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int `output` () const
Returns if a widget is used for output only.
- `FI_Group` * `parent` () const
Returns a pointer to the parent widget.
- void `parent` (`FI_Group` *p)
Internal use only - "for hacks only".
- void `position` (int X, int Y)
Repositions the window or widget.
- void `redraw` ()
Schedules the drawing of the widget.
- void `redraw_label` ()

- Schedules the drawing of the label.*

 - [FI_Color selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([FI_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [FI_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [FI_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([FI_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.

- void `vertical_label_margin` (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int `visible` () const
Returns whether a widget is visible.
- unsigned int `visible_focus` () const
Checks whether this widget has a visible focus.
- void `visible_focus` (int v)
Modifies keyboard focus navigation.
- int `visible_r` () const
Returns whether a widget and all its parents are visible.
- int `w` () const
Gets the widget width.
- `FL_When` `when` () const
Returns the conditions under which the callback is called.
- void `when` (uchar i)
Sets the flags used to decide when a callback is called.
- `FL_Window` * `window` () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int `x` () const
Gets the widget position in its window.
- int `y` () const
Gets the widget position in its window.
- virtual `~FL_Widget` ()
Destroys the widget.

Protected Member Functions

- void `draw` () `FL_OVERRIDE`
Draws the file input widget.

Protected Member Functions inherited from `FL_Input`

- void `draw` () `FL_OVERRIDE`
Draws the widget.
- int `handle_key` ()
Handles a keystroke.
- int `handle_rmb` ()
Handle right mouse button down events.

Protected Member Functions inherited from `FL_Input_`

- int `apply_undo` ()
Apply the current undo/redo operation.
- void `drawtext` (int, int, int, int)
Draws the text in the passed bounding box.
- void `drawtext` (int, int, int, int, bool draw_active)
Draws the text in the passed bounding box.
- void `handle_mouse` (int, int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.
- int `handletext` (int e, int, int, int, int)
Handles all kinds of text field related events.
- int `line_end` (int i) const

- *Finds the end of a line.*
- int **line_start** (int i) const
- *Finds the start of a line.*
- int **linesPerPage** ()
- void **maybe_do_callback** (FI_Callback_Reason reason=FL_REASON_UNKNOWN)
- int **up_down_position** (int, int keepmark=0)
- *Moves the cursor to the column given by up_down_pos.*
- int **word_end** (int i) const
- *Finds the end of a word.*
- int **word_start** (int i) const
- *Finds the start of a word.*
- int **xscroll** () const
- int **yscroll** () const
- void **yscroll** (int yOffset)

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
- *Clears a flag in the flags mask.*
- void **draw_backdrop** () const
- *If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.*
- void **draw_box** () const
- *Draws the widget box according its box style.*
- void **draw_box** (FI_Boxtype t, FI_Color c) const
- *Draws a box of type t, of color c at the widget's position and size.*
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
- *Draws a box of type t, of color c at the position X,Y and size W,H.*
- void **draw_focus** () const
- *Draws a focus rectangle around the widget.*
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
- *Draws a focus rectangle around the widget.*
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
- *Draws a focus box for the widget at the given position and size.*
- void **draw_label** () const
- *Draws the widget's label at the defined label position.*
- void **draw_label** (int, int, int, int) const
- *Draws the label in an arbitrary bounding box.*
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
- *Creates a widget at the given position and size.*
- unsigned int **flags** () const
- *Gets the widget flags mask.*
- void **h** (int v)
- *Internal use only.*
- void **set_flag** (unsigned int c)
- *Sets a flag in the flags mask.*
- void **w** (int v)
- *Internal use only.*
- void **x** (int v)
- *Internal use only.*
- void **y** (int v)
- *Internal use only.*

Additional Inherited Members

Static Public Member Functions inherited from [Fl_Widget](#)

- static void [default_callback](#) ([Fl_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from [Fl_Input](#)

- static const char * [copy_menu_text](#) = "Copy"
[this text may be customized at run-time]
- static const char * [cut_menu_text](#) = "Cut"
[this text may be customized at run-time]
- static const char * [paste_menu_text](#) = "Paste"
[this text may be customized at run-time]

Protected Types inherited from [Fl_Widget](#)

[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

11.38.1 Detailed Description

This widget displays a pathname in a text input field.

A navigation bar located above the input field allows the user to navigate upward in the directory tree. You may want to handle `FL_WHEN_CHANGED` events for tracking text changes and also `FL_WHEN_RELEASE` for button release when changing to parent dir. `FL_WHEN_RELEASE` callback won't be called if the directory clicked is the same as the current one.

Figure 11.17 `Fl_File_Input`

Note

As all [Fl_Input](#) derived objects, [Fl_File_Input](#) may call its callback when losing focus (see `FL_UNFOCUS`) to update its state like its cursor shape. One resulting side effect is that you should call `clear_changed()` early in your callback to avoid reentrant calls if you plan to show another window or dialog box in the callback.

11.38.2 Constructor & Destructor Documentation

11.38.2.1 Fl_File_Input()

```
Fl_File_Input::Fl_File_Input (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Creates a new [Fl_File_Input](#) widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

Parameters

in	<i>X,Y,W,H</i>	position and size of the widget
in	<i>L</i>	widget label, default is no label

11.38.3 Member Function Documentation

11.38.3.1 draw()

```
void Fl_File_Input::draw (
    void ) [protected], [virtual]
```

Draws the file input widget.

Implements [Fl_Widget](#).

11.38.3.2 errorcolor() [1/2]

```
Fl_Color Fl_File_Input::errorcolor () const [inline]
```

Gets the current error color.

Returns FL_RED since FLTK 1.4.0 (default in 1.3.x). Retained for backwards compatibility.

Deprecated Will be removed in FLTK 1.5.0 or higher.

Todo Remove [Fl_File_Input::errorcolor\(\)](#) in FLTK 1.5.0 or higher.

11.38.3.3 errorcolor() [2/2]

```
void Fl_File_Input::errorcolor (
    Fl_Color c) [inline]
```

Sets the current error color to *c*.

Does nothing since FLTK 1.4.0. Retained for backwards compatibility.

Deprecated Will be removed in FLTK 1.5.0 or higher.

Todo Remove [Fl_File_Input::errorcolor\(Fl_Color\)](#) in FLTK 1.5.0 or higher.

11.38.3.4 handle()

```
int Fl_File_Input::handle (
    int event) [virtual]
```

Handle events in the widget.

Return non zero if event is handled.

Parameters

in	<i>event</i>	
----	--------------	--

Reimplemented from [Fl_Widget](#).

11.38.3.5 value() [1/2]

```
int Fl_File_Input::value (
    const char * str)
```

Sets the value of the widget given a new string value.
Returns non 0 on success.

Parameters

in	<i>str</i>	new string value
----	------------	------------------

11.38.3.6 value() [2/2]

```
int Fl_File_Input::value (
    const char * str,
    int len)
```

Sets the value of the widget given a new string value and its length.
Returns non 0 on success.

Parameters

in	<i>str</i>	new string value
in	<i>len</i>	length of value

The documentation for this class was generated from the following files:

- Fl_File_Input.H
- Fl_File_Input.cxx

11.39 Fl_Fill_Dial Class Reference

Draws a dial with a filled arc.

```
#include <Fl_Fill_Dial.H>
```

Inheritance diagram for Fl_Fill_Dial:

**Public Member Functions**

- **Fl_Fill_Dial** (int X, int Y, int W, int H, const char *L=NULL)
Creates a filled dial, also setting its type to FL_FILL_DIAL.

Public Member Functions inherited from [Fl_Dial](#)

- short [angle1](#) () const
Sets Or gets the angles used for the minimum and maximum values.
- void **angle1** (short a)

- See short [angle1\(\)](#) *const*.
- short **angle2** () *const*
 - See short [angle1\(\)](#) *const*.
- void **angle2** (short a)
 - See short [angle1\(\)](#) *const*.
- void **angles** (short a, short b)
 - See short [angle1\(\)](#) *const*.
- **FI_Dial** (int x, int y, int w, int h, const char *l=0)
 - Creates a new [FI_Dial](#) widget using the given position, size, and label string.
- int **handle** (int) [FL_OVERRIDE](#)
 - Allow subclasses to handle event based on current position and size.

Public Member Functions inherited from [FI_Valuator](#)

- void **bounds** (double a, double b)
 - Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
 - Clamps the passed value to the valuator range.
- virtual int **format** (char *)
 - Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double **increment** (double, int)
 - Adds n times the step value to the passed value.
- double **maximum** () *const*
 - Gets the maximum value for the valuator.
- void **maximum** (double a)
 - Sets the maximum value for the valuator.
- double **minimum** () *const*
 - Gets the minimum value for the valuator.
- void **minimum** (double a)
 - Sets the minimum value for the valuator.
- void **precision** (int digits)
 - Sets the step value to $1.0 / 10^{\text{digits}}$.
- void **range** (double a, double b)
 - Sets the minimum and maximum values for the valuator.
- double **round** (double)
 - Round the passed value to the nearest step increment.
- double **step** () *const*
 - Gets or sets the step value.
- void **step** (double a, int b)
 - See double [FI_Valuator::step\(\)](#) *const*.
- void **step** (double s)
 - See double [FI_Valuator::step\(\)](#) *const*.
- void **step** (int a)
 - See double [FI_Valuator::step\(\)](#) *const*.
- double **value** () *const*
 - Gets the floating point(double) value.
- int **value** (double)
 - Sets the current value.
- **~FI_Valuator** () [FL_OVERRIDE](#)
 - Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

 - void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*
- void `clear_output` ()
- Sets a widget to accept input.*
- void `clear_visible` ()
- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `FL_Color color` () const
- Gets the background color of the widget.*
- void `color` (FL_Color bg)
- Sets the background color of the widget.*
- void `color` (FL_Color bg, FL_Color sel)
- Sets the background and selection color of the widget.*
- `FL_Color color2` () const
- For back compatibility only.*
- void `color2` (unsigned a)
- For back compatibility only.*
- int `contains` (const FL_Widget *w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char *new_label)
- Sets the current label.*
- void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*
- `uchar damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)
- Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*
- `FL_Image * deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image * deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (FL_Image &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (FL_Image *img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*
- void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with default arguments.*

- void `do_callback` (`FI_Widget` *widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `do_callback` (`FI_Widget` *widget, void *arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FI_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FI_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FI_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FI_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FI_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FI_Color` c)
Sets the label color.
- `FI_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FI_Font` f)
Sets the font to use.
- `FI_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)
Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const

- Gets the label type.*

 - void [labeltype](#) ([FL_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const

Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)

Changes the size or position of the widget.
- [FL_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([FL_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
Gets the current tooltip text.
- `void tooltip (const char *text)`
Sets the current tooltip text.
- `Fl_Window * top_window () const`
Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type () const`
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data () const`
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible () const`
Returns whether a widget is visible.
- `unsigned int visible_focus () const`
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r () const`
Returns whether a widget and all its parents are visible.
- `int w () const`
Gets the widget width.
- `Fl_When when () const`
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window () const`
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from FI_Widget

- static void **default_callback** (FI_Widget *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from FI_Widget

- enum {
INACTIVE = 1<<0 , **INVISIBLE** = 1<<1 , **OUTPUT** = 1<<2 , **NOBORDER** = 1<<3 ,
FORCE_POSITION = 1<<4 , **NON_MODAL** = 1<<5 , **SHORTCUT_LABEL** = 1<<6 , **CHANGED** = 1<<7
, **OVERRIDE** = 1<<8 , **VISIBLE_FOCUS** = 1<<9 , **COPIED_LABEL** = 1<<10 , **CLIP_CHILDREN** = 1<<11
, **MENU_WINDOW** = 1<<12 , **TOOLTIP_WINDOW** = 1<<13 , **MODAL** = 1<<14 , **NO_OVERLAY** = 1<<15
, **GROUP_RELATIVE** = 1<<16 , **COPIED_TOOLTIP** = 1<<17 , **FULLSCREEN** = 1<<18 , **MAC_USE_ACCENTS_MENU**
= 1<<19 ,
NEEDS_KEYBOARD = 1<<20 , **IMAGE_BOUND** = 1<<21 , **DEIMAGE_BOUND** = 1<<22 ,
AUTO_DELETE_USER_DATA = 1<<23 ,
MAXIMIZED = 1<<24 , **POPUP** = 1<<25 , **USERFLAG3** = 1<<29 , **USERFLAG2** = 1<<30 ,
USERFLAG1 = 1<<31 }
flags possible values enumeration.

Protected Member Functions inherited from FI_Dial

- void **draw** () **FL_OVERRIDE**
Draws dial at current position and size.
- void **draw** (int X, int Y, int W, int H)
Draws dial at given position and size.
- int **handle** (int event, int X, int Y, int W, int H)
Allows subclasses to handle event based on given position and size.

Protected Member Functions inherited from FI_Valuator

- **FI_Valuator** (int X, int Y, int W, int H, const char *L)
Creates a new FI_Valuator widget using the given position, size, and label string.
- void **handle_drag** (double newvalue)
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push** ()
Stores the current value in the previous value.
- void **handle_release** ()
Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)

Clamps the value, but accepts v if the previous value is not already out of range.

- virtual void **value_damage** ()

Asks for partial redraw.

Protected Member Functions inherited from **FL_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FL_Boxtype t, FL_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FL_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

11.39.1 Detailed Description

Draws a dial with a filled arc.

The documentation for this class was generated from the following files:

- FL_Fill_Dial.H
- FL_Dial.cxx

11.40 Fl_Fill_Slider Class Reference

Widget that draws a filled horizontal slider, useful as a progress or value meter.

```
#include <Fl_Fill_Slider.H>
```

Inheritance diagram for Fl_Fill_Slider:

Public Member Functions

- **Fl_Fill_Slider** (int X, int Y, int W, int H, const char *L=0)

Creates the slider from its position, size and optional title.

Public Member Functions inherited from [Fl_Slider](#)

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- [Fl_Slider](#) (int X, int Y, int W, int H, const char *L=0)
Creates a new [Fl_Slider](#) widget using the given position, size, and label string.
- **Fl_Slider** (uchar t, int X, int Y, int W, int H, const char *L)
Creates a new [Fl_Slider](#) widget using the given type, position, size, and label string.
- int **handle** (int) [FL_OVERRIDE](#)
Handles the specified event.
- int **scrollvalue** (int pos, int size, int first, int total)
Sets the size and position of the sliding knob in the box.
- [Fl_Boxtype](#) **slider** () const
Gets the slider box type.
- void **slider** ([Fl_Boxtype](#) c)
Sets the slider box type.
- float **slider_size** () const
Get the dimensions of the moving piece of slider.
- void **slider_size** (double v)
Set the dimensions of the moving piece of slider.

Public Member Functions inherited from [Fl_Valuator](#)

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.
- virtual int **format** (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- double **increment** (double, int)
Adds n times the step value to the passed value.
- double **maximum** () const

- Gets the maximum value for the valuator.*

 - void **maximum** (double a)
- Sets the maximum value for the valuator.*

 - double **minimum** () const
- Gets the minimum value for the valuator.*

 - void **minimum** (double a)
- Sets the minimum value for the valuator.*

 - void **precision** (int digits)
- Sets the step value to $1.0 / 10^{\text{digits}}$.*

 - void **range** (double a, double b)
- Sets the minimum and maximum values for the valuator.*

 - double **round** (double)
- Round the passed value to the nearest step increment.*

 - double **step** () const
- Gets or sets the step value.*

 - void **step** (double a, int b)
- See double [FI_Valuator::step\(\)](#) const.*

 - void **step** (double s)
- See double [FI_Valuator::step\(\)](#) const.*

 - void **step** (int a)
- See double [FI_Valuator::step\(\)](#) const.*

 - double **value** () const
- Gets the floating point(double) value.*

 - int **value** (double)
- Sets the current value.*

 - ~**FI_Valuator** () **FL_OVERRIDE**
- Destructor is accessible despite protected constructor.*

Public Member Functions inherited from [FI_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
- Activates the widget.*
- unsigned int **active** () const
- Returns whether the widget is active.*
- int **active_r** () const
- Returns whether the widget and all of its parents are active.*
- [FI_Align](#) align () const
- Gets the label alignment.*
- void **align** ([FI_Align](#) alignment)
- Sets the label alignment.*
- long **argument** () const
- Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
- Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI_Gl_Window](#) * **as_gl_window** ()
- Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class [FI_Gl_Window](#) const * **as_gl_window** () const
- virtual [FI_Group](#) * **as_group** ()
- Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).*

- virtual [FI_Group](#) const * **as_group** () const
- virtual [FI_Window](#) * **as_window** ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * **as_window** () const
- void **bind_deimage** ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind_image** ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void **bind_image** (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) **box** () const
Gets the box type of the widget.
- void **box** ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) **callback** () const
Gets the current callback function for the widget.
- void **callback** ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void **callback** ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void **callback** ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void **callback** ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void **callback** ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int **changed** () const
Checks if the widget value changed since the last callback.
- void **clear_active** ()
Marks the widget as inactive without sending events or changing focus.
- void **clear_changed** ()
Marks the value of the widget as unchanged.
- void **clear_damage** (uchar c=0)
Clears or sets the damage flags.
- void **clear_output** ()
Sets a widget to accept input.
- void **clear_visible** ()
Hides the widget.
- void **clear_visible_focus** ()
Disables keyboard focus navigation with this widget.
- [FI_Color](#) **color** () const
Gets the background color of the widget.
- void **color** ([FI_Color](#) bg)
Sets the background color of the widget.
- void **color** ([FI_Color](#) bg, [FI_Color](#) sel)
Sets the background and selection color of the widget.
- [FI_Color](#) **color2** () const
For back compatibility only.
- void **color2** (unsigned a)

- For back compatibility only.*

 - int `contains` (const `Fl_Widget` *w) const
Checks if w is a child of this widget.
 - void `copy_label` (const char *new_label)
Sets the current label.
 - void `copy_tooltip` (const char *text)
Sets the current tooltip text.
 - `uchar` `damage` () const
Returns non-zero if `draw()` needs to be called.
 - void `damage` (`uchar` c)
Sets the damage bits for the widget.
 - void `damage` (`uchar` c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
 - int `damage_resize` (int, int, int, int)
Internal use only.
 - void `deactivate` ()
Deactivates the widget.
 - `Fl_Image` * `deimage` ()
Gets the image that is used as part of the widget label when in the inactive state.
 - const `Fl_Image` * `deimage` () const
Gets the image that is used as part of the widget label when in the inactive state.
 - void `deimage` (`Fl_Image` &img)
Sets the image to use as part of the widget label when in the inactive state.
 - void `deimage` (`Fl_Image` *img)
Sets the image to use as part of the widget label when in the inactive state.
 - int `deimage_bound` () const
Returns whether the inactive image is managed by the widget.
 - void `do_callback` (`Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with default arguments.
 - void `do_callback` (`Fl_Widget` *widget, long arg, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
 - void `do_callback` (`Fl_Widget` *widget, void *arg=0, `Fl_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
 - void `draw_label` (int, int, int, int, `Fl_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
 - int `h` () const
Gets the widget height.
 - virtual void `hide` ()
Makes a widget invisible.
 - int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
 - void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
 - `Fl_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
 - const `Fl_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
 - void `image` (`Fl_Image` &img)
Sets the image to use as part of the widget label when in the active state.
 - void `image` (`Fl_Image` *img)
Sets the image to use as part of the widget label when in the active state.

- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FL_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FL_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FL_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FL_Color` c)
Sets the label color.
- `FL_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FL_Font` f)
Sets the font to use.
- `FL_Fontsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FL_Fontsize` pix)
Sets the font size in pixels.
- `FL_Labeltype` `labeltype` () const
Gets the label type.
- void `labeltype` (`FL_Labeltype` a)
Sets the label type.
- void `measure_label` (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const
Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int `output` () const
Returns if a widget is used for output only.
- `FL_Group` * `parent` () const
Returns a pointer to the parent widget.
- void `parent` (`FL_Group` *p)
Internal use only - "for hacks only".
- void `position` (int X, int Y)
Repositions the window or widget.
- void `redraw` ()
Schedules the drawing of the widget.
- void `redraw_label` ()
Schedules the drawing of the label.
- virtual void `resize` (int x, int y, int w, int h)

- Changes the size or position of the widget.*

 - [Fl_Color selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.

- void `vertical_label_margin` (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int `visible` () const
Returns whether a widget is visible.
- unsigned int `visible_focus` () const
Checks whether this widget has a visible focus.
- void `visible_focus` (int v)
Modifies keyboard focus navigation.
- int `visible_r` () const
Returns whether a widget and all its parents are visible.
- int `w` () const
Gets the widget width.
- `Fl_When` `when` () const
Returns the conditions under which the callback is called.
- void `when` (uchar i)
Sets the flags used to decide when a callback is called.
- `Fl_Window` * `window` () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int `x` () const
Gets the widget position in its window.
- int `y` () const
Gets the widget position in its window.
- virtual `~Fl_Widget` ()
Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget` *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `Fl_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

Protected Member Functions inherited from [FI_Slider](#)

- void [draw](#) () [FL_OVERRIDE](#)
Draws the widget.
- void **draw** (int, int, int, int)
- int **handle** (int, int, int, int, int)

Protected Member Functions inherited from [FI_Valuator](#)

- [FI_Valuator](#) (int X, int Y, int W, int H, const char *L)
Creates a new [FI_Valuator](#) widget using the given position, size, and label string.
- void **handle_drag** (double newvalue)
Called during a drag operation, after an [FL_WHEN_CHANGED](#) event is received and before the callback.
- void **handle_push** ()
Stores the current value in the previous value.
- void **handle_release** ()
Called after an [FL_WHEN_RELEASE](#) event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an [FL_HORIZONTAL](#) one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)
Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void [value_damage](#) ()
Asks for partial redraw.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If [FL_ALIGN_IMAGE_BACKDROP](#) is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.

- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

11.40.1 Detailed Description

Widget that draws a filled horizontal slider, useful as a progress or value meter. The documentation for this class was generated from the following files:

- Fl_Fill_Slider.H
- Fl_Slider.cxx

11.41 Fl_Flex Class Reference

Fl_Flex is a container (layout) widget for one row or one column of widgets.

```
#include <Fl_Flex.H>
```

Inheritance diagram for Fl_Flex:

Public Types

- enum { **VERTICAL** = 0 , **HORIZONTAL** = 1 , **COLUMN** = 0 , **ROW** = 1 }

Public Member Functions

- virtual void **end** ()
Ends automatic child addition and resizes all children.
- void **fixed** (Fl_Widget &**w**, int **size**)
Set the horizontal or vertical size of a child widget.
- int **fixed** (Fl_Widget ***w**) const
Return whether the given widget has a fixed size or resizes dynamically.
- void **fixed** (Fl_Widget ***w**, int **size**)
Set the horizontal or vertical size of a child widget.
- **Fl_Flex** (int direction)
Construct a new Fl_Flex widget specifying its layout.
- **Fl_Flex** (int **w**, int **h**, int direction)
Construct a new Fl_Flex widget specifying its layout and size.

- **FL_Flex** (int X, int Y, int W, int H, const char *L=0)
*Construct a new **FL_Flex** widget with the given position, size, and label.*
- **FL_Flex** (int x, int y, int w, int h, int direction)
*Construct a new **FL_Flex** widget specifying its layout, position, and size.*
- int **gap** () const
Return the gap size of the widget.
- void **gap** (int g)
Set the gap size of the widget.
- int **horizontal** () const
*Returns non-zero (true) if **FL_Flex** alignment is horizontal (row mode).*
- void **layout** ()
Calculates the layout of the widget and redraws it.
- int **margin** () const
Returns the left margin size of the widget.
- int **margin** (int *left, int *top, int *right, int *bottom) const
Returns all (four) margin sizes of the widget.
- void **margin** (int left, int top, int right, int bottom)
*Set the margin sizes at all four edges of the **FL_Flex** widget.*
- void **margin** (int m, int g=-1)
Set the margin and optionally the gap size of the widget.
- bool **need_layout** () const
Returns whether layout calculation is required.
- void **need_layout** (int set)
Set or reset the request to calculate the layout of children.
- void **resize** (int x, int y, int w, int h) **FL_OVERRIDE**
Resize the container and calculate all child positions and sizes.
- int **spacing** () const
Gets the number of extra pixels of blank space that are added between the children.
- void **spacing** (int i)
Sets the number of extra pixels of blank space that are added between the children.

Public Member Functions inherited from **FL_Group**

- **FL_Widget** *& **_ddfdesign_kludge** ()
This is for forms compatibility only.
- void **add** (**FL_Widget** &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** (**FL_Widget** *o)
*See void **FL_Group::add(FL_Widget &w)***
- void **add_resizable** (**FL_Widget** &o)
Adds a widget to the group and makes it the resizable widget.
- **FL_Widget** *const * **array** () const
Returns a pointer to the array of children.
- **FL_Group** const * **as_group** () const **FL_OVERRIDE**
- **FL_Group** * **as_group** () **FL_OVERRIDE**
*Returns an **FL_Group** pointer if this widget is an **FL_Group**.*
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- **FL_Widget** * **child** (int n) const
Returns the n'th child.
- int **children** () const

- Returns how many child widgets the group has.*

 - void `clear` ()

Deletes all child widgets from memory recursively.
- unsigned int `clip_children` ()

Returns the current clipping mode.
- void `clip_children` (int c)

Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int `delete_child` (int n)

Removes the widget at `index` from the group and deletes it.
- void `end` ()

Exactly the same as `current(this->parent())`.
- int `find` (const FL_Widget &o) const

*See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const FL_Widget *) const

Searches the child array for the widget and returns the index.
- FL_Group (int, int, int, int, const char *==0)

Creates a new FL_Group widget using the given position, size, and label string.
- void `focus` (FL_Widget *W)
- void `forms_end` ()

This is for forms compatibility only.
- int `handle` (int) FL_OVERRIDE

Handles the specified event.
- void `init_sizes` ()

Resets the internal array of widget sizes and positions.
- void `insert` (FL_Widget &, int i)

The widget is removed from its current group (if any) and then inserted into this group.
- void `insert` (FL_Widget &o, FL_Widget *before)

This does `insert(w, find(before))`.
- void `remove` (FL_Widget &)

Removes a widget from the group but does not delete it.
- void `remove` (FL_Widget *o)

Removes the widget `o` from the group.
- void `remove` (int index)

Removes the widget at `index` from the group but does not delete it.
- FL_Widget * `resizable` () const

Returns the group's resizable widget.
- void `resizable` (FL_Widget &o)

Sets the group's resizable widget.
- void `resizable` (FL_Widget *o)

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void `resize` (int, int, int, int) FL_OVERRIDE

Resizes the FL_Group widget and all of its children.
- virtual ~FL_Group ()

The destructor also deletes all the children.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

- Marks the widget as inactive without sending events or changing focus.*

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

 - void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*

 - void `clear_output` ()
- Sets a widget to accept input.*

 - void `clear_visible` ()
- Hides the widget.*

 - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

 - `FL_Color` `color` () const
- Gets the background color of the widget.*

 - void `color` (FL_Color bg)
- Sets the background color of the widget.*

 - void `color` (FL_Color bg, FL_Color sel)
- Sets the background and selection color of the widget.*

 - `FL_Color` `color2` () const
- For back compatibility only.*

 - void `color2` (unsigned a)
- For back compatibility only.*

 - int `contains` (const FL_Widget *w) const
- Checks if w is a child of this widget.*

 - void `copy_label` (const char *new_label)
- Sets the current label.*

 - void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*

 - uchar `damage` () const
- Returns non-zero if `draw()` needs to be called.*

 - void `damage` (uchar c)
- Sets the damage bits for the widget.*

 - void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int `damage_resize` (int, int, int, int)
- Internal use only.*

 - void `deactivate` ()
- Deactivates the widget.*

 - `FL_Image` * `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const `FL_Image` * `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void `deimage` (FL_Image &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `deimage` (FL_Image *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

 - void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with default arguments.*

 - void `do_callback` (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with arbitrary arguments.*

- void `do_callback` (`FL_Widget *widget`, void *arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FL_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FL_Image * image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FL_Image * image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FL_Image &img`)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FL_Image *img`)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FL_Widget *wgt`) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FL_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FL_Color labelcolor` () const
Gets the label color.
- void `labelcolor` (`FL_Color` c)
Sets the label color.
- `FL_Font labelfont` () const
Gets the font to use.
- void `labelfont` (`FL_Font` f)
Sets the font to use.
- `FL_Fonsize labelsz` () const
Gets the font size in pixels.
- void `labelsize` (`FL_Fonsize` pix)
Sets the font size in pixels.
- `FL_Labeltype labeltype` () const
Gets the label type.
- void `labeltype` (`FL_Labeltype` a)

- Sets the label type.*

 - void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `FI_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`FI_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- `FI_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`FI_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void `show` ()

Makes a widget visible.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the current tooltip text.

- `Fl_Window * top_window ()` const
Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type ()` const
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data ()` const
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible ()` const
Returns whether a widget is visible.
- `unsigned int visible_focus ()` const
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r ()` const
Returns whether a widget and all its parents are visible.
- `int w ()` const
Gets the widget width.
- `Fl_When when ()` const
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window ()` const
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x ()` const
Gets the widget position in its window.
- `int y ()` const
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Protected Member Functions

- `virtual int alloc_size (int size)` const
Return new size to be allocated for array of fixed size widgets.
- `void draw () FL_OVERRIDE`
Draw the widget.
- `void init (int t=VERTICAL)`
- `void on_remove (int) FL_OVERRIDE`
Allow derived groups to act when a child widget is removed from the group.

Protected Member Functions inherited from FL_Group

- `FL_Rect * bounds ()`
Returns the internal array of widget sizes and positions.
- `void draw () FL_OVERRIDE`
Draws the widget.
- `void draw_child (FL_Widget &widget) const`
Forces a child to redraw.
- `void draw_children ()`
Draws all children of the group.
- `void draw_outside_label (const FL_Widget &widget) const`
Parents normally call this to draw outside labels of child widgets.
- `virtual int on_insert (FL_Widget *, int)`
Allow derived groups to act when a widget is added as a child.
- `virtual int on_move (int, int)`
Allow derived groups to act when a widget is moved within the group.
- `int * sizes ()`
Returns the internal array of widget sizes and positions.
- `void update_child (FL_Widget &widget) const`
Draws a child only if it needs it.

Protected Member Functions inherited from FL_Widget

- `void clear_flag (unsigned int c)`
Clears a flag in the flags mask.
- `void draw_backdrop () const`
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
Draws the widget box according its box style.
- `void draw_box (FL_Boxtype t, FL_Color c) const`
Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`
Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`
Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
Draws the widget's label at the defined label position.
- `void draw_label (int, int, int, int) const`
Draws the label in an arbitrary bounding box.
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`
Creates a widget at the given position and size.
- `unsigned int flags () const`
Gets the widget flags mask.
- `void h (int v)`
Internal use only.
- `void set_flag (unsigned int c)`
Sets a flag in the flags mask.
- `void w (int v)`

Internal use only.

- void `x` (int v)

Internal use only.

- void `y` (int v)

Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Group`

- static `Fl_Group * current` ()
Returns the currently active group.
- static void `current` (`Fl_Group *g`)
Sets the current group.

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget *widget`, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `Fl_Widget`

`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.41.1 Detailed Description

`Fl_Flex` is a container (layout) widget for one row or one column of widgets.

It provides flexible positioning of its children either in one row or in one column.

`Fl_Flex` is designed to be as simple as possible. You can set individual widget sizes or let `Fl_Flex` position and size the widgets to fit in the container. All "flexible" (i.e. non-fixed size) widgets are assigned the same width or height, respectively. For details see below.

You can set the margins **around** all children at the inner side of the box frame (if any). `Fl_Flex` supports setting different margin sizes on top, bottom, left, and right sides. The default margin size is 0 on all edges of the container. You can set the gap size **between** all children. The gap size is always the same between all of its children. This is similar to the 'spacing' of `Fl_Pack`. The default gap size is 0.

`Fl_Flex` can either consist of a single row, i.e. `type(Fl_Flex::HORIZONTAL)` or a single column, i.e. `type(Fl_Flex::VERTICAL)`. The default value is `Fl_Flex::VERTICAL` for consistency with `Fl_Pack` but you can use `type()` to assign a row (`Fl_Flex::HORIZONTAL`) layout.

If `type() == Fl_Flex::HORIZONTAL` widgets are resized horizontally to fit in the container and their height is the full `Fl_Flex` height minus border size and margins. You can set a fixed widget width by using `fixed()`.

If `type() == Fl_Flex::VERTICAL` widgets are resized vertically to fit in the container and their width is the full `Fl_Flex` width minus border size and margins. You can set a fixed widget height by using `fixed()`.

To create arbitrary spacing you can use invisible boxes of flexible or fixed sizes (see example below).

Alternate constructors let you specify the layout as `Fl_Flex::HORIZONTAL` or `Fl_Flex::VERTICAL` directly. `Fl_Flex::ROW` is an alias of `Fl_Flex::HORIZONTAL` and `Fl_Flex::COLUMN` is an alias of `Fl_Flex::VERTICAL`.

The default box type is `FL_NO_BOX` as inherited from `Fl_Group`. You **may** need to set a box type with a solid background depending on your layout.

Important: You should always make sure that the `Fl_Flex` container cannot be resized smaller than its designed minimal size. This can usually be done by setting a `size_range()` on the window as shown in the example below. `Fl_Flex` does not take care of sensible sizes. If it is resized too small the behavior is undefined, i.e. widgets may overlap and/or shrink to zero size.

Hint: In many cases `Fl_Flex` can be used as a drop-in replacement for `Fl_Pack`. This is the recommended single row/column container since FLTK 1.4.0. Its resizing behavior is much more predictable than that of `Fl_Pack` which *"resizes itself to shrink-wrap itself around all of the children"*.

`Fl_Flex` containers can be nested so you can create flexible layouts with multiple columns and rows. However, if your UI design is more complex you may want to use `Fl_Grid` instead.

Example:

Figure 11.18 Fl_Flex

Example code:

```
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Flex.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_Button.H>

int main(int argc, char **argv) {
    Fl_Double_Window window(410, 40, "Simple Fl_Flex Demo");
    Fl_Flex flex(5, 5, 400, 30, Fl_Flex::HORIZONTAL);
    Fl_Button b1(0, 0, 0, 0, "File");
    Fl_Button b2(0, 0, 0, 0, "Save");
    Fl_Box bx(0, 0, 0, 0);
    Fl_Button b3(0, 0, 0, 0, "Exit");
    flex.fixed(bx, 60); // set fix width of invisible box
    flex.gap(10);
    flex.end();
    window.resizable(flex);
    window.end();
    window.size_range(300, 30);
    window.show(argc, argv);
    return Fl::run();
}
```

Since

1.4.0

11.41.2 Member Enumeration Documentation

11.41.2.1 anonymous enum

anonymous enum

Enumerator

VERTICAL	vertical layout (one column)
HORIZONTAL	horizontal layout (one row)
COLUMN	alias for VERTICAL
ROW	alias for HORIZONTAL

11.41.3 Constructor & Destructor Documentation

11.41.3.1 `Fl_Flex()` [1/4]

```
Fl_Flex::Fl_Flex (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Construct a new [Fl_Flex](#) widget with the given position, size, and label.

You can set `type(Fl_Flex::HORIZONTAL)` or `type(Fl_Flex::VERTICAL)`. The default is `type(Fl_Flex::VERTICAL)`.

Alternate constructors let you specify the layout as [Fl_Flex::HORIZONTAL](#) or [Fl_Flex::VERTICAL](#) directly. [Fl_Flex::ROW](#) is an alias of [Fl_Flex::HORIZONTAL](#) and [Fl_Flex::COLUMN](#) is an alias of [Fl_Flex::VERTICAL](#).

Parameters

in	<i>X,Y</i>	position
in	<i>W,H</i>	size (width and height)
in	<i>L</i>	label (optional)

See also

[Fl_Flex::Fl_Flex\(int direction\)](#)
[Fl_Flex::Fl_Flex\(int w, int h, int direction\)](#)
[Fl_Flex::Fl_Flex\(int x, int y, int w, int h, int direction\)](#)
[Fl_Flex::Fl_Flex\(int x, int y, int w, int h, const char *L\)](#)

11.41.3.2 `Fl_Flex()` [2/4]

```
Fl_Flex::Fl_Flex (
    int direction)
```

Construct a new [Fl_Flex](#) widget specifying its layout.

Use [Fl_Flex::HORIZONTAL](#) (aka [Fl_Flex::ROW](#)) or [Fl_Flex::VERTICAL](#) (aka [Fl_Flex::COLUMN](#)) as the `direction` argument.

This constructor sets the position and size to (0, 0, 0, 0) which is suitable for nested [Fl_Flex](#) widgets. Use one of the other constructors to set the desired position and size as well.

Parameters

in	<i>direction</i>	horizontal (row) or vertical (column) layout
----	------------------	--

[Fl_Flex::Fl_Flex\(int w, int h, int direction\)](#)
[Fl_Flex::Fl_Flex\(int x, int y, int w, int h, int direction\)](#)
[Fl_Flex::Fl_Flex\(int x, int y, int w, int h, const char *L\)](#)

11.41.3.3 `Fl_Flex()` [3/4]

```
Fl_Flex::Fl_Flex (
    int w,
    int h,
    int direction)
```

Construct a new [Fl_Flex](#) widget specifying its layout and size.

Use [FI_Flex::HORIZONTAL](#) (aka [FI_Flex::ROW](#)) or [FI_Flex::VERTICAL](#) (aka [FI_Flex::COLUMN](#)) as the `direction` argument.

This constructor sets the position to (x = 0, y = 0) which is suitable for nested [FI_Flex](#) widgets. Use one of the other constructors to set the desired position as well.

Parameters

in	<i>w,h</i>	widget size
in	<i>direction</i>	horizontal (row) or vertical (column) layout

See also

[FI_Flex::FI_Flex\(int direction\)](#)

[FI_Flex::FI_Flex\(int x, int y, int w, int h, int direction\)](#)

[FI_Flex::FI_Flex\(int x, int y, int w, int h, const char *L\)](#)

11.41.3.4 FI_Flex() [4/4]

```
FI_Flex::FI_Flex (
    int x,
    int y,
    int w,
    int h,
    int direction)
```

Construct a new [FI_Flex](#) widget specifying its layout, position, and size.

Use [FI_Flex::HORIZONTAL](#) (aka [FI_Flex::ROW](#)) or [FI_Flex::VERTICAL](#) (aka [FI_Flex::COLUMN](#)) as the `direction` argument.

This constructor sets the position and size of the widget which is suitable for top level [FI_Flex](#) widgets but does not set a widget label. Use [FI_Widget::label\(\)](#) to set one if desired.

Parameters

in	<i>x,y</i>	widget position
in	<i>w,h</i>	widget size
in	<i>direction</i>	horizontal (row) or vertical (column) layout

See also

[FI_Flex::FI_Flex\(int direction\)](#)

[FI_Flex::FI_Flex\(int w, int h, int direction\)](#)

[FI_Flex::FI_Flex\(int x, int y, int w, int h, const char *L\)](#)

11.41.4 Member Function Documentation

11.41.4.1 alloc_size()

```
int FI_Flex::alloc_size (
    int size) const [protected], [virtual]
```

Return new size to be allocated for array of fixed size widgets.

This method is called when the array of fixed size widgets needs to be expanded. The current `size` is provided (size can be 0). The default method adds 8 to the current size.

This can be used in derived classes to change the allocation strategy. Note that this method only *queries* the new size which shall be allocated but does not allocate the memory.

Parameters

in	size	current size
----	------	--------------

Returns

int new size (to be allocated)

11.41.4.2 draw()

```
void Fl_Flex::draw (
    void ) [protected], [virtual]
```

Draw the widget.

This will finally calculate the layout of the widget and of all its children if necessary and draw the widget.

Some changes of included children may require a new layout to be calculated. If this is the case the user may need to call [layout\(\)](#) to make sure everything is calculated properly.

See also

[layout\(\)](#)

Implements [Fl_Widget](#).

11.41.4.3 end()

```
void Fl_Flex::end () [virtual]
```

Ends automatic child addition and resizes all children.

This marks the [Fl_Flex](#) widget as changed (`need_layout(1)`) which forces the widget to calculate its layout depending on all children and whether they have been assigned fix sizes or not right before it is drawn.

See also

[need_layout\(int\)](#)

[draw\(\)](#)

11.41.4.4 fixed() [1/3]

```
void Fl_Flex::fixed (
    Fl_Widget & w,
    int size) [inline]
```

Set the horizontal or vertical size of a child widget.

Parameters

in	w	widget to be affected
in	size	width (Fl_Flex::HORIZONTAL) or height (Fl_Flex::VERTICAL)

See also

[fixed\(Fl_Widget *w, int size\)](#)

11.41.4.5 fixed() [2/3]

```
int Fl_Flex::fixed (
    Fl_Widget * w) const
```

Return whether the given widget has a fixed size or resizes dynamically.

Parameters

in	<i>w</i>	widget
----	----------	--------

Returns

whether the widget has a fixed size

Return values

1	the widget has a fixed size
0	the widget resizes dynamically

11.41.4.6 fixed() [3/3]

```
void Fl_Flex::fixed (
    Fl_Widget * child,
    int size)
```

Set the horizontal or vertical size of a child widget.

This sets either the width or height of a child widget, depending on the `type()` of the `Fl_Flex` container (`Fl_Flex::HORIZONTAL` or `Fl_Flex::VERTICAL`). The other dimension is set to the full width or height of the `Fl_Flex` widget minus border and margin sizes.

This can be used to set a fixed widget width or height of children of `Fl_Flex` so they are not resized dynamically.

If `size` is 0 (zero) or negative the widget size is reset to flexible size.

Parameters

in	<i>child</i>	widget to be affected
in	<i>size</i>	width (<code>Fl_Flex::HORIZONTAL</code>) or height (<code>Fl_Flex::VERTICAL</code>)

11.41.4.7 gap() [1/2]

```
int Fl_Flex::gap () const [inline]
```

Return the gap size of the widget.

Returns

gap size between all child widgets.

11.41.4.8 gap() [2/2]

```
void Fl_Flex::gap (
    int g) [inline]
```

Set the gap size of the widget.

The gap size is some free space **between** child widgets. The size must be ≥ 0 . Negative values are clamped to 0.

Parameters

in	<i>g</i>	gap size
----	----------	----------

11.41.4.9 horizontal()

```
int Fl_Flex::horizontal () const [inline]
```

Returns non-zero (true) if [Fl_Flex](#) alignment is horizontal (row mode).

Returns

non-zero if [Fl_Flex](#) alignment is horizontal

Return values

1	if <code>type() == Fl_Flex::HORIZONTAL</code>
0	if <code>type() == Fl_Flex::VERTICAL</code>

See class [Fl_Flex](#) documentation for details.

11.41.4.10 layout()

```
void Fl_Flex::layout ()
```

Calculates the layout of the widget and redraws it.

If you change widgets in the [Fl_Flex](#) container you should call this method to force recalculation of child widget sizes and positions. This can be useful (necessary) if you [hide\(\)](#), [show\(\)](#), [add\(\)](#) or [remove\(\)](#) children.

Call this method if you need to recalculate widget positions for usage in an algorithm that places widgets at certain positions or when you need to display (show) or hide one or more children depending on the current layout (for instance a side bar).

This method also calls [redraw\(\)](#) on the [Fl_Flex](#) widget.

11.41.4.11 margin() [1/4]

```
int Fl_Flex::margin () const [inline]
```

Returns the left margin size of the widget.

This returns the **left** margin of the widget which is not necessarily the same as all other margins.

Note

This method is useful if you never set different margin sizes.

See also

`int margin(int *left, int *top, int *right, int *bottom)` to get all four [margin](#) values.

Returns

size of left margin.

11.41.4.12 margin() [2/4]

```
int Fl_Flex::margin (
    int * left,
    int * top,
    int * right,
    int * bottom) const [inline]
```

Returns all (four) margin sizes of the widget.

All margin sizes are returned in the given arguments. If any argument is `NULL` the respective value is not returned.

Parameters

in	<i>left</i>	returns left margin if not <code>NULL</code>
in	<i>top</i>	returns top margin if not <code>NULL</code>

in	<i>right</i>	returns right margin if not NULL
in	<i>bottom</i>	returns bottom margin if not NULL

Returns

whether all margins are equal

Return values

1	all margins have the same size
0	at least one margin has a different size

11.41.4.13 margin() [3/4]

```
void Fl_Flex::margin (
    int left,
    int top,
    int right,
    int bottom) [inline]
```

Set the margin sizes at all four edges of the [Fl_Flex](#) widget.

The margin is the free space inside the widget border **around** all child widgets.

You must use all four parameters of this method to set the four margins in the order `left, top, right, bottom`.

Negative values are set to 0 (zero).

To set all margins to equal sizes, use `margin(int m)` which sets all four margins to the same size.

Parameters

in	<i>left, top, right, bottom</i>	margin sizes, must be ≥ 0
----	---------------------------------	--------------------------------

See also

[margin\(int, int\)](#)

11.41.4.14 margin() [4/4]

```
void Fl_Flex::margin (
    int m,
    int g = -1) [inline]
```

Set the margin and optionally the gap size of the widget.

This method can be used to set both the margin and the gap size.

If you don't use the second parameter `g` or supply a negative value the gap size is not changed.

The margin is the free space inside the widget border **around** all child widgets.

This method sets the margin to the same size at all four edges of the [Fl_Flex](#) widget.

The gap size `g` is the free space **between** child widgets. Negative values do not change the gap value. This is the default if this argument is omitted.

Parameters

in	<i>m</i>	margin size, must be ≥ 0
in	<i>g</i>	gap size (ignored, if negative)

See also

[gap\(int\)](#)

11.41.4.15 need_layout() [1/2]

```
bool Fl_Flex::need_layout () const [inline]
```

Returns whether layout calculation is required.

This should rarely be needed by user code. Used internally in [draw\(\)](#).

11.41.4.16 need_layout() [2/2]

```
void Fl_Flex::need_layout (
    int set) [inline]
```

Set or reset the request to calculate the layout of children.

This is intended for internal use but can also be used by user code to request layout calculation before the widget is drawn.

Call this if you changed attributes or sizes of children to ensure that the layout is calculated properly. Changing other [Fl_Flex](#) attributes or resizing the widget does this automatically.

Note

Never call this with 'set == 0' because this would defeat its purpose to recalculate the layout before the widget is drawn.

11.41.4.17 on_remove()

```
void Fl_Flex::on_remove (
    int index) [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group.

Widgets derived from [Fl_Group](#) may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

Parameters

<i>index</i>	remove the child at this position in the array_
--------------	---

Reimplemented from [Fl_Group](#).

11.41.4.18 resize()

```
void Fl_Flex::resize (
    int x,
    int y,
    int w,
    int h) [virtual]
```

Resize the container and calculate all child positions and sizes.

Parameters

in	<i>x,y</i>	position
in	<i>w,h</i>	width and height

Reimplemented from [Fl_Widget](#).

11.41.4.19 spacing() [1/2]

```
int Fl_Flex::spacing () const [inline]
```

Gets the number of extra pixels of blank space that are added between the children.

This method is the same as 'int [gap\(\)](#)' and is defined to enable using [Fl_Flex](#) as a drop-in replacement of [Fl_Pack](#).

See also

int [gap\(\)](#)

11.41.4.20 spacing() [2/2]

```
void Fl_Flex::spacing (
    int i) [inline]
```

Sets the number of extra pixels of blank space that are added between the children.

This method is the same as '[gap\(int\)](#)' and is defined to enable using [Fl_Flex](#) as a drop-in replacement of [Fl_Pack](#).

See also

```
void gap\(int\)
```

The documentation for this class was generated from the following files:

- [Fl_Flex.cxx](#)

11.42 Fl_Float_Input Class Reference

The [Fl_Float_Input](#) class is a subclass of [Fl_Input](#) that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits).

```
#include <Fl_Float_Input.H>
```

Inheritance diagram for [Fl_Float_Input](#):

**Public Member Functions**

- [Fl_Float_Input](#) (int X, int Y, int W, int H, const char *l=0)
Creates a new [Fl_Float_Input](#) widget using the given position, size, and label string.

Public Member Functions inherited from [Fl_Input](#)

- [Fl_Input](#) (int, int, int, int, const char *l=0)
Creates a new [Fl_Input](#) widget using the given position, size, and label string.
- int [handle](#) (int) [FL_OVERRIDE](#)
Handles the specified event.

Public Member Functions inherited from [Fl_Input_](#)

- int [append](#) (const char *t, int l=0, char keep_selection=0)
Append text at the end.
- bool [can_redo](#) () const
Check if there is a redo action available.
- bool [can_undo](#) () const
Check if the last operation can be undone.
- int [copy](#) (int clipboard)
Put the current selection into the clipboard.
- int [copy_cuts](#) ()

- Copies the yank buffer to the clipboard.*

 - `FL_Color cursor_color ()` const

Gets the color of the cursor.
- `void cursor_color (FL_Color n)`

Sets the color of the cursor.
- `int cut ()`

Deletes the current selection.
- `int cut (int a, int b)`

*Deletes all characters between index *a* and *b*.*
- `int cut (int n)`

*Deletes the next *n* bytes rounded to characters before or after the cursor.*
- `double dvalue ()` const

Returns the widget text interpreted as a floating point number.
- `FL_Input_ (int, int, int, int, const char *=0)`

*Creates a new *FL_Input_* widget.*
- `unsigned int index (int i)` const

*Returns the character at index *i*.*
- `int input_type ()` const

Gets the input field type.
- `void input_type (int t)`

Sets the input field type.
- `int insert (const char *t, int l=0)`

Inserts text at the cursor position.
- `int insert_position ()` const

Gets the position of the text cursor.
- `int insert_position (int p)`

Sets the cursor position and mark.
- `int insert_position (int p, int m)`

Sets the index for the cursor and mark.
- `int ivalue ()` const

Returns the widget text interpreted as a signed integer.
- `int mark ()` const

Gets the current selection mark.
- `int mark (int m)`

Sets the current selection mark.
- `int maximum_size ()` const

Gets the maximum length of the input field in characters.
- `void maximum_size (int m)`

Sets the maximum length of the input field in characters.
- `int position ()` const
- `int position (int p)`
- `int position (int p, int m)`
- `int readonly ()` const

Gets the read-only state of the input field.
- `void readonly (int b)`

Sets the read-only state of the input field.
- `int redo ()`

Redo previous undo operation.
- `int replace (int b, int e, const char *text, int ilen=0)`

*Deletes text from *b* to *e* and inserts the new string *text*.*
- `void resize (int, int, int, int) FL_OVERRIDE`

- Changes the size of the widget.*
- int [shortcut](#) () const
 - Return the shortcut key associated with this widget.*
- void [shortcut](#) (int s)
 - Sets the shortcut key associated with this widget.*
- int [size](#) () const
 - Returns the number of bytes in [value\(\)](#).*
- void [size](#) (int W, int H)
 - Sets the width and height of this widget.*
- int [static_value](#) (const char *)
 - Changes the widget text.*
- int [static_value](#) (const char *, int)
 - Changes the widget text.*
- int [tab_nav](#) () const
 - Gets whether the Tab key causes focus navigation in multiline input fields or not.*
- void [tab_nav](#) (int val)
 - Sets whether the Tab key does focus navigation, or inserts tab characters into [FI_Multiline_Input](#).*
- [FI_Color](#) [textcolor](#) () const
 - Gets the color of the text in the input field.*
- void [textcolor](#) ([FI_Color](#) n)
 - Sets the color of the text in the input field.*
- [FI_Font](#) [textfont](#) () const
 - Gets the font of the text in the input field.*
- void [textfont](#) ([FI_Font](#) s)
 - Sets the font of the text in the input field.*
- [FI_Fontsize](#) [textsize](#) () const
 - Gets the size of the text in the input field.*
- void [textsize](#) ([FI_Fontsize](#) s)
 - Sets the size of the text in the input field.*
- int [undo](#) ()
 - Undoes previous changes to the text buffer.*
- const char * [value](#) () const
 - Returns the text displayed in the widget.*
- int [value](#) (const char *)
 - Changes the widget text.*
- int [value](#) (const char *, int)
 - Changes the widget text.*
- int [value](#) (double value)
 - Changes the widget text to a floating point number ("%g").*
- int [value](#) (int value)
 - Changes the widget text to a signed integer number.*
- int [wrap](#) () const
 - Gets the word wrapping state of the input field.*
- void [wrap](#) (int b)
 - Sets the word wrapping state of the input field.*
- [~FI_Input](#) ()
 - Destroys the widget.*

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

 - void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()

Marks the value of the widget as unchanged.
- void `clear_damage` (uchar c=0)

Clears or sets the damage flags.
- void `clear_output` ()

Sets a widget to accept input.
- void `clear_visible` ()

Hides the widget.
- void `clear_visible_focus` ()

Disables keyboard focus navigation with this widget.
- `FL_Color color` () const

Gets the background color of the widget.
- void `color` (FL_Color bg)

Sets the background color of the widget.
- void `color` (FL_Color bg, FL_Color sel)

Sets the background and selection color of the widget.
- `FL_Color color2` () const

For back compatibility only.
- void `color2` (unsigned a)

For back compatibility only.
- int `contains` (const FL_Widget *w) const

Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)

Sets the current label.
- void `copy_tooltip` (const char *text)

Sets the current tooltip text.
- `uchar damage` () const

Returns non-zero if `draw()` needs to be called.
- void `damage` (uchar c)

Sets the damage bits for the widget.
- void `damage` (uchar c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)

Internal use only.
- void `deactivate` ()

Deactivates the widget.
- `FL_Image * deimage` ()

Gets the image that is used as part of the widget label when in the inactive state.
- const `FL_Image * deimage` () const

Gets the image that is used as part of the widget label when in the inactive state.
- void `deimage` (FL_Image &img)

Sets the image to use as part of the widget label when in the inactive state.
- void `deimage` (FL_Image *img)

Sets the image to use as part of the widget label when in the inactive state.
- int `deimage_bound` () const

Returns whether the inactive image is managed by the widget.
- void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with default arguments.

- void `do_callback` (`FI_Widget` *widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `do_callback` (`FI_Widget` *widget, void *arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FI_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FI_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FI_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FI_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FI_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FI_Color` c)
Sets the label color.
- `FI_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FI_Font` f)
Sets the font to use.
- `FI_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)
Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const

- Gets the label type.*

 - void [labeltype](#) ([FI_Labeltype](#) a)

Sets the label type.

 - void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.

 - bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.

 - void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.

 - unsigned int [output](#) () const

Returns if a widget is used for output only.

 - [FI_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.

 - void [parent](#) ([FI_Group](#) *p)

Internal use only - "for hacks only".

 - void [position](#) (int X, int Y)

Repositions the window or widget.

 - void [redraw](#) ()

Schedules the drawing of the widget.

 - void [redraw_label](#) ()

Schedules the drawing of the label.

 - [FI_Color](#) [selection_color](#) () const

Gets the selection color.

 - void [selection_color](#) ([FI_Color](#) a)

Sets the selection color.

 - void [set_active](#) ()

Marks the widget as active without sending events or changing focus.

 - void [set_changed](#) ()

Marks the value of the widget as changed.

 - void [set_output](#) ()

Sets a widget to output only.

 - void [set_visible](#) ()

Makes the widget visible.

 - void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.

 - int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.

 - void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.

 - virtual void [show](#) ()

Makes a widget visible.

 - void [size](#) (int W, int H)

Changes the size of the widget.

 - int [take_focus](#) ()

Gives the widget the keyboard focus.

 - unsigned int [takeevents](#) () const

Returns if the widget is able to take events.

 - int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.

 - const char * [tooltip](#) () const

Gets the current tooltip text.

- void **tooltip** (const char *text)
Sets the current tooltip text.
- **Fl_Window** * **top_window** () const
Returns a pointer to the top-level window for the widget.
- **Fl_Window** * **top_window_offset** (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- **uchar** **type** () const
Gets the widget type.
- void **type** (**uchar** t)
Sets the widget type.
- int **use_accents_menu** ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * **user_data** () const
Gets the user data for this widget.
- void **user_data** (**Fl_Callback_User_Data** *v, bool auto_free)
Sets the user data for this widget.
- void **user_data** (void *v)
Sets the user data for this widget.
- int **vertical_label_margin** ()
Get the spacing between the label and the vertical edge of the widget.
- void **vertical_label_margin** (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int **visible** () const
Returns whether a widget is visible.
- unsigned int **visible_focus** () const
Checks whether this widget has a visible focus.
- void **visible_focus** (int v)
Modifies keyboard focus navigation.
- int **visible_r** () const
Returns whether a widget and all its parents are visible.
- int **w** () const
Gets the widget width.
- **Fl_When** **when** () const
Returns the conditions under which the callback is called.
- void **when** (**uchar** i)
Sets the flags used to decide when a callback is called.
- **Fl_Window** * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
Gets the widget position in its window.
- int **y** () const
Gets the widget position in its window.
- virtual **~Fl_Widget** ()
Destroys the widget.

Additional Inherited Members

Static Public Member Functions inherited from FI_Widget

- static void [default_callback](#) (FI_Widget *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Static Public Attributes inherited from FI_Input

- static const char * [copy_menu_text](#) = "Copy"
[this text may be customized at run-time]
- static const char * [cut_menu_text](#) = "Cut"
[this text may be customized at run-time]
- static const char * [paste_menu_text](#) = "Paste"
[this text may be customized at run-time]

Protected Types inherited from FI_Widget

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,
[FORCE_POSITION](#) = 1<<4 , [NON_MODAL](#) = 1<<5 , [SHORTCUT_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7
, [OVERRIDE](#) = 1<<8 , [VISIBLE_FOCUS](#) = 1<<9 , [COPIED_LABEL](#) = 1<<10 , [CLIP_CHILDREN](#) = 1<<11
, [MENU_WINDOW](#) = 1<<12 , [TOOLTIP_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO_OVERLAY](#) = 1<<15
, [GROUP_RELATIVE](#) = 1<<16 , [COPIED_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC_USE_ACCENTS_MENU](#)
= 1<<19 ,
[NEEDS_KEYBOARD](#) = 1<<20 , [IMAGE_BOUND](#) = 1<<21 , [DEIMAGE_BOUND](#) = 1<<22 ,
[AUTO_DELETE_USER_DATA](#) = 1<<23 ,
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,
[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

Protected Member Functions inherited from FI_Input

- void [draw](#) () [FL_OVERRIDE](#)
Draws the widget.
- int [handle_key](#) ()
Handles a keystroke.
- int [handle_rmb](#) ()
Handle right mouse button down events.

Protected Member Functions inherited from FI_Input_

- int [apply_undo](#) ()
Apply the current undo/redo operation.
- void [drawtext](#) (int, int, int, int)
Draws the text in the passed bounding box.
- void [drawtext](#) (int, int, int, int, bool draw_active)
Draws the text in the passed bounding box.

- void **handle_mouse** (int, int, int, int, int keepmark=0)
Handles mouse clicks and mouse moves.
- int **handletext** (int e, int, int, int, int)
Handles all kinds of text field related events.
- int **line_end** (int i) const
Finds the end of a line.
- int **line_start** (int i) const
Finds the start of a line.
- int **linesPerPage** ()
- void **maybe_do_callback** (FI_Callback_Reason reason=FL_REASON_UNKNOWN)
- int **up_down_position** (int, int keepmark=0)
Moves the cursor to the column given by up_down_pos.
- int **word_end** (int i) const
Finds the end of a word.
- int **word_start** (int i) const
Finds the start of a word.
- int **xscroll** () const
- int **yscroll** () const
- void **yscroll** (int yOffset)

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)

Internal use only.

- void **x** (int v)

Internal use only.

- void **y** (int v)

Internal use only.

11.42.1 Detailed Description

The [Fl_Float_Input](#) class is a subclass of [Fl_Input](#) that only allows the user to type floating point numbers (sign, digits, decimal point, more digits, 'E' or 'e', sign, digits).

11.42.2 Constructor & Destructor Documentation

11.42.2.1 Fl_Float_Input()

```
Fl_Float_Input::Fl_Float_Input (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0)
```

Creates a new [Fl_Float_Input](#) widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

Inherited destructor destroys the widget and any value associated with it.

The documentation for this class was generated from the following files:

- Fl_Float_Input.H
- Fl_Input.cxx

11.43 Fl_FormsBitmap Class Reference

Forms compatibility Bitmap Image Widget.

```
#include <Fl_FormsBitmap.H>
```

Inheritance diagram for Fl_FormsBitmap:

Public Member Functions

- [Fl_Bitmap](#) * **bitmap** () const
Gets a the current associated [Fl_Bitmap](#) objects.
- void **bitmap** ([Fl_Bitmap](#) *B)
Sets a new bitmap.
- **Fl_FormsBitmap** ([Fl_Boxtype](#), int, int, int, int, const char *l=0)
Creates a bitmap widget from a box type, position, size and optional label specification.
- void **set** (int W, int H, const [uchar](#) *bits)
Sets a new bitmap bits with size W,H.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

 - void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()

Marks the value of the widget as unchanged.
- void `clear_damage` (uchar c=0)

Clears or sets the damage flags.
- void `clear_output` ()

Sets a widget to accept input.
- void `clear_visible` ()

Hides the widget.
- void `clear_visible_focus` ()

Disables keyboard focus navigation with this widget.
- `FL_Color color` () const

Gets the background color of the widget.
- void `color` (FL_Color bg)

Sets the background color of the widget.
- void `color` (FL_Color bg, FL_Color sel)

Sets the background and selection color of the widget.
- `FL_Color color2` () const

For back compatibility only.
- void `color2` (unsigned a)

For back compatibility only.
- int `contains` (const FL_Widget *w) const

Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)

Sets the current label.
- void `copy_tooltip` (const char *text)

Sets the current tooltip text.
- `uchar damage` () const

Returns non-zero if `draw()` needs to be called.
- void `damage` (uchar c)

Sets the damage bits for the widget.
- void `damage` (uchar c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)

Internal use only.
- void `deactivate` ()

Deactivates the widget.
- `FL_Image * deimage` ()

Gets the image that is used as part of the widget label when in the inactive state.
- const `FL_Image * deimage` () const

Gets the image that is used as part of the widget label when in the inactive state.
- void `deimage` (FL_Image &img)

Sets the image to use as part of the widget label when in the inactive state.
- void `deimage` (FL_Image *img)

Sets the image to use as part of the widget label when in the inactive state.
- int `deimage_bound` () const

Returns whether the inactive image is managed by the widget.
- void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)

Calls the widget callback function with default arguments.

- void `do_callback` (`FL_Widget` *widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `do_callback` (`FL_Widget` *widget, void *arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FL_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual int `handle` (int event)
Handles the specified event.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FL_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FL_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FL_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FL_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FL_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FL_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FL_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FL_Color` c)
Sets the label color.
- `FL_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FL_Font` f)
Sets the font to use.
- `FL_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FL_Fonsize` pix)

- Sets the font size in pixels.*

 - [FI_Labeltype labeltype](#) () const
- Gets the label type.*

 - void [labeltype](#) ([FI_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const
- Sets width ww and height hh accordingly with the label size.*

 - bool [needs_keyboard](#) () const
- Returns whether this widget needs a keyboard.*

 - void [needs_keyboard](#) (bool needs)
- Sets whether this widget needs a keyboard.*

 - unsigned int [output](#) () const
- Returns if a widget is used for output only.*

 - [FI_Group](#) * [parent](#) () const
- Returns a pointer to the parent widget.*

 - void [parent](#) ([FI_Group](#) *p)
- Internal use only - "for hacks only".*

 - void [position](#) (int X, int Y)
- Repositions the window or widget.*

 - void [redraw](#) ()
- Schedules the drawing of the widget.*

 - void [redraw_label](#) ()
- Schedules the drawing of the label.*

 - virtual void [resize](#) (int x, int y, int w, int h)
- Changes the size or position of the widget.*

 - [FI_Color](#) [selection_color](#) () const
- Gets the selection color.*

 - void [selection_color](#) ([FI_Color](#) a)
- Sets the selection color.*

 - void [set_active](#) ()
- Marks the widget as active without sending events or changing focus.*

 - void [set_changed](#) ()
- Marks the value of the widget as changed.*

 - void [set_output](#) ()
- Sets a widget to output only.*

 - void [set_visible](#) ()
- Makes the widget visible.*

 - void [set_visible_focus](#) ()
- Enables keyboard focus navigation with this widget.*

 - int [shortcut_label](#) () const
- Returns whether the widget's label uses '&' to indicate shortcuts.*

 - void [shortcut_label](#) (int value)
- Sets whether the widget's label uses '&' to indicate shortcuts.*

 - virtual void [show](#) ()
- Makes a widget visible.*

 - void [size](#) (int W, int H)
- Changes the size of the widget.*

 - int [take_focus](#) ()
- Gives the widget the keyboard focus.*

 - unsigned int [takeevents](#) () const
- Returns if the widget is able to take events.*

- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)
Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const
Gets the widget position in its window.
- int [y](#) () const
Gets the widget position in its window.
- virtual ~[Fl_Widget](#) ()
Destroys the widget.

Protected Member Functions

- void **draw** () [FL_OVERRIDE](#)
Draws the bitmap and its associated box.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members**Static Public Member Functions inherited from [FI_Widget](#)**

- static void **default_callback** ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [Fl_Widget](#)

[USERFLAG1](#) = 1<<31 }

flags possible values enumeration.

11.43.1 Detailed Description

Forms compatibility Bitmap Image Widget.

11.43.2 Member Function Documentation

11.43.2.1 `draw()`

```
void Fl_FormsBitmap::draw (
    void ) [protected], [virtual]
```

Draws the bitmap and its associated box.

Implements [Fl_Widget](#).

11.43.2.2 `set()`

```
void Fl_FormsBitmap::set (
    int W,
    int H,
    const uchar * bits)
```

Sets a new bitmap bits with size W,H.

Deletes the previous one.

The documentation for this class was generated from the following files:

- `Fl_FormsBitmap.H`
- `forms_bitmap.cxx`

11.44 [Fl_FormsPixmap](#) Class Reference

Forms pixmap drawing routines.

```
#include <Fl_FormsPixmap.H>
```

Inheritance diagram for [Fl_FormsPixmap](#):

Public Member Functions

- [FL_FormsPixmap](#) ([FL_Boxtype](#) t, int X, int Y, int W, int H, const char *L=0)
Creates a new [FL_FormsPixmap](#) widget using the given box type, position, size and label string.
- [FL_Pixmap](#) * [Pixmap](#) () const
Get the internal pixmap pointer.
- void [Pixmap](#) ([FL_Pixmap](#) *B)
Set the internal pixmap pointer to an existing pixmap.
- void [set](#) (char *const *bits)
Set/create the internal pixmap using raw data.

Public Member Functions inherited from [FL_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FL_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FL_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FL_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FL_Gl_Window](#) pointer if this widget is an [FL_Gl_Window](#).
- virtual class [FL_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FL_Group](#) * [as_group](#) ()
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- virtual [FL_Group](#) const * [as_group](#) () const
- virtual [FL_Window](#) * [as_window](#) ()
Returns an [FL_Window](#) pointer if this widget is an [FL_Window](#).
- virtual [FL_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FL_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FL_Boxtype](#) new_box)
Sets the box type for the widget.
- [FL_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.

- void `callback` (`FI_Callback` *cb)
Sets the current callback function for the widget.
- void `callback` (`FI_Callback` *cb, `FI_Callback_User_Data` *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void `callback` (`FI_Callback` *cb, void *p)
Sets the current callback function and data for the widget.
- void `callback` (`FI_Callback0` *cb)
Sets the current callback function for the widget.
- void `callback` (`FI_Callback1` *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int `changed` () const
Checks if the widget value changed since the last callback.
- void `clear_active` ()
Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()
Marks the value of the widget as unchanged.
- void `clear_damage` (uchar c=0)
Clears or sets the damage flags.
- void `clear_output` ()
Sets a widget to accept input.
- void `clear_visible` ()
Hides the widget.
- void `clear_visible_focus` ()
Disables keyboard focus navigation with this widget.
- `FI_Color` `color` () const
Gets the background color of the widget.
- void `color` (`FI_Color` bg)
Sets the background color of the widget.
- void `color` (`FI_Color` bg, `FI_Color` sel)
Sets the background and selection color of the widget.
- `FI_Color` `color2` () const
For back compatibility only.
- void `color2` (unsigned a)
For back compatibility only.
- int `contains` (const `FI_Widget` *w) const
Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)
Sets the current label.
- void `copy_tooltip` (const char *text)
Sets the current tooltip text.
- uchar `damage` () const
Returns non-zero if `draw()` needs to be called.
- void `damage` (uchar c)
Sets the damage bits for the widget.
- void `damage` (uchar c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int `damage_resize` (int, int, int, int)
Internal use only.
- void `deactivate` ()
Deactivates the widget.
- `FI_Image` * `deimage` ()

- Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL_Image](#) * [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL_Image](#) *img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage_bound](#) () const
- Returns whether the inactive image is managed by the widget.*
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with default arguments.*
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const
- Gets the widget height.*
- virtual int [handle](#) (int event)
- Handles the specified event.*
- virtual void [hide](#) ()
- Makes a widget invisible.*
- int [horizontal_label_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal_label_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*
- [FL_Image](#) * [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*
- const [FL_Image](#) * [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL_Image](#) *img)
- Sets the image to use as part of the widget label when in the active state.*
- int [image_bound](#) () const
- Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL_Widget](#) *wgt) const
- Checks if this widget is a child of wgt.*
- int [is_label_copied](#) () const
- Returns whether the current label was assigned with [copy_label\(\)](#).*
- const char * [label](#) () const
- Gets the current label text.*
- void [label](#) (const char *text)
- Sets the current label pointer.*
- void [label](#) ([FL_Labeltype](#) a, const char *b)
- Shortcut to set the label text and type in one call.*
- int [label_image_spacing](#) ()
- Return the gap size between the label and the image.*
- void [label_image_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*

- [FL_Color labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize labelsiz](#)e () const
Gets the font size in pixels.
- void [labelsiz](#)e ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype labeltyp](#)e () const
Gets the label type.
- void [labeltyp](#)e ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group * parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
- [FL_Color selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([FL_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

- Returns whether the widget's label uses '&' to indicate shortcuts.*

 - void **shortcut_label** (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void **show** ()

Makes a widget visible.
- void **size** (int W, int H)

Changes the size of the widget.
- int **take_focus** ()

Gives the widget the keyboard focus.
- unsigned int **takeevents** () const

Returns if the widget is able to take events.
- int **test_shortcut** ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * **tooltip** () const

Gets the current tooltip text.
- void **tooltip** (const char *text)

Sets the current tooltip text.
- **Fl_Window** * **top_window** () const

Returns a pointer to the top-level window for the widget.
- **Fl_Window** * **top_window_offset** (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- **uchar** **type** () const

Gets the widget type.
- void **type** (**uchar** t)

Sets the widget type.
- int **use_accents_menu** ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * **user_data** () const

Gets the user data for this widget.
- void **user_data** (**Fl_Callback_User_Data** *v, bool auto_free)

Sets the user data for this widget.
- void **user_data** (void *v)

Sets the user data for this widget.
- int **vertical_label_margin** ()

Get the spacing between the label and the vertical edge of the widget.
- void **vertical_label_margin** (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int **visible** () const

Returns whether a widget is visible.
- unsigned int **visible_focus** () const

Checks whether this widget has a visible focus.
- void **visible_focus** (int v)

Modifies keyboard focus navigation.
- int **visible_r** () const

Returns whether a widget and all its parents are visible.
- int **w** () const

Gets the widget width.
- **Fl_When** **when** () const

Returns the conditions under which the callback is called.
- void **when** (**uchar** i)

Sets the flags used to decide when a callback is called.

- `FL_Window * window () const`
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~FL_Widget ()`
Destroys the widget.

Protected Member Functions

- `void draw () FL_OVERRIDE`
Draws the widget.

Protected Member Functions inherited from `FL_Widget`

- `void clear_flag (unsigned int c)`
Clears a flag in the flags mask.
- `void draw_backdrop () const`
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
Draws the widget box according its box style.
- `void draw_box (FL_Boxtype t, FL_Color c) const`
Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`
Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`
Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
Draws the widget's label at the defined label position.
- `void draw_label (int, int, int, int) const`
Draws the label in an arbitrary bounding box.
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`
Creates a widget at the given position and size.
- `unsigned int flags () const`
Gets the widget flags mask.
- `void h (int v)`
Internal use only.
- `void set_flag (unsigned int c)`
Sets a flag in the flags mask.
- `void w (int v)`
Internal use only.
- `void x (int v)`
Internal use only.
- `void y (int v)`
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from Fl_Widget

- static void `default_callback` (`Fl_Widget *widget`, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
,
`OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
,
`MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
,
`GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.44.1 Detailed Description

Forms pixmap drawing routines.

11.44.2 Constructor & Destructor Documentation

11.44.2.1 Fl_FormsPixmap()

```
Fl_FormsPixmap::Fl_FormsPixmap (
    Fl_Boxtype t,
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Creates a new `Fl_FormsPixmap` widget using the given box type, position, size and label string.

Parameters

in	<i>t</i>	box type
in	<i>X,Y,W,H</i>	position and size
in	<i>L</i>	widget label, default is no label

11.44.3 Member Function Documentation

11.44.3.1 draw()

```
void Fl_FormsPixmap::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

11.44.3.2 Pixmap()

```
void Fl_FormsPixmap::Pixmap (
    Fl_Pixmap * B) [inline]
```

Set the internal pixmap pointer to an existing pixmap.

Parameters

in	<i>B</i>	existing pixmap
----	----------	-----------------

11.44.3.3 set()

```
void Fl_FormsPixmap::set (
    char *const * bits)
```

Set/create the internal pixmap using raw data.

Parameters

in	<i>bits</i>	raw data
----	-------------	----------

The documentation for this class was generated from the following files:

- [Fl_FormsPixmap.H](#)
- [forms_pixmap.cxx](#)

11.45 Fl_FormsText Class Reference

Inheritance diagram for [Fl_FormsText](#):

Public Member Functions

- **Fl_FormsText** ([Fl_Boxtype](#) b, int X, int Y, int W, int H, const char *l=0)

Public Member Functions inherited from [Fl_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const

- Returns whether the widget is active.*

 - int `active_r` () const
- Returns whether the widget and all of its parents are active.*

 - `FL_Align align` () const
- Gets the label alignment.*

 - void `align` (`FL_Align alignment`)
- Sets the label alignment.*

 - long `argument` () const
- Gets the current user data (long) argument that is passed to the callback function.*

 - void `argument` (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

 - virtual class `FL_Gl_Window` * `as_gl_window` ()
- Returns an `FL_Gl_Window` pointer if this widget is an `FL_Gl_Window`.*

 - virtual class `FL_Gl_Window` const * `as_gl_window` () const
- Returns an `FL_Group` pointer if this widget is an `FL_Group`.*

 - virtual `FL_Group` * `as_group` ()
- Returns an `FL_Window` pointer if this widget is an `FL_Window`.*

 - virtual `FL_Group` const * `as_group` () const
- Returns an `FL_Window` pointer if this widget is an `FL_Window`.*

 - virtual `FL_Window` * `as_window` ()
- Returns an `FL_Window` pointer if this widget is an `FL_Window`.*

 - virtual `FL_Window` const * `as_window` () const
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `bind_deimage` (`FL_Image *img`)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `bind_deimage` (int f)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

 - void `bind_image` (`FL_Image *img`)
- Sets the image to use as part of the widget label when in the active state.*

 - void `bind_image` (int f)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

 - `FL_Boxtype box` () const
- Gets the box type of the widget.*

 - void `box` (`FL_Boxtype new_box`)
- Sets the box type for the widget.*

 - `FL_Callback_p callback` () const
- Gets the current callback function for the widget.*

 - void `callback` (`FL_Callback *cb`)
- Sets the current callback function for the widget.*

 - void `callback` (`FL_Callback *cb`, `FL_Callback_User_Data *p`, bool auto_free)
- Sets the current callback function and managed user data for the widget.*

 - void `callback` (`FL_Callback *cb`, void *p)
- Sets the current callback function and data for the widget.*

 - void `callback` (`FL_Callback0 *cb`)
- Sets the current callback function for the widget.*

 - void `callback` (`FL_Callback1 *cb`, long p=0)
- Sets the current callback function for the widget.*

 - unsigned int `changed` () const
- Checks if the widget value changed since the last callback.*

 - void `clear_active` ()
- Marks the widget as inactive without sending events or changing focus.*

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

 - void `clear_damage` (uchar c=0)

- Clears or sets the damage flags.*
- void `clear_output` ()
- Sets a widget to accept input.*
- void `clear_visible` ()
- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `FI_Color` `color` () const
- Gets the background color of the widget.*
- void `color` (`FI_Color` bg)
- Sets the background color of the widget.*
- void `color` (`FI_Color` bg, `FI_Color` sel)
- Sets the background and selection color of the widget.*
- `FI_Color` `color2` () const
- For back compatibility only.*
- void `color2` (unsigned a)
- For back compatibility only.*
- int `contains` (const `FI_Widget` *w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char *new_label)
- Sets the current label.*
- void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*
- `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (`uchar` c)
- Sets the damage bits for the widget.*
- void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*
- `FI_Image` * `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const `FI_Image` * `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (`FI_Image` *img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*
- void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*
- void `do_callback` (`FI_Widget` *widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*
- void `do_callback` (`FI_Widget` *widget, void *arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*
- void `draw_label` (int, int, int, int, `FI_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

- int [h](#) () const
Gets the widget height.
- virtual int [handle](#) (int event)
Handles the specified event.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const

- Sets width ww and height hh accordingly with the label size.*

 - bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `FI_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`FI_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- virtual void `resize` (int x, int y, int w, int h)

Changes the size or position of the widget.
- `FI_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`FI_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void `show` ()

Makes a widget visible.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the current tooltip text.

- `Fl_Window * top_window ()` const
Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff)` const
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type ()` const
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data ()` const
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible ()` const
Returns whether a widget is visible.
- `unsigned int visible_focus ()` const
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r ()` const
Returns whether a widget and all its parents are visible.
- `int w ()` const
Gets the widget width.
- `Fl_When when ()` const
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window ()` const
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x ()` const
Gets the widget position in its window.
- `int y ()` const
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Protected Member Functions

- `void draw ()` **FL_OVERRIDE**
Draws the widget.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from [FI_Widget](#)

- static void **default_callback** ([FI_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from Fl_Widget

flags possible values enumeration.

11.45.1 Member Function Documentation

11.45.1.1 draw()

```
void Fl_FormsText::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

The documentation for this class was generated from the following file:

- forms.H

11.46 Fl_Free Class Reference

Emulation of the Forms "free" widget.

```
#include <Fl_Free.H>
```

Inheritance diagram for Fl_Free:

Public Member Functions

- [Fl_Free](#) ([uchar](#) t, int X, int Y, int W, int H, const char *L, [FL_HANDLEPTR](#) hdl)
Create a new [Fl_Free](#) widget with type, position, size, label and handler.
- int [handle](#) (int e) [FL_OVERRIDE](#)
Handles the specified event.
- [~Fl_Free](#) ()
The destructor will call the handle function with the event `FL_FREE_MEM`.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const

- Checks if the widget value changed since the last callback.*

 - void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*
- void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*
- void `clear_output` ()
- Sets a widget to accept input.*
- void `clear_visible` ()
- Hides the widget.*
- void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*
- `FL_Color color` () const
- Gets the background color of the widget.*
- void `color` (FL_Color bg)
- Sets the background color of the widget.*
- void `color` (FL_Color bg, FL_Color sel)
- Sets the background and selection color of the widget.*
- `FL_Color color2` () const
- For back compatibility only.*
- void `color2` (unsigned a)
- For back compatibility only.*
- int `contains` (const FL_Widget *w) const
- Checks if w is a child of this widget.*
- void `copy_label` (const char *new_label)
- Sets the current label.*
- void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*
- `uchar damage` () const
- Returns non-zero if `draw()` needs to be called.*
- void `damage` (uchar c)
- Sets the damage bits for the widget.*
- void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*
- int `damage_resize` (int, int, int, int)
- Internal use only.*
- void `deactivate` ()
- Deactivates the widget.*
- `FL_Image * deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*
- const `FL_Image * deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void `deimage` (FL_Image &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void `deimage` (FL_Image *img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*
- void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with default arguments.*

- void `do_callback` (`FI_Widget` *widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `do_callback` (`FI_Widget` *widget, void *arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FI_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FI_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FI_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FI_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FI_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FI_Color` c)
Sets the label color.
- `FI_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FI_Font` f)
Sets the font to use.
- `FI_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)
Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const

- Gets the label type.*

 - void [labeltype](#) ([FL_Labeltype](#) a)
- Sets the label type.*

 - void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const

Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)

Changes the size or position of the widget.
- [FL_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([FL_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
Gets the current tooltip text.
- `void tooltip (const char *text)`
Sets the current tooltip text.
- `Fl_Window * top_window () const`
Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type () const`
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data () const`
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible () const`
Returns whether a widget is visible.
- `unsigned int visible_focus () const`
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r () const`
Returns whether a widget and all its parents are visible.
- `int w () const`
Gets the widget width.
- `Fl_When when () const`
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window () const`
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Protected Member Functions

- `void draw () FL_OVERRIDE`
Draws the widget.

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from FI_Widget

- static void **default_callback** (FI_Widget *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [Fl_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,

[USERFLAG1](#) = 1<<31 }

flags possible values enumeration.

11.46.1 Detailed Description

Emulation of the Forms "free" widget.

This emulation allows the free demo to run, and appears to be useful for porting programs written in Forms which use the free widget or make subclasses of the Forms widgets.

There are five types of free, which determine when the handle function is called:

- [FL_NORMAL_FREE](#) normal event handling.
- [FL_SLEEPING_FREE](#) deactivates event handling (widget is inactive).
- [FL_INPUT_FREE](#) accepts [FL_FOCUS](#) events.
- [FL_CONTINUOUS_FREE](#) sets a timeout callback 100 times a second and provides an [FL_STEP](#) event. This has obvious detrimental effects on machine performance.
- [FL_ALL_FREE](#) same as [FL_INPUT_FREE](#) and [FL_CONTINUOUS_FREE](#).

11.46.2 Constructor & Destructor Documentation

11.46.2.1 [Fl_Free\(\)](#)

```
Fl_Free::Fl_Free (
    uchar t,
    int X,
    int Y,
    int W,
    int H,
    const char * L,
    FL_HANDLERPTR hdl)
```

Create a new [Fl_Free](#) widget with type, position, size, label and handler.

Parameters

in	<i>t</i>	type
in	<i>X,Y,W,H</i>	position and size
in	<i>L</i>	widget label
in	<i>hdl</i>	handler function

The constructor takes both the type and the handle function. The handle function should be declared as follows:

```
int handle_function(Fl_Widget *w,
    int event,
```

```
float    event_x,
float    event_y,
char     key)
```

This function is called from the [handle\(\)](#) method in response to most events, and is called by the [draw\(\)](#) method. The event argument contains the event type:

```
// old event names for compatibility:
#define FL_MOUSE      FL_DRAG
#define FL_DRAW       0
#define FL_STEP       9
#define FL_FREEMEM    12
#define FL_FREEZE     FL_UNMAP
#define FL_THAW       FL_MAP
```

11.46.3 Member Function Documentation

11.46.3.1 draw()

```
void Fl_Free::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

11.46.3.2 handle()

```
int Fl_Free::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

- [forms_free.cxx](#)

11.47 FI_GIF_Image Class Reference

The [FI_GIF_Image](#) class supports loading, caching, and drawing of Compuserve GIFSM images.

```
#include <FI_GIF_Image.H>
```

Inheritance diagram for [FI_GIF_Image](#):

Classes

- struct [GIF_FRAME](#)

Public Member Functions

- [FI_GIF_Image](#) (const char *filename)
This constructor loads a GIF image from the given file.
- [FI_GIF_Image](#) (const char *imagename, const unsigned char *data)
This constructor loads a GIF image from memory (deprecated).
- [FI_GIF_Image](#) (const char *imagename, const unsigned char *data, const size_t length)
This constructor loads a GIF image from memory.

Public Member Functions inherited from [FI_Pixmap](#)

- int **cache_h** ()
- int **cache_w** ()
- void [color_average](#) ([FI_Color](#) c, float i) [FL_OVERRIDE](#)
The [color_average\(\)](#) method averages the colors in the image with the provided FLTK color value.
- [FI_Image](#) * **copy** () const
- [FI_Image](#) * **copy** (int W, int H) const [FL_OVERRIDE](#)
Creates a resized copy of the image.
- void [desaturate](#) () [FL_OVERRIDE](#)
The [desaturate\(\)](#) method converts an image to grayscale.
- void **draw** (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) [FL_OVERRIDE](#)
Draws the image to the current drawing surface with a bounding box.
- [FI_Pixmap](#) (char *const *D)
The constructors create a new pixmap from the specified XPM data.
- [FI_Pixmap](#) (const char *const *D)
The constructors create a new pixmap from the specified XPM data.
- [FI_Pixmap](#) (const [uchar](#) *const *D)
The constructors create a new pixmap from the specified XPM data.
- [FI_Pixmap](#) ([uchar](#) *const *D)
The constructors create a new pixmap from the specified XPM data.
- void [label](#) ([FI_Menu_Item](#) *m) [FL_OVERRIDE](#)
This method is an obsolete way to set the image attribute of a menu item.

- void **label** (FI_Widget *w) **FL_OVERRIDE**
This method is an obsolete way to set the image attribute of a widget or menu item.
- void **uncache** () **FL_OVERRIDE**
If the image has been cached for display, delete the cache data.
- virtual **~FI_Pixmap** ()
The destructor frees all memory and server resources that are used by the pixmap.

Public Member Functions inherited from FI_Image

- virtual class FI_Shared_Image * **as_shared_image** ()
Returns whether an image is an FI_Shared_Image or not.
- FI_Image * **copy** () const
Creates a copy of the image in the same size.
- int **count** () const
Returns the number of data values associated with the image.
- int **d** () const
Returns the image depth.
- const char *const * **data** () const
Returns a pointer to the current image data array.
- int **data_h** () const
Returns the height of the image data.
- int **data_w** () const
Returns the width of the image data.
- void **draw** (int X, int Y)
Draws the image to the current drawing surface.
- int **fail** () const
Returns a value that is not 0 if there is currently no image available.
- FI_Image (int W, int H, int D)
The constructor creates an empty image with the specified width, height, and depth.
- int **h** () const
Returns the current image drawing height in FLTK units.
- void **inactive** ()
The inactive() method calls color_average(FL_BACKGROUND_COLOR, 0.33f) to produce an image that appears grayed out.
- int **ld** () const
Returns the current line data size in bytes.
- virtual void **release** ()
Releases an FI_Image - the same as 'delete this'.
- virtual void **scale** (int width, int height, int proportional=1, int can_expand=0)
Sets the drawing size of the image.
- int **w** () const
Returns the current image drawing width in FLTK units.
- virtual **~FI_Image** ()
The destructor is a virtual method that frees all memory used by the image.

Static Public Member Functions

- static bool **is_animated** (const char *name_)

Static Public Member Functions inherited from [FI_Image](#)

- static [FI_Labeltype](#) [define_FL_IMAGE_LABEL](#) ()
- static [FI_RGB_Scaling](#) [RGB_scaling](#) ()
Returns the currently used RGB image scaling method.
- static void [RGB_scaling](#) ([FI_RGB_Scaling](#))
Sets the RGB image scaling method used for copy(int, int).
- static [FI_RGB_Scaling](#) [scaling_algorithm](#) ()
Gets what algorithm is used when resizing a source image to draw it.
- static void [scaling_algorithm](#) ([FI_RGB_Scaling](#) algorithm)
Sets what algorithm is used when resizing a source image to draw it.

Static Public Attributes

- static bool [animate](#) = false
Sets how the shared image core routine should treat animated GIF files.

Static Public Attributes inherited from [FI_Image](#)

- static const int [ERR_FILE_ACCESS](#) = -2
- static const int [ERR_FORMAT](#) = -3
- static const int [ERR_MEMORY_ACCESS](#) = -4
- static const int [ERR_NO_IMAGE](#) = -1
- static bool [register_images_done](#) = false
True after [fl_register_images\(\)](#) was called, false before.

Protected Member Functions

- [FI_GIF_Image](#) ()
The default constructor creates an empty GIF image.
- [FI_GIF_Image](#) (const char *filename, bool anim)
- [FI_GIF_Image](#) (const char *imagename, const unsigned char *data, const size_t length, bool anim)
- void [load](#) (const char *filename, bool anim)
The protected [load\(\)](#) methods are used by [FI_Anim_GIF_Image](#) to request loading of animated GIF's.
- void [load](#) (const char *imagename, const unsigned char *data, const size_t length, bool anim)
- void [load_gif_](#) (class [FI_Image_Reader](#) &rdr, bool anim=false)
- virtual void [on_extension_data](#) ([GIF_FRAME](#) &)
- virtual void [on_frame_data](#) ([GIF_FRAME](#) &)

Protected Member Functions inherited from [FI_Pixmap](#)

- void [measure](#) ()

Protected Member Functions inherited from [FI_Image](#)

- void [d](#) (int D)
Sets the current image depth.
- void [data](#) (const char *const *p, int c)
Sets the current data pointer and count of pointers in the array.
- void [draw_empty](#) (int X, int Y)
The protected method [draw_empty\(\)](#) draws a box with an X in it.
- int [draw_scaled](#) (int X, int Y, int W, int H)
Draw the image to the current drawing surface rescaled to a given width and height.
- void [h](#) (int H)
Sets the height of the image data.

- void **ld** (int LD)
Sets the current line data size in bytes.
- void **w** (int W)
Sets the width of the image data.

Additional Inherited Members

Public Attributes inherited from [Fl_Pixmap](#)

- int **alloc_data**

Static Protected Member Functions inherited from [Fl_Image](#)

- static void **labeltype** (const [Fl_Label](#) *lo, int lx, int ly, int lw, int lh, [Fl_Align](#) la)
- static void **measure** (const [Fl_Label](#) *lo, int &lw, int &lh)

11.47.1 Detailed Description

The [Fl_GIF_Image](#) class supports loading, caching, and drawing of Compuserve GIFSM images. The class loads the first image and supports transparency.

11.47.2 Constructor & Destructor Documentation

11.47.2.1 [Fl_GIF_Image\(\)](#) [1/3]

```
Fl_GIF_Image::Fl_GIF_Image (
    const char * filename)
```

This constructor loads a GIF image from the given file.

If a GIF image is animated, [Fl_GIF_Image](#) will only read and display the first frame of the animation.

The destructor frees all memory and server resources that are used by the image.

Use [Fl_Image::fail\(\)](#) to check if [Fl_GIF_Image](#) failed to load. [fail\(\)](#) returns `ERR_FILE_ACCESS` if the file could not be opened or read, `ERR_FORMAT` if the GIF format could not be decoded, and `ERR_NO_IMAGE` if the image could not be loaded for another reason.

Parameters

<code>in</code>	<code>filename</code>	a full path and name pointing to a GIF image file.
-----------------	-----------------------	--

See also

`Fl_GIF_Image::Fl_GIF_Image(const char *imagename, const unsigned char *data, const long length)`

11.47.2.2 [Fl_GIF_Image\(\)](#) [2/3]

```
Fl_GIF_Image::Fl_GIF_Image (
    const char * imagename,
    const unsigned char * data)
```

This constructor loads a GIF image from memory (deprecated).

Deprecated Please use `Fl_GIF_Image(const char *imagename, const unsigned char *data, const size_t length)` instead.

Note

Buffer overruns will not be checked.

This constructor should not be used because the caller can't supply the memory size and the image reader can't check for "end of memory" errors.

Note

A new constructor with parameter `length` is available since FLTK 1.4.0.

Parameters

in	<i>imagename</i>	A name given to this image or NULL
in	<i>data</i>	Pointer to the start of the GIF image in memory.

[FI_GIF_Image\(const char *filename\)](#)

[FI_GIF_Image\(const char *imagename, const unsigned char *data, const size_t length\)](#)

11.47.2.3 FI_GIF_Image() [3/3]

```
FI_GIF_Image::FI_GIF_Image (
    const char * imagename,
    const unsigned char * data,
    const size_t length)
```

This constructor loads a GIF image from memory.

Construct an image from a block of memory inside the application. Fluid offers "binary data" chunks as a great way to add image data into the C++ source code. *imagename* can be NULL. If a name is given, the image is added to the list of shared images and will be available by that name.

If a GIF image is animated, [FI_GIF_Image](#) will only read and display the first frame of the animation.

The destructor frees all memory and server resources that are used by the image.

The third parameter *length* is used to test for buffer overruns, i.e. truncated images.

Use [FI_Image::fail\(\)](#) to check if [FI_GIF_Image](#) failed to load. [fail\(\)](#) returns ERR_FILE_ACCESS if the file could not be opened or read, ERR_FORMAT if the GIF format could not be decoded, and ERR_NO_IMAGE if the image could not be loaded for another reason.

Parameters

in	<i>imagename</i>	A name given to this image or NULL
in	<i>data</i>	Pointer to the start of the GIF image in memory.
in	<i>length</i>	Length of the GIF image in memory.

[FI_GIF_Image::FI_GIF_Image\(const char *filename\)](#)

[FI_Shared_Image](#)

Since

1.4.0

11.47.3 Member Data Documentation**11.47.3.1 animate**

```
bool FI_GIF_Image::animate = false [static]
```

Sets how the shared image core routine should treat animated GIF files.

The default is to treat them as ordinary GIF's e.g. it creates a [FI_GIF_Image](#) object. If this variable is set, then an animated GIF object [FI_Anim_GIF_Image](#) is created.

The documentation for this class was generated from the following files:

- [FI_GIF_Image.H](#)
- [FI_Anim_GIF_Image.cxx](#)

11.48 FL_Gl_Choice Class Reference

Public Member Functions

- **FL_Gl_Choice** (int m, const int *alistp, [FL_Gl_Choice](#) *n)

Friends

- class **FL_Gl_Window_Driver**

The documentation for this class was generated from the following file:

- [FL_Gl_Choice.H](#)

11.49 FL_Gl_Window Class Reference

The [FL_Gl_Window](#) widget sets things up so OpenGL works.

```
#include <FL_Gl_Window.H>
```

Inheritance diagram for [FL_Gl_Window](#):

Public Member Functions

- [FL_Gl_Window](#) const * [as_gl_window](#) () const [FL_OVERRIDE](#)
- [FL_Gl_Window](#) * [as_gl_window](#) () [FL_OVERRIDE](#)
Returns an [FL_Gl_Window](#) pointer if this widget is an [FL_Gl_Window](#).
- int **can_do** ()
Returns non-zero if the hardware supports the current OpenGL mode.
- int [can_do_overlay](#) ()
Returns true if the hardware overlay is possible.
- [GLContext](#) [context](#) () const
Returns a pointer to the window's OpenGL rendering context.
- void [context](#) ([GLContext](#), int destroy_flag=0)
Sets a pointer to the [GLContext](#) that this window is using.
- char [context_valid](#) () const
Will only be set if the OpenGL context is created or recreated.
- void **context_valid** (char v)
See char [FL_Gl_Window::context_valid\(\)](#) const.
- [FL_Gl_Window](#) (int W, int H, const char *l=0)
Creates a new [FL_Gl_Window](#) widget using the given size, and label string.
- [FL_Gl_Window](#) (int X, int Y, int W, int H, const char *l=0)
Creates a new [FL_Gl_Window](#) widget using the given position, size, and label string.
- void **flush** () [FL_OVERRIDE](#)

- Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).*

 - int [handle](#) (int) [FL_OVERRIDE](#)

Handle some FLTK events as needed.
 - void [hide](#) () [FL_OVERRIDE](#)

Hides the window and destroys the OpenGL context.
 - void [hide_overlay](#) ()

Hides the window if it is not this window, does nothing in Windows.
 - void [invalidate](#) ()

The [invalidate\(\)](#) method turns off [valid\(\)](#) and is equivalent to calling [value\(0\)](#).
 - void [make_current](#) ()

The [make_current\(\)](#) method selects the OpenGL context for the widget.
 - void [make_overlay_current](#) ()

Selects the OpenGL context for the widget's overlay.
 - [Fl_Mode mode](#) () const

Returns the current OpenGL capabilities of the window.
 - int [mode](#) (const int *a)

Set the OpenGL capabilities of the window using platform-specific data.
 - int [mode](#) (int a)

Set or change the OpenGL capabilities of the window.
 - void [ortho](#) ()

Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.
 - int [pixel_h](#) ()

Gives the window height in OpenGL pixels.
 - int [pixel_w](#) ()

Gives the window width in OpenGL pixels.
 - float [pixels_per_unit](#) ()

The number of pixels per FLTK unit of length for the window.
 - void [redraw_overlay](#) ()

Causes [draw_overlay\(\)](#) to be called at a later time.
 - void [resize](#) (int, int, int, int) [FL_OVERRIDE](#)

Changes the size or position of the widget.
 - void [show](#) () [FL_OVERRIDE](#)

Makes a widget visible.
 - void [show](#) (int a, char **b)

*Same as [Fl_Window::show\(int a, char **b\)](#)*
 - void [swap_buffers](#) ()

The [swap_buffers\(\)](#) method swaps the back and front buffers.
 - int [swap_interval](#) () const

Gets the rate at which the GL windows swaps buffers.
 - void [swap_interval](#) (int)

Sets the rate at which the GL windows swaps buffers.
 - char [valid](#) () const

Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on after [draw\(\)](#) is called.
 - void [valid](#) (char v)

See char [Fl_Gl_Window::valid\(\)](#) const.
 - [~Fl_Gl_Window](#) ()

The destructor removes the widget and destroys the OpenGL context associated with it.

Public Member Functions inherited from FL_Window

- void [allow_expand_outside_parent](#) ()
Allow this subwindow to expand outside the area of its parent window.
- virtual class [FL_Double_Window](#) * [as_double_window](#) ()
Return non-null if this is an [FL_Double_Window](#) object.
- virtual class [FL_Overlay_Window](#) * [as_overlay_window](#) ()
Return non-null if this is an [FL_Overlay_Window](#) object.
- [FL_Window](#) const * [as_window](#) () const [FL_OVERRIDE](#)
- [FL_Window](#) * [as_window](#) () [FL_OVERRIDE](#)
Returns an [FL_Window](#) pointer if this widget is an [FL_Window](#).
- unsigned int **border** () const
Returns whether the window possesses a border.
- void [border](#) (int b)
Sets whether or not the window manager border is around the window.
- void [clear_border](#) ()
Fast inline function to turn the window manager border off.
- void [clear_modal_states](#) ()
Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void **copy_label** (const char *a)
Sets the window titlebar label to a copy of a character string.
- void [cursor](#) (const [FL_RGB_Image](#) *, int, int)
Changes the cursor for this window using the provided image as cursor's shape.
- void [cursor](#) ([FL_Cursor](#) c, [FL_Color](#), [FL_Color](#)=[FL_WHITE](#))
For back compatibility only.
- void [cursor](#) ([FL_Cursor](#))
Changes the cursor for this window.
- int [decorated_h](#) () const
Returns the window height including any window title bar and any frame added by the window manager.
- int [decorated_w](#) () const
Returns the window width including any frame added by the window manager.
- void [default_cursor](#) ([FL_Cursor](#) c, [FL_Color](#), [FL_Color](#)=[FL_WHITE](#))
For back compatibility only.
- void [default_cursor](#) ([FL_Cursor](#))
Sets the default window cursor.
- void **draw_backdrop** ()
Draw the background image if one is set and is aligned inside.
- [FL_Window](#) (int w, int h, const char *title=0)
Creates a window from the given width w, height h, and title.
- [FL_Window](#) (int x, int y, int w, int h, const char *title=0)
Creates a window from the given position (x, y), size (w, h) and title.
- void [free_position](#) ()
Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.
- void [fullscreen](#) ()
Makes the window completely fill one or more screens, without any window manager border visible.
- unsigned int **fullscreen_active** () const
Returns non zero if [FULLSCREEN](#) flag is set, 0 otherwise.
- void **fullscreen_off** ()
Turns off any side effects of [fullscreen\(\)](#)
- void **fullscreen_off** (int X, int Y, int W, int H)

- Turns off any side effects of [fullscreen\(\)](#) and does [resize\(x,y,w,h\)](#).*

 - void [fullscreen_screens](#) (int top, int bottom, int left, int right)

Sets which screens should be used when this window is in fullscreen mode.
- [uchar get_size_range](#) (int *minw, int *minh, int *maxw=NULL, int *maxh=NULL, int *dw=NULL, int *dh=NULL, int *aspect=NULL)

Gets the allowable range to which the user can resize this window.
- int [handle](#) (int) [FL_OVERRIDE](#)

Handles the specified event.
- void [hide](#) () [FL_OVERRIDE](#)

Removes the window from the screen.
- void [hotspot](#) (const [FL_Widget](#) &p, int offscreen=0)

See void [FL_Window::hotspot](#)(int x, int y, int offscreen = 0)
- void [hotspot](#) (const [FL_Widget](#) *, int offscreen=0)

See void [FL_Window::hotspot](#)(int x, int y, int offscreen = 0)
- void [hotspot](#) (int x, int y, int offscreen=0)

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.
- const void * [icon](#) () const

Gets the current icon window target dependent data.
- void [icon](#) (const [FL_RGB_Image](#) *)

Sets or resets a single window icon.
- void [icon](#) (const void *ic)

Platform-specific method to set the window icon usable on Windows and X11 only.
- void [iconize](#) ()

Iconifies the window.
- const char * [iconlabel](#) () const

See void [FL_Window::iconlabel](#)(const char)*
- void [iconlabel](#) (const char *)

Sets the icon label.
- void [icons](#) (const [FL_RGB_Image](#) *[], int)

Sets the window icons.
- void [icons](#) (HICON big_icon, HICON small_icon)

Sets the window icons using HICON handles (Windows platform only).
- const char * [label](#) () const

See void [FL_Window::label](#)(const char)*
- void [label](#) (const char *)

Sets the window title bar label.
- void [label](#) (const char *label, const char *[iconlabel](#))

Sets the icon label.
- void [make_current](#) ()

Sets things up so that the drawing functions in [<FL/fl_draw.H>](#) will go into this window.
- void [maximize](#) ()

Maximizes a top-level window to its current screen.
- unsigned int [maximize_active](#) () const

Returns whether the window is currently maximized.
- unsigned int [menu_window](#) () const

Returns true if this window is a menu window.
- unsigned int [modal](#) () const

Returns true if this window is modal.
- unsigned int [non_modal](#) () const

Returns true if this window is modal or non-modal.

- `fl_uintptr_t os_id ()`
Returns a platform-specific identification of a shown window, or 0 if not shown.
- `unsigned int override () const`
Returns non zero if OVERRIDE flag is set, 0 otherwise.
- `void resize (int X, int Y, int W, int H) FL_OVERRIDE`
Changes the size and position of the window.
- `int screen_num ()`
The number of the screen containing the mapped window.
- `void screen_num (int screen_num)`
Set the number of the screen where to map the window.
- `void set_menu_window ()`
Marks the window as a menu window.
- `void set_modal ()`
A "modal" window, when `shown()`, will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).
- `void set_non_modal ()`
A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a `modal()` one in that it remains on top, but it has no effect on event delivery.
- `void set_override ()`
Activates the flags NOBORDER|OVERRIDE.
- `void set_tooltip_window ()`
Marks the window as a tooltip window.
- `const FL_Image * shape ()`
Returns the image controlling the window shape or NULL.
- `void shape (const FL_Image &b)`
Set the window's shape with an `FL_Image`.
- `void shape (const FL_Image *img)`
Assigns a non-rectangular shape to the window.
- `void show () FL_OVERRIDE`
Puts the window on the screen.
- `void show (int argc, char **argv)`
Puts the window on the screen with `show()` and parses command-line arguments.
- `int shown ()`
Returns non-zero if `show()` has been called (but not `hide()`).
- `void size_range (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)`
Sets the allowable range to which the user can resize this window.
- `unsigned int tooltip_window () const`
Returns true if this window is a tooltip window.
- `void un_maximize ()`
Returns a previously maximized top-level window to its previous size.
- `void wait_for_expose ()`
Waits for the window to be displayed after calling `show()`.
- `int x_root () const`
Gets the x position of the window on the screen.
- `const char * xclass () const`
Returns the xclass for this window, or a default.
- `void xclass (const char *c)`
Sets the xclass for this window.
- `int y_root () const`
Gets the y position of the window on the screen.
- `virtual ~FL_Window ()`
The destructor also deletes all the children.

Public Member Functions inherited from `FL_Group`

- `FL_Widget * & _ddfdesign_kludge ()`
This is for forms compatibility only.
- `void add (FL_Widget &)`
The widget is removed from its current group (if any) and then added to the end of this group.
- `void add (FL_Widget *o)`
See void `FL_Group::add(FL_Widget &w)`
- `void add_resizable (FL_Widget &o)`
Adds a widget to the group and makes it the resizable widget.
- `FL_Widget *const * array () const`
Returns a pointer to the array of children.
- `FL_Group const * as_group () const FL_OVERRIDE`
- `FL_Group * as_group () FL_OVERRIDE`
Returns an `FL_Group` pointer if this widget is an `FL_Group`.
- `void begin ()`
Sets the current group so you can build the widget tree by just constructing the widgets.
- `FL_Widget * child (int n) const`
Returns the n'th child.
- `int children () const`
Returns how many child widgets the group has.
- `void clear ()`
Deletes all child widgets from memory recursively.
- `unsigned int clip_children ()`
Returns the current clipping mode.
- `void clip_children (int c)`
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- `virtual int delete_child (int n)`
Removes the widget at `index` from the group and deletes it.
- `void end ()`
Exactly the same as `current(this->parent())`.
- `int find (const FL_Widget &o) const`
*See int `FL_Group::find(const FL_Widget *w) const`.*
- `int find (const FL_Widget *) const`
Searches the child array for the widget and returns the index.
- `FL_Group (int, int, int, int, const char * = 0)`
Creates a new `FL_Group` widget using the given position, size, and label string.
- `void focus (FL_Widget *W)`
- `void forms_end ()`
This is for forms compatibility only.
- `void init_sizes ()`
Resets the internal array of widget sizes and positions.
- `void insert (FL_Widget &, int i)`
The widget is removed from its current group (if any) and then inserted into this group.
- `void insert (FL_Widget &o, FL_Widget *before)`
This does `insert(w, find(before))`.
- `void remove (FL_Widget &)`
Removes a widget from the group but does not delete it.
- `void remove (FL_Widget *o)`
Removes the widget `o` from the group.
- `void remove (int index)`

- Removes the widget at `index` from the group but does not delete it.*
- `FI_Widget * resizable () const`
Returns the group's resizable widget.
- `void resizable (FI_Widget &o)`
Sets the group's resizable widget.
- `void resizable (FI_Widget *o)`
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- `virtual ~FI_Group ()`
The destructor also deletes all the children.

Public Member Functions inherited from FI_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
Activates the widget.
- `unsigned int active () const`
Returns whether the widget is active.
- `int active_r () const`
Returns whether the widget and all of its parents are active.
- `FI_Align align () const`
Gets the label alignment.
- `void align (FI_Align alignment)`
Sets the label alignment.
- `long argument () const`
Gets the current user data (long) argument that is passed to the callback function.
- `void argument (long v)`
Sets the current user data (long) argument that is passed to the callback function.
- `void bind_deimage (FI_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void bind_deimage (int f)`
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- `void bind_image (FI_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `void bind_image (int f)`
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FI_Boxtype box () const`
Gets the box type of the widget.
- `void box (FI_Boxtype new_box)`
Sets the box type for the widget.
- `FI_Callback_p callback () const`
Gets the current callback function for the widget.
- `void callback (FI_Callback *cb)`
Sets the current callback function for the widget.
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`
Sets the current callback function and managed user data for the widget.
- `void callback (FI_Callback *cb, void *p)`
Sets the current callback function and data for the widget.
- `void callback (FI_Callback0 *cb)`
Sets the current callback function for the widget.
- `void callback (FI_Callback1 *cb, long p=0)`

- Sets the current callback function for the widget.*

 - unsigned int `changed` () const

Checks if the widget value changed since the last callback.
- void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()

Marks the value of the widget as unchanged.
- void `clear_damage` (uchar c=0)

Clears or sets the damage flags.
- void `clear_output` ()

Sets a widget to accept input.
- void `clear_visible` ()

Hides the widget.
- void `clear_visible_focus` ()

Disables keyboard focus navigation with this widget.
- `FL_Color` `color` () const

Gets the background color of the widget.
- void `color` (`FL_Color` bg)

Sets the background color of the widget.
- void `color` (`FL_Color` bg, `FL_Color` sel)

Sets the background and selection color of the widget.
- `FL_Color` `color2` () const

For back compatibility only.
- void `color2` (unsigned a)

For back compatibility only.
- int `contains` (const `FL_Widget` *w) const

Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)

Sets the current label.
- void `copy_tooltip` (const char *text)

Sets the current tooltip text.
- `uchar` `damage` () const

Returns non-zero if `draw()` needs to be called.
- void `damage` (uchar c)

Sets the damage bits for the widget.
- void `damage` (uchar c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.
- int **`damage_resize`** (int, int, int, int)

Internal use only.
- void `deactivate` ()

Deactivates the widget.
- `FL_Image` * `deimage` ()

Gets the image that is used as part of the widget label when in the inactive state.
- const `FL_Image` * `deimage` () const

Gets the image that is used as part of the widget label when in the inactive state.
- void `deimage` (`FL_Image` &img)

Sets the image to use as part of the widget label when in the inactive state.
- void `deimage` (`FL_Image` *img)

Sets the image to use as part of the widget label when in the inactive state.
- int `deimage_bound` () const

Returns whether the inactive image is managed by the widget.

- void `do_callback` (`FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with default arguments.
- void `do_callback` (`FI_Widget` *widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `do_callback` (`FI_Widget` *widget, void *arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FI_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FI_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FI_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FI_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FI_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FI_Color` c)
Sets the label color.
- `FI_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FI_Font` f)
Sets the font to use.
- `FI_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)
Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const

- Gets the label type.*

 - void `labeltype` (`Fl_Labeltype` a)
- Sets the label type.*

 - void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `Fl_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`Fl_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- `Fl_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`Fl_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the current tooltip text.

- `FL_Window * top_window ()` const
Returns a pointer to the top-level window for the widget.
- `FL_Window * top_window_offset (int &xoff, int &yoff)` const
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type ()` const
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data ()` const
Gets the user data for this widget.
- `void user_data (FL_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible ()` const
Returns whether a widget is visible.
- `unsigned int visible_focus ()` const
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r ()` const
Returns whether a widget and all its parents are visible.
- `int w ()` const
Gets the widget width.
- `FL_When when ()` const
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `FL_Window * window ()` const
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x ()` const
Gets the widget position in its window.
- `int y ()` const
Gets the widget position in its window.
- `virtual ~FL_Widget ()`
Destroys the widget.

Static Public Member Functions

- `static int can_do (const int *m)`
Returns non-zero if the hardware supports the given OpenGL mode.
- `static int can_do (int m)`
Returns non-zero if the hardware supports the given OpenGL mode.

Static Public Member Functions inherited from [Fl_Window](#)

- static [Fl_Window](#) * [current](#) ()
Returns the last window that was made current.
- static void [default_callback](#) ([Fl_Window](#) *, void *v)
Back compatibility: Sets the default callback v for win to call on close event.
- static void [default_icon](#) (const [Fl_RGB_Image](#) *)
Sets a single default window icon.
- static void [default_icons](#) (const [Fl_RGB_Image](#) *[], int)
Sets the default window icons.
- static void [default_icons](#) (HICON big_icon, HICON small_icon)
Sets the default window icons (Windows platform only).
- static const char * [default_xclass](#) ()
Returns the default xclass.
- static void [default_xclass](#) (const char *)
Sets the default window xclass.
- static bool [is_a_rescale](#) ()
Returns true when a window is being rescaled.
- static char [show_next_window_iconic](#) ()
Returns the static flag whether the next window should be opened iconified.
- static void [show_next_window_iconic](#) (char stat)
Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from [Fl_Group](#)

- static [Fl_Group](#) * [current](#) ()
Returns the currently active group.
- static void [current](#) ([Fl_Group](#) *g)
Sets the current group.

Static Public Member Functions inherited from [Fl_Widget](#)

- static void [default_callback](#) ([Fl_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

- void [draw](#) () [FL_OVERRIDE](#)
Draws the [Fl_Gl_Window](#).
- void [draw_begin](#) ()
Supports drawing to an [Fl_Gl_Window](#) with the FLTK 2D drawing API.
- void [draw_end](#) ()
To be used as a match for a previous call to [Fl_Gl_Window::draw_begin\(\)](#).

Protected Member Functions inherited from FI_Window

- void `default_size_range` ()
Protected method to calculate the default size range of a window.
- void `draw` () `FL_OVERRIDE`
Draws the widget.
- int `force_position` () const
Returns the internal state of the window's `FORCE_POSITION` flag.
- void `force_position` (int force)
Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void `free_icons` ()
Deletes all icons previously attached to the window.
- int `is_resizable` ()
Protected method to determine whether a window is resizable.

Protected Member Functions inherited from FI_Group

- `FI_Rect` * `bounds` ()
Returns the internal array of widget sizes and positions.
- void `draw_child` (`FI_Widget` &widget) const
Forces a child to redraw.
- void `draw_children` ()
Draws all children of the group.
- void `draw_outside_label` (const `FI_Widget` &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int `on_insert` (`FI_Widget` *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int `on_move` (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void `on_remove` (int)
Allow derived groups to act when a child widget is removed from the group.
- int * `sizes` ()
Returns the internal array of widget sizes and positions.
- void `update_child` (`FI_Widget` &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from FI_Widget

- void `clear_flag` (unsigned int c)
Clears a flag in the flags mask.
- void `draw_backdrop` () const
If `FL_ALIGN_IMAGE_BACKDROP` is set, the image or deimage will be drawn.
- void `draw_box` () const
Draws the widget box according its box style.
- void `draw_box` (`FI_Boxtype` t, `FI_Color` c) const
Draws a box of type t, of color c at the widget's position and size.
- void `draw_box` (`FI_Boxtype` t, int x, int y, int w, int h, `FI_Color` c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void `draw_focus` () const
Draws a focus rectangle around the widget.
- void `draw_focus` (`FI_Boxtype` t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.

- void **draw_focus** (**FI_Boxtype** t, int x, int y, int w, int h, **FI_Color** bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FI_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

USERFLAG1 = 1<<31 }
flags possible values enumeration.

Static Protected Attributes inherited from **FI_Window**

- static **FI_Window** * **current_**
Stores the last window that was made current.

11.49.1 Detailed Description

The [FL_Gl_Window](#) widget sets things up so OpenGL works.

It also keeps an OpenGL "context" for that window, so that changes to the lighting and projection may be reused between redraws. [FL_Gl_Window](#) also flushes the OpenGL streams and swaps buffers after [draw\(\)](#) returns.

OpenGL hardware typically provides some overlay bit planes, which are very useful for drawing UI controls atop your 3D graphics. If the overlay hardware is not provided, FLTK tries to simulate the overlay. This works pretty well if your graphics are double buffered, but not very well for single-buffered.

Please note that the FLTK drawing and clipping functions will not work inside an [FL_Gl_Window](#). All drawing should be done using OpenGL calls exclusively.

See also

[OpenGL and support of HighDPI displays](#)

Note

FLTK 1.4 introduces a driver system for graphic calls. It is now possible to add a selection of widgets to an OpenGL window. The widgets will draw on top of any OpenGL rendering. The number of supported widgets will increase as the driver development improves. Program `test/cube.cxx` illustrates how to do that.

FLTK expects that when an [FL_Gl_Window](#) is a child of a parent [FL_Window](#), the child window lies entirely inside its parent window. If that's not the case, what happens to the part of the GL subwindow which leaks outside its parent is undefined and susceptible to be platform-specific.

11.49.2 Constructor & Destructor Documentation

11.49.2.1 FL_Gl_Window() [1/2]

```
Fl_Gl_Window::Fl_Gl_Window (
    int W,
    int H,
    const char * l = 0) [inline]
```

Creates a new [FL_Gl_Window](#) widget using the given size, and label string.

The default boxtype is `FL_NO_BOX`. The default mode is `FL_RGB|FL_DOUBLE|FL_DEPTH`.

11.49.2.2 FL_Gl_Window() [2/2]

```
Fl_Gl_Window::Fl_Gl_Window (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0) [inline]
```

Creates a new [FL_Gl_Window](#) widget using the given position, size, and label string.

The default boxtype is `FL_NO_BOX`. The default mode is `FL_RGB|FL_DOUBLE|FL_DEPTH`.

11.49.3 Member Function Documentation

11.49.3.1 as_gl_window() [1/2]

```
Fl_Gl_Window const * Fl_Gl_Window::as_gl_window () const [inline], [virtual]
```

Reimplemented from [FL_Widget](#).

11.49.3.2 as_gl_window() [2/2]

```
Fl_Gl_Window * Fl_Gl_Window::as_gl_window () [inline], [virtual]
```

Returns an [FL_Gl_Window](#) pointer if this widget is an [FL_Gl_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [FL_Gl_Window](#).

If it returns non-NULL, then the widget in question is derived from [FL_Gl_Window](#).

Return values

<code>NULL</code>	if this widget is not derived from Fl_Gl_Window .
-------------------	---

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl_Widget::as_group\(\)](#), [Fl_Widget::as_window\(\)](#)

Reimplemented from [Fl_Widget](#).

11.49.3.3 can_do()

```
static int Fl_Gl_Window::can_do (
    const int * m) [inline], [static]
```

Returns non-zero if the hardware supports the given OpenGL mode.

See also

[Fl_Gl_Window::mode\(const int *a\)](#)

11.49.3.4 can_do_overlay()

```
int Fl_Gl_Window::can_do_overlay ()
```

Returns true if the hardware overlay is possible.

If this is false, FLTK will try to simulate the overlay, with significant loss of update speed. Calling this will cause FLTK to open the display.

11.49.3.5 context() [1/2]

```
GLContext Fl_Gl_Window::context () const [inline]
```

Returns a pointer to the window's OpenGL rendering context.

See also

`void` [context\(GLContext c, int destroy_flag\)](#)

11.49.3.6 context() [2/2]

```
void Fl_Gl_Window::context (
    GLContext v,
    int destroy_flag = 0)
```

Sets a pointer to the [GLContext](#) that this window is using.

This is a system-dependent structure, but it is portable to copy the context from one window to another. You can also set it to `NULL`, which will force FLTK to recreate the context the next time [make_current\(\)](#) is called, this is useful for getting around bugs in OpenGL implementations.

If *destroy_flag* is true the context will be destroyed by fltk when the window is destroyed, or when the `mode()` is changed, or the next time `context(x)` is called.

11.49.3.7 context_valid()

```
char Fl_Gl_Window::context_valid () const [inline]
```

Will only be set if the OpenGL context is created or recreated.

It differs from [Fl_Gl_Window::valid\(\)](#) which is also set whenever the context changes size.

11.49.3.8 draw()

```
void Fl_Gl_Window::draw (
    void ) [protected], [virtual]
```

Draws the [Fl_Gl_Window](#).

You **must** subclass [Fl_Gl_Window](#) and provide an implementation for [draw\(\)](#). You may also provide an implementation of [draw_overlay\(\)](#) if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking [valid\(\)](#) at the start of [draw\(\)](#) and only doing the initialization if it is false.

The [draw\(\)](#) method can *only* use OpenGL calls. Do not attempt to call X, any of the functions in [<FL/fl_draw.H>](#), or glX directly. Do not call [gl_start\(\)](#) or [gl_finish\(\)](#).

If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed.

The following pseudo-code shows how to use "if (!valid())" to initialize the viewport:

```
void mywindow::draw() {
    if (!valid()) {
        glViewport(0,0,pixel_w(),pixel_h());
        glFrustum(...) or glOrtho(...)
        ...other initialization...
    }
    if (!context_valid()) {
        ...load textures, etc. ...
    }
    // clear screen
    glClearColor(...);
    glClear(...);
    ... draw your geometry here ...
}
```

Actual example code to clear screen to black and draw a 2D white "X":

```
void mywindow::draw() {
    if (!valid()) {
        glLoadIdentity();
        glViewport(0,0,pixel_w(),pixel_h());
        glOrtho(-w(),w(),-h(),h(),-1,1);
    }
    // Clear screen
    glClear(GL_COLOR_BUFFER_BIT);
    // Draw white 'X'
    glColor3f(1.0, 1.0, 1.0);
    glBegin(GL_LINE_STRIP); glVertex2f(w(), h()); glVertex2f(-w(),-h()); glEnd();
    glBegin(GL_LINE_STRIP); glVertex2f(w(),-h()); glVertex2f(-w(), h()); glEnd();
}
```

Regular FLTK widgets can be added as children to the [Fl_Gl_Window](#). To correctly overlay the widgets, [Fl_Gl_Window::draw\(\)](#) must be called after rendering the main scene.

```
void mywindow::draw() {
    // draw 3d graphics scene
    Fl_Gl_Window::draw();
    // -- or --
    draw_begin();
    Fl_Window::draw();
    // other 2d drawing calls, overlays, etc.
    draw_end();
}
```

Implements [Fl_Widget](#).

Reimplemented in [Fl_Glut_Window](#).

11.49.3.9 draw_begin()

```
void Fl_Gl_Window::draw_begin () [protected]
```

Supports drawing to an [Fl_Gl_Window](#) with the FLTK 2D drawing API.

See also

[Using FLTK widgets in OpenGL Windows](#)

11.49.3.10 draw_end()

```
void Fl_Gl_Window::draw_end () [protected]
```

To be used as a match for a previous call to [Fl_Gl_Window::draw_begin\(\)](#).

See also

[Using FLTK widgets in OpenGL Windows](#)

11.49.3.11 flush()

```
void Fl_Gl_Window::flush () [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented from [Fl_Window](#).

11.49.3.12 handle()

```
int Fl_Gl_Window::handle (
    int event) [virtual]
```

Handle some FLTK events as needed.

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Glut_Window](#).

11.49.3.13 hide()

```
void Fl_Gl_Window::hide () [virtual]
```

Hides the window and destroys the OpenGL context.

Reimplemented from [Fl_Widget](#).

11.49.3.14 make_current()

```
void Fl_Gl_Window::make_current ()
```

The [make_current\(\)](#) method selects the OpenGL context for the widget.

It is called automatically prior to the [draw\(\)](#) method being called and can also be used to implement feedback and/or selection within the [handle\(\)](#) method.

11.49.3.15 make_overlay_current()

```
void Fl_Gl_Window::make_overlay_current ()
```

Selects the OpenGL context for the widget's overlay.

This method is called automatically prior to the [draw_overlay\(\)](#) method being called and can also be used to implement feedback and/or selection within the [handle\(\)](#) method.

11.49.3.16 mode() [1/3]

```
Fl_Mode Fl_Gl_Window::mode () const [inline]
```

Returns the current OpenGL capabilities of the window.

Don't use this if capabilities were set through [Fl_Gl_Window::mode\(const int *a\)](#).

11.49.3.17 mode() [2/3]

```
int Fl_Gl_Window::mode (
    const int * a) [inline]
```

Set the OpenGL capabilities of the window using platform-specific data.

Parameters

<i>a</i>	zero-ending array of platform-specific attributes and attribute values
----------	--

Unix/Linux platform: attributes are GLX attributes adequate for the 3rd argument of the `glXChooseVisual()` function (e.g., `GLX_DOUBLEBUFFER`, defined by including `<GL/glx.h>`).

Note

What attributes are adequate here is subject to change. The preferred, stable public API is [Fl_Gl_Window::mode\(int a\)](#).

Windows platform: this member function is of no use.

Mac OS X platform: attributes belong to the `kCGLPixelFormatAttribute` enumeration (defined by including `<OpenGL/OpenGL.h>`, e.g., `kCGLPFADoubleBuffer`) and may be followed by adequate attribute values.

11.49.3.18 mode() [3/3]

```
int Fl_Gl_Window::mode (
    int a) [inline]
```

Set or change the OpenGL capabilities of the window.

The value can be any of the following OR'd together:

- `FL_RGB` - RGB color (not indexed)
- `FL_RGB8` - RGB color with at least 8 bits of each color
- `FL_INDEX` - Indexed mode
- `FL_SINGLE` - not double buffered
- `FL_DOUBLE` - double buffered
- `FL_ACCUM` - accumulation buffer
- `FL_ALPHA` - alpha channel in color
- `FL_DEPTH` - depth buffer
- `FL_STENCIL` - stencil buffer
- `FL_MULTISAMPLE` - multisample antialiasing
- `FL_OPENGL3` - use OpenGL version 3.0 or more.

`FL_RGB` and `FL_SINGLE` have a value of zero, so they are "on" unless you give `FL_INDEX` or `FL_DOUBLE`.

If the desired combination cannot be done, FLTK will try turning off `FL_MULTISAMPLE`. If this also fails the `show()` will call `Fl::error()` and not show the window.

You can change the mode while the window is displayed. This is most useful for turning double-buffering on and off. Under X this will cause the old X window to be destroyed and a new one to be created. If this is a top-level window this will unfortunately also cause the window to blink, raise to the top, and be de-iconized, and the `xid()` will change, possibly breaking other code. It is best to make the GL window a child of another window if you wish to do this!

`mode()` must not be called within `draw()` since it changes the current context.

The `FL_OPENGL3` flag is recommended to use OpenGL version 3 or more. This flag is required (not just recommended) if GL 3.0 is in use and at least one of these conditions applies:

- the program runs on the macOS platform;
- the `Fl_Gl_Window` has child widgets.

See more details in [Using OpenGL 3.0 \(or higher versions\)](#).

Version

the `FL_OPENGL3` flag appeared in version 1.3.4

11.49.3.19 ortho()

```
void Fl_Gl_Window::ortho ()
```

Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.

If you are drawing 2D images, your `draw()` method may want to call this if `valid()` is false.

11.49.3.20 pixel_h()

```
int Fl_Gl_Window::pixel_h () [inline]
```

Gives the window height in OpenGL pixels.

When an `Fl_Gl_Window` is mapped to a HighDPI display, the value given by `Fl_Gl_Window::h()` which is expressed in FLTK units, may differ from the window height in pixels. Calls to OpenGL functions expecting pixel values (e.g., `glViewport`) should therefore use `pixel_h()` rather than `h()`. Method `pixel_h()` detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

Version

1.3.4

11.49.3.21 pixel_w()

```
int Fl_Gl_Window::pixel_w () [inline]
```

Gives the window width in OpenGL pixels.

When an [Fl_Gl_Window](#) is mapped to a HighDPI display, the value given by [Fl_Gl_Window::w\(\)](#) which is expressed in FLTK units, may differ from the window width in pixels. Calls to OpenGL functions expecting pixel values (e.g., `glViewport`) should therefore use [pixel_w\(\)](#) rather than [w\(\)](#). Method [pixel_w\(\)](#) detects when the GUI is rescaled or when the window has been moved between low and high resolution displays and automatically adjusts the returned value.

Version

1.3.4

11.49.3.22 pixels_per_unit()

```
float Fl_Gl_Window::pixels_per_unit ()
```

The number of pixels per FLTK unit of length for the window.

This method dynamically adjusts its value when the GUI is rescaled or when the window is moved to/from displays of distinct resolutions. This method is useful, e.g., to convert, in a window's [handle\(\)](#) method, the FLTK units returned by [Fl::event_x\(\)](#) and [Fl::event_y\(\)](#) to the pixel units used by the OpenGL source code.

Version

1.3.4

11.49.3.23 redraw_overlay()

```
void Fl_Gl_Window::redraw_overlay ()
```

Causes [draw_overlay\(\)](#) to be called at a later time.

Initially the overlay is clear. If you want the window to display something in the overlay when it first appears, you must call this immediately after you [show\(\)](#) your window.

11.49.3.24 resize()

```
void Fl_Gl_Window::resize (
    int x,
    int y,
    int w,
    int h) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

`position(X, Y)` is a shortcut for `resize(X, Y, w\(\), h\(\))`, and `size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl_Widget](#).

11.49.3.25 show()

```
void Fl_Gl_Window::show () [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like FL_SHOW.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send FL_SHOW or FL_HIDE events to the widget. *Do not change it if the parent is not visible, as this will send false FL_SHOW or FL_HIDE events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible_r\(\)](#)

Reimplemented from [Fl_Widget](#).

11.49.3.26 swap_buffers()

```
void Fl_Gl_Window::swap_buffers ()
```

The [swap_buffers\(\)](#) method swaps the back and front buffers.

It is called automatically after the [draw\(\)](#) method is called.

11.49.3.27 swap_interval() [1/2]

```
int Fl_Gl_Window::swap_interval () const
```

Gets the rate at which the GL windows swaps buffers.

This method can be called after the OpenGL context was created, typically within the user overridden [Fl_Gl_Window::draw\(\)](#) method that will be overridden by the user.

Note

This method depends highly on the underlying OpenGL contexts and driver implementation. Some drivers return no information, most drivers don't support intervals with multiple frames and return only 0 or 1.

Some drivers have the ability to set the swap interval but no way to query it, hence this method may return -1 even though the interval was set correctly. Conversely a return value greater zero does not guarantee that the driver actually honors the setting.

Returns

an integer greater zero if vertical blanking is taken into account when swapping OpenGL buffers

0 if the vertical blanking is ignored

-1 if the information can not be retrieved

11.49.3.28 swap_interval() [2/2]

```
void Fl_Gl_Window::swap_interval (
    int frames)
```

Sets the rate at which the GL windows swaps buffers.

This method can be called after the OpenGL context was created, typically within the user overridden [Fl_Gl_Window::draw\(\)](#) method that will be overridden by the user.

Note

This method depends highly on the underlying OpenGL contexts and driver implementation. Most driver seem to accept only 0 and 1 to swap buffer asynchronously or in sync with the vertical blank.

Parameters

<code>in</code>	<code>frames</code>	set the number of vertical frame blanks between OpenGL buffer swaps
-----------------	---------------------	---

11.49.3.29 valid()

```
char Fl_Gl_Window::valid () const [inline]
```

Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on *after* [draw\(\)](#) is called.

You can use this inside your [draw\(\)](#) method to avoid unnecessarily initializing the OpenGL context. Just do this:

```
void mywindow::draw() {
    if (!valid()) {
        glViewport(0,0,pixel_w(),pixel_h());
        glFrustum(...);
        ...other initialization...
    }
    if (!context_valid()) {
        ...load textures, etc. ...
    }
    ... draw your geometry here ...
}
```

You can turn [valid\(\)](#) on by calling [valid\(1\)](#). You should only do this after fixing the transformation inside a [draw\(\)](#) or after [make_current\(\)](#). This is done automatically after [draw\(\)](#) returns.

11.55 FI_Glut_Window Class Reference

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in glut_compatibility.cxx):

```
#include <glut.H>
```

Inheritance diagram for FI_Glut_Window:

Public Member Functions

- **FI_Glut_Window** (int w, int h, const char *t=0)
Creates a glut window, registers to the glut windows list.
- **FI_Glut_Window** (int x, int y, int w, int h, const char *t=0)
Creates a glut window, registers to the glut windows list.
- void **make_current** ()
- ~**FI_Glut_Window** ()
Destroys the glut window, first unregister it from the glut windows list.

Public Member Functions inherited from `FL_Gl_Window`

- `FL_Gl_Window` const * `as_gl_window` () const `FL_OVERRIDE`
- `FL_Gl_Window` * `as_gl_window` () `FL_OVERRIDE`
Returns an `FL_Gl_Window` pointer if this widget is an `FL_Gl_Window`.
- int `can_do` ()
Returns non-zero if the hardware supports the current OpenGL mode.
- int `can_do_overlay` ()
Returns true if the hardware overlay is possible.
- `GLContext` `context` () const
Returns a pointer to the window's OpenGL rendering context.
- void `context` (`GLContext`, int `destroy_flag`=0)
Sets a pointer to the `GLContext` that this window is using.
- char `context_valid` () const
Will only be set if the OpenGL context is created or recreated.
- void `context_valid` (char v)
See char `FL_Gl_Window::context_valid()` const.
- `FL_Gl_Window` (int W, int H, const char *l=0)
Creates a new `FL_Gl_Window` widget using the given size, and label string.
- `FL_Gl_Window` (int X, int Y, int W, int H, const char *l=0)
Creates a new `FL_Gl_Window` widget using the given position, size, and label string.
- void `flush` () `FL_OVERRIDE`
Forces the window to be drawn, this window is also made current and calls `draw()`.
- void `hide` () `FL_OVERRIDE`
Hides the window and destroys the OpenGL context.
- void `hide_overlay` ()
Hides the window if it is not this window, does nothing in Windows.
- void `invalidate` ()
The `invalidate()` method turns off `valid()` and is equivalent to calling `value(0)`.
- void `make_current` ()
The `make_current()` method selects the OpenGL context for the widget.
- void `make_overlay_current` ()
Selects the OpenGL context for the widget's overlay.
- `FL_Mode` `mode` () const
Returns the current OpenGL capabilities of the window.
- int `mode` (const int *a)
Set the OpenGL capabilities of the window using platform-specific data.
- int `mode` (int a)
Set or change the OpenGL capabilities of the window.
- void `ortho` ()
Sets the projection so 0,0 is in the lower left of the window and each pixel is 1 unit wide/tall.
- int `pixel_h` ()
Gives the window height in OpenGL pixels.
- int `pixel_w` ()
Gives the window width in OpenGL pixels.
- float `pixels_per_unit` ()
The number of pixels per FLTK unit of length for the window.
- void `redraw_overlay` ()
Causes `draw_overlay()` to be called at a later time.
- void `resize` (int, int, int, int) `FL_OVERRIDE`
Changes the size or position of the widget.

- void `show` () `FL_OVERRIDE`
Makes a widget visible.
- void `show` (int a, char **b)
*Same as `Fl_Window::show(int a, char **b)`*
- void `swap_buffers` ()
The `swap_buffers()` method swaps the back and front buffers.
- int `swap_interval` () const
Gets the rate at which the GL windows swaps buffers.
- void `swap_interval` (int)
Sets the rate at which the GL windows swaps buffers.
- char `valid` () const
Is turned off when FLTK creates a new context for this window or when the window resizes, and is turned on after `draw()` is called.
- void `valid` (char v)
See char `Fl_Gl_Window::valid()` const.
- `~Fl_Gl_Window` ()
The destructor removes the widget and destroys the OpenGL context associated with it.

Public Member Functions inherited from `Fl_Window`

- void `allow_expand_outside_parent` ()
Allow this subwindow to expand outside the area of its parent window.
- virtual class `Fl_Double_Window * as_double_window` ()
Return non-null if this is an `Fl_Double_Window` object.
- virtual class `Fl_Overlay_Window * as_overlay_window` ()
Return non-null if this is an `Fl_Overlay_Window` object.
- `Fl_Window` const * `as_window` () const `FL_OVERRIDE`
- `Fl_Window * as_window` () `FL_OVERRIDE`
Returns an `Fl_Window` pointer if this widget is an `Fl_Window`.
- unsigned int `border` () const
Returns whether the window possesses a border.
- void `border` (int b)
Sets whether or not the window manager border is around the window.
- void `clear_border` ()
Fast inline function to turn the window manager border off.
- void `clear_modal_states` ()
Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void `copy_label` (const char *a)
Sets the window titlebar label to a copy of a character string.
- void `cursor` (const `Fl_RGB_Image` *, int, int)
Changes the cursor for this window using the provided image as cursor's shape.
- void `cursor` (`Fl_Cursor` c, `Fl_Color`, `Fl_Color`=`FL_WHITE`)
For back compatibility only.
- void `cursor` (`Fl_Cursor`)
Changes the cursor for this window.
- int `decorated_h` () const
Returns the window height including any window title bar and any frame added by the window manager.
- int `decorated_w` () const
Returns the window width including any frame added by the window manager.
- void `default_cursor` (`Fl_Cursor` c, `Fl_Color`, `Fl_Color`=`FL_WHITE`)
For back compatibility only.

- void **default_cursor** ([FL_Cursor](#))
Sets the default window cursor.
- void **draw_backdrop** ()
Draw the background image if one is set and is aligned inside.
- [FL_Window](#) (int *w*, int *h*, const char **title*=0)
*Creates a window from the given width *w*, height *h*, and *title*.*
- [FL_Window](#) (int *x*, int *y*, int *w*, int *h*, const char **title*=0)
*Creates a window from the given position (*x*, *y*), size (*w*, *h*) and *title*.*
- void **free_position** ()
Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.
- void **fullscreen** ()
Makes the window completely fill one or more screens, without any window manager border visible.
- unsigned int **fullscreen_active** () const
Returns non zero if FULLSCREEN flag is set, 0 otherwise.
- void **fullscreen_off** ()
Turns off any side effects of [fullscreen\(\)](#)
- void **fullscreen_off** (int *X*, int *Y*, int *W*, int *H*)
Turns off any side effects of [fullscreen\(\)](#) and does [resize\(x,y,w,h\)](#).
- void **fullscreen_screens** (int *top*, int *bottom*, int *left*, int *right*)
Sets which screens should be used when this window is in fullscreen mode.
- [uchar](#) **get_size_range** (int **minw*, int **minh*, int **maxw*=NULL, int **maxh*=NULL, int **dw*=NULL, int **dh*=NULL, int **aspect*=NULL)
Gets the allowable range to which the user can resize this window.
- int **handle** (int) [FL_OVERRIDE](#)
Handles the specified event.
- void **hide** () [FL_OVERRIDE](#)
Removes the window from the screen.
- void **hotspot** (const [FL_Widget](#) &*p*, int *offscreen*=0)
*See void [FL_Window::hotspot](#)(int *x*, int *y*, int *offscreen* = 0)*
- void **hotspot** (const [FL_Widget](#) *, int *offscreen*=0)
*See void [FL_Window::hotspot](#)(int *x*, int *y*, int *offscreen* = 0)*
- void **hotspot** (int *x*, int *y*, int *offscreen*=0)
Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.
- const void * **icon** () const
Gets the current icon window target dependent data.
- void **icon** (const [FL_RGB_Image](#) *)
Sets or resets a single window icon.
- void **icon** (const void **ic*)
Platform-specific method to set the window icon usable on Windows and X11 only.
- void **iconize** ()
Iconifies the window.
- const char * **iconlabel** () const
See void [FL_Window::iconlabel](#)(const char)*
- void **iconlabel** (const char *)
Sets the icon label.
- void **icons** (const [FL_RGB_Image](#) *[], int)
Sets the window icons.
- void **icons** (HICON *big_icon*, HICON *small_icon*)
Sets the window icons using HICON handles (Windows platform only).

- const char * **label** () const
See void [Fl_Window::label\(const char\)](#)*
- void **label** (const char *)
Sets the window title bar label.
- void **label** (const char *label, const char *iconlabel)
Sets the icon label.
- void **make_current** ()
Sets things up so that the drawing functions in [<FL/fl_draw.H>](#) will go into this window.
- void **maximize** ()
Maximizes a top-level window to its current screen.
- unsigned int **maximize_active** () const
Returns whether the window is currently maximized.
- unsigned int **menu_window** () const
Returns true if this window is a menu window.
- unsigned int **modal** () const
Returns true if this window is modal.
- unsigned int **non_modal** () const
Returns true if this window is modal or non-modal.
- [fl_uintptr_t](#) **os_id** ()
Returns a platform-specific identification of a shown window, or 0 if not shown.
- unsigned int **override** () const
Returns non zero if `OVERRIDE` flag is set, 0 otherwise.
- void **resize** (int X, int Y, int W, int H) [FL_OVERRIDE](#)
Changes the size and position of the window.
- int **screen_num** ()
The number of the screen containing the mapped window.
- void **screen_num** (int screen_num)
Set the number of the screen where to map the window.
- void **set_menu_window** ()
Marks the window as a menu window.
- void **set_modal** ()
A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).
- void **set_non_modal** ()
A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.
- void **set_override** ()
Activates the flags `NOBORDER|OVERRIDE`.
- void **set_tooltip_window** ()
Marks the window as a tooltip window.
- const [Fl_Image](#) * **shape** ()
Returns the image controlling the window shape or `NULL`.
- void **shape** (const [Fl_Image](#) &b)
Set the window's shape with an [Fl_Image](#).
- void **shape** (const [Fl_Image](#) *img)
Assigns a non-rectangular shape to the window.
- void **show** () [FL_OVERRIDE](#)
Puts the window on the screen.
- void **show** (int argc, char **argv)
Puts the window on the screen with [show\(\)](#) and parses command-line arguments.
- int **shown** ()

- Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#)).*
- void [size_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
 - Sets the allowable range to which the user can resize this window.*
- unsigned int **tooltip_window** () const
 - Returns true if this window is a tooltip window.*
- void [un_maximize](#) ()
 - Returns a previously maximized top-level window to its previous size.*
- void [wait_for_expose](#) ()
 - Waits for the window to be displayed after calling [show\(\)](#).*
- int **x_root** () const
 - Gets the x position of the window on the screen.*
- const char * [xclass](#) () const
 - Returns the xclass for this window, or a default.*
- void [xclass](#) (const char *c)
 - Sets the xclass for this window.*
- int **y_root** () const
 - Gets the y position of the window on the screen.*
- virtual [~FL_Window](#) ()
 - The destructor also deletes all the children.*

Public Member Functions inherited from [FL_Group](#)

- [FL_Widget](#) *& **_ddfdesign_kludge** ()
 - This is for forms compatibility only.*
- void **add** ([FL_Widget](#) &)
 - The widget is removed from its current group (if any) and then added to the end of this group.*
- void **add** ([FL_Widget](#) *o)
 - See void [FL_Group::add\(FL_Widget &w\)](#)*
- void **add_resizable** ([FL_Widget](#) &o)
 - Adds a widget to the group and makes it the resizable widget.*
- [FL_Widget](#) *const * **array** () const
 - Returns a pointer to the array of children.*
- [FL_Group](#) const * **as_group** () const [FL_OVERRIDE](#)
- [FL_Group](#) * **as_group** () [FL_OVERRIDE](#)
 - Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).*
- void **begin** ()
 - Sets the current group so you can build the widget tree by just constructing the widgets.*
- [FL_Widget](#) * **child** (int n) const
 - Returns the n'th child.*
- int **children** () const
 - Returns how many child widgets the group has.*
- void **clear** ()
 - Deletes all child widgets from memory recursively.*
- unsigned int **clip_children** ()
 - Returns the current clipping mode.*
- void **clip_children** (int c)
 - Controls whether the group widget clips the drawing of child widgets to its bounding box.*
- virtual int **delete_child** (int n)
 - Removes the widget at *index* from the group and deletes it.*
- void **end** ()
 - Exactly the same as *current(this->parent())*.*

- int **find** (const [FL_Widget](#) &o) const
*See int [FL_Group::find\(const FL_Widget *w\)](#) const.*
- int **find** (const [FL_Widget](#) *) const
Searches the child array for the widget and returns the index.
- [FL_Group](#) (int, int, int, int, const char *s=0)
Creates a new [FL_Group](#) widget using the given position, size, and label string.
- void **focus** ([FL_Widget](#) *W)
- void **forms_end** ()
This is for forms compatibility only.
- void **init_sizes** ()
Resets the internal array of widget sizes and positions.
- void **insert** ([FL_Widget](#) &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** ([FL_Widget](#) &o, [FL_Widget](#) *before)
This does insert(w, find(before)).
- void **remove** ([FL_Widget](#) &)
Removes a widget from the group but does not delete it.
- void **remove** ([FL_Widget](#) *o)
Removes the widget o from the group.
- void **remove** (int index)
Removes the widget at index from the group but does not delete it.
- [FL_Widget](#) * **resizable** () const
Returns the group's resizable widget.
- void **resizable** ([FL_Widget](#) &o)
Sets the group's resizable widget.
- void **resizable** ([FL_Widget](#) *o)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- virtual **~FL_Group** ()
The destructor also deletes all the children.

Public Member Functions inherited from [FL_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- [FL_Align](#) **align** () const
Gets the label alignment.
- void **align** ([FL_Align](#) alignment)
Sets the label alignment.
- long **argument** () const
Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
Sets the current user data (long) argument that is passed to the callback function.
- void **bind_deimage** ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)

- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

 - void `bind_image` (`FI_Image` *img)

Sets the image to use as part of the widget label when in the active state.
- void `bind_image` (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FI_Boxtype` `box` () const

Gets the box type of the widget.
- void `box` (`FI_Boxtype` new_box)

Sets the box type for the widget.
- `FI_Callback_p` `callback` () const

Gets the current callback function for the widget.
- void `callback` (`FI_Callback` *cb)

Sets the current callback function for the widget.
- void `callback` (`FI_Callback` *cb, `FI_Callback_User_Data` *p, bool auto_free)

Sets the current callback function and managed user data for the widget.
- void `callback` (`FI_Callback` *cb, void *p)

Sets the current callback function and data for the widget.
- void `callback` (`FI_Callback0` *cb)

Sets the current callback function for the widget.
- void `callback` (`FI_Callback1` *cb, long p=0)

Sets the current callback function for the widget.
- unsigned int `changed` () const

Checks if the widget value changed since the last callback.
- void `clear_active` ()

Marks the widget as inactive without sending events or changing focus.
- void `clear_changed` ()

Marks the value of the widget as unchanged.
- void `clear_damage` (uchar c=0)

Clears or sets the damage flags.
- void `clear_output` ()

Sets a widget to accept input.
- void `clear_visible` ()

Hides the widget.
- void `clear_visible_focus` ()

Disables keyboard focus navigation with this widget.
- `FI_Color` `color` () const

Gets the background color of the widget.
- void `color` (`FI_Color` bg)

Sets the background color of the widget.
- void `color` (`FI_Color` bg, `FI_Color` sel)

Sets the background and selection color of the widget.
- `FI_Color` `color2` () const

For back compatibility only.
- void `color2` (unsigned a)

For back compatibility only.
- int `contains` (const `FI_Widget` *w) const

Checks if w is a child of this widget.
- void `copy_label` (const char *new_label)

Sets the current label.
- void `copy_tooltip` (const char *text)

Sets the current tooltip text.

- `uchar damage () const`
Returns non-zero if `draw()` needs to be called.
- `void damage (uchar c)`
Sets the damage bits for the widget.
- `void damage (uchar c, int x, int y, int w, int h)`
Sets the damage bits for an area inside the widget.
- `int damage_resize (int, int, int, int)`
Internal use only.
- `void deactivate ()`
Deactivates the widget.
- `Fl_Image * deimage ()`
Gets the image that is used as part of the widget label when in the inactive state.
- `const Fl_Image * deimage () const`
Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (Fl_Image &img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (Fl_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
Returns whether the inactive image is managed by the widget.
- `void do_callback (Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with default arguments.
- `void do_callback (Fl_Widget *widget, long arg, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void do_callback (Fl_Widget *widget, void *arg=0, Fl_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, Fl_Align) const`
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
Gets the widget height.
- `int horizontal_label_margin ()`
Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`
Set the spacing between the label and the horizontal edge of the widget.
- `Fl_Image * image ()`
Gets the image that is used as part of the widget label when in the active state.
- `const Fl_Image * image () const`
Gets the image that is used as part of the widget label when in the active state.
- `void image (Fl_Image &img)`
Sets the image to use as part of the widget label when in the active state.
- `void image (Fl_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`
Returns whether the image is managed by the widget.
- `int inside (const Fl_Widget *wgt) const`
Checks if this widget is a child of `wgt`.
- `int is_label_copied () const`
Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`
Gets the current label text.
- `void label (const char *text)`

- Sets the current label pointer.*

 - void `label` (`FI_Labeltype` a, const char *b)

Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()

Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)

Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const

Gets the label color.
- void `labelcolor` (`FI_Color` c)

Sets the label color.
- `FI_Font` `labelfont` () const

Gets the font to use.
- void `labelfont` (`FI_Font` f)

Sets the font to use.
- `FI_Fonsize` `labelsize` () const

Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)

Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const

Gets the label type.
- void `labeltype` (`FI_Labeltype` a)

Sets the label type.
- void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `FI_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`FI_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- `FI_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`FI_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.

- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const

- Returns the conditions under which the callback is called.*

 - void **when** (uchar i)

Sets the flags used to decide when a callback is called.
- **FL_Window** * **window** () const
- Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const
- Gets the widget position in its window.*
- int **y** () const
- Gets the widget position in its window.*
- virtual ~**FL_Widget** ()
- Destroys the widget.*

Public Attributes

- void(* **display**)()
- void(* **entry**)(int)
- void(* **keyboard**)(uchar, int x, int y)
- int **menu** [3]
- void(* **motion**)(int x, int y)
- void(* **mouse**)(int b, int state, int x, int y)
- int **number**
- void(* **overlaydisplay**)()
- void(* **passivemotion**)(int x, int y)
- void(* **reshape**)(int w, int h)
- void(* **special**)(int, int x, int y)
- void(* **visibility**)(int)

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
- Draws the **FL_Gl_Window**.*
- void **draw_overlay** () **FL_OVERRIDE**
- You must implement this virtual function if you want to draw into the overlay.*
- int **handle** (int) **FL_OVERRIDE**
- Handle some FLTK events as needed.*

Protected Member Functions inherited from **FL_Gl_Window**

- void **draw_begin** ()
- Supports drawing to an **FL_Gl_Window** with the FLTK 2D drawing API.*
- void **draw_end** ()
- To be used as a match for a previous call to **FL_Gl_Window::draw_begin()**.*

Protected Member Functions inherited from **FL_Window**

- void **default_size_range** ()
- Protected method to calculate the default size range of a window.*
- void **draw** () **FL_OVERRIDE**
- Draws the widget.*
- int **force_position** () const
- Returns the internal state of the window's **FORCE_POSITION** flag.*
- void **force_position** (int force)
- Sets an internal flag that tells FLTK and the window manager to honor position requests.*
- void **free_icons** ()

Deletes all icons previously attached to the window.

- int **is_resizable** ()

Protected method to determine whether a window is resizable.

Protected Member Functions inherited from **Fl_Group**

- **Fl_Rect** * **bounds** ()
Returns the internal array of widget sizes and positions.
- void **draw_child** (**Fl_Widget** &widget) const
Forces a child to redraw.
- void **draw_children** ()
Draws all children of the group.
- void **draw_outside_label** (const **Fl_Widget** &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int **on_insert** (**Fl_Widget** *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int **on_move** (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void **on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.
- int * **sizes** ()
Returns the internal array of widget sizes and positions.
- void **update_child** (**Fl_Widget** &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from **Fl_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** (**Fl_Boxtype** t, **Fl_Color** c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (**Fl_Boxtype** t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (**Fl_Boxtype** t, int x, int y, int w, int h, **Fl_Color** bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **Fl_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)

Internal use only.

- void **set_flag** (unsigned int c)

Sets a flag in the flags mask.

- void **w** (int v)

Internal use only.

- void **x** (int v)

Internal use only.

- void **y** (int v)

Internal use only.

Additional Inherited Members

Public Types inherited from [FI_Window](#)

- typedef struct HICON__ * **HICON**

Static Public Member Functions inherited from [FI_GI_Window](#)

- static int **can_do** (const int *m)

Returns non-zero if the hardware supports the given OpenGL mode.

- static int **can_do** (int m)

Returns non-zero if the hardware supports the given OpenGL mode.

Static Public Member Functions inherited from [FI_Window](#)

- static [FI_Window](#) * **current** ()

Returns the last window that was made current.

- static void **default_callback** ([FI_Window](#) *, void *v)

Back compatibility: Sets the default callback v for win to call on close event.

- static void **default_icon** (const [FI_RGB_Image](#) *)

Sets a single default window icon.

- static void **default_icons** (const [FI_RGB_Image](#) *[], int)

Sets the default window icons.

- static void **default_icons** (HICON big_icon, HICON small_icon)

Sets the default window icons (Windows platform only).

- static const char * **default_xclass** ()

Returns the default xclass.

- static void **default_xclass** (const char *)

Sets the default window xclass.

- static bool **is_a_rescale** ()

Returns true when a window is being rescaled.

- static char **show_next_window_iconic** ()

Returns the static flag whether the next window should be opened iconified.

- static void **show_next_window_iconic** (char stat)

Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from [FI_Group](#)

- static [FI_Group](#) * **current** ()

Returns the currently active group.

- static void **current** ([FI_Group](#) *g)

Sets the current group.

Static Public Member Functions inherited from [Fl_Widget](#)

- static void [default_callback](#) ([Fl_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [Fl_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,

[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

Static Protected Attributes inherited from [Fl_Window](#)

- static [Fl_Window](#) * [current_](#)
Stores the last window that was made current.

11.55.1 Detailed Description

GLUT is emulated using this window class and these static variables (plus several more static variables hidden in `glut_compatibility.cxx`):

11.55.2 Member Function Documentation

11.55.2.1 [draw\(\)](#)

```
void Fl_Glut_Window::draw (
    void ) [protected], [virtual]
```

Draws the [Fl_Gl_Window](#).

You **must** subclass [Fl_Gl_Window](#) and provide an implementation for [draw\(\)](#). You may also provide an implementation of [draw_overlay\(\)](#) if you want to draw into the overlay planes. You can avoid reinitializing the viewport and lights and other things by checking [valid\(\)](#) at the start of [draw\(\)](#) and only doing the initialization if it is false.

The [draw\(\)](#) method can *only* use OpenGL calls. Do not attempt to call X, any of the functions in `<FL/fl_draw.H>`, or glX directly. Do not call [gl_start\(\)](#) or [gl_finish\(\)](#).

If double-buffering is enabled in the window, the back and front buffers are swapped after this function is completed. The following pseudo-code shows how to use "if (!valid())" to initialize the viewport:

```
void mywindow::draw() {
    if (!valid()) {
        glViewport(0,0,pixel_w(),pixel_h());
        glFrustum(...) or glOrtho(...)
        ...other initialization...
    }
    if (!context_valid()) {
        ...load textures, etc. ...
    }
    // clear screen
```

```

glClearColor(...);
glClear(...);
... draw your geometry here ...
}

```

Actual example code to clear screen to black and draw a 2D white "X":

```

void mywindow::draw() {
    if (!valid()) {
        glLoadIdentity();
        glViewport(0,0,pixel_w(),pixel_h());
        glOrtho(-w(),w(),-h(),h(),-1,1);
    }
    // Clear screen
    glClear(GL_COLOR_BUFFER_BIT);
    // Draw white 'X'
    glColor3f(1.0, 1.0, 1.0);
    glBegin(GL_LINE_STRIP); glVertex2f(w(), h()); glVertex2f(-w(),-h()); glEnd();
    glBegin(GL_LINE_STRIP); glVertex2f(w(),-h()); glVertex2f(-w(), h()); glEnd();
}

```

Regular FLTK widgets can be added as children to the [Fl_Gl_Window](#). To correctly overlay the widgets, [Fl_Gl_Window::draw\(\)](#) must be called after rendering the main scene.

```

void mywindow::draw() {
    // draw 3d graphics scene
    Fl_Gl_Window::draw();
    // -- or --
    draw_begin();
    Fl_Window::draw();
    // other 2d drawing calls, overlays, etc.
    draw_end();
}

```

Reimplemented from [Fl_Gl_Window](#).

11.55.2.2 draw_overlay()

```
void Fl_Glut_Window::draw_overlay () [protected], [virtual]
```

You must implement this virtual function if you want to draw into the overlay.

The overlay is cleared before this is called. You should draw anything that is not clear using OpenGL. You must use `gl_color(i)` to choose colors (it allocates them from the colormap using system-specific calls), and remember that you are in an indexed OpenGL mode and drawing anything other than flat-shaded will probably not work.

Both this function and [Fl_Gl_Window::draw\(\)](#) should check [Fl_Gl_Window::valid\(\)](#) and set the same transformation. If you don't your code may not work on other systems. Depending on the OS, and on whether overlays are real or simulated, the OpenGL context may be the same or different between the overlay and main window.

Reimplemented from [Fl_Gl_Window](#).

11.55.2.3 handle()

```
int Fl_Glut_Window::handle (
    int event) [protected], [virtual]
```

Handle some FLTK events as needed.

Reimplemented from [Fl_Gl_Window](#).

The documentation for this class was generated from the following files:

- glut.H
- glut_compatibility.cxx

11.56 Fl_Grid Class Reference

[Fl_Grid](#) is a container (layout) widget with multiple columns and rows.

```
#include <Fl_Grid.H>
```

Inheritance diagram for [Fl_Grid](#):

Classes

- class [Cell](#)

Public Member Functions

- [Fl_Grid::Cell * cell](#) ([Fl_Widget *widget](#)) const
Get the grid cell of widget `widget`.
- [Fl_Grid::Cell * cell](#) (int row, int col) const
Get the grid cell of row `row` and column `col`.
- virtual void [clear_layout](#) ()
Reset the layout w/o removing widgets.
- void [col_gap](#) (const int *value, [size_t size](#))
Set more than one column gaps at once.
- int [col_gap](#) (int col) const
- void [col_gap](#) (int col, int value)
Set the gap of column `col`.
- void [col_weight](#) (const int *value, [size_t size](#))
Set the weight of more than one column.
- int [col_weight](#) (int col) const
- void [col_weight](#) (int col, int value)
Set the weight of a column.
- void [col_width](#) (const int *value, [size_t size](#))
Set minimal widths of more than one column.
- int [col_width](#) (int col) const
- void [col_width](#) (int col, int value)
Set the minimal width of a column.
- short [cols](#) () const
- int [computed_col_width](#) (int col) const
- int [computed_row_height](#) (int row) const
- void [debug](#) (int level=127)
Output layout information of this [Fl_Grid](#) to stderr.
- [Fl_Grid](#) (int X, int Y, int W, int H, const char *L=0)
Create a new [Fl_Grid](#) widget.
- void [gap](#) (int *row_gap, int *col_gap) const
Get the default gaps for rows and columns.
- virtual void [gap](#) (int row_gap, int col_gap=-1)
Set default gaps for rows and columns.
- virtual void [layout](#) ()
Calculate the grid layout and resize and position all widgets.
- virtual void [layout](#) (int rows, int cols, int margin=-1, int gap=-1)
Set the basic layout parameters of the [Fl_Grid](#) widget.
- int [margin](#) (int *left, int *top, int *right, int *bottom) const
Returns all outside margin sizes of the grid.

- virtual void **margin** (int left, int top=-1, int right=-1, int bottom=-1)
Set all margins (left, top, right, bottom).
- bool **need_layout** () const
Return whether layout calculation is required.
- void **need_layout** (int set)
Request or reset the request to calculate the layout of children.
- virtual void **resize** (int X, int Y, int W, int H) **FL_OVERRIDE**
Recalculate the layout and position and resize all widgets.
- void **row_gap** (const int *value, size_t size)
Set more than one row gaps at once.
- int **row_gap** (int row) const
- void **row_gap** (int row, int value)
Set the gap of row `row`.
- void **row_height** (const int *value, size_t size)
Set the minimal row height of more than one row.
- int **row_height** (int row) const
- void **row_height** (int row, int value)
Set the minimal row height of row `row`.
- void **row_weight** (const int *value, size_t size)
Set the weight of more than one row.
- int **row_weight** (int row) const
- void **row_weight** (int row, int value)
Set the row weight of row `row`.
- short **rows** () const
- void **show_grid** (int set)
Enable or disable drawing of the grid helper lines for visualization.
- void **show_grid** (int set, **FL_Color** col)
Enable or disable drawing of the grid helper lines for visualization.
- **FL_Grid::Cell** * **widget** (**FL_Widget** *wi, int row, int col, **FL_Grid_Align** align=**FL_GRID_FILL**)
Assign a widget to a grid cell and set its alignment.
- **FL_Grid::Cell** * **widget** (**FL_Widget** *wi, int row, int col, int rowspan, int colspan, **FL_Grid_Align** align=**FL_GRID_FILL**)
Assign a widget to a grid cell and set cell spanning and alignment.

Public Member Functions inherited from **FL_Group**

- **FL_Widget** *& **_ddfdesign_kludge** ()
This is for forms compatibility only.
- void **add** (**FL_Widget** &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** (**FL_Widget** *o)
*See void **FL_Group::add**(**FL_Widget** &w)*
- void **add_resizable** (**FL_Widget** &o)
Adds a widget to the group and makes it the resizable widget.
- **FL_Widget** *const * **array** () const
Returns a pointer to the array of children.
- **FL_Group** const * **as_group** () const **FL_OVERRIDE**
- **FL_Group** * **as_group** () **FL_OVERRIDE**
*Returns an **FL_Group** pointer if this widget is an **FL_Group**.*
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- **FL_Widget** * **child** (int n) const

- Returns the n'th child.*

 - int **children** () const

Returns how many child widgets the group has.
- void **clear** ()

Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()

Returns the current clipping mode.
- void **clip_children** (int c)

Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete_child** (int n)

Removes the widget at `index` from the group and deletes it.
- void **end** ()

Exactly the same as `current(this->parent())`.
- int **find** (const FL_Widget &o) const

*See int FL_Group::find(const FL_Widget *w) const.*
- int **find** (const FL_Widget *) const

Searches the child array for the widget and returns the index.
- FL_Group (int, int, int, int, const char *s=0)

Creates a new FL_Group widget using the given position, size, and label string.
- void **focus** (FL_Widget *w)
- void **forms_end** ()

This is for forms compatibility only.
- int **handle** (int) FL_OVERRIDE

Handles the specified event.
- void **init_sizes** ()

Resets the internal array of widget sizes and positions.
- void **insert** (FL_Widget &, int i)

The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** (FL_Widget &o, FL_Widget *before)

This does `insert(w, find(before))`.
- void **remove** (FL_Widget &)

Removes a widget from the group but does not delete it.
- void **remove** (FL_Widget *o)

Removes the widget `o` from the group.
- void **remove** (int index)

Removes the widget at `index` from the group but does not delete it.
- FL_Widget * **resizable** () const

Returns the group's resizable widget.
- void **resizable** (FL_Widget &o)

Sets the group's resizable widget.
- void **resizable** (FL_Widget *o)

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void **resize** (int, int, int, int) FL_OVERRIDE

Resizes the FL_Group widget and all of its children.
- virtual ~FL_Group ()

The destructor also deletes all the children.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

- Marks the widget as inactive without sending events or changing focus.*

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

 - void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*

 - void `clear_output` ()
- Sets a widget to accept input.*

 - void `clear_visible` ()
- Hides the widget.*

 - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

 - `FL_Color` `color` () const
- Gets the background color of the widget.*

 - void `color` (FL_Color bg)
- Sets the background color of the widget.*

 - void `color` (FL_Color bg, FL_Color sel)
- Sets the background and selection color of the widget.*

 - `FL_Color` `color2` () const
- For back compatibility only.*

 - void `color2` (unsigned a)
- For back compatibility only.*

 - int `contains` (const FL_Widget *w) const
- Checks if w is a child of this widget.*

 - void `copy_label` (const char *new_label)
- Sets the current label.*

 - void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*

 - uchar `damage` () const
- Returns non-zero if `draw()` needs to be called.*

 - void `damage` (uchar c)
- Sets the damage bits for the widget.*

 - void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int `damage_resize` (int, int, int, int)
- Internal use only.*

 - void `deactivate` ()
- Deactivates the widget.*

 - `FL_Image` * `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const `FL_Image` * `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void `deimage` (FL_Image &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `deimage` (FL_Image *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

 - void `do_callback` (FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with default arguments.*

 - void `do_callback` (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)
- Calls the widget callback function with arbitrary arguments.*

- void `do_callback` (`FL_Widget` *widget, void *arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FL_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- virtual void `hide` ()
Makes a widget invisible.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FL_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FL_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FL_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FL_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FL_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FL_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FL_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FL_Color` c)
Sets the label color.
- `FL_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FL_Font` f)
Sets the font to use.
- `FL_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FL_Fonsize` pix)
Sets the font size in pixels.
- `FL_Labeltype` `labeltype` () const
Gets the label type.
- void `labeltype` (`FL_Labeltype` a)

- Sets the label type.*

 - void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `FI_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`FI_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- `FI_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`FI_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void `show` ()

Makes a widget visible.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the current tooltip text.

- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)
Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const
Gets the widget position in its window.
- int [y](#) () const
Gets the widget position in its window.
- virtual [~Fl_Widget](#) ()
Destroys the widget.

Protected Member Functions

- [Cell](#) * [add_cell](#) (int row, int col)
- virtual void [draw](#) () [FL_OVERRIDE](#)
Draws the [Fl_Grid](#) widget and all children.
- virtual void [draw_grid](#) ()
Draws the grid helper lines for design and debugging purposes.
- void [init](#) ()
- void [on_remove](#) (int) [FL_OVERRIDE](#)
[Fl_Group](#) calls this method when a child widget is about to be removed.
- void [remove_cell](#) (int row, int col)

Protected Member Functions inherited from FL_Group

- `FL_Rect * bounds ()`
Returns the internal array of widget sizes and positions.
- `void draw () FL_OVERRIDE`
Draws the widget.
- `void draw_child (FL_Widget &widget) const`
Forces a child to redraw.
- `void draw_children ()`
Draws all children of the group.
- `void draw_outside_label (const FL_Widget &widget) const`
Parents normally call this to draw outside labels of child widgets.
- `virtual int on_insert (FL_Widget *, int)`
Allow derived groups to act when a widget is added as a child.
- `virtual int on_move (int, int)`
Allow derived groups to act when a widget is moved within the group.
- `int * sizes ()`
Returns the internal array of widget sizes and positions.
- `void update_child (FL_Widget &widget) const`
Draws a child only if it needs it.

Protected Member Functions inherited from FL_Widget

- `void clear_flag (unsigned int c)`
Clears a flag in the flags mask.
- `void draw_backdrop () const`
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
Draws the widget box according its box style.
- `void draw_box (FL_Boxtype t, FL_Color c) const`
Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const`
Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int X, int Y, int W, int H) const`
Draws a focus rectangle around the widget.
- `void draw_focus (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const`
Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
Draws the widget's label at the defined label position.
- `void draw_label (int, int, int, int) const`
Draws the label in an arbitrary bounding box.
- `FL_Widget (int x, int y, int w, int h, const char *label=0L)`
Creates a widget at the given position and size.
- `unsigned int flags () const`
Gets the widget flags mask.
- `void h (int v)`
Internal use only.
- `void set_flag (unsigned int c)`
Sets a flag in the flags mask.
- `void w (int v)`

Internal use only.

- void `x` (int v)

Internal use only.

- void `y` (int v)

Internal use only.

Protected Attributes

- bool `draw_grid_`
- `Fl_Color` `grid_color`

Friends

- class `Fl_Grid_Type`

Additional Inherited Members

Static Public Member Functions inherited from `Fl_Group`

- static `Fl_Group * current` ()
Returns the currently active group.
- static void `current` (`Fl_Group *g`)
Sets the current group.

Static Public Member Functions inherited from `Fl_Widget`

- static void `default_callback` (`Fl_Widget *widget`, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from `Fl_Widget`

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

11.56.1 Detailed Description

[FL_Grid](#) is a container (layout) widget with multiple columns and rows.

This container widget features very flexible layouts in columns and rows w/o the need to position each child widget in x/y coordinates.

Widgets are assigned to grid cells (column, row) with their minimal sizes in `w()` and `h()`. The `x()` and `y()` positions are ignored and can be (0, 0). [FL_Grid](#) calculates widget positions and resizes the widgets to fit into the grid. It is possible to create a single row or column of widgets with [FL_Grid](#).

You should design your grid with the smallest possible sizes of all widgets in mind. [FL_Grid](#) will automatically assign additional space to cells according to some rules (described later) when resizing the [FL_Grid](#) widget.

Hint: You should set a minimum window size to make sure the [FL_Grid](#) is never resized below its minimal sizes. Resizing below the given widget sizes results in undefined behavior.

[FL_Grid](#) and other container widgets (e.g. [FL_Group](#)) can be nested. One main advantage of this usage is that widget coordinates in embedded [FL_Group](#) widgets become relative to the group and will be positioned as expected.

Todo This (relative group coordinates of nested groups of [FL_Grid](#)) needs explanation and maybe an example.

[FL_Grid](#) child widgets are handled by its base class [FL_Group](#) but [FL_Grid](#) stores additional data corresponding to each widget in internal grid cells.

[FL_Grid](#) children are allowed to span multiple columns and rows like HTML `<table>` cells. Individual children can have fixed sizes or be aligned inside their cells (left, right, top, bottom, and more) and/or follow their cell sizes when the [FL_Grid](#) container is resized.

Note to resizing: since [FL_Grid](#) uses its own layout algorithm the normal [FL_Group::resizable\(\)](#) widget is ignored (if set). Calling [init_sizes\(\)](#) is not necessary.

Note

[FL_Grid](#) is, as of FLTK 1.4.x, still in experimental state and should be used with caution. The API can still be changed although it is assumed to be almost stable - as stable as possible for a first release.

Example: Simple 3x3 [FL_Grid](#) with five buttons:

```
#include <FL/Fl.H>
#include <FL/Fl_Double_Window.H>
#include <FL/Fl_Grid.H>
#include <FL/Fl_Button.H>

int main(int argc, char **argv) {
    Fl_Double_Window *win = new Fl_Double_Window(320, 180, "3x3 FL_Grid with Buttons");
    // create the FL_Grid container with five buttons
    FL_Grid *grid = new FL_Grid(0, 0, win->w(), win->h());
    grid->layout(3, 3, 10, 10);
    grid->color(FL_WHITE);
    FL_Button *b0 = new FL_Button(0, 0, 0, 0, "New");
    FL_Button *b1 = new FL_Button(0, 0, 0, 0, "Options");
    FL_Button *b3 = new FL_Button(0, 0, 0, 0, "About");
    FL_Button *b4 = new FL_Button(0, 0, 0, 0, "Help");
    FL_Button *b6 = new FL_Button(0, 0, 0, 0, "Quit");
    // assign buttons to grid positions
    grid->widget(b0, 0, 0);
    grid->widget(b1, 0, 2);
    grid->widget(b3, 1, 1);
    grid->widget(b4, 2, 0);
    grid->widget(b6, 2, 2);
    grid->show_grid(0); // 1 to display grid helper lines
    grid->end();
    win->end();
    win->resizable(grid);
    win->size_range(300, 100);
    win->show(argc, argv);
    return FL::run();
}
```

Figure 11.19 Simple 3x3 Fl_Grid

Figure 11.20 show_grid() set to 1

11.56.2 Constructor & Destructor Documentation

11.56.2.1 Fl_Grid()

```
Fl_Grid::Fl_Grid (
    int X,
    int Y,
    int W,
    int H,
    const char * L = 0)
```

Create a new [Fl_Grid](#) widget.

Todo More documentation of [Fl_Grid](#) constructor?

11.56.3 Member Function Documentation

11.56.3.1 cell() [1/2]

```
Fl_Grid::Cell * Fl_Grid::cell (
    Fl_Widget * widget) const
```

Get the grid cell of widget `widget`.

The pointer to the cell can be used for further assignment of properties like alignment etc.

Hint: If you know the row and column index of the cell you should use `Fl_Grid::cell(int row, int col)` instead because it is **much** faster.

Please see `Fl_Grid::cell(int row, int col)` for details and the validity of cell pointers.

Parameters

in	<i>widget</i>	widget whose cell is requested
----	---------------	--------------------------------

Return values

<code>NULL</code>	if <code>widget</code> is not assigned to a cell
-------------------	--

11.56.3.2 `cell()` [2/2]

```
Fl_Grid::Cell * Fl_Grid::cell (
    int row,
    int col) const
```

Get the grid cell of row `row` and column `col`.

Widgets and other attributes are organized in cells ([Fl_Grid::Cell](#)).

This cell is an opaque structure (class) with some public methods. **Don't** assume anything about grid cell sizes and ordering in memory. These are implementation details that can be changed without notice.

The validity of an [Fl_Grid::Cell](#) pointer is limited. It will definitely be invalidated when the overall grid layout is changed, for instance by calling `layout(int, int)`.

Adding new cells beyond the current layout limits will also invalidate cell pointers but this is not (yet) implemented. Attempts to assign widgets to out-of-bounds cells are currently ignored.

The only well-defined usage of cell pointers is to set one or more properties like widget alignment of a cell after retrieving the cell pointer. Don't store cell pointers in your program for later reference.

Parameters

in	<i>row</i>	row index
in	<i>col</i>	column index

Returns

pointer to cell

Return values

<code>NULL</code>	if <code>row</code> or <code>col</code> is out of bounds or no widget was assigned
-------------------	--

11.56.3.3 `clear_layout()`

```
void Fl_Grid::clear_layout () [virtual]
```

Reset the layout w/o removing widgets.

Removes all cells and sets rows and cols to zero. Existing widgets are kept as children of the [Fl_Group](#) (base class) but are hidden.

This method should be rarely used. You may want to call [Fl_Grid::clear\(\)](#) to remove all widgets and reset the layout to zero rows and columns.

You must call `layout(int rows, int cols, ...)` to set a new layout, allocate new cells, and assign widgets to new cells.

Todo [Fl_Grid::clear\(\)](#) needs to be implemented as documented above!

11.56.3.4 `col_gap()` [1/2]

```
void Fl_Grid::col_gap (
    const int * value,
    size_t size)
```

Set more than one column gaps at once.

See also

[Fl_Grid::col_weight\(const int *value, size_t size\)](#) for handling of the value `array` and `size`.

11.56.3.5 col_gap() [2/2]

```
void Fl_Grid::col_gap (
    int col,
    int value)
```

Set the gap of column `col`.

Note that the gap is right of each column except the last one which is ignored. Use [margin\(\)](#) for the right most column.

Parameters

in	<i>col</i>	column
in	<i>value</i>	gap size after the column

11.56.3.6 col_weight() [1/2]

```
void Fl_Grid::col_weight (
    const int * value,
    size_t size)
```

Set the weight of more than one column.

The values are taken from the array `value` and assigned sequentially to columns, starting from column 0. If the array `size` is too large extraneous values are ignored.

Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:

```
int val[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_weight(val, sizeof(val)/sizeof(val[0]));
```

Parameters

in	<i>value</i>	an array of column weights
in	<i>size</i>	the size of the array (number of values)

11.56.3.7 col_weight() [2/2]

```
void Fl_Grid::col_weight (
    int col,
    int value)
```

Set the weight of a column.

Column and row weights are used to distribute additional space when the grid is resized beyond its defined (minimal) size. All weight values are relative and can be chosen freely. Suggested weights are in the range {0 .. 100}, 0 (zero) disables resizing of the column.

How does it work?

Whenever additional space (say: `SPACE` in pixels) is to be distributed to a set of columns the weights of all columns are added to a value `SUM`, then every single column width is increased by the value (in pseudo code):

```
col.width += SPACE * col.weight / SUM
```

Resulting pixel values are rounded to the next integer and rounding differences are added to or subtracted from the column with the highest weight. If more columns have the same weight one of them is chosen.

Note

If none of the columns considered for resizing have weights > 0 then `FL_Grid` assigns the remaining space to an arbitrary column or to all considered columns evenly. This is implementation defined and can be changed without notice. You can avoid this situation by designing your grid with sensible sizes and weights.

Parameters

in	<i>col</i>	column number (counting from 0)
in	<i>value</i>	weight, must be ≥ 0

11.56.3.8 col_width() [1/2]

```
void Fl_Grid::col_width (
    const int * value,
    size_t size)
```

Set minimal widths of more than one column.

The values are taken from the array `value` and assigned sequentially to columns, starting from column 0. If the array `size` is too large extraneous values are ignored.

Negative values in the array are not assigned to their columns, i.e. the existing value for the corresponding column is not changed.

Example:

```
int widths[] = { 0, 0, 50, -1, -1, 50, 0 };
grid->col_width(widths, sizeof(width)/sizeof(width[0]));
```

Parameters

in	<i>value</i>	an array of column widths
in	<i>size</i>	the size of the array (number of values)

11.56.3.9 col_width() [2/2]

```
void Fl_Grid::col_width (
    int col,
    int value)
```

Set the minimal width of a column.

Column widths are calculated by using the maximum of all widget widths in that column and the given column width. After calculating the width additional space is added when resizing according to the `weight` of the column.

You can set one or more column widths in one call by using [Fl_Grid::col_width\(const int *value, size_t size\)](#).

Parameters

in	<i>col</i>	column number (counting from 0)
in	<i>value</i>	minimal column width, must be ≥ 0

See also

[Fl_Grid::col_width\(const int *value, size_t size\)](#)

11.56.3.10 debug()

```
void Fl_Grid::debug (
    int level = 127)
```

Output layout information of this [Fl_Grid](#) to stderr.

Parameter `level` will be used to define the amount of output.

- 0 = nothing
- 127 = everything
- other values not yet defined

Note

It is not yet defined which kind of values `level` will have, either a numerical value (127 = maximum, 0 = nothing) or a bit mask that determines what to output.

Todo Add more information about cells and children.

Control output by using `level`.

Parameters

in	<i>level</i>	not yet used (0-127, default = 127)
----	--------------	-------------------------------------

11.56.3.11 draw()

```
void Fl_Grid::draw (
    void ) [protected], [virtual]
```

Draws the [Fl_Grid](#) widget and all children.

If the layout has been changed [layout\(\)](#) is called before the widget is drawn so all children are arranged as designed.

See also

[layout\(\)](#)

[need_layout\(\)](#)

Implements [Fl_Widget](#).

11.56.3.12 draw_grid()

```
void Fl_Grid::draw_grid () [protected], [virtual]
```

Draws the grid helper lines for design and debugging purposes.

This method is protected so it can be modified in subclasses.

11.56.3.13 gap() [1/2]

```
void Fl_Grid::gap (
    int * row_gap,
    int * col_gap) const
```

Get the default gaps for rows and columns.

Parameters

out	<i>row_gap</i>	pointer to int to receive column gap, may be NULL
out	<i>col_gap</i>	pointer to int to receive column gap, may be NULL

11.56.3.14 gap() [2/2]

```
void Fl_Grid::gap (
    int row_gap,
    int col_gap = -1) [virtual]
```

Set default gaps for rows and columns.

All gaps are positioned below the rows and right of their columns.

The bottom row and the right-most column don't have a gap, i.e. the gap sizes of these columns and rows are ignored. You can use a right or bottom margin instead.

You have to specify at least one argument, `col_gap` is optional. If you don't specify an argument or use a negative value (e.g. -1) then that margin is not affected.

You can also initialize the default gaps with [layout\(int, int, int, int\)](#).

Parameters

in	<i>row_gap</i>	default gap for all rows
in	<i>col_gap</i>	default gap for all columns

See also

[Fl_Grid::layout\(int rows, int cols, int margin, int gap\)](#)

11.56.3.15 layout() [1/2]

```
void Fl_Grid::layout () [virtual]
```

Calculate the grid layout and resize and position all widgets.

This is called automatically when the [Fl_Grid](#) is resized. You need to call it once after you added widgets or moved widgets between cells.

Calling it once after all modifications are completed is enough.

Todo Document when and why to call [layout\(\)](#) w/o args. See [Fl_Flex::layout\(\)](#)

See also

[Fl_Grid::layout\(int rows, int cols, int margin, int gap\)](#)

11.56.3.16 layout() [2/2]

```
void Fl_Grid::layout (
    int rows,
    int cols,
    int margin = -1,
    int gap = -1) [virtual]
```

Set the basic layout parameters of the [Fl_Grid](#) widget.

You need to specify at least `rows` and `cols` to define a layout before you can add widgets to the grid.

Parameters `margin` and `gap` are optional.

You can call [layout\(int rows, int cols, int margin, int gap\)](#) again to change the layout but this is inefficient since all cells are reallocated if the layout changed.

Calling this with the same values of `rows` and `cols` is fast and can be used to change `margin` and `gap` w/o reallocating the cells.

`margin` sets all margins (left, top, right, bottom) to the same value. Negative values (e.g. -1) don't change the established margins. The default value set by the constructor is 0.

`gap` sets row and column gaps to the same value. Negative values (e.g. -1) do not affect the established gaps. The default value set by the constructor is 0.

After you added all widgets you must call [layout\(\)](#) once without arguments to calculate the actual layout and to position and resize all widgets.

Todo Document when and why to call [layout\(\)](#) w/o args. See [Fl_Flex::layout\(\)](#)

Parameters

in	<i>rows</i>	number of rows
in	<i>cols</i>	number of columns
in	<i>margin</i>	margin size inside the Fl_Grid 's border
in	<i>gap</i>	gap size between cells

See also

[Fl_Grid::layout\(\)](#)

11.56.3.17 margin() [1/2]

```
int Fl_Grid::margin (
    int * left,
    int * top,
    int * right,
    int * bottom) const
```

Returns all outside margin sizes of the grid.

All margin sizes are returned in the given arguments. If any argument is `NULL` the respective value is not returned.

Parameters

out	<i>left</i>	returns left margin if not <code>NULL</code>
out	<i>top</i>	returns top margin if not <code>NULL</code>
out	<i>right</i>	returns right margin if not <code>NULL</code>
out	<i>bottom</i>	returns bottom margin if not <code>NULL</code>

Returns

whether all margins are equal

Return values

1	all margins have the same size
0	at least one margin has a different size

11.56.3.18 margin() [2/2]

```
void Fl_Grid::margin (
    int left,
    int top = -1,
    int right = -1,
    int bottom = -1) [virtual]
```

Set all margins (left, top, right, bottom).

All margins are measured in pixels inside the box borders. You need to specify at least one argument, all other arguments are optional. If you don't specify an argument or use a negative value (e.g. -1) then that particular margin is not affected.

Parameters

in	<i>left</i>	left margin
in	<i>top</i>	top margin
in	<i>right</i>	right margin
in	<i>bottom</i>	bottom margin

11.56.3.19 need_layout()

```
void Fl_Grid::need_layout (
    int set) [inline]
```

Request or reset the request to calculate the layout of children.

If called with `true` (1) this calls [redraw\(\)](#) to schedule a full [draw\(\)](#). When draw is eventually called, the layout is (re)calculated before actually drawing the widget.

Parameters

in	set	1 to request layout calculation, 0 to reset the request
----	-----	--

11.56.3.20 on_remove()

```
void Fl_Grid::on_remove (
    int index) [protected], [virtual]
```

[Fl_Group](#) calls this method when a child widget is about to be removed.

Make sure that the widget is also removed from our internal list of children.

Reimplemented from [Fl_Group](#).

11.56.3.21 resize()

```
void Fl_Grid::resize (
    int X,
    int Y,
    int W,
    int H) [virtual]
```

Recalculate the layout and position and resize all widgets.

This method overrides [Fl_Group::resize\(\)](#) and calculates all positions and sizes of its children according to its own rules.

Parameters

in	<i>X,Y</i>	new widget position
in	<i>W,H</i>	new widget size

Reimplemented from [Fl_Widget](#).

11.56.3.22 row_gap() [1/2]

```
void Fl_Grid::row_gap (
    const int * value,
    size_t size)
```

Set more than one row gaps at once.

See also

[Fl_Grid::col_weight\(const int *value, size_t size\)](#) for handling of the value [array](#) and [size](#).

11.56.3.23 row_gap() [2/2]

```
void Fl_Grid::row_gap (
    int row,
    int value)
```

Set the gap of row `row`.

Note that the gap is below each row except the last one which is ignored. Use [margin\(\)](#) for the bottom row.

Parameters

in	<i>row</i>	row
in	<i>value</i>	gap size below the row

11.56.3.24 row_height() [1/2]

```
void Fl_Grid::row_height (
    const int * value,
    size_t size)
```

Set the minimal row height of more than one row.

Parameters

in	<i>value</i>	array of height values
in	<i>size</i>	size of array <i>value</i>

See also

[Fl_Grid::col_weight\(const int *value, size_t size\)](#) for handling of the value [array](#) and [size](#).

11.56.3.25 row_height() [2/2]

```
void Fl_Grid::row_height (
    int row,
    int value)
```

Set the minimal row height of row *row*.

Parameters

in	<i>row</i>	<i>row</i>
in	<i>value</i>	minimal height of the row

11.56.3.26 row_weight() [1/2]

```
void Fl_Grid::row_weight (
    const int * value,
    size_t size)
```

Set the weight of more than one row.

Parameters

in	<i>value</i>	array of height values
in	<i>size</i>	size of array <i>value</i>

See also

[Fl_Grid::col_weight\(const int *value, size_t size\)](#) for handling of the value [array](#) and [size](#).

11.56.3.27 row_weight() [2/2]

```
void Fl_Grid::row_weight (
    int row,
    int value)
```

Set the row weight of row *row*.

Parameters

in	<i>row</i>	<i>row</i>
in	<i>value</i>	weight of the row

11.56.3.28 show_grid() [1/2]

```
void Fl_Grid::show_grid (
    int set) [inline]
```

Enable or disable drawing of the grid helper lines for visualization.

Use this method during the design stage of your [Fl_Grid](#) widget or for debugging if widgets are not positioned as intended.

The default is a light green color but you can change it for better contrast if needed, see [show_grid\(int set, Fl_Color col\)](#).

Note

You can define the environment variable `FLTK_GRID_DEBUG=1` to set `show_grid(1)` for all [Fl_Grid](#) widgets at construction time. This enables you to debug the grid layout w/o changing code.

Parameters

in	set	1 (true) = draw, 0 = don't draw the grid
----	-----	--

See also

[show_grid\(int set, Fl_Color col\)](#)

11.56.3.29 show_grid() [2/2]

```
void Fl_Grid::show_grid (
    int set,
    Fl_Color col) [inline]
```

Enable or disable drawing of the grid helper lines for visualization.

This method also sets the color used for the helper lines.

The default is a light green color but you can change it to any color for better contrast if needed.

Parameters

in	set	1 (true) = draw, 0 = don't draw the grid
in	col	color to use for the grid helper lines

See also

[show_grid\(int set\)](#)

11.56.3.30 widget() [1/2]

```
Fl_Grid::Cell * Fl_Grid::widget (
    Fl_Widget * wi,
    int row,
    int col,
    Fl_Grid_Align align = FL_GRID_FILL)
```

Assign a widget to a grid cell and set its alignment.

This short form sets row and column spanning attributes to (1, 1).

For more information see [Fl_Grid::widget\(Fl_Widget *wi, int row, int col, int rowspan, int colspan, Fl_Grid_Align align\)](#)

Parameters

in	wi	widget to be assigned to the cell
in	row	row
in	col	column
in	align	widget alignment inside the cell

Returns

assigned cell

Return values

<code>NULL</code>	if <code>row</code> or <code>col</code> is out of bounds
-------------------	--

See also

[Fl_Grid::widget\(Fl_Widget *wi, int row, int col, int rowspan, int colspan, Fl_Grid_Align align\)](#)

11.56.3.31 widget() [2/2]

```
Fl_Grid::Cell * Fl_Grid::widget (
    Fl_Widget * wi,
    int row,
    int col,
    int rowspan,
    int colspan,
    Fl_Grid_Align align = FL_GRID_FILL)
```

Assign a widget to a grid cell and set cell spanning and alignment.

Default alignment is `FL_GRID_FILL` which stretches the widget in horizontal and vertical directions to fill the whole cell(s) given by `colspan` and `rowspan`.

You can use this method to move a widget from one cell to another; it is automatically removed from its old cell. If the new cell is already assigned to another widget that widget is deassigned but kept as a child of the group.

Before you can assign a widget to a cell it must have been created as a child of the [Fl_Grid](#) widget (i.e. its [Fl_Group](#)).

Parameters

in	<i>wi</i>	widget to be assigned to the cell
in	<i>row</i>	row
in	<i>col</i>	column
in	<i>rowspan</i>	vertical span in cells, default 1
in	<i>colspan</i>	horizontal span in cells, default 1
in	<i>align</i>	widget alignment inside the cell

Returns

assigned cell

Return values

<code>NULL</code>	if <code>row</code> or <code>col</code> is out of bounds or <code>wi</code> is not a child
-------------------	--

The documentation for this class was generated from the following files:

- [Fl_Grid.H](#)
- [Fl_Grid.cxx](#)

11.57 Fl_Group Class Reference

The [Fl_Group](#) class is the main FLTK container widget.

```
#include <Fl_Group.H>
```

Inheritance diagram for [Fl_Group](#):

Public Member Functions

- [FL_Widget](#) * & [_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void [add](#) ([FL_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void [add](#) ([FL_Widget](#) *o)
See void [FL_Group::add\(FL_Widget &w\)](#)
- void [add_resizable](#) ([FL_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FL_Widget](#) *const * [array](#) () const
Returns a pointer to the array of children.
- [FL_Group](#) const * [as_group](#) () const [FL_OVERRIDE](#)
- [FL_Group](#) * [as_group](#) () [FL_OVERRIDE](#)
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- void [begin](#) ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL_Widget](#) * [child](#) (int n) const
Returns the n'th child.
- int [children](#) () const
Returns how many child widgets the group has.
- void [clear](#) ()
Deletes all child widgets from memory recursively.
- unsigned int [clip_children](#) ()
Returns the current clipping mode.

- void `clip_children` (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int `delete_child` (int n)
Removes the widget at `index` from the group and deletes it.
- void `end` ()
Exactly the same as `current(this->parent())`.
- int `find` (const `FL_Widget` &o) const
*See int `FL_Group::find(const FL_Widget *w)` const.*
- int `find` (const `FL_Widget` *) const
Searches the child array for the widget and returns the index.
- `FL_Group` (int, int, int, int, const char *s=0)
Creates a new `FL_Group` widget using the given position, size, and label string.
- void `focus` (`FL_Widget` *W)
- void `forms_end` ()
This is for forms compatibility only.
- int `handle` (int) `FL_OVERRIDE`
Handles the specified event.
- void `init_sizes` ()
Resets the internal array of widget sizes and positions.
- void `insert` (`FL_Widget` &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void `insert` (`FL_Widget` &o, `FL_Widget` *before)
This does `insert(w, find(before))`.
- void `remove` (`FL_Widget` &)
Removes a widget from the group but does not delete it.
- void `remove` (`FL_Widget` *o)
Removes the widget o from the group.
- void `remove` (int index)
Removes the widget at `index` from the group but does not delete it.
- `FL_Widget` * `resizable` () const
Returns the group's resizable widget.
- void `resizable` (`FL_Widget` &o)
Sets the group's resizable widget.
- void `resizable` (`FL_Widget` *o)
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void `resize` (int, int, int, int) `FL_OVERRIDE`
Resizes the `FL_Group` widget and all of its children.
- virtual `~FL_Group` ()
The destructor also deletes all the children.

Public Member Functions inherited from `FL_Widget`

- void `_clear_fullscreen` ()
- void `_set_fullscreen` ()
- void `activate` ()
Activates the widget.
- unsigned int `active` () const
Returns whether the widget is active.
- int `active_r` () const
Returns whether the widget and all of its parents are active.
- `FL_Align` `align` () const

- Gets the label alignment.*
- void [align](#) ([FI_Align](#) alignment)
- Sets the label alignment.*
- long [argument](#) () const
- Gets the current user data (long) argument that is passed to the callback function.*
- void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
- Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
- Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).*
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void [bind_deimage](#) (int f)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void [bind_image](#) ([FI_Image](#) *img)
- Sets the image to use as part of the widget label when in the active state.*
- void [bind_image](#) (int f)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- [FI_Boxtype](#) [box](#) () const
- Gets the box type of the widget.*
- void [box](#) ([FI_Boxtype](#) new_box)
- Sets the box type for the widget.*
- [FI_Callback_p](#) [callback](#) () const
- Gets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
- Sets the current callback function and managed user data for the widget.*
- void [callback](#) ([FI_Callback](#) *cb, void *p)
- Sets the current callback function and data for the widget.*
- void [callback](#) ([FI_Callback0](#) *cb)
- Sets the current callback function for the widget.*
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
- Sets the current callback function for the widget.*
- unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*
- void [clear_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*
- void [clear_changed](#) ()
- Marks the value of the widget as unchanged.*
- void [clear_damage](#) (uchar c=0)
- Clears or sets the damage flags.*
- void [clear_output](#) ()
- Sets a widget to accept input.*
- void [clear_visible](#) ()
- Hides the widget.*
- void [clear_visible_focus](#) ()
- Disables keyboard focus navigation with this widget.*

- `FL_Color color () const`
Gets the background color of the widget.
- `void color (FL_Color bg)`
Sets the background color of the widget.
- `void color (FL_Color bg, FL_Color sel)`
Sets the background and selection color of the widget.
- `FL_Color color2 () const`
For back compatibility only.
- `void color2 (unsigned a)`
For back compatibility only.
- `int contains (const FL_Widget *w) const`
Checks if w is a child of this widget.
- `void copy_label (const char *new_label)`
Sets the current label.
- `void copy_tooltip (const char *text)`
Sets the current tooltip text.
- `uchar damage () const`
Returns non-zero if `draw()` needs to be called.
- `void damage (uchar c)`
Sets the damage bits for the widget.
- `void damage (uchar c, int x, int y, int w, int h)`
Sets the damage bits for an area inside the widget.
- `int damage_resize (int, int, int, int)`
Internal use only.
- `void deactivate ()`
Deactivates the widget.
- `FL_Image * deimage ()`
Gets the image that is used as part of the widget label when in the inactive state.
- `const FL_Image * deimage () const`
Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (FL_Image &img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (FL_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`
Returns whether the inactive image is managed by the widget.
- `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with default arguments.
- `void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`
Calls the widget callback function with arbitrary arguments.
- `void draw_label (int, int, int, int, FL_Align) const`
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`
Gets the widget height.
- `virtual void hide ()`
Makes a widget invisible.
- `int horizontal_label_margin ()`
Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`

- Set the spacing between the label and the horizontal edge of the widget.*

 - `FL_Image * image ()`

Gets the image that is used as part of the widget label when in the active state.

 - `const FL_Image * image () const`
- Gets the image that is used as part of the widget label when in the active state.*
- `void image (FL_Image &img)`
- Sets the image to use as part of the widget label when in the active state.*
- `void image (FL_Image *img)`
- Sets the image to use as part of the widget label when in the active state.*
- `int image_bound () const`
- Returns whether the image is managed by the widget.*
- `int inside (const FL_Widget *wgt) const`
- Checks if this widget is a child of wgt.*
- `int is_label_copied () const`
- Returns whether the current label was assigned with `copy_label()`.*
- `const char * label () const`
- Gets the current label text.*
- `void label (const char *text)`
- Sets the current label pointer.*
- `void label (FL_Labeltype a, const char *b)`
- Shortcut to set the label text and type in one call.*
- `int label_image_spacing ()`
- Return the gap size between the label and the image.*
- `void label_image_spacing (int gap)`
- Set the gap between the label and the image in pixels.*
- `FL_Color labelcolor () const`
- Gets the label color.*
- `void labelcolor (FL_Color c)`
- Sets the label color.*
- `FL_Font labelfont () const`
- Gets the font to use.*
- `void labelfont (FL_Font f)`
- Sets the font to use.*
- `FL_Fonsize labelsize () const`
- Gets the font size in pixels.*
- `void labelsize (FL_Fonsize pix)`
- Sets the font size in pixels.*
- `FL_Labeltype labeltype () const`
- Gets the label type.*
- `void labeltype (FL_Labeltype a)`
- Sets the label type.*
- `void measure_label (int &ww, int &hh) const`
- Sets width ww and height hh accordingly with the label size.*
- `bool needs_keyboard () const`
- Returns whether this widget needs a keyboard.*
- `void needs_keyboard (bool needs)`
- Sets whether this widget needs a keyboard.*
- `unsigned int output () const`
- Returns if a widget is used for output only.*
- `FL_Group * parent () const`
- Returns a pointer to the parent widget.*

- void [parent](#) ([Fl_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- [Fl_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

- Gets the user data for this widget.*
- void **user_data** ([FL_Callback_User_Data](#) *v, bool auto_free)
- Sets the user data for this widget.*
- void **user_data** (void *v)
- Sets the user data for this widget.*
- int [vertical_label_margin](#) ()
- Get the spacing between the label and the vertical edge of the widget.*
- void [vertical_label_margin](#) (int px)
- Set the spacing between the label and the vertical edge of the widget.*
- unsigned int [visible](#) () const
- Returns whether a widget is visible.*
- unsigned int [visible_focus](#) () const
- Checks whether this widget has a visible focus.*
- void [visible_focus](#) (int v)
- Modifies keyboard focus navigation.*
- int [visible_r](#) () const
- Returns whether a widget and all its parents are visible.*
- int [w](#) () const
- Gets the widget width.*
- [FL_When](#) [when](#) () const
- Returns the conditions under which the callback is called.*
- void [when](#) (uchar i)
- Sets the flags used to decide when a callback is called.*
- [FL_Window](#) * [window](#) () const
- Returns a pointer to the nearest parent window up the widget hierarchy.*
- int [x](#) () const
- Gets the widget position in its window.*
- int [y](#) () const
- Gets the widget position in its window.*
- virtual [~FL_Widget](#) ()
- Destroys the widget.*

Static Public Member Functions

- static [FL_Group](#) * [current](#) ()
- Returns the currently active group.*
- static void [current](#) ([FL_Group](#) *g)
- Sets the current group.*

Static Public Member Functions inherited from [FL_Widget](#)

- static void [default_callback](#) ([FL_Widget](#) *widget, void *data)
- The default callback for all widgets that don't set a callback.*
- static unsigned int [label_shortcut](#) (const char *t)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
- Returns true if the given text t contains the entered '&x' shortcut.*

Protected Member Functions

- `FI_Rect * bounds ()`
Returns the internal array of widget sizes and positions.
- `void draw () FL_OVERRIDE`
Draws the widget.
- `void draw_child (FI_Widget &widget) const`
Forces a child to redraw.
- `void draw_children ()`
Draws all children of the group.
- `void draw_outside_label (const FI_Widget &widget) const`
Parents normally call this to draw outside labels of child widgets.
- `virtual int on_insert (FI_Widget *, int)`
Allow derived groups to act when a widget is added as a child.
- `virtual int on_move (int, int)`
Allow derived groups to act when a widget is moved within the group.
- `virtual void on_remove (int)`
Allow derived groups to act when a child widget is removed from the group.
- `int * sizes ()`
Returns the internal array of widget sizes and positions.
- `void update_child (FI_Widget &widget) const`
Draws a child only if it needs it.

Protected Member Functions inherited from `FI_Widget`

- `void clear_flag (unsigned int c)`
Clears a flag in the flags mask.
- `void draw_backdrop () const`
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- `void draw_box () const`
Draws the widget box according its box style.
- `void draw_box (FI_Boxtype t, FI_Color c) const`
Draws a box of type t, of color c at the widget's position and size.
- `void draw_box (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const`
Draws a box of type t, of color c at the position X,Y and size W,H.
- `void draw_focus () const`
Draws a focus rectangle around the widget.
- `void draw_focus (FI_Boxtype t, int X, int Y, int W, int H) const`
Draws a focus rectangle around the widget.
- `void draw_focus (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const`
Draws a focus box for the widget at the given position and size.
- `void draw_label () const`
Draws the widget's label at the defined label position.
- `void draw_label (int, int, int, int) const`
Draws the label in an arbitrary bounding box.
- `FI_Widget (int x, int y, int w, int h, const char *label=0L)`
Creates a widget at the given position and size.
- `unsigned int flags () const`
Gets the widget flags mask.
- `void h (int v)`
Internal use only.
- `void set_flag (unsigned int c)`

Sets a flag in the flags mask.

- void [w](#) (int v)

Internal use only.

- void [x](#) (int v)

Internal use only.

- void [y](#) (int v)

Internal use only.

flags possible values enumeration.

11.57.1 Detailed Description

The [Fl_Group](#) class is the main FLTK container widget.

It maintains an array of child widgets. These children can themselves be any widget including [Fl_Group](#). The most important subclass of [Fl_Group](#) is [Fl_Window](#), however groups can also be used to control radio buttons or to enforce resize behavior.

The tab and arrow keys are used to move the focus between widgets of this group, and to other groups. The only modifier grabbed is shift (for shift-tab), so that ctrl-tab, alt-up, and such are free for the app to use as shortcuts.

To remove a widget from the group and destroy it, in 1.3.x (and up) you can simply use:

```
delete some_widget;
```

..and this will trigger proper scheduling of the widget's removal from its parent group.

If used as a child of [Fl_Tabs](#), setting `when (FL_WHEN_CLOSED)` will enable the Close button in the corresponding tab. If the user clicks the Close button, the callback of this group will be called with the callback reason `FL_REASON_CLOSED`.

11.57.2 Constructor & Destructor Documentation

11.57.2.1 [Fl_Group](#)()

```
Fl_Group::Fl_Group (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0)
```

Creates a new [Fl_Group](#) widget using the given position, size, and label string.

The default boxttype is `FL_NO_BOX`.

11.57.2.2 ~Fl_Group()

```
Fl_Group::~~Fl_Group () [virtual]
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. It is allowed that the [Fl_Group](#) and all of its children are automatic (local) variables, but you must declare the [Fl_Group](#) *first*, so that it is destroyed last.

If you add static or automatic (local) variables to an [Fl_Group](#), then it is your responsibility to remove (or delete) all such static or automatic child widgets *before destroying* the group - otherwise the group will attempt to call delete operator on them leading to undefined behavior!

11.57.3 Member Function Documentation

11.57.3.1 array()

```
Fl_Widget *const * Fl_Group::array () const
```

Returns a pointer to the array of children.

Note

This pointer is only valid until the next time a child is added or removed.

11.57.3.2 as_group() [1/2]

```
Fl_Group const * Fl_Group::as_group () const [inline], [virtual]
```

Reimplemented from [Fl_Widget](#).

11.57.3.3 as_group() [2/2]

```
Fl_Group * Fl_Group::as_group () [inline], [virtual]
```

Returns an [Fl_Group](#) pointer if this widget is an [Fl_Group](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl_Group](#). If it returns non-NULL, then the widget in question is derived from [Fl_Group](#), and you can use the returned pointer to access its children or other [Fl_Group](#)-specific methods.

Example:

```
void my_callback (Fl_Widget *w, void *) {
    Fl_Group *g = w->as_group();
    if (g)
        printf ("This group has %d children\n", g->children());
    else
        printf ("This widget is not a group!\n");
}
```

Return values

NULL	if this widget is not derived from Fl_Group .
------	---

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl_Widget::as_window\(\)](#), [Fl_Widget::as_gl_window\(\)](#)

Reimplemented from [Fl_Widget](#).

11.57.3.4 begin()

```
void Fl_Group::begin ()
```

Sets the current group so you can build the widget tree by just constructing the widgets.

[begin\(\)](#) is automatically called by the constructor for [Fl_Group](#) (and thus for [Fl_Window](#) as well). [begin\(\)](#) is *exactly the same as* [current\(this\)](#). *Don't forget to [end\(\)](#) the group or window!*

11.57.3.5 bounds()

```
Fl_Rect * Fl_Group::bounds () [protected]
```

Returns the internal array of widget sizes and positions.

If the `bounds()` array does not exist, it will be allocated and filled with the current widget sizes and positions.

The `bounds()` array stores the initial positions of widgets as `Fl_Rect`'s. The size of the array is `children() + 2`.

- The first `Fl_Rect` is the group,
- the second is the resizable (clipped to the group),
- the rest are the children.

This is a convenient order for the resize algorithm.

If the group and/or the `resizable()` is a `Fl_Window` (or subclass) then the `x()` and `y()` coordinates of their respective `Fl_Rect`'s are zero.

Note

You should never need to use this *protected* method directly, unless you have special needs to rearrange the children of a `Fl_Group`. `Fl_Tile` uses this to rearrange its widget positions. The returned array should be considered read-only. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call `init_sizes()`.

#include <FL/Fl_Rect.H> if you want to access the `bounds()` array in your derived class. `Fl_Rect.H` is intentionally not included by `Fl_Group.H` to avoid unnecessary dependencies.

Returns

Array of `Fl_Rect`'s with widget positions and sizes. The returned array is only valid until `init_sizes()` is called or widgets are added to or removed from the group.

See also

`init_sizes()`

Since

FLTK 1.4.0

11.57.3.6 child()

```
Fl_Widget * Fl_Group::child (
    int n) const [inline]
```

Returns the n'th child.

Returns NULL if n is out of range (since FLTK 1.4.0).

No range checking was done in FLTK 1.3 and older versions!

Parameters

in	<i>n</i>	index of child (0 .. <code>children()</code> - 1)
----	----------	---

Returns

pointer to the n'th child or NULL if out of range

11.57.3.7 clear()

```
void Fl_Group::clear (
    void )
```

Deletes all child widgets from memory recursively.

This method differs from the `remove()` method in that it affects all child widgets and deletes them from memory.

The `resizable()` widget of the `Fl_Group` is set to the `Fl_Group` itself.

11.57.3.8 clip_children() [1/2]

```
unsigned int Fl_Group::clip_children () [inline]
```

Returns the current clipping mode.

Returns

true, if clipping is enabled, false otherwise.

See also

void [Fl_Group::clip_children\(int c\)](#)

11.57.3.9 clip_children() [2/2]

```
void Fl_Group::clip_children (
    int c) [inline]
```

Controls whether the group widget clips the drawing of child widgets to its bounding box.

Set *c* to 1 if you want to clip the child widgets to the bounding box.

The default is to not clip (0) the drawing of child widgets.

11.57.3.10 current() [1/2]

```
Fl_Group * Fl_Group::current () [static]
```

Returns the currently active group.

The [Fl_Widget](#) constructor automatically does [current\(\)](#)->[add\(widget\)](#) if this is not null. To prevent new widgets from being added to a group, call [Fl_Group::current\(0\)](#).

11.57.3.11 current() [2/2]

```
void Fl_Group::current (
    Fl_Group * g) [static]
```

Sets the current group.

See also

[Fl_Group::current\(\)](#)

11.57.3.12 delete_child()

```
int Fl_Group::delete_child (
    int index) [virtual]
```

Removes the widget at *index* from the group and deletes it.

This method does nothing if *index* is out of bounds.

This method differs from the [remove\(\)](#) method in that it deletes the widget from memory. Since this method is virtual it can be reimplemented in subclasses with additional requirements and consequences. See the documentation of subclasses.

Many subclasses don't need to reimplement this method.

Note

This method **may** refuse to remove and delete the widget if it is an essential part of the [Fl_Group](#), for instance a scrollbar in an [Fl_Scroll](#) group. In this case the widget is neither removed nor deleted.

This method does not call [init_sizes\(\)](#) or [redraw\(\)](#). This is left to user code if necessary.

Returns 0 if the widget was removed and deleted. Return values > 0 are reserved for use by FLTK core widgets.

Return values < 0 are free to be used by user defined widgets.

Todo Reimplementation of [Fl_Group::delete_child\(int\)](#) in more FLTK subclasses. This is not yet complete.

Parameters

<code>in</code>	<code>index</code>	index of child to be removed
-----------------	--------------------	------------------------------

Returns

success (0) or error code

Return values

0	success
1	index out of range
2	widget not allowed to be removed (see note)
>2	reserved for FLTK use

Since

FLTK 1.4.0

Reimplemented in [Fl_Scroll](#).

11.57.3.13 draw()

```
void Fl_Group::draw () [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

Reimplemented in [Fl_Help_View](#), [Fl_Input_Choice](#), [Fl_Pack](#), [Fl_Scroll](#), [Fl_Spinner](#), [Fl_Table](#), [Fl_Tabs](#), [Fl_Terminal](#), [Fl_Text_Display](#), [Fl_Tree](#), [Fl_Window](#), and [Fl_Wizard](#).

11.57.3.14 draw_child()

```
void Fl_Group::draw_child (
    Fl_Widget & widget) const [protected]
```

Forces a child to redraw.

This draws a child widget, if it is not clipped. The damage bits are cleared after drawing.

11.57.3.15 draw_children()

```
void Fl_Group::draw_children () [protected]
```

Draws all children of the group.

This is useful, if you derived a widget from [Fl_Group](#) and want to draw a special border or background. You can call [draw_children\(\)](#) from the derived [draw\(\)](#) method after drawing the box, border, or background.

11.57.3.16 end()

```
void Fl_Group::end ()
```

Exactly the same as [current\(this->parent\(\)\)](#).

Any new widgets added to the widget tree will be added to the parent of the group.

11.57.3.17 find()

```
int Fl_Group::find (
    const Fl_Widget * o) const
```

Searches the child array for the widget and returns the index.
Returns [children\(\)](#) if the widget is NULL or not found.

11.57.3.18 focus()

```
void Fl_Group::focus (
    Fl_Widget * W) [inline]
```

Deprecated This is for backwards compatibility only. You should use *W->take_focus()* instead.

See also

[Fl_Widget::take_focus\(\)](#);

11.57.3.19 handle()

```
int Fl_Group::handle (
    int event) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received
----	--------------	----------------------------

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

Reimplemented in [Fl_Help_View](#), [Fl_Scroll](#), [Fl_Spinner](#), [Fl_Table](#), [Fl_Table_Row](#), [Fl_Tabs](#), [Fl_Terminal](#), [Fl_Text_Display](#), [Fl_Text_Editor](#), [Fl_Tile](#), [Fl_Tree](#), and [Fl_Window](#).

11.57.3.20 init_sizes()

```
void Fl_Group::init_sizes ()
```

Resets the internal array of widget sizes and positions.

The [Fl_Group](#) widget keeps track of the original widget sizes and positions when resizing occurs so that if you resize a window back to its original size the widgets will be in the correct places. If you rearrange the widgets in your group, call this method to register the new arrangement with the [Fl_Group](#) that contains them.

If you add or remove widgets, this will be done automatically.

Note

The internal array of widget sizes and positions will be allocated and filled when the next `resize()` occurs. For more information on the contents and structure of the `bounds()` array see `bounds()`.

See also

`bounds()`

`sizes()` (deprecated)

11.57.3.21 insert() [1/2]

```
void Fl_Group::insert (
    Fl_Widget & o,
    int index)
```

The widget is removed from its current group (if any) and then inserted into this group.

It is put at index `n` - or at the end, if `n >= children()`. This can also be used to rearrange the widgets inside a group.

11.57.3.22 insert() [2/2]

```
void Fl_Group::insert (
    Fl_Widget & o,
    Fl_Widget * before) [inline]
```

This does `insert(w, find(before))`.

This will append the widget if `before` is not in the group.

11.57.3.23 on_insert()

```
int Fl_Group::on_insert (
    Fl_Widget * candidate,
    int index) [protected], [virtual]
```

Allow derived groups to act when a widget is added as a child.

Widgets derived from `Fl_Group` may store additional data for their children. Overriding this method will allow derived classes to generate these data structures just before the child is added.

This method usually returns the same index that was given in the parameters. By setting a new index, the position of other widgets in the child pointer array can be preserved (e.g. `Fl_Scroll` keeps its scroll bars as the last two children).

By returning `-1`, `Fl_Group::insert` will not add the child to `array_`. This is not recommended, but `Fl_Table` does something similar to forward children to a hidden group.

Parameters

<i>candidate</i>	the candidate will be added to the child <code>array_</code> after this method returns.
<i>index</i>	add the child at this position in the <code>array_</code>

Returns

index to position the child as planned

a new index to force the child to a different position

`-1` to keep the group from adding the candidate

Reimplemented in `Fl_Scroll`, `Fl_Tabs`, and `Fl_Tile`.

11.57.3.24 on_move()

```
int Fl_Group::on_move (
    int oldIndex,
    int newIndex) [protected], [virtual]
```

Allow derived groups to act when a widget is moved within the group.

Widgets derived from [Fl_Group](#) may store additional data for their children. Overriding this method will allow derived classes to move these data structures just before the child itself is moved.

This method usually returns the new index that was given in the parameters. By setting a different destination index, the position of other widgets in the child pointer array can be preserved.

By returning -1, [Fl_Group::insert](#) will not move the child.

Parameters

<i>oldIndex</i>	the current index of the child that will be moved
<i>newIndex</i>	the new index of the child

Returns

newIndex to position the child as planned

a different index to force the child to a different position

-1 to keep the group from moving the child

Reimplemented in [Fl_Scroll](#), [Fl_Tabs](#), and [Fl_Tile](#).

11.57.3.25 on_remove()

```
void Fl_Group::on_remove (
    int index) [protected], [virtual]
```

Allow derived groups to act when a child widget is removed from the group.

Widgets derived from [Fl_Group](#) may store additional data for their children. Overriding this method will allow derived classes to remove these data structures just before the child is removed.

Parameters

<i>index</i>	remove the child at this position in the array_
--------------	---

Reimplemented in [Fl_Flex](#), [Fl_Grid](#), [Fl_Tabs](#), and [Fl_Tile](#).

11.57.3.26 remove() [1/3]

```
void Fl_Group::remove (
    Fl_Widget & o)
```

Removes a widget from the group but does not delete it.

This method does nothing if the widget is not a child of the group.

This method differs from the [clear\(\)](#) method in that it only affects a single widget and does not delete it from memory.

Note

If you have the child's index anyway, use [remove\(int index\)](#) instead, because this doesn't need a child lookup in the group's table of children. This can be much faster, if there are lots of children.

11.57.3.27 remove() [2/3]

```
void Fl_Group::remove (
    Fl_Widget * o) [inline]
```

Removes the widget *o* from the group.

See also

void [remove\(Fl_Widget&\)](#)

11.57.3.28 remove() [3/3]

```
void Fl_Group::remove (
    int index)
```

Removes the widget at `index` from the group but does not delete it.

This method does nothing if `index` is out of bounds.

This method differs from the [clear\(\)](#) method in that it only affects a single widget and does not delete it from memory.

Since

FLTK 1.3.0

11.57.3.29 resizable() [1/3]

```
Fl_Widget * Fl_Group::resizable () const [inline]
```

Returns the group's resizable widget.

See void [Fl_Group::resizable\(Fl_Widget *o\)](#)

11.57.3.30 resizable() [2/3]

```
void Fl_Group::resizable (
    Fl_Widget & o) [inline]
```

Sets the group's resizable widget.

See void [Fl_Group::resizable\(Fl_Widget *o\)](#)

11.57.3.31 resizable() [3/3]

```
void Fl_Group::resizable (
    Fl_Widget * o) [inline]
```

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.

If the resizable is NULL the group's size is fixed and all of the widgets in the group remain a fixed size and distance from the top-left corner. This is the default for groups derived from [Fl_Window](#) and [Fl_Pack](#).

The resizable may be set to the group itself, in which case all of the widgets that are its direct children are resized proportionally. This is the default value for [Fl_Group](#).

The resizable widget defines the resizing box for the group, which could be the group itself or one of the group's direct children. When the group is resized it calculates a new size and position for all of its children. Widgets that are horizontally or vertically inside the dimensions of the box are scaled to the new size. Widgets outside the box are moved.

Note

The resizable of a group **must** be one of

- NULL
- the group itself
- a direct child of the group.

If you set any other widget that is not a direct child of the group as its resizable then the behavior is undefined. This is **not** checked by [Fl_Group](#) for historical reasons.

In these examples the gray area is the resizable:

Figure 11.21 before resize

Figure 11.22 after resize

It is possible to achieve any type of resize behavior by using an invisible [Fl_Box](#) as the resizable and/or by using a hierarchy of [Fl_Group](#) widgets, each with their own resizing strategies.

See the [How Does Resizing Work?](#) chapter for more examples and detailed explanation.

Note

The [resizable\(\)](#) widget of a window can also affect the window's resizing behavior if [Fl_Window::size_range\(\)](#) is not called. Please see [Fl_Window::default_size_range\(\)](#) for more information on how the default size range is calculated.

See also

[Fl_Window::size_range\(\)](#)

[Fl_Window::default_size_range\(\)](#)

11.57.3.32 `resize()`

```
void Fl_Group::resize (
    int X,
    int Y,
    int W,
    int H) [virtual]
```

Resizes the [Fl_Group](#) widget and all of its children.

The [Fl_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [Fl_Group::resizable\(Fl_Widget*\)](#)

See also

[FI_Group::resizable\(FI_Widget*\)](#)

[FI_Group::resizable\(\)](#)

[FI_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [FI_Widget](#).

Reimplemented in [FI_Help_View](#), [FI_Input_Choice](#), [FI_Overlay_Window](#), [FI_Pack](#), [FI_Scroll](#), [FI_Spinner](#), [FI_Table](#), [FI_Tabs](#), [FI_Terminal](#), [FI_Text_Display](#), [FI_Tile](#), [FI_Tree](#), and [FI_Window](#).

11.57.3.33 sizes()

```
int * FI_Group::sizes () [protected]
```

Returns the internal array of widget sizes and positions.

For backward compatibility with FLTK versions before 1.4.

The [sizes\(\)](#) array stores the initial positions of widgets as (left, right, top, bottom) quads. The first quad is the group, the second is the resizable (clipped to the group), and the rest are the children. If the group and/or the [resizable\(\)](#) is a [FI_Window](#), then the first (left) and third (top) entries of their respective quads (x,y) are zero.

Deprecated Deprecated since 1.4.0. Please use [bounds\(\)](#) instead.

Note

This method will be removed in a future FLTK version (1.5.0 or higher).

Returns

Array of int's with widget positions and sizes. The returned array is only valid until [init_sizes\(\)](#) is called or widgets are added to or removed from the group.

Note

Since FLTK 1.4.0 the returned array is a **read-only** and re-ordered copy of the internal [bounds\(\)](#) array. Do not change its contents. If you need to rearrange children in a group, do so by resizing the children and call [init_sizes\(\)](#).

See also

[bounds\(\)](#)

11.57.3.34 update_child()

```
void FI_Group::update_child (
    FI_Widget & widget) const [protected]
```

Draws a child only if it needs it.

This draws a child widget, if it is not clipped *and* if any [damage\(\)](#) bits are set. The damage bits are cleared after drawing.

See also

[FI_Group::draw_child\(FI_Widget& widget\) const](#)

*Shows the main Help Dialog Window Delegates call to encapsulated window_ void [FI_Window::show\(int argc, char **argv\)](#) instance method.*
- [FI_Fontsize](#) **textsize** ()
Sets or gets the default text size for the help view.
- void **textsize** ([FI_Fontsize](#) s)
Sets or gets the default text size for the help view.
- void **topline** (const char *n)
Sets the top line in the [FI_Help_View](#) widget to the named or numbered line.
- void **topline** (int n)
Sets the top line in the [FI_Help_View](#) widget to the named or numbered line.
- const char * **value** () const
The first form sets the current buffer to the string provided and reformats the text.
- void **value** (const char *f)

The first form sets the current buffer to the string provided and reformats the text.

- `int visible ()`
Returns 1 if the [Fl_Help_Dialog](#) window is visible.
- `int w ()`
Returns the position and size of the help dialog.
- `int x ()`
Returns the position and size of the help dialog.
- `int y ()`
Returns the position and size of the help dialog.
- `~Fl_Help_Dialog ()`
The destructor destroys the widget and frees all memory that has been allocated for the current file.

11.59.1 Detailed Description

The [Fl_Help_Dialog](#) widget displays a standard help dialog window using the [Fl_Help_View](#) widget.

The [Fl_Help_Dialog](#) class is not part of the FLTK core library, but instead of [fltk_images](#). Use `--use-images` when compiling with `fltk-config`.

Figure 11.23 [Fl_Help_Dialog](#)

11.59.2 Member Function Documentation

11.59.2.1 load()

```
int Fl_Help_Dialog::load (
    const char * f)
```

Loads the specified HTML file into the [Fl_Help_View](#) widget.

The filename can also contain a target name ("filename.html#target"). Always use forward slashes as path delimiters, Windows-style backslashes are not supported here.

Parameters

<code>in</code>	<code>f</code>	the name and path of an HTML file
-----------------	----------------	-----------------------------------

Returns

0 on success, -1 on error

See also

[Fl_Help_View::load\(\)](#), [fl_load_uri\(\)](#)

11.59.2.2 show()

```
void Fl_Help_Dialog::show ()
```

Shows the [Fl_Help_Dialog](#) window.

Shows the main Help Dialog Window Delegates call to encapsulated window_ void [Fl_Window::show\(\)](#) method.

11.59.2.3 textsize()

```
void Fl_Help_Dialog::textsize (
    Fl_Fontsize s)
```

Sets or gets the default text size for the help view.

Sets the internal [Fl_Help_View](#) instance text size.

Delegates call to encapsulated view_ void [Fl_Help_View::textsize\(Fl_Fontsize s\)](#) instance method

11.59.2.4 value() [1/2]

```
const char * Fl_Help_Dialog::value () const
```

The first form sets the current buffer to the string provided and reformats the text.

It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

11.59.2.5 value() [2/2]

```
void Fl_Help_Dialog::value (
    const char * v)
```

The first form sets the current buffer to the string provided and reformats the text.

It also clears the history of the "back" and "forward" buttons. The second form returns the current buffer contents.

The documentation for this class was generated from the following files:

- [Fl_Help_Dialog.H](#)
- [Fl_Help_Dialog.cxx](#)
- [Fl_Help_Dialog_Dox.cxx](#)

11.60 Fl_Help_Font_Stack Struct Reference

Public Member Functions

- `size_t count () const`
Gets the current count of font style elements in the stack.
- `Fl_Help_Font_Stack ()`
font stack construction, initialize attributes.
- `void init (Fl_Font f, Fl_Fontsize s, Fl_Color c)`
- `void pop (Fl_Font &f, Fl_Fontsize &s, Fl_Color &c)`
Pops from the stack the font style triplet and calls [fl_font\(\)](#) & [fl_color\(\)](#) adequately.
- `void push (Fl_Font f, Fl_Fontsize s, Fl_Color c)`
Pushes the font style triplet on the stack, also calls [fl_font\(\)](#) & [fl_color\(\)](#) adequately.
- `void top (Fl_Font &f, Fl_Fontsize &s, Fl_Color &c)`
Gets the top (current) element on the stack.

Protected Attributes

- `Fl_Help_Font_Style elts_ [MAX_FL_HELP_FS_ELTS]`
font elements
- `size_t nfonts_`
current number of fonts in stack

The documentation for this struct was generated from the following file:

- [Fl_Help_View.H](#)

11.61 Fl_Help_Font_Style Struct Reference

[Fl_Help_View](#) font stack element definition.

```
#include <Fl_Help_View.H>
```

Public Member Functions

- **Fl_Help_Font_Style** ([Fl_Font](#) afont, [Fl_Fontsize](#) asize, [Fl_Color](#) acolor)
- void **get** ([Fl_Font](#) &afont, [Fl_Fontsize](#) &asize, [Fl_Color](#) &acolor)
Gets current font attributes.
- void **set** ([Fl_Font](#) afont, [Fl_Fontsize](#) asize, [Fl_Color](#) acolor)
Sets current font attributes.

Public Attributes

- [Fl_Color](#) **c**
Font Color.
- [Fl_Font](#) **f**
Font.
- [Fl_Fontsize](#) **s**
Font Size.

11.61.1 Detailed Description

[Fl_Help_View](#) font stack element definition.

The documentation for this struct was generated from the following file:

- Fl_Help_View.H

11.62 Fl_Help_Link Struct Reference

Definition of a link for the html viewer.

```
#include <Fl_Help_View.H>
```

Public Attributes

- char **filename** [192]
Reference filename.
- int **h**
Height of link text.
- char **name** [32]
Link target (blank if none)
- int **w**
Width of link text.
- int **x**
X offset of link text.
- int **y**
Y offset of link text.

11.62.1 Detailed Description

Definition of a link for the html viewer.

The documentation for this struct was generated from the following file:

- Fl_Help_View.H

11.63 `Fl_Help_Target` Struct Reference

`Fl_Help_Target` structure.

```
#include <Fl_Help_View.H>
```

Public Attributes

- char **name** [32]
Target name.
- int **y**
Y offset of target.

11.63.1 Detailed Description

`Fl_Help_Target` structure.

The documentation for this struct was generated from the following file:

- `Fl_Help_View.H`

11.64 `Fl_Help_View` Class Reference

The `Fl_Help_View` widget displays HTML text.

```
#include <Fl_Help_View.H>
```

Inheritance diagram for `Fl_Help_View`:

Public Member Functions

- void **clear_selection** ()
Removes the current text selection.
- int **copy** (int clipboard=1)
If text is selected in this view, copy it to a clipboard.
- const char * **directory** () const
Returns the current directory for the text in the buffer.
- const char * **filename** () const
Returns the current filename for the text in the buffer.
- int **find** (const char *s, int p=0)
Finds the specified string s at starting position p.
- **Fl_Help_View** (int xx, int yy, int ww, int hh, const char *l=0)
The constructor creates the `Fl_Help_View` widget at the specified position and size.
- int **handle** (int) **FL_OVERRIDE**
Handles events in the widget.
- `Fl_Scrollbar` * **hscrollbar** ()
Return pointer to horizontal scrollbar.
- int **leftline** () const
Gets the left position in pixels.
- void **leftline** (int)

- Scrolls the text to the indicated position, given a pixel column.*

 - void **link** (FI_Help_Func *fn)

This method assigns a callback function to use when a link is followed or a file is loaded (via [FI_Help_View::load\(\)](#)) that requires a different file or path.
 - int **load** (const char *f)

Loads the specified file.
 - void **resize** (int, int, int, int) [FL_OVERRIDE](#)

Resizes the help widget.
 - [FI_Scrollbar](#) * **scrollbar** ()

Return pointer to vertical scrollbar.
 - int **scrollbar_size** () const

Gets the current size of the scrollbars' troughs, in pixels.
 - void **scrollbar_size** (int newSize)

*Sets the pixel size of the scrollbars' troughs to *newSize*, in pixels.*
 - void **select_all** ()

Selects all the text in the view.
 - int **size** () const

Gets the size of the help view.
 - void **size** (int W, int H)
 - int **text_selected** ()

Check if the user selected text in this view.
 - [FI_Color](#) **textcolor** () const

Returns the current default text color.
 - void **textcolor** ([FI_Color](#) c)

Sets the default text color.
 - [FI_Font](#) **textfont** () const

Returns the current default text font.
 - void **textfont** ([FI_Font](#) f)

Sets the default text font.
 - [FI_Fontsize](#) **textsize** () const

Gets the default text size.
 - void **textsize** ([FI_Fontsize](#) s)

Sets the default text size.
 - const char * **title** ()

Returns the current document title, or NULL if there is no title.
 - int **topline** () const

Returns the current top line in pixels.
 - void **topline** (const char *n)

Scrolls the text to the indicated position, given a named destination.
 - void **topline** (int)

Scrolls the text to the indicated position, given a pixel line.
 - const char * **value** () const

Returns the current buffer contents.
 - void **value** (const char *val)

Sets the current help text buffer to the string provided and reformats the text.
 - ~[FI_Help_View](#) ()

Destroys the [FI_Help_View](#) widget.

Public Member Functions inherited from [FL_Group](#)

- [FL_Widget](#) *[_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void [add](#) ([FL_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void [add](#) ([FL_Widget](#) *o)
See void [FL_Group::add\(FL_Widget &w\)](#)
- void [add_resizable](#) ([FL_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FL_Widget](#) *const * [array](#) () const
Returns a pointer to the array of children.
- [FL_Group](#) const * [as_group](#) () const [FL_OVERRIDE](#)
- [FL_Group](#) * [as_group](#) () [FL_OVERRIDE](#)
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- void [begin](#) ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL_Widget](#) * [child](#) (int n) const
Returns the n'th child.
- int [children](#) () const
Returns how many child widgets the group has.
- void [clear](#) ()
Deletes all child widgets from memory recursively.
- unsigned int [clip_children](#) ()
Returns the current clipping mode.
- void [clip_children](#) (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int [delete_child](#) (int n)
*Removes the widget at *index* from the group and deletes it.*
- void [end](#) ()
*Exactly the same as *current(this->parent())*.*
- int [find](#) (const [FL_Widget](#) &o) const
*See int [FL_Group::find\(const FL_Widget *w\)](#) const.*
- int [find](#) (const [FL_Widget](#) *) const
Searches the child array for the widget and returns the index.
- [FL_Group](#) (int, int, int, int, const char *==0)
Creates a new [FL_Group](#) widget using the given position, size, and label string.
- void [focus](#) ([FL_Widget](#) *W)
- void [forms_end](#) ()
This is for forms compatibility only.
- void [init_sizes](#) ()
Resets the internal array of widget sizes and positions.
- void [insert](#) ([FL_Widget](#) &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void [insert](#) ([FL_Widget](#) &o, [FL_Widget](#) *before)
*This does *insert(w, find(before))*.*
- void [remove](#) ([FL_Widget](#) &)
Removes a widget from the group but does not delete it.
- void [remove](#) ([FL_Widget](#) *o)
Removes the widget o from the group.
- void [remove](#) (int index)

- Removes the widget at `index` from the group but does not delete it.*

 - `FI_Widget * resizable () const`
 - Returns the group's resizable widget.*
 - `void resizable (FI_Widget &o)`
 - Sets the group's resizable widget.*
 - `void resizable (FI_Widget *o)`
 - The resizable widget defines both the resizing box and the resizing behavior of the group and its children.*
 - `virtual ~FI_Group ()`
 - The destructor also deletes all the children.*

Public Member Functions inherited from FI_Widget

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
 - Activates the widget.*
- `unsigned int active () const`
 - Returns whether the widget is active.*
- `int active_r () const`
 - Returns whether the widget and all of its parents are active.*
- `FI_Align align () const`
 - Gets the label alignment.*
- `void align (FI_Align alignment)`
 - Sets the label alignment.*
- `long argument () const`
 - Gets the current user data (long) argument that is passed to the callback function.*
- `void argument (long v)`
 - Sets the current user data (long) argument that is passed to the callback function.*
- `virtual class FI_GL_Window * as_gl_window ()`
 - Returns an `FI_GL_Window` pointer if this widget is an `FI_GL_Window`.*
- `virtual class FI_GL_Window const * as_gl_window () const`
- `virtual FI_Window * as_window ()`
 - Returns an `FI_Window` pointer if this widget is an `FI_Window`.*
- `virtual FI_Window const * as_window () const`
- `void bind_deimage (FI_Image *img)`
 - Sets the image to use as part of the widget label when in the inactive state.*
- `void bind_deimage (int f)`
 - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- `void bind_image (FI_Image *img)`
 - Sets the image to use as part of the widget label when in the active state.*
- `void bind_image (int f)`
 - Bind the image to the widget, so the widget will delete the image when it is no longer needed.*
- `FI_Boxtype box () const`
 - Gets the box type of the widget.*
- `void box (FI_Boxtype new_box)`
 - Sets the box type for the widget.*
- `FI_Callback_p callback () const`
 - Gets the current callback function for the widget.*
- `void callback (FI_Callback *cb)`
 - Sets the current callback function for the widget.*
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`

- Sets the current callback function and managed user data for the widget.*

 - void [callback](#) ([FI_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.

 - void [callback](#) ([FI_Callback0](#) *cb)

Sets the current callback function for the widget.

 - void [callback](#) ([FI_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.

 - unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.

 - void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.

 - void [clear_changed](#) ()

Marks the value of the widget as unchanged.

 - void [clear_damage](#) ([uchar](#) c=0)

Clears or sets the damage flags.

 - void [clear_output](#) ()

Sets a widget to accept input.

 - void [clear_visible](#) ()

Hides the widget.

 - void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.

 - [FI_Color](#) [color](#) () const

Gets the background color of the widget.

 - void [color](#) ([FI_Color](#) bg)

Sets the background color of the widget.

 - void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)

Sets the background and selection color of the widget.

 - [FI_Color](#) [color2](#) () const

For back compatibility only.

 - void [color2](#) (unsigned a)

For back compatibility only.

 - int [contains](#) (const [FI_Widget](#) *w) const

Checks if w is a child of this widget.

 - void [copy_label](#) (const char *new_label)

Sets the current label.

 - void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.

 - [uchar](#) [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.

 - void [damage](#) ([uchar](#) c)

Sets the damage bits for the widget.

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

 - int [damage_resize](#) (int, int, int, int)

Internal use only.

 - void [deactivate](#) ()

Deactivates the widget.

 - [FI_Image](#) * [deimage](#) ()

Gets the image that is used as part of the widget label when in the inactive state.

 - const [FI_Image](#) * [deimage](#) () const

Gets the image that is used as part of the widget label when in the inactive state.

- void [deimage](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the inactive state.
- void [deimage](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- int [deimage_bound](#) () const
Returns whether the inactive image is managed by the widget.
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const

- Gets the font to use.*

 - void [labelfont](#) ([FI_Font](#) f)

Sets the font to use.
- [FI_Fontsize](#) [labelsize](#) () const

Gets the font size in pixels.
- void [labelsize](#) ([FI_Fontsize](#) pix)

Sets the font size in pixels.
- [FI_Labeltype](#) [labeltype](#) () const

Gets the label type.
- void [labeltype](#) ([FI_Labeltype](#) a)

Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const

Returns if a widget is used for output only.
- [FI_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.
- void [parent](#) ([FI_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- [FI_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([FI_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.

- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the current tooltip text.
- [FI_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [FI_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- uchar [type](#) () const
Gets the widget type.
- void [type](#) (uchar t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([FI_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [FI_When](#) [when](#) () const
Returns the conditions under which the callback is called.
- void [when](#) (uchar i)
Sets the flags used to decide when a callback is called.
- [FI_Window](#) * [window](#) () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const
Gets the widget position in its window.
- int [y](#) () const
Gets the widget position in its window.
- virtual [~FI_Widget](#) ()
Destroys the widget.

Static Public Attributes

- static const char * **copy_menu_text** = "Copy"
[this text may be customized at run-time]

Protected Member Functions

- void **draw** () **FL_OVERRIDE**
Draws the [FL_Help_View](#) widget.

Protected Member Functions inherited from [FI_Group](#)

- [FI_Rect](#) * **bounds** ()
Returns the internal array of widget sizes and positions.
- void **draw_child** ([FI_Widget](#) &widget) const
Forces a child to redraw.
- void **draw_children** ()
Draws all children of the group.
- void **draw_outside_label** (const [FI_Widget](#) &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int **on_insert** ([FI_Widget](#) *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int **on_move** (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void **on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.
- int * **sizes** ()
Returns the internal array of widget sizes and positions.
- void **update_child** ([FI_Widget](#) &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from [FI_Widget](#)

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If [FL_ALIGN_IMAGE_BACKDROP](#) is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according its box style.
- void **draw_box** ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
