00002  * FLTK: Important!
00003  * This file should remain as close to Markus Kuhn's original source
00004  * as possible for easy checking for changes later, however unlikely.
00005  * All customisations to work with FLTK shall be annotated!
00006  */
00007
00008 /*
00009  * This is an implementation of wcwidth() and wcswidth() (defined in
00010  * IEEE Std 1002.1-2001) for Unicode.
00011  *
00012  * http://www.opengroup.org/onlinepubs/007904975/functions/wcwidth.html
00013  * http://www.opengroup.org/onlinepubs/007904975/functions/wcswidth.html
00014  *
00015  * In fixed-width output devices, Latin characters all occupy a single
00016  * "cell" position of equal width, whereas ideographic CJK characters
00017  * occupy two such cells. Interoperability between terminal-line
00018  * applications and (teletype-style) character terminals using the
00019  * UTF-8 encoding requires agreement on which character should advance
00020  * the cursor by how many cell positions. No established formal
00021  * standards exist at present on which Unicode character shall occupy
00022  * how many cell positions on character terminals. These routines are
00023  * a first attempt of defining such behavior based on simple rules
00024  * applied to data provided by the Unicode Consortium.
00025  *
00026  * For some graphical characters, the Unicode standard explicitly
00027  * defines a character-cell width via the definition of the East Asian
00028  * FullWidth (F), Wide (W), Half-width (H), and Narrow (Na) classes.
00029  * In all these cases, there is no ambiguity about which width a
00030  * terminal shall use. For characters in the East Asian Ambiguous (A)
00031  * class, the width choice depends purely on a preference of backward
00032  * compatibility with either historic CJK or Western practice.
00033  * Choosing single-width for these characters is easy to justify as
00034  * the appropriate long-term solution, as the CJK practice of
00035  * displaying these characters as double-width comes from historic
00036  * implementation simplicity (8-bit encoded characters were displayed
00037  * single-width and 16-bit ones double-width, even for Greek,
00038  * Cyrillic, etc.) and not any typographic considerations.
00039  *
00040  * Much less clear is the choice of width for the Not East Asian
00041  * (Neutral) class. Existing practice does not dictate a width for any
00042  * of these characters. It would nevertheless make sense
00043  * typographically to allocate two character cells to characters such
00044  * as for instance EM SPACE or VOLUME INTEGRAL, which cannot be
00045  * represented adequately with a single-width glyph. The following
00046  * routines at present merely assign a single-cell width to all
00047  * neutral characters, in the interest of simplicity. This is not
00048  * entirely satisfactory and should be reconsidered before
00049  * establishing a formal standard in this area. At the moment, the
00050  * decision which Not East Asian (Neutral) characters should be
00051  * represented by double-width glyphs cannot yet be answered by
00052  * applying a simple rule from the Unicode database content. Setting
00053  * up a proper standard for the behavior of UTF-8 character terminals
00054  * will require a careful analysis not only of each Unicode character,
00055  * but also of each presentation form, something the author of these
00056  * routines has avoided to do so far.

00116 * - Non-spacing and enclosing combining characters (general
00117 *   category code Mn or Me in the Unicode database) have a
00118 *   column width of 0.
00119 *
00120 * - SOFT HYPHEN (U+00AD) has a column width of 1.
00121 *
00122 * - Other format characters (general category code Cf in the Unicode
00123 *   database) and ZERO WIDTH SPACE (U+200B) have a column width of 0.
00124 *
00125 * - Hangul Jamo medial vowels and final consonants (U+1160-U+11FF)
00126 *   have a column width of 0.
00127 *
00128 * - Spacing characters in the East Asian Wide (W) or East Asian
00129 *   Full-width (F) category as defined in Unicode Technical
00130 *   Report #11 have a column width of 2.
00131 *
00132 * - All remaining characters (including all printable
00133 *   ISO 8859-1 and WGL4 characters, Unicode control characters,
00134 *   etc.) have a column width of 1.
00135 *
00136 * This implementation assumes that wchar_t characters are encoded
00137 * in ISO 10646.
