# Table of Contents

<b>1. Driver Basics.....</b>	<b>1</b>
1.1. Driver Entry and Exit points .....	1
module_init .....	1
module_exit.....	1
1.2. Atomic and pointer manipulation .....	2
atomic_read.....	2
atomic_set .....	3
atomic_add.....	4
atomic_sub .....	5
atomic_sub_and_test.....	6
atomic_inc.....	7
atomic_dec .....	7
atomic_dec_and_test.....	8
atomic_inc_and_test .....	9
atomic_add_negative.....	10
atomic_add_return .....	11
atomic_sub_return.....	11
atomic_add_unless.....	12
atomic64_xchg .....	13
atomic64_set .....	14
atomic64_read.....	15
atomic64_add_return .....	16
atomic64_add .....	17
atomic64_sub .....	17
atomic64_sub_and_test.....	18
atomic64_inc.....	19
atomic64_dec .....	20
atomic64_dec_and_test.....	21
atomic64_inc_and_test .....	22
atomic64_add_negative.....	22
/usr/src/linux-2.6.32.59-1/arch/x86/include/asm/unaligned.h .....	23
1.3. Delaying, scheduling, and timer routines .....	24
struct task_cputime .....	24
struct thread_group_cputimer .....	25
pid_alive.....	26
is_global_init .....	27
kthread_bind .....	28
wake_up_process .....	29
preempt_notifier_register .....	29
preempt_notifier_unregister .....	30
__wake_up .....	31

__wake_up_sync_key .....	32
complete .....	33
complete_all .....	34
wait_for_completion .....	35
wait_for_completion_timeout .....	36
wait_for_completion_interruptible .....	37
wait_for_completion_interruptible_timeout .....	37
wait_for_completion_killable .....	38
try_wait_for_completion .....	39
completion_done .....	40
task_nice .....	41
sched_setscheduler .....	42
yield .....	43
__round_jiffies .....	43
__round_jiffies_relative .....	45
round_jiffies .....	46
round_jiffies_relative .....	47
__round_jiffies_up .....	48
__round_jiffies_up_relative .....	48
round_jiffies_up .....	49
round_jiffies_up_relative .....	50
init_timer_key .....	51
mod_timer_pending .....	52
mod_timer .....	53
mod_timer_pinned .....	54
add_timer .....	55
add_timer_on .....	56
del_timer .....	57
try_to_del_timer_sync .....	58
del_timer_sync .....	59
schedule_timeout .....	60
msleep .....	61
msleep_interruptible .....	62
1.4. High-resolution timers .....	62
ktime_set .....	62
ktime_sub .....	63
ktime_add .....	64
timespec_to_ktime .....	65
timeval_to_ktime .....	66
ktime_to_timespec .....	66
ktime_to_timeval .....	67
ktime_to_ns .....	68
ktime_equal .....	69

struct hrtimer.....	70
struct hrtimer_sleeper.....	71
struct hrtimer_clock_base .....	72
ktime_add_ns .....	74
ktime_sub_ns .....	74
hrtimer_forward .....	75
hrtimer_start_range_ns .....	76
hrtimer_start.....	77
hrtimer_try_to_cancel.....	78
hrtimer_cancel.....	79
hrtimer_get_remaining.....	80
hrtimer_init .....	81
hrtimer_get_res .....	81
schedule_hrtimeout_range .....	82
schedule_hrtimeout.....	84
1.5. Workqueues and Kevents .....	85
queue_work.....	85
queue_work_on.....	86
queue_delayed_work .....	87
queue_delayed_work_on .....	88
flush_workqueue .....	89
flush_work.....	90
cancel_work_sync.....	91
cancel_delayed_work_sync .....	92
schedule_work .....	93
schedule_delayed_work.....	94
flush_delayed_work .....	94
schedule_delayed_work_on.....	95
execute_in_process_context.....	96
destroy_workqueue .....	97
work_on_cpu.....	98
1.6. Internal Functions .....	99
reparent_to_kthreadd .....	99
sys_tgkill.....	100
kthread_run .....	101
kthread_should_stop .....	102
kthread_create .....	103
kthread_stop.....	104
1.7. Kernel objects manipulation .....	105
kobject_get_path.....	106
kobject_set_name.....	106
kobject_init .....	107
kobject_add.....	108

kobject_init_and_add .....	110
kobject_rename .....	111
kobject_del .....	112
kobject_get .....	113
kobject_put .....	113
kobject_create_and_add .....	114
kset_register .....	115
kset_unregister .....	116
kset_create_and_add .....	116
1.8. Kernel utility functions .....	117
upper_32_bits .....	118
lower_32_bits .....	118
might_sleep .....	119
trace_printk .....	120
clamp .....	121
clamp_t .....	122
clamp_val .....	123
container_of .....	124
printk .....	124
acquire_console_sem .....	126
release_console_sem .....	126
console_conditional_schedule .....	127
printk_timed_ratelimit .....	128
printk_hash .....	129
printk_dev_hash .....	130
panic .....	131
emergency_restart .....	132
kernel_restart .....	133
kernel_halt .....	134
kernel_power_off .....	134
orderly_poweroff .....	135
synchronize_rcu .....	136
synchronize_sched .....	137
synchronize_rcu_bh .....	138
1.9. Device Resource Management .....	139
devres_alloc .....	139
devres_free .....	140
devres_add .....	141
devres_find .....	142
devres_get .....	143
devres_remove .....	144
devres_destroy .....	145

# Chapter 1. Driver Basics

## 1.1. Driver Entry and Exit points

### module\_init

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`module_init` — driver initialization entry point

#### Synopsis

```
module_init ( x );
```

#### Arguments

`x`

function to be run at kernel boot time or module insertion

#### Description

`module_init` will either be called during `do_initcalls` (if builtin) or at module insertion time (if a module). There can only be one per module.

# module\_exit

## LINUX

Kernel Hackers Manual March 2019

### Name

`module_exit` — driver exit entry point

### Synopsis

```
module_exit ( x );
```

### Arguments

`x`

function to be run when driver is removed

### Description

`module_exit` will wrap the driver clean-up code with `cleanup_module` when used with `rmmod` when the driver is a module. If the driver is statically compiled into the kernel, `module_exit` has no effect. There can only be one per module.

## 1.2. Atomic and pointer manipulation

### atomic\_read

## LINUX

## Name

`atomic_read` — read atomic variable

## Synopsis

```
int atomic_read (const atomic_t * v);
```

## Arguments

`v`

pointer of type `atomic_t`

## Description

Atomically reads the value of `v`.

# atomic\_set

## LINUX

## Name

`atomic_set` — set atomic variable

## Synopsis

```
void atomic_set (atomic_t * v, int i);
```

## Arguments

*v*

pointer of type `atomic_t`

*i*

required value

## Description

Atomically sets the value of *v* to *i*.

## `atomic_add`

### LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_add` — add integer to atomic variable

## Synopsis

```
void atomic_add (int i, atomic_t * v);
```

## Arguments

*i*

integer value to add

*v*

pointer of type `atomic_t`

## Description

Atomically adds *i* to *v*.

# atomic\_sub

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_sub` — subtract integer from atomic variable

## Synopsis

```
void atomic_sub (int i, atomic_t * v);
```

## Arguments

*i*

integer value to subtract

*v*

pointer of type `atomic_t`

## Description

Atomically subtracts *i* from *v*.

# atomic\_sub\_and\_test

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_sub_and_test` — subtract value from variable and test result

## Synopsis

```
int atomic_sub_and_test (int i, atomic_t * v);
```

## Arguments

*i*

integer value to subtract

*v*

pointer of type `atomic_t`

## Description

Atomically subtracts  $i$  from  $v$  and returns true if the result is zero, or false for all other cases.

# atomic\_inc

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_inc` — increment atomic variable

## Synopsis

```
void atomic_inc (atomic_t * v);
```

## Arguments

$v$   
pointer of type `atomic_t`

## Description

Atomically increments  $v$  by 1.

# atomic\_dec

## LINUX

Kernel Hackers Manual March 2019

### Name

`atomic_dec` — decrement atomic variable

### Synopsis

```
void atomic_dec (atomic_t * v);
```

### Arguments

`v`  
pointer of type `atomic_t`

### Description

Atomically decrements `v` by 1.

# atomic\_dec\_and\_test

## LINUX

Kernel Hackers Manual March 2019

### Name

`atomic_dec_and_test` — decrement and test

## Synopsis

```
int atomic_dec_and_test (atomic_t * v);
```

## Arguments

*v*

pointer of type `atomic_t`

## Description

Atomically decrements *v* by 1 and returns true if the result is 0, or false for all other cases.

## atomic\_inc\_and\_test

### LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_inc_and_test` — increment and test

## Synopsis

```
int atomic_inc_and_test (atomic_t * v);
```

## Arguments

*v*

pointer of type `atomic_t`

## Description

Atomically increments *v* by 1 and returns true if the result is zero, or false for all other cases.

# atomic\_add\_negative

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_add_negative` — add and test if negative

## Synopsis

```
int atomic_add_negative (int i, atomic_t * v);
```

## Arguments

*i*

integer value to add

*v*

pointer of type `atomic_t`

## Description

Atomically adds  $i$  to  $v$  and returns true if the result is negative, or false when result is greater than or equal to zero.

# atomic\_add\_return

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic_add_return` — add integer and return

## Synopsis

```
int atomic_add_return (int  $i$ , atomic_t *  $v$ );
```

## Arguments

$i$

integer value to add

$v$

pointer of type `atomic_t`

## Description

Atomically adds  $i$  to  $v$  and returns  $i + v$

# atomic\_sub\_return

## LINUX

Kernel Hackers Manual March 2019

### Name

`atomic_sub_return` — subtract integer and return

### Synopsis

```
int atomic_sub_return (int i, atomic_t * v);
```

### Arguments

*i*  
integer value to subtract

*v*  
pointer of type `atomic_t`

### Description

Atomically subtracts *i* from *v* and returns  $v - i$

# atomic\_add\_unless

## LINUX

## Name

`atomic_add_unless` — add unless the number is already a given value

## Synopsis

```
int atomic_add_unless (atomic_t * v, int a, int u);
```

## Arguments

*v*

pointer of type `atomic_t`

*a*

the amount to add to *v*...

*u*

...unless *v* is equal to *u*.

## Description

Atomically adds *a* to *v*, so long as *v* was not already *u*. Returns non-zero if *v* was not *u*, and zero otherwise.

## `atomic64_xchg`

**LINUX**

## Name

`atomic64_xchg` — xchg atomic64 variable

## Synopsis

```
u64 atomic64_xchg (atomic64_t * ptr, u64 new_val);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

*new\_val*

value to assign

## Description

Atomically xchgs the value of *ptr* to *new\_val* and returns the old value.

# atomic64\_set

## LINUX

## Name

`atomic64_set` — set atomic64 variable

## Synopsis

```
void atomic64_set (atomic64_t * ptr, u64 new_val);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

*new\_val*

value to assign

## Description

Atomically sets the value of *ptr* to *new\_val*.

## atomic64\_read

### LINUX

Kernel Hackers Manual March 2019

## Name

`atomic64_read` — read `atomic64` variable

## Synopsis

```
u64 atomic64_read (atomic64_t * ptr);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

## Description

Atomically reads the value of *ptr* and returns it.

# atomic64\_add\_return

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic64_add_return` — add and return

## Synopsis

```
u64 atomic64_add_return (u64 delta, atomic64_t * ptr);
```

## Arguments

*delta*

integer value to add

*ptr*

pointer to type `atomic64_t`

## Description

Atomically adds *delta* to *ptr* and returns  $delta + *ptr$

# atomic64\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic64_add` — add integer to atomic64 variable

## Synopsis

```
void atomic64_add (u64 delta, atomic64_t * ptr);
```

## Arguments

*delta*

integer value to add

*ptr*

pointer to type `atomic64_t`

## Description

Atomically adds *delta* to *ptr*.

# atomic64\_sub

**LINUX**

Kernel Hackers Manual March 2019

## Name

`atomic64_sub` — subtract the `atomic64` variable

## Synopsis

```
void atomic64_sub (u64 delta, atomic64_t * ptr);
```

## Arguments

*delta*

integer value to subtract

*ptr*

pointer to type `atomic64_t`

## Description

Atomically subtracts *delta* from *ptr*.

# atomic64\_sub\_and\_test

**LINUX**

## Name

`atomic64_sub_and_test` — subtract value from variable and test result

## Synopsis

```
int atomic64_sub_and_test (u64 delta, atomic64_t * ptr);
```

## Arguments

*delta*

integer value to subtract

*ptr*

pointer to type `atomic64_t`

## Description

Atomically subtracts *delta* from *ptr* and returns true if the result is zero, or false for all other cases.

# atomic64\_inc

## LINUX

## Name

`atomic64_inc` — increment `atomic64` variable

## Synopsis

```
void atomic64_inc (atomic64_t * ptr);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

## Description

Atomically increments *ptr* by 1.

## atomic64\_dec

### LINUX

Kernel Hackers Manual March 2019

## Name

`atomic64_dec` — decrement `atomic64` variable

## Synopsis

```
void atomic64_dec (atomic64_t * ptr);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

## Description

Atomically decrements *ptr* by 1.

# atomic64\_dec\_and\_test

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic64_dec_and_test` — decrement and test

## Synopsis

```
int atomic64_dec_and_test (atomic64_t * ptr);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

## Description

Atomically decrements *ptr* by 1 and returns true if the result is 0, or false for all other cases.

# atomic64\_inc\_and\_test

## LINUX

Kernel Hackers Manual March 2019

## Name

`atomic64_inc_and_test` — increment and test

## Synopsis

```
int atomic64_inc_and_test (atomic64_t * ptr);
```

## Arguments

*ptr*

pointer to type `atomic64_t`

## Description

Atomically increments *ptr* by 1 and returns true if the result is zero, or false for all other cases.

# atomic64\_add\_negative

## LINUX

Kernel Hackers Manual March 2019

### Name

`atomic64_add_negative` — add and test if negative

### Synopsis

```
int atomic64_add_negative (u64 delta, atomic64_t * ptr);
```

### Arguments

*delta*

integer value to add

*ptr*

pointer to type `atomic64_t`

### Description

Atomically adds *delta* to *ptr* and returns true if the result is negative, or false when result is greater than or equal to zero.

**/usr/src/linux-2.6.32.59-  
1//arch/x86/include/asm/unaligned.h**

## Name

/usr/src/linux-2.6.32.59-1//arch/x86/include/asm/unaligned.h  
— Document generation inconsistency

## Oops

### Warning

The template for this document tried to insert the structured comment from the file

/usr/src/linux-2.6.32.59-1//arch/x86/include/asm/unaligned.h  
at this point, but none was found. This dummy section is inserted to allow generation to continue.

## 1.3. Delaying, scheduling, and timer routines

### struct task\_cputime

#### LINUX

Kernel Hackers Manual March 2019

## Name

struct task\_cputime — collected CPU time counts

## Synopsis

```
struct task_cputime {  
    cputime_t utime;  
    cputime_t stime;
```

```
    unsigned long long sum_exec_runtime;
};
```

## Members

utime

time spent in user mode, in cputime\_t units

stime

time spent in kernel mode, in cputime\_t units

sum\_exec\_runtime

total time spent on the CPU, in nanoseconds

## Description

This structure groups together three kinds of CPU time that are tracked for threads and thread groups. Most things considering CPU time want to group these counts together and treat all three of them in parallel.

# struct thread\_group\_cputimer

## LINUX

Kernel Hackers Manual March 2019

## Name

struct thread\_group\_cputimer — thread group interval timer counts

## Synopsis

```
struct thread_group_cputimer {
    struct task_cputime cputime;
    int running;
```

```
    spinlock_t lock;
};
```

## Members

`cputime`

thread group interval timers.

`running`

non-zero when there are timers running and *cputime* receives updates.

`lock`

lock for fields in this struct.

## Description

This structure contains the version of `task_cputime`, above, that is used for thread group CPU timer calculations.

## pid\_alive

### LINUX

Kernel Hackers Manual March 2019

### Name

`pid_alive` — check that a task structure is not stale

### Synopsis

```
int pid_alive (struct task_struct * p);
```

## Arguments

*p*

Task structure to be checked.

## Description

Test if a process is not yet dead (at most zombie state) If pid\_alive fails, then pointers within the task structure can be stale and must not be dereferenced.

# is\_global\_init

## LINUX

Kernel Hackers Manual March 2019

## Name

`is_global_init` — check if a task structure is init

## Synopsis

```
int is_global_init (struct task_struct * tsk);
```

## Arguments

*tsk*

Task structure to be checked.

## Description

Check if a task structure is the first user space task the kernel created.

# kthread\_bind

## LINUX

Kernel Hackers Manual March 2019

## Name

`kthread_bind` — bind a just-created kthread to a cpu.

## Synopsis

```
void kthread_bind (struct task_struct * p, unsigned int cpu);
```

## Arguments

*p*

thread created by `kthread_create`.

*cpu*

cpu (might not be online, must be possible) for *k* to run on.

## Description

This function is equivalent to `set_cpus_allowed`, except that *cpu* doesn't need to be online, and the thread must be stopped (i.e., just returned from `kthread_create`).

Function lives here instead of kthread.c because it messes with scheduler internals which require locking.

# wake\_up\_process

## LINUX

Kernel Hackers Manual March 2019

### Name

`wake_up_process` — Wake up a specific process

### Synopsis

```
int wake_up_process (struct task_struct * p);
```

### Arguments

*p*

The process to be woken up.

### Description

Attempt to wake up the nominated process and move it to the set of runnable processes. Returns 1 if the process was woken up, 0 if it was already running.

It may be assumed that this function implies a write memory barrier before changing the task state if and only if any tasks are woken up.

# preempt\_notifier\_register

## LINUX

Kernel Hackers Manual March 2019

### Name

`preempt_notifier_register` — tell me when current is being preempted & rescheduled

### Synopsis

```
void preempt_notifier_register (struct preempt_notifier *  
notifier);
```

### Arguments

*notifier*

notifier struct to register

# preempt\_notifier\_unregister

## LINUX

Kernel Hackers Manual March 2019

### Name

`preempt_notifier_unregister` — no longer interested in preemption notifications

## Synopsis

```
void preempt_notifier_unregister (struct preempt_notifier *
notifier);
```

## Arguments

*notifier*

notifier struct to unregister

## Description

This is safe to call from within a preemption notifier.

## \_\_wake\_up

### LINUX

Kernel Hackers Manual March 2019

## Name

\_\_wake\_up — wake up threads blocked on a waitqueue.

## Synopsis

```
void __wake_up (wait_queue_head_t * q, unsigned int mode, int
nr_exclusive, void * key);
```

## Arguments

<i>q</i>	the waitqueue
<i>mode</i>	which threads
<i>nr_exclusive</i>	how many wake-one or wake-many threads to wake up
<i>key</i>	is directly passed to the wakeup function

## Description

It may be assumed that this function implies a write memory barrier before changing the task state if and only if any tasks are woken up.

# \_\_wake\_up\_sync\_key

## LINUX

Kernel Hackers Manual March 2019

## Name

`__wake_up_sync_key` — wake up threads blocked on a waitqueue.

## Synopsis

```
void __wake_up_sync_key (wait_queue_head_t * q, unsigned int  
mode, int nr_exclusive, void * key);
```

## Arguments

*q*

the waitqueue

*mode*

which threads

*nr\_exclusive*

how many wake-one or wake-many threads to wake up

*key*

opaque value to be passed to wakeup targets

## Description

The sync wakeup differs that the waker knows that it will schedule away soon, so while the target thread will be woken up, it will not be migrated to another CPU - ie. the two threads are 'synchronized' with each other. This can prevent needless bouncing between CPUs.

On UP it can prevent extra preemption.

It may be assumed that this function implies a write memory barrier before changing the task state if and only if any tasks are woken up.

## complete

**LINUX**

Kernel Hackers Manual March 2019

## Name

`complete` — signals a single thread waiting on this completion

## Synopsis

```
void complete (struct completion * x);
```

## Arguments

*x*

holds the state of this particular completion

## Description

This will wake up a single thread waiting on this completion. Threads will be awakened in the same order in which they were queued.

See also `complete_all`, `wait_for_completion` and related routines.

It may be assumed that this function implies a write memory barrier before changing the task state if and only if any tasks are woken up.

## complete\_all

### LINUX

Kernel Hackers Manual March 2019

## Name

`complete_all` — signals all threads waiting on this completion

## Synopsis

```
void complete_all (struct completion * x);
```

## Arguments

`x`

holds the state of this particular completion

## Description

This will wake up all threads waiting on this particular completion event.

It may be assumed that this function implies a write memory barrier before changing the task state if and only if any tasks are woken up.

# wait\_for\_completion

## LINUX

Kernel Hackers Manual March 2019

## Name

`wait_for_completion` — waits for completion of a task

## Synopsis

```
void __sched wait_for_completion (struct completion * x);
```

## Arguments

`x`

holds the state of this particular completion

## Description

This waits to be signaled for completion of a specific task. It is NOT interruptible and there is no timeout.

See also similar routines (i.e. `wait_for_completion_timeout`) with timeout and interrupt capability. Also see `complete`.

# wait\_for\_completion\_timeout

## LINUX

Kernel Hackers Manual March 2019

## Name

`wait_for_completion_timeout` — waits for completion of a task (w/timeout)

## Synopsis

```
unsigned long __sched wait_for_completion_timeout (struct  
completion * x, unsigned long timeout);
```

## Arguments

*x*

holds the state of this particular completion

*timeout*

timeout value in jiffies

## Description

This waits for either a completion of a specific task to be signaled or for a specified timeout to expire. The timeout is in jiffies. It is not interruptible.

# wait\_for\_completion\_interruptible

## LINUX

Kernel Hackers Manual March 2019

## Name

`wait_for_completion_interruptible` — waits for completion of a task (w/intr)

## Synopsis

```
int __sched wait_for_completion_interruptible (struct  
completion * x);
```

## Arguments

`x`

holds the state of this particular completion

## Description

This waits for completion of a specific task to be signaled. It is interruptible.

# wait\_for\_completion\_interruptible\_timeout

## LINUX

Kernel Hackers Manual March 2019

### Name

`wait_for_completion_interruptible_timeout` — waits for completion (w/(to,intr))

### Synopsis

```
unsigned long __sched
wait_for_completion_interruptible_timeout (struct completion *
x, unsigned long timeout);
```

### Arguments

*x*  
holds the state of this particular completion

*timeout*  
timeout value in jiffies

### Description

This waits for either a completion of a specific task to be signaled or for a specified timeout to expire. It is interruptible. The timeout is in jiffies.

# wait\_for\_completion\_killable

## LINUX

Kernel Hackers Manual March 2019

### Name

`wait_for_completion_killable` — waits for completion of a task (killable)

### Synopsis

```
int __sched wait_for_completion_killable (struct completion *  
x);
```

### Arguments

`x`  
holds the state of this particular completion

### Description

This waits to be signaled for completion of a specific task. It can be interrupted by a kill signal.

# try\_wait\_for\_completion

## LINUX

## Name

`try_wait_for_completion` — try to decrement a completion without blocking

## Synopsis

```
bool try_wait_for_completion (struct completion * x);
```

## Arguments

`x`  
completion structure

## Returns

0 if a decrement cannot be done without blocking 1 if a decrement succeeded.

If a completion is being used as a counting completion, attempt to decrement the counter without blocking. This enables us to avoid waiting if the resource the completion is protecting is not available.

# completion\_done

## LINUX

## Name

`completion_done` — Test to see if a completion has any waiters

## Synopsis

```
bool completion_done (struct completion * x);
```

## Arguments

*x*

completion structure

## Returns

0 if there are waiters (`wait_for_completion` in progress) 1 if there are no waiters.

# task\_nice

## LINUX

Kernel Hackers Manual March 2019

## Name

`task_nice` — return the nice value of a given task.

## Synopsis

```
int task_nice (const struct task_struct * p);
```

## Arguments

*p*

the task in question.

## sched\_setscheduler

### LINUX

Kernel Hackers Manual March 2019

### Name

`sched_setscheduler` — change the scheduling policy and/or RT priority of a thread.

### Synopsis

```
int sched_setscheduler (struct task_struct * p, int policy,  
struct sched_param * param);
```

### Arguments

*p*

the task in question.

*policy*

new policy.

*param*

structure containing the new RT priority.

## Description

NOTE that the task may be already dead.

# yield

## LINUX

Kernel Hackers Manual March 2019

## Name

`yield` — yield the current processor to other threads.

## Synopsis

```
void __sched yield ( void );
```

## Arguments

*void*

no arguments

## Description

This is a shortcut for kernel-space yielding - it marks the thread runnable and calls `sys_sched_yield`.

# \_\_round\_jiffies

## LINUX

Kernel Hackers Manual March 2019

### Name

`__round_jiffies` — function to round jiffies to a full second

### Synopsis

```
unsigned long __round_jiffies (unsigned long j, int cpu);
```

### Arguments

*j*

the time in (absolute) jiffies that should be rounded

*cpu*

the processor number on which the timeout will happen

### Description

`__round_jiffies` rounds an absolute time in the future (in jiffies) up or down to (approximately) full seconds. This is useful for timers for which the exact time they fire does not matter too much, as long as they fire approximately every X seconds.

By rounding these timers to whole seconds, all such timers will fire at the same time, rather than at various times spread out. The goal of this is to have the CPU wake up less, which saves power.

The exact rounding is skewed for each processor to avoid all processors firing at the exact same time, which could lead to lock contention or spurious cache line bouncing.

The return value is the rounded version of the *j* parameter.

# **\_\_round\_jiffies\_relative**

## **LINUX**

Kernel Hackers Manual March 2019

### **Name**

`__round_jiffies_relative` — function to round jiffies to a full second

### **Synopsis**

```
unsigned long __round_jiffies_relative (unsigned long j, int  
cpu);
```

### **Arguments**

*j*

the time in (relative) jiffies that should be rounded

*cpu*

the processor number on which the timeout will happen

### **Description**

`__round_jiffies_relative` rounds a time delta in the future (in jiffies) up or down to (approximately) full seconds. This is useful for timers for which the exact time they fire does not matter too much, as long as they fire approximately every X seconds.

By rounding these timers to whole seconds, all such timers will fire at the same time, rather than at various times spread out. The goal of this is to have the CPU wake up less, which saves power.

The exact rounding is skewed for each processor to avoid all processors firing at the exact same time, which could lead to lock contention or spurious cache line bouncing.

The return value is the rounded version of the *j* parameter.

## round\_jiffies

### LINUX

Kernel Hackers Manual March 2019

### Name

`round_jiffies` — function to round jiffies to a full second

### Synopsis

```
unsigned long round_jiffies (unsigned long j);
```

### Arguments

*j*

the time in (absolute) jiffies that should be rounded

### Description

`round_jiffies` rounds an absolute time in the future (in jiffies) up or down to (approximately) full seconds. This is useful for timers for which the exact time they fire does not matter too much, as long as they fire approximately every X seconds.

By rounding these timers to whole seconds, all such timers will fire at the same time, rather than at various times spread out. The goal of this is to have the CPU wake up less, which saves power.

The return value is the rounded version of the *j* parameter.

# round\_jiffies\_relative

## LINUX

Kernel Hackers Manual March 2019

### Name

`round_jiffies_relative` — function to round jiffies to a full second

### Synopsis

```
unsigned long round_jiffies_relative (unsigned long j);
```

### Arguments

*j*

the time in (relative) jiffies that should be rounded

### Description

`round_jiffies_relative` rounds a time delta in the future (in jiffies) up or down to (approximately) full seconds. This is useful for timers for which the exact time they fire does not matter too much, as long as they fire approximately every X seconds.

By rounding these timers to whole seconds, all such timers will fire at the same time, rather than at various times spread out. The goal of this is to have the CPU wake up less, which saves power.

The return value is the rounded version of the *j* parameter.

# \_\_round\_jiffies\_up

## LINUX

Kernel Hackers Manual March 2019

### Name

`__round_jiffies_up` — function to round jiffies up to a full second

### Synopsis

```
unsigned long __round_jiffies_up (unsigned long j, int cpu);
```

### Arguments

*j*

the time in (absolute) jiffies that should be rounded

*cpu*

the processor number on which the timeout will happen

### Description

This is the same as `__round_jiffies` except that it will never round down. This is useful for timeouts for which the exact time of firing does not matter too much, as long as they don't fire too early.

# \_\_round\_jiffies\_up\_relative

## LINUX

Kernel Hackers Manual March 2019

### Name

`__round_jiffies_up_relative` — function to round jiffies up to a full second

### Synopsis

```
unsigned long __round_jiffies_up_relative (unsigned long j,  
int cpu);
```

### Arguments

*j*

the time in (relative) jiffies that should be rounded

*cpu*

the processor number on which the timeout will happen

### Description

This is the same as `__round_jiffies_relative` except that it will never round down. This is useful for timeouts for which the exact time of firing does not matter too much, as long as they don't fire too early.

# round\_jiffies\_up

**LINUX**

Kernel Hackers Manual March 2019

## Name

`round_jiffies_up` — function to round jiffies up to a full second

## Synopsis

```
unsigned long round_jiffies_up (unsigned long j);
```

## Arguments

*j*

the time in (absolute) jiffies that should be rounded

## Description

This is the same as `round_jiffies` except that it will never round down. This is useful for timeouts for which the exact time of firing does not matter too much, as long as they don't fire too early.

# round\_jiffies\_up\_relative

**LINUX**

## Name

`round_jiffies_up_relative` — function to round jiffies up to a full second

## Synopsis

```
unsigned long round_jiffies_up_relative (unsigned long j);
```

## Arguments

*j*

the time in (relative) jiffies that should be rounded

## Description

This is the same as `round_jiffies_relative` except that it will never round down. This is useful for timeouts for which the exact time of firing does not matter too much, as long as they don't fire too early.

# init\_timer\_key

## LINUX

## Name

`init_timer_key` — initialize a timer

## Synopsis

```
void init_timer_key (struct timer_list * timer, const char *  
name, struct lock_class_key * key);
```

## Arguments

*timer*

the timer to be initialized

*name*

name of the timer

*key*

lockdep class key of the fake lock used for tracking timer sync lock dependencies

## Description

`init_timer_key` must be done to a timer prior calling *any* of the other timer functions.

# mod\_timer\_pending

**LINUX**

Kernel Hackers Manual March 2019

## Name

`mod_timer_pending` — modify a pending timer's timeout

## Synopsis

```
int mod_timer_pending (struct timer_list * timer, unsigned
long expires);
```

## Arguments

*timer*

the pending timer to be modified

*expires*

new timeout in jiffies

## Description

`mod_timer_pending` is the same for pending timers as `mod_timer`, but will not re-activate and modify already deleted timers.

It is useful for unserialized use of timers.

## mod\_timer

### LINUX

Kernel Hackers Manual March 2019

## Name

`mod_timer` — modify a timer's timeout

## Synopsis

```
int mod_timer (struct timer_list * timer, unsigned long
expires);
```

## Arguments

*timer*

the timer to be modified

*expires*

new timeout in jiffies

## Description

`mod_timer` is a more efficient way to update the expire field of an active timer (if the timer is inactive it will be activated)

`mod_timer(timer, expires)` is equivalent to:

```
del_timer(timer); timer->expires = expires; add_timer(timer);
```

Note that if there are multiple unserialized concurrent users of the same timer, then `mod_timer` is the only safe way to modify the timeout, since `add_timer` cannot modify an already running timer.

The function returns whether it has modified a pending timer or not. (ie.

`mod_timer` of an inactive timer returns 0, `mod_timer` of an active timer returns 1.)

## mod\_timer\_pinned

**LINUX**

## Name

`mod_timer_pinned` — modify a timer's timeout

## Synopsis

```
int mod_timer_pinned (struct timer_list * timer, unsigned long
expires);
```

## Arguments

*timer*

the timer to be modified

*expires*

new timeout in jiffies

## Description

`mod_timer_pinned` is a way to update the expire field of an active timer (if the timer is inactive it will be activated) and not allow the timer to be migrated to a different CPU.

`mod_timer_pinned(timer, expires)` is equivalent to:

```
del_timer(timer); timer->expires = expires; add_timer(timer);
```

## add\_timer

**LINUX**

## Name

`add_timer` — start a timer

## Synopsis

```
void add_timer (struct timer_list * timer);
```

## Arguments

*timer*

the timer to be added

## Description

The kernel will do a `->function(->data)` callback from the timer interrupt at the `->expires` point in the future. The current time is 'jiffies'.

The timer's `->expires`, `->function` (and if the handler uses it, `->data`) fields must be set prior calling this function.

Timers with an `->expires` field in the past will be executed in the next timer tick.

## `add_timer_on`

### LINUX

## Name

`add_timer_on` — start a timer on a particular CPU

## Synopsis

```
void add_timer_on (struct timer_list * timer, int cpu);
```

## Arguments

*timer*

the timer to be added

*cpu*

the CPU to start it on

## Description

This is not very scalable on SMP. Double adds are not possible.

## del\_timer

### LINUX

Kernel Hackers Manual March 2019

## Name

`del_timer` — deactivate a timer.

## Synopsis

```
int del_timer (struct timer_list * timer);
```

## Arguments

*timer*

the timer to be deactivated

## Description

`del_timer` deactivates a timer - this works on both active and inactive timers.

The function returns whether it has deactivated a pending timer or not. (ie.

`del_timer` of an inactive timer returns 0, `del_timer` of an active timer returns 1.)

# try\_to\_del\_timer\_sync

## LINUX

Kernel Hackers Manual March 2019

## Name

`try_to_del_timer_sync` — Try to deactivate a timer

## Synopsis

```
int try_to_del_timer_sync (struct timer_list * timer);
```

## Arguments

*timer*

timer to del

## Description

This function tries to deactivate a timer. Upon successful (`ret >= 0`) exit the timer is not queued and the handler is not running on any CPU.

It must not be called from interrupt contexts.

## del\_timer\_sync

### LINUX

Kernel Hackers Manual March 2019

## Name

`del_timer_sync` — deactivate a timer and wait for the handler to finish.

## Synopsis

```
int del_timer_sync (struct timer_list * timer);
```

## Arguments

*timer*

the timer to be deactivated

## Description

This function only differs from `del_timer` on SMP: besides deactivating the timer it also makes sure the handler has finished executing on other CPUs.

## Synchronization rules

Callers must prevent restarting of the timer, otherwise this function is meaningless. It must not be called from interrupt contexts. The caller must not hold locks which would prevent completion of the timer's handler. The timer's handler must not call `add_timer_on`. Upon exit the timer is not queued and the handler is not running on any CPU.

The function returns whether it has deactivated a pending timer or not.

## schedule\_timeout

### LINUX

Kernel Hackers Manual March 2019

### Name

`schedule_timeout` — sleep until timeout

### Synopsis

```
signed long __sched schedule_timeout (signed long timeout);
```

### Arguments

*timeout*

timeout value in jiffies

### Description

Make the current task sleep until *timeout* jiffies have elapsed. The routine will return immediately unless the current task state has been set (see `set_current_state`).

You can set the task state as follows -

`TASK_UNINTERRUPTIBLE` - at least *timeout* jiffies are guaranteed to pass before the routine returns. The routine will return 0

`TASK_INTERRUPTIBLE` - the routine may return early if a signal is delivered to the current task. In this case the remaining time in jiffies will be returned, or 0 if the timer expired in time

The current task state is guaranteed to be `TASK_RUNNING` when this routine returns.

Specifying a *timeout* value of `MAX_SCHEDULE_TIMEOUT` will schedule the CPU away without a bound on the timeout. In this case the return value will be `MAX_SCHEDULE_TIMEOUT`.

In all cases the return value is guaranteed to be non-negative.

## msleep

### LINUX

Kernel Hackers Manual March 2019

### Name

`msleep` — sleep safely even with waitqueue interruptions

### Synopsis

```
void msleep (unsigned int msecs);
```

### Arguments

*msecs*

Time in milliseconds to sleep for

# msleep\_interruptible

## LINUX

Kernel Hackers Manual March 2019

### Name

`msleep_interruptible` — sleep waiting for signals

### Synopsis

```
unsigned long msleep_interruptible (unsigned int msecs);
```

### Arguments

*msecs*

Time in milliseconds to sleep for

## 1.4. High-resolution timers

### ktime\_set

## LINUX

## Name

`ktime_set` — Set a `ktime_t` variable from a seconds/nanoseconds value

## Synopsis

```
ktime_t ktime_set (const long secs, const unsigned long  
nsecs);
```

## Arguments

*secs*

seconds to set

*nsecs*

nanoseconds to set

## Description

Return the `ktime_t` representation of the value

# ktime\_sub

## LINUX

## Name

`ktime_sub` — subtract two `ktime_t` variables

## Synopsis

```
ktime_t ktime_sub (const ktime_t lhs, const ktime_t rhs);
```

## Arguments

*lhs*

minuend

*rhs*

subtrahend

## Description

Returns the remainder of the subtraction

## ktime\_add

### LINUX

Kernel Hackers Manual March 2019

## Name

`ktime_add` — add two `ktime_t` variables

## Synopsis

```
ktime_t ktime_add (const ktime_t add1, const ktime_t add2);
```

## Arguments

*add1*

addend1

*add2*

addend2

## Description

Returns the sum of *add1* and *add2*.

# timespec\_to\_ktime

## LINUX

Kernel Hackers Manual March 2019

## Name

`timespec_to_ktime` — convert a `timespec` to `ktime_t` format

## Synopsis

```
ktime_t timespec_to_ktime (const struct timespec ts);
```

## Arguments

*ts*

the `timespec` variable to convert

## Description

Returns a `ktime_t` variable with the converted timespec value

# timeval\_to\_ktime

## LINUX

Kernel Hackers Manual March 2019

## Name

`timeval_to_ktime` — convert a `timeval` to `ktime_t` format

## Synopsis

```
ktime_t timeval_to_ktime (const struct timeval tv);
```

## Arguments

*tv*

the `timeval` variable to convert

## Description

Returns a `ktime_t` variable with the converted `timeval` value

# ktime\_to\_timespec

## LINUX

Kernel Hackers Manual March 2019

### Name

`ktime_to_timespec` — convert a `ktime_t` variable to `timespec` format

### Synopsis

```
struct timespec ktime_to_timespec (const ktime_t kt);
```

### Arguments

*kt*

the `ktime_t` variable to convert

### Description

Returns the `timespec` representation of the `ktime` value

# ktime\_to\_timeval

## LINUX

Kernel Hackers Manual March 2019

### Name

`ktime_to_timeval` — convert a `ktime_t` variable to `timeval` format

## Synopsis

```
struct timeval ktime_to_timeval (const ktime_t kt);
```

## Arguments

*kt*

the ktime\_t variable to convert

## Description

Returns the timeval representation of the ktime value

## ktime\_to\_ns

### LINUX

Kernel Hackers Manual March 2019

## Name

ktime\_to\_ns — convert a ktime\_t variable to scalar nanoseconds

## Synopsis

```
s64 ktime_to_ns (const ktime_t kt);
```

## Arguments

*kt*

the `ktime_t` variable to convert

## Description

Returns the scalar nanoseconds representation of *kt*

# ktime\_equal

## LINUX

Kernel Hackers Manual March 2019

## Name

`ktime_equal` — Compares two `ktime_t` variables to see if they are equal

## Synopsis

```
int ktime_equal (const ktime_t cmp1, const ktime_t cmp2);
```

## Arguments

*cmp1*

comparable1

*cmp2*

comparable2

## Description

Compare two `ktime_t` variables, returns 1 if equal

## struct hrtimer

### LINUX

Kernel Hackers Manual March 2019

### Name

`struct hrtimer` — the basic hrtimer structure

### Synopsis

```
struct hrtimer {
    struct rb_node node;
    ktime_t _expires;
    ktime_t _softexpires;
    enum hrtimer_restart (* function) (struct hrtimer *);
    struct hrtimer_clock_base * base;
    unsigned long state;
#ifdef CONFIG_TIMER_STATS
    int start_pid;
    void * start_site;
    char start_comm[16];
#endif
};
```

### Members

`node`

red black tree node for time ordered insertion

`_expires`

the absolute expiry time in the `hrtimers` internal representation. The time is related to the clock on which the timer is based. Is setup by adding slack to the `_softexpires` value. For non range timers identical to `_softexpires`.

`_softexpires`

the absolute earliest expiry time of the `hrtimer`. The time which was given as expiry time when the timer was armed.

`function`

timer expiry callback function

`base`

pointer to the timer base (per cpu and per clock)

`state`

state information (See bit values above)

`start_pid`

timer statistics field to store the pid of the task which started the timer

`start_site`

timer statistics field to store the site where the timer was started

`start_comm[16]`

timer statistics field to store the name of the process which started the timer

## Description

The `hrtimer` structure must be initialized by `hrtimer_init`

## struct `hrtimer_sleeper`

**LINUX**

## Name

`struct hrtimer_sleeper` — simple sleeper structure

## Synopsis

```
struct hrtimer_sleeper {  
    struct hrtimer timer;  
    struct task_struct * task;  
};
```

## Members

`timer`

embedded timer structure

`task`

task to wake up

## Description

`task` is set to `NULL`, when the timer expires.

# struct hrtimer\_clock\_base

## LINUX

## Name

`struct hrtimer_clock_base` — the timer base for a specific clock

## Synopsis

```
struct hrtimer_clock_base {
    struct hrtimer_cpu_base * cpu_base;
    clockid_t index;
    struct rb_root active;
    struct rb_node * first;
    ktime_t resolution;
    ktime_t (* get_time) (void);
    ktime_t softirq_time;
#ifdef CONFIG_HIGH_RES_TIMERS
    ktime_t offset;
#endif
};
```

## Members

`cpu_base`

per cpu clock base

`index`

clock type index for per\_cpu support when moving a timer to a base on another cpu.

`active`

red black tree root node for the active timers

`first`

pointer to the timer node which expires first

`resolution`

the resolution of the clock, in nanoseconds

`get_time`

function to retrieve the current time of the clock

`softirq_time`

the time when running the hrtimer queue in the softirq

`offset`

offset of this clock to the monotonic base

# ktime\_add\_ns

## LINUX

Kernel Hackers Manual March 2019

### Name

`ktime_add_ns` — Add a scalar nanoseconds value to a `ktime_t` variable

### Synopsis

```
ktime_t ktime_add_ns (const ktime_t kt, u64 nsec);
```

### Arguments

*kt*

addend

*nsec*

the scalar nsec value to add

### Description

Returns the sum of `kt` and `nsec` in `ktime_t` format

# ktime\_sub\_ns

## LINUX

Kernel Hackers Manual March 2019

### Name

`ktime_sub_ns` — Subtract a scalar nanoseconds value from a `ktime_t` variable

### Synopsis

```
ktime_t ktime_sub_ns (const ktime_t kt, u64 nsec);
```

### Arguments

*kt*

minuend

*nsec*

the scalar nsec value to subtract

### Description

Returns the subtraction of *nsec* from *kt* in `ktime_t` format

# hrtimer\_forward

## LINUX

## Name

`hrtimer_forward` — forward the timer expiry

## Synopsis

```
u64 hrtimer_forward (struct hrtimer * timer, ktime_t now,  
ktime_t interval);
```

## Arguments

*timer*

hrtimer to forward

*now*

forward past this time

*interval*

the interval to forward

## Description

Forward the timer expiry so it will expire in the future. Returns the number of overruns.

## `hrtimer_start_range_ns`

**LINUX**

## Name

`hrtimer_start_range_ns` — (re)start an hrtimer on the current CPU

## Synopsis

```
int hrtimer_start_range_ns (struct hrtimer * timer, ktime_t
tim, unsigned long delta_ns, const enum hrtimer_mode mode);
```

## Arguments

*timer*

the timer to be added

*tim*

expiry time

*delta\_ns*

"slack" range for the timer

*mode*

expiry mode: absolute (HRTIMER\_ABS) or relative (HRTIMER\_REL)

## Returns

0 on success 1 when the timer was active

# hrtimer\_start

**LINUX**

## Name

`hrtimer_start` — (re)start an hrtimer on the current CPU

## Synopsis

```
int hrtimer_start (struct hrtimer * timer, ktime_t tim, const
enum hrtimer_mode mode);
```

## Arguments

*timer*

the timer to be added

*tim*

expiry time

*mode*

expiry mode: absolute (HRTIMER\_ABS) or relative (HRTIMER\_REL)

## Returns

0 on success 1 when the timer was active

## `hrtimer_try_to_cancel`

**LINUX**

## Name

`hrtimer_try_to_cancel` — try to deactivate a timer

## Synopsis

```
int hrtimer_try_to_cancel (struct hrtimer * timer);
```

## Arguments

*timer*

hrtimer to stop

## Returns

0 when the timer was not active 1 when the timer was active -1 when the timer is currently excuting the callback function and cannot be stopped

# hrtimer\_cancel

## LINUX

## Name

`hrtimer_cancel` — cancel a timer and wait for the handler to finish.

## Synopsis

```
int hrtimer_cancel (struct hrtimer * timer);
```

## Arguments

*timer*

the timer to be cancelled

## Returns

0 when the timer was not active 1 when the timer was active

## hrtimer\_get\_remaining

### LINUX

Kernel Hackers Manual March 2019

## Name

`hrtimer_get_remaining` — get remaining time for the timer

## Synopsis

```
ktime_t hrtimer_get_remaining (const struct hrtimer * timer);
```

## Arguments

*timer*

the timer to read

## hrtimer\_init

### LINUX

Kernel Hackers Manual March 2019

## Name

`hrtimer_init` — initialize a timer to the given clock

## Synopsis

```
void hrtimer_init (struct hrtimer * timer, clockid_t clock_id,  
enum hrtimer_mode mode);
```

## Arguments

*timer*

the timer to be initialized

*clock\_id*

the clock to be used

*mode*

timer mode abs/rel

# hrtimer\_get\_res

## LINUX

Kernel Hackers Manual March 2019

### Name

`hrtimer_get_res` — get the timer resolution for a clock

### Synopsis

```
int hrtimer_get_res (const clockid_t which_clock, struct
timespec * tp);
```

### Arguments

*which\_clock*

which clock to query

*tp*

pointer to timespec variable to store the resolution

### Description

Store the resolution of the clock selected by *which\_clock* in the variable pointed to by *tp*.

# schedule\_hrtimeout\_range

## LINUX

## Name

`schedule_hrttimeout_range` — sleep until timeout

## Synopsis

```
int __sched schedule_hrttimeout_range (ktime_t * expires,
unsigned long delta, const enum hrtimer_mode mode);
```

## Arguments

*expires*

timeout value (ktime\_t)

*delta*

slack in expires timeout (ktime\_t)

*mode*

timer mode, HRTIMER\_MODE\_ABS or HRTIMER\_MODE\_REL

## Description

Make the current task sleep until the given expiry time has elapsed. The routine will return immediately unless the current task state has been set (see `set_current_state`).

The *delta* argument gives the kernel the freedom to schedule the actual wakeup to a time that is both power and performance friendly. The kernel give the normal best effort behavior for “*expires+delta*”, but may decide to fire the timer earlier, but no earlier than *expires*.

You can set the task state as follows -

`TASK_UNINTERRUPTIBLE` - at least *timeout* time is guaranteed to pass before the routine returns.

`TASK_INTERRUPTIBLE` - the routine may return early if a signal is delivered to the current task.

The current task state is guaranteed to be `TASK_RUNNING` when this routine returns.

Returns 0 when the timer has expired otherwise `-EINTR`

## schedule\_hrtimeout

### LINUX

Kernel Hackers Manual March 2019

### Name

`schedule_hrtimeout` — sleep until timeout

### Synopsis

```
int __sched schedule_hrtimeout (ktime_t * expires, const enum
hrtimer_mode mode);
```

### Arguments

*expires*

timeout value (`ktime_t`)

*mode*

timer mode, `HRTIMER_MODE_ABS` or `HRTIMER_MODE_REL`

## Description

Make the current task sleep until the given expiry time has elapsed. The routine will return immediately unless the current task state has been set (see `set_current_state`).

You can set the task state as follows -

`TASK_UNINTERRUPTIBLE` - at least *timeout* time is guaranteed to pass before the routine returns.

`TASK_INTERRUPTIBLE` - the routine may return early if a signal is delivered to the current task.

The current task state is guaranteed to be `TASK_RUNNING` when this routine returns.

Returns 0 when the timer has expired otherwise `-EINTR`

## 1.5. Workqueues and Kevents

### queue\_work

#### LINUX

Kernel Hackers Manual March 2019

#### Name

`queue_work` — queue work on a workqueue

#### Synopsis

```
int queue_work (struct workqueue_struct * wq, struct
work_struct * work);
```

## Arguments

*wq*

workqueue to use

*work*

work to queue

## Description

Returns 0 if *work* was already on a queue, non-zero otherwise.

We queue the work to the CPU on which it was submitted, but if the CPU dies it can be processed by another CPU.

# queue\_work\_on

## LINUX

Kernel Hackers Manual March 2019

## Name

queue\_work\_on — queue work on specific cpu

## Synopsis

```
int queue_work_on (int cpu, struct workqueue_struct * wq,  
struct work_struct * work);
```

## Arguments

*cpu*

CPU number to execute work on

*wq*

workqueue to use

*work*

work to queue

## Description

Returns 0 if *work* was already on a queue, non-zero otherwise.

We queue the work to a specific CPU, the caller must ensure it can't go away.

# queue\_delayed\_work

## LINUX

Kernel Hackers Manual March 2019

## Name

`queue_delayed_work` — queue work on a workqueue after delay

## Synopsis

```
int queue_delayed_work (struct workqueue_struct * wq, struct
delayed_work * dwork, unsigned long delay);
```

## Arguments

*wq*

workqueue to use

*dwork*

delayable work to queue

*delay*

number of jiffies to wait before queueing

## Description

Returns 0 if *work* was already on a queue, non-zero otherwise.

# queue\_delayed\_work\_on

## LINUX

Kernel Hackers Manual March 2019

## Name

queue\_delayed\_work\_on — queue work on specific CPU after delay

## Synopsis

```
int queue_delayed_work_on (int cpu, struct workqueue_struct *  
wq, struct delayed_work * dwork, unsigned long delay);
```

## Arguments

*cpu*

CPU number to execute work on

*wq*

workqueue to use

*dwork*

work to queue

*delay*

number of jiffies to wait before queueing

## Description

Returns 0 if *work* was already on a queue, non-zero otherwise.

# flush\_workqueue

## LINUX

Kernel Hackers Manual March 2019

## Name

`flush_workqueue` — ensure that any scheduled work has run to completion.

## Synopsis

```
void flush_workqueue (struct workqueue_struct * wq);
```

## Arguments

*wq*

workqueue to flush

## Description

Forces execution of the workqueue and blocks until its completion. This is typically used in driver shutdown handlers.

We sleep until all works which were queued on entry have been handled, but we are not livelocked by new incoming ones.

This function used to run the workqueues itself. Now we just wait for the helper threads to do it.

## flush\_work

### LINUX

Kernel Hackers Manual March 2019

## Name

`flush_work` — block until a `work_struct`'s callback has terminated

## Synopsis

```
int flush_work (struct work_struct * work);
```

## Arguments

*work*

the work which is to be flushed

## Description

Returns false if *work* has already terminated.

It is expected that, prior to calling `flush_work`, the caller has arranged for the work to not be requeued, otherwise it doesn't make sense to use this function.

# cancel\_work\_sync

## LINUX

Kernel Hackers Manual March 2019

## Name

`cancel_work_sync` — block until a `work_struct`'s callback has terminated

## Synopsis

```
int cancel_work_sync (struct work_struct * work);
```

## Arguments

*work*

the work which is to be flushed

## Description

Returns true if *work* was pending.

`cancel_work_sync` will cancel the work if it is queued. If the work's callback appears to be running, `cancel_work_sync` will block until it has completed.

It is possible to use this function if the work re-queues itself. It can cancel the work even if it migrates to another workqueue, however in that case it only guarantees that `work->func` has completed on the last queued workqueue.

`cancel_work_sync(delayed_work->work)` should be used only if `->timer` is not pending, otherwise it goes into a busy-wait loop until the timer expires.

The caller must ensure that `workqueue_struct` on which this work was last queued can't be destroyed before this function returns.

## cancel\_delayed\_work\_sync

### LINUX

Kernel Hackers Manual March 2019

## Name

`cancel_delayed_work_sync` — reliably kill off a delayed work.

## Synopsis

```
int cancel_delayed_work_sync (struct delayed_work * dwork);
```

## Arguments

*dwork*

the delayed work struct

## Description

Returns true if *dwork* was pending.

It is possible to use this function if *dwork* rearms itself via `queue_work` or `queue_delayed_work`. See also the comment for `cancel_work_sync`.

# schedule\_work

## LINUX

Kernel Hackers Manual March 2019

## Name

`schedule_work` — put work task in global workqueue

## Synopsis

```
int schedule_work (struct work_struct * work);
```

## Arguments

*work*

job to be done

## Description

Returns zero if *work* was already on the kernel-global workqueue and non-zero otherwise.

This puts a job in the kernel-global workqueue if it was not already queued and leaves it in the same position on the kernel-global workqueue otherwise.

# schedule\_delayed\_work

## LINUX

Kernel Hackers Manual March 2019

### Name

`schedule_delayed_work` — put work task in global workqueue after delay

### Synopsis

```
int schedule_delayed_work (struct delayed_work * dwork,  
unsigned long delay);
```

### Arguments

*dwork*

job to be done

*delay*

number of jiffies to wait or 0 for immediate execution

### Description

After waiting for a given time this puts a job in the kernel-global workqueue.

# flush\_delayed\_work

## LINUX

Kernel Hackers Manual March 2019

### Name

`flush_delayed_work` — block until a `dwork_struct`'s callback has terminated

### Synopsis

```
void flush_delayed_work (struct delayed_work * dwork);
```

### Arguments

*dwork*

the delayed work which is to be flushed

### Description

Any timeout is cancelled, and any pending work is run immediately.

# schedule\_delayed\_work\_on

## LINUX

## Name

`schedule_delayed_work_on` — queue work in global workqueue on CPU after delay

## Synopsis

```
int schedule_delayed_work_on (int cpu, struct delayed_work *  
dwork, unsigned long delay);
```

## Arguments

*cpu*

cpu to use

*dwork*

job to be done

*delay*

number of jiffies to wait

## Description

After waiting for a given time this puts a job in the kernel-global workqueue on the specified CPU.

# execute\_in\_process\_context

**LINUX**

## Name

`execute_in_process_context` — reliably execute the routine with user context

## Synopsis

```
int execute_in_process_context (work_func_t fn, struct  
execute_work * ew);
```

## Arguments

*fn*

the function to execute

*ew*

guaranteed storage for the execute work structure (must be available when the work executes)

## Description

Executes the function immediately if process context is available, otherwise schedules the function for delayed execution.

## Returns

0 - function was executed 1 - function was scheduled for execution

# destroy\_workqueue

## LINUX

Kernel Hackers Manual March 2019

### Name

`destroy_workqueue` — safely terminate a workqueue

### Synopsis

```
void destroy_workqueue (struct workqueue_struct * wq);
```

### Arguments

*wq*  
target workqueue

### Description

Safely destroy a workqueue. All work currently pending will be done first.

# work\_on\_cpu

## LINUX

Kernel Hackers Manual March 2019

### Name

`work_on_cpu` — run a function in user context on a particular cpu

## Synopsis

```
long work_on_cpu (unsigned int cpu, long (*fn) (void *), void
* arg);
```

## Arguments

*cpu*

the cpu to run on

*fn*

the function to run

*arg*

the function arg

## Description

This will return the value *fn* returns. It is up to the caller to ensure that the cpu doesn't go offline. The caller must not hold any locks which would prevent *fn* from completing.

## 1.6. Internal Functions

### reparent\_to\_kthreadd

**LINUX**

## Name

`reparent_to_kthreadd` — Reparent the calling kernel thread to `kthreadd`

## Synopsis

```
void reparent_to_kthreadd ( void );
```

## Arguments

*void*

no arguments

## Description

If a kernel thread is launched as a result of a system call, or if it ever exits, it should generally reparent itself to `kthreadd` so it isn't in the way of other processes and is correctly cleaned up on exit.

The various task state such as scheduling policy and priority may have been inherited from a user process, so we reset them to sane values here.

NOTE that `reparent_to_kthreadd` gives the caller full capabilities.

## sys\_tgkill

**LINUX**

## Name

`sys_tgkill` — send signal to one specific thread

## Synopsis

```
long sys_tgkill (pid_t tgid, pid_t pid, int sig);
```

## Arguments

*tgid*

the thread group ID of the thread

*pid*

the PID of the thread

*sig*

signal to be sent

## Description

This syscall also checks the *tgid* and returns `-ESRCH` even if the PID exists but it's not belonging to the target process anymore. This method solves the problem of threads exiting and PIDs getting reused.

## kthread\_run

**LINUX**

## Name

`kthread_run` — create and wake a thread.

## Synopsis

```
kthread_run ( threadfn, data, namefmt, ... );
```

## Arguments

*threadfn*

the function to run until `signal_pending(current)`.

*data*

data ptr for *threadfn*.

*namefmt*

printf-style name for the thread.

...

variable arguments

## Description

Convenient wrapper for `kthread_create` followed by `wake_up_process`.  
Returns the kthread or `ERR_PTR(-ENOMEM)`.

# kthread\_should\_stop

**LINUX**

## Name

`kthread_should_stop` — should this kthread return now?

## Synopsis

```
int kthread_should_stop ( void );
```

## Arguments

*void*

no arguments

## Description

When someone calls `kthread_stop` on your kthread, it will be woken and this will return true. You should then return, and your return value will be passed through to `kthread_stop`.

# kthread\_create

## LINUX

## Name

`kthread_create` — create a kthread.

## Synopsis

```
struct task_struct * kthread_create (int (*threadfn) (void  
*data), void * data, const char namefmt[], ...);
```

## Arguments

*threadfn*

the function to run until `signal_pending(current)`.

*data*

data ptr for *threadfn*.

*namefmt* []

printf-style name for the thread.

...

variable arguments

## Description

This helper function creates and names a kernel thread. The thread will be stopped: use `wake_up_process` to start it. See also `kthread_run`, `kthread_create_on_cpu`.

When woken, the thread will run *threadfn*() with *data* as its argument. *threadfn*() can either call `do_exit` directly if it is a standalone thread for which no one will call `kthread_stop`, or return when '`kthread_should_stop`' is true (which means `kthread_stop` has been called). The return value should be zero or a negative error number; it will be passed to `kthread_stop`.

Returns a `task_struct` or `ERR_PTR(-ENOMEM)`.

# kthread\_stop

## LINUX

Kernel Hackers Manual March 2019

### Name

`kthread_stop` — stop a thread created by `kthread_create`.

### Synopsis

```
int kthread_stop (struct task_struct * k);
```

### Arguments

*k*

thread created by `kthread_create`.

### Description

Sets `kthread_should_stop` for *k* to return true, wakes it, and waits for it to exit. This can also be called after `kthread_create` instead of calling `wake_up_process`: the thread will exit without calling `threadfn`.

If `threadfn` may call `do_exit` itself, the caller must ensure `task_struct` can't go away.

Returns the result of `threadfn`, or `-EINTR` if `wake_up_process` was never called.

## 1.7. Kernel objects manipulation

### kobject\_get\_path

#### LINUX

Kernel Hackers Manual March 2019

#### Name

`kobject_get_path` — generate and return the path associated with a given `kobj` and `kset` pair.

#### Synopsis

```
char * kobject_get_path (struct kobject * kobj, gfp_t  
gfp_mask);
```

#### Arguments

*kobj*

kobject in question, with which to build the path

*gfp\_mask*

the allocation type used to allocate the path

#### Description

The result must be freed by the caller with `kfree`.

# kobject\_set\_name

## LINUX

Kernel Hackers Manual March 2019

### Name

`kobject_set_name` — Set the name of a kobject

### Synopsis

```
int kobject_set_name (struct kobject * kobj, const char * fmt,  
...);
```

### Arguments

*kobj*

struct kobject to set the name of

*fmt*

format string used to build the name

...

variable arguments

### Description

This sets the name of the kobject. If you have already added the kobject to the system, you must call `kobject_rename` in order to change the name of the kobject.

# kobject\_init

## LINUX

Kernel Hackers Manual March 2019

### Name

`kobject_init` — initialize a kobject structure

### Synopsis

```
void kobject_init (struct kobject * kobj, struct kobj_type *  
ktype);
```

### Arguments

*kobj*

pointer to the kobject to initialize

*ktype*

pointer to the ktype for this kobject.

### Description

This function will properly initialize a kobject such that it can then be passed to the `kobject_add` call.

After this function is called, the kobject **MUST** be cleaned up by a call to `kobject_put`, not by a call to `kfree` directly to ensure that all of the memory is cleaned up properly.

# kobject\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`kobject_add` — the main kobject add function

## Synopsis

```
int kobject_add (struct kobject * kobj, struct kobject *
parent, const char * fmt, ...);
```

## Arguments

*kobj*

the kobject to add

*parent*

pointer to the parent of the kobject.

*fmt*

format to name the kobject with.

...

variable arguments

## Description

The kobject name is set and added to the kobject hierarchy in this function.

If *parent* is set, then the parent of the *kobj* will be set to it. If *parent* is NULL, then the parent of the *kobj* will be set to the kobject associated with the kset

assigned to this kobject. If no kset is assigned to the kobject, then the kobject will be located in the root of the sysfs tree.

If this function returns an error, `kobject_put` must be called to properly clean up the memory associated with the object. Under no instance should the kobject that is passed to this function be directly freed with a call to `kfree`, that can leak memory.

Note, no “add” uevent will be created with this call, the caller should set up all of the necessary sysfs files for the object and then call `kobject_uevent` with the `UEVENT_ADD` parameter to ensure that userspace is properly notified of this kobject’s creation.

## kobject\_init\_and\_add

### LINUX

Kernel Hackers Manual March 2019

### Name

`kobject_init_and_add` — initialize a kobject structure and add it to the kobject hierarchy

### Synopsis

```
int kobject_init_and_add (struct kobject * kobj, struct
kobj_type * ktype, struct kobject * parent, const char * fmt,
...);
```

### Arguments

*kobj*

pointer to the kobject to initialize

*ktype*

pointer to the ktype for this kobject.

*parent*

pointer to the parent of this kobject.

*fmt*

the name of the kobject.

...

variable arguments

## Description

This function combines the call to `kobject_init` and `kobject_add`. The same type of error handling after a call to `kobject_add` and kobject lifetime rules are the same here.

# kobject\_rename

## LINUX

Kernel Hackers Manual March 2019

## Name

`kobject_rename` — change the name of an object

## Synopsis

```
int kobject_rename (struct kobject * kobj, const char *
new_name);
```

## Arguments

*kobj*

object in question.

*new\_name*

object's new name

## Description

It is the responsibility of the caller to provide mutual exclusion between two different calls of `kobject_rename` on the same `kobject` and to ensure that `new_name` is valid and won't conflict with other `kobjects`.

# kobject\_del

## LINUX

Kernel Hackers Manual March 2019

## Name

`kobject_del` — unlink `kobject` from hierarchy.

## Synopsis

```
void kobject_del (struct kobject * kobj);
```

## Arguments

*kobj*

object.

# kobject\_get

## LINUX

Kernel Hackers Manual March 2019

### Name

`kobject_get` — increment refcount for object.

### Synopsis

```
struct kobject * kobject_get (struct kobject * kobj);
```

### Arguments

*kobj*  
object.

# kobject\_put

## LINUX

Kernel Hackers Manual March 2019

### Name

`kobject_put` — decrement refcount for object.

## Synopsis

```
void kobject_put (struct kobject * kobj);
```

## Arguments

*kobj*

object.

## Description

Decrement the refcount, and if 0, call `kobject_cleanup`.

# kobject\_create\_and\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`kobject_create_and_add` — create a struct kobject dynamically and register it with sysfs

## Synopsis

```
struct kobject * kobject_create_and_add (const char * name,  
struct kobject * parent);
```

## Arguments

*name*

the name for the kset

*parent*

the parent kobject of this kobject, if any.

## Description

This function creates a kobject structure dynamically and registers it with sysfs.

When you are finished with this structure, call `kobject_put` and the structure will be dynamically freed when it is no longer being used.

If the kobject was not able to be created, `NULL` will be returned.

## kset\_register

### LINUX

Kernel Hackers Manual March 2019

### Name

`kset_register` — initialize and add a kset.

### Synopsis

```
int kset_register (struct kset * k);
```

## Arguments

*k*

kset.

# kset\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

kset\_unregister — remove a kset.

## Synopsis

```
void kset_unregister (struct kset * k);
```

## Arguments

*k*

kset.

# kset\_create\_and\_add

## LINUX

## Name

`kset_create_and_add` — create a struct kset dynamically and add it to sysfs

## Synopsis

```
struct kset * kset_create_and_add (const char * name, struct  
kset_uevent_ops * uevent_ops, struct kobject * parent_kobj);
```

## Arguments

*name*

the name for the kset

*uevent\_ops*

a struct kset\_uevent\_ops for the kset

*parent\_kobj*

the parent kobject of this kset, if any.

## Description

This function creates a kset structure dynamically and registers it with sysfs. When you are finished with this structure, call `kset_unregister` and the structure will be dynamically freed when it is no longer being used.

If the kset was not able to be created, NULL will be returned.

## 1.8. Kernel utility functions

### upper\_32\_bits

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`upper_32_bits` — return bits 32-63 of a number

#### Synopsis

```
upper_32_bits ( n );
```

#### Arguments

*n*

the number we're accessing

#### Description

A basic shift-right of a 64- or 32-bit quantity. Use this to suppress the “right shift count  $\geq$  width of type” warning when that quantity is 32-bits.

### lower\_32\_bits

**LINUX**

## Name

`lower_32_bits` — return bits 0-31 of a number

## Synopsis

```
lower_32_bits ( n );
```

## Arguments

*n*

the number we're accessing

# might\_sleep

## LINUX

## Name

`might_sleep` — annotation for functions that can sleep

## Synopsis

```
might_sleep (void);
```

## Arguments

None

## Description

this macro will print a stack trace if it is executed in an atomic context (spinlock, irq-handler, ...).

This is a useful debugging help to be able to catch problems early and not be bitten later when the calling function happens to sleep when it is not supposed to.

# trace\_printk

## LINUX

Kernel Hackers Manual March 2019

## Name

`trace_printk` — printf formatting in the ftrace buffer

## Synopsis

```
trace_printk ( fmt,  args... );
```

## Arguments

*fmt*

the printf format for printing

*args...*

variable arguments

## Note

`__trace_printk` is an internal function for `trace_printk` and the `ip` is passed in via the `trace_printk` macro.

This function allows a kernel developer to debug fast path sections that `printk` is not appropriate for. By scattering in various `printk` like tracing in the code, a developer can quickly see where problems are occurring.

This is intended as a debugging tool for the developer only. Please refrain from leaving `trace_printks` scattered around in your code.

## clamp

### LINUX

Kernel Hackers Manual March 2019

## Name

`clamp` — return a value clamped to a given range with strict typechecking

## Synopsis

```
clamp ( val,  min,  max );
```

## Arguments

*val*

current value

*min*

minimum allowable value

*max*

maximum allowable value

## Description

This macro does strict typechecking of min/max to make sure they are of the same type as val. See the unnecessary pointer comparisons.

# clamp\_t

## LINUX

Kernel Hackers Manual March 2019

## Name

`clamp_t` — return a value clamped to a given range using a given type

## Synopsis

```
clamp_t ( type, val, min, max );
```

## Arguments

*type*

the type of variable to use

*val*

current value

*min*

minimum allowable value

*max*

maximum allowable value

## Description

This macro does no typechecking and uses temporary variables of type 'type' to make all the comparisons.

# clamp\_val

## LINUX

Kernel Hackers Manual March 2019

## Name

`clamp_val` — return a value clamped to a given range using `val`'s type

## Synopsis

```
clamp_val ( val, min, max );
```

## Arguments

*val*

current value

*min*

minimum allowable value

*max*

maximum allowable value

## Description

This macro does no typechecking and uses temporary variables of whatever type the input argument 'val' is. This is useful when val is an unsigned type and min and max are literals that will otherwise be assigned a signed integer type.

## container\_of

### LINUX

Kernel Hackers Manual March 2019

### Name

`container_of` — cast a member of a structure out to the containing structure

### Synopsis

```
container_of ( ptr, type, member );
```

### Arguments

*ptr*

the pointer to the member.

*type*

the type of the container struct this is embedded in.

*member*

the name of the member within the struct.

# printk

## LINUX

Kernel Hackers Manual March 2019

### Name

`printk` — print a kernel message

### Synopsis

```
int printk (const char * fmt,  ...);
```

### Arguments

*fmt*

format string

...

variable arguments

### Description

This is `printk`. It can be called from any context. We want it to work.

We try to grab the `console_sem`. If we succeed, it's easy - we log the output and call the console drivers. If we fail to get the semaphore we place the output into the log buffer and return. The current holder of the `console_sem` will notice the new output in `release_console_sem` and will send it to the consoles before releasing the semaphore.

One effect of this deferred printing is that code which calls `printk` and then changes `console_loglevel` may break. This is because `console_loglevel` is inspected when the actual printing occurs.

## See also

`printf(3)`

See the `vsnprintf` documentation for format string extensions over C99.

# acquire\_console\_sem

## LINUX

Kernel Hackers Manual March 2019

## Name

`acquire_console_sem` — lock the console system for exclusive use.

## Synopsis

```
void acquire_console_sem ( void );
```

## Arguments

*void*

no arguments

## Description

Acquires a semaphore which guarantees that the caller has exclusive access to the console system and the `console_drivers` list.

Can sleep, returns nothing.

# release\_console\_sem

## LINUX

Kernel Hackers Manual March 2019

### Name

`release_console_sem` — unlock the console system

### Synopsis

```
void release_console_sem ( void );
```

### Arguments

*void*

no arguments

### Description

Releases the semaphore which the caller holds on the console system and the console driver list.

While the semaphore was held, console output may have been buffered by `printk`. If this is the case, `release_console_sem` emits the output prior to releasing the semaphore.

If there is output waiting for `klogd`, we wake it up.

`release_console_sem` may be called from any context.

# console\_conditional\_schedule

## LINUX

Kernel Hackers Manual March 2019

### Name

`console_conditional_schedule` — yield the CPU if required

### Synopsis

```
void __sched console_conditional_schedule ( void );
```

### Arguments

*void*

no arguments

### Description

If the console code is currently allowed to sleep, and if this CPU should yield the CPU to another task, do so here.

Must be called within `acquire_console_sem`.

# printk\_timed\_ratelimit

## LINUX

## Name

`printk_timed_ratelimit` — caller-controlled `printk` ratelimiting

## Synopsis

```
bool printk_timed_ratelimit (unsigned long * caller_jiffies,
unsigned int interval_msecs);
```

## Arguments

*caller\_jiffies*

pointer to caller's state

*interval\_msecs*

minimum interval between prints

## Description

`printk_timed_ratelimit` returns true if more than *interval\_msecs* milliseconds have elapsed since the last time `printk_timed_ratelimit` returned true.

## `printk_hash`

**LINUX**

## Name

`printk_hash` — print a kernel message include a hash over the message

## Synopsis

```
int printk_hash (const char * prefix, const char * fmt, ...);
```

## Arguments

*prefix*

message prefix including the “.06x” for the hash

*fmt*

format string

...

variable arguments

# printk\_dev\_hash

## LINUX

## Name

`printk_dev_hash` — print a kernel message include a hash over the message

## Synopsis

```
int printk_dev_hash (const char * prefix, const char *
driver_name, const char * fmt, ...);
```

## Arguments

*prefix*

message prefix including the “.06x” for the hash

*driver\_name*

-- undescribed --

*fmt*

format string

...

variable arguments

## panic

### LINUX

Kernel Hackers Manual March 2019

## Name

`panic` — halt the system

## Synopsis

```
NORET_TYPE void panic (const char * fmt, ...);
```

## Arguments

*fmt*

The text string to print

...

variable arguments

## Description

Display a message, then perform cleanups.

This function never returns.

# emergency\_restart

## LINUX

Kernel Hackers Manual March 2019

## Name

`emergency_restart` — reboot the system

## Synopsis

```
void emergency_restart ( void );
```

## Arguments

*void*

no arguments

## Description

Without shutting down any hardware or taking any locks reboot the system. This is called when we know we are in trouble so this is our best effort to reboot. This is safe to call in interrupt context.

## kernel\_restart

### LINUX

Kernel Hackers Manual March 2019

## Name

`kernel_restart` — reboot the system

## Synopsis

```
void kernel_restart (char * cmd);
```

## Arguments

*cmd*

pointer to buffer containing command to execute for restart or `NULL`

## Description

Shutdown everything and perform a clean reboot. This is not safe to call in interrupt context.

# kernel\_halt

## LINUX

Kernel Hackers Manual March 2019

## Name

`kernel_halt` — halt the system

## Synopsis

```
void kernel_halt ( void );
```

## Arguments

*void*

no arguments

## Description

Shutdown everything and perform a clean system halt.

# kernel\_power\_off

## LINUX

Kernel Hackers Manual March 2019

### Name

`kernel_power_off` — power\_off the system

### Synopsis

```
void kernel_power_off ( void );
```

### Arguments

*void*

no arguments

### Description

Shutdown everything and perform a clean system power\_off.

# orderly\_poweroff

## LINUX

Kernel Hackers Manual March 2019

### Name

`orderly_poweroff` — Trigger an orderly system poweroff

## Synopsis

```
int orderly_poweroff (bool force);
```

## Arguments

*force*

force poweroff if command execution fails

## Description

This may be called from any context to trigger a system shutdown. If the orderly shutdown fails, it will force an immediate shutdown.

# synchronize\_rcu

## LINUX

Kernel Hackers Manual March 2019

## Name

`synchronize_rcu` — wait until a grace period has elapsed.

## Synopsis

```
void synchronize_rcu ( void);
```

## Arguments

*void*

no arguments

## Description

Control will return to the caller some time after a full grace period has elapsed, in other words after all currently executing RCU read-side critical sections have completed. RCU read-side critical sections are delimited by `rcu_read_lock` and `rcu_read_unlock`, and may be nested.

# synchronize\_sched

## LINUX

Kernel Hackers Manual March 2019

## Name

`synchronize_sched` — wait until an rcu-sched grace period has elapsed.

## Synopsis

```
void synchronize_sched ( void );
```

## Arguments

*void*

no arguments

## Description

Control will return to the caller some time after a full rcu-sched grace period has elapsed, in other words after all currently executing rcu-sched read-side critical sections have completed. These read-side critical sections are delimited by `rcu_read_lock_sched` and `rcu_read_unlock_sched`, and may be nested. Note that `preempt_disable`, `local_irq_disable`, and so on may be used in place of `rcu_read_lock_sched`.

This means that all `preempt_disable` code sequences, including NMI and hardware-interrupt handlers, in progress on entry will have completed before this primitive returns. However, this does not guarantee that softirq handlers will have completed, since in some kernels, these handlers can run in process context, and can block.

This primitive provides the guarantees made by the (now removed) `synchronize_kernel` API. In contrast, `synchronize_rcu` only guarantees that `rcu_read_lock` sections will have completed. In “classic RCU”, these two guarantees happen to be one and the same, but can differ in realtime RCU implementations.

## synchronize\_rcu\_bh

### LINUX

Kernel Hackers Manual March 2019

### Name

`synchronize_rcu_bh` — wait until an `rcu_bh` grace period has elapsed.

### Synopsis

```
void synchronize_rcu_bh ( void );
```

## Arguments

*void*

no arguments

## Description

Control will return to the caller some time after a full rcu\_bh grace period has elapsed, in other words after all currently executing rcu\_bh read-side critical sections have completed. RCU read-side critical sections are delimited by `rcu_read_lock_bh` and `rcu_read_unlock_bh`, and may be nested.

# 1.9. Device Resource Management

## devres\_alloc

### LINUX

Kernel Hackers Manual March 2019

## Name

`devres_alloc` — Allocate device resource data

## Synopsis

```
void * devres_alloc (dr_release_t release, size_t size, gfp_t
gfp);
```

## Arguments

*release*

Release function devres will be associated with

*size*

Allocation size

*gfp*

Allocation flags

## Description

Allocate devres of *size* bytes. The allocated area is zeroed, then associated with *release*. The returned pointer can be passed to other devres\_\*( ) functions.

## RETURNS

Pointer to allocated devres on success, NULL on failure.

## devres\_free

### LINUX

Kernel Hackers Manual March 2019

## Name

devres\_free — Free device resource data

## Synopsis

```
void devres_free (void * res);
```

## Arguments

*res*

Pointer to devres data to free

## Description

Free devres created with `devres_alloc`.

# devres\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`devres_add` — Register device resource

## Synopsis

```
void devres_add (struct device * dev, void * res);
```

## Arguments

*dev*

Device to add resource to

*res*

Resource to register

## Description

Register devres *res* to *dev*. *res* should have been allocated using `devres_alloc`. On driver detach, the associated release function will be invoked and devres will be freed automatically.

## devres\_find

### LINUX

Kernel Hackers Manual March 2019

## Name

`devres_find` — Find device resource

## Synopsis

```
void * devres_find (struct device * dev, dr_release_t release,  
dr_match_t match, void * match_data);
```

## Arguments

*dev*

Device to lookup resource from

*release*

Look for resources associated with this release function

*match*

Match function (optional)

*match\_data*

Data for the match function

## Description

Find the latest devres of *dev* which is associated with *release* and for which *match* returns 1. If *match* is NULL, it's considered to match all.

## RETURNS

Pointer to found devres, NULL if not found.

# devres\_get

## LINUX

Kernel Hackers Manual March 2019

## Name

`devres_get` — Find devres, if non-existent, add one atomically

## Synopsis

```
void * devres_get (struct device * dev, void * new_res,
dr_match_t match, void * match_data);
```

## Arguments

*dev*

Device to lookup or add devres for

*new\_res*

Pointer to new initialized devres to add if not found

*match*

Match function (optional)

*match\_data*

Data for the match function

## Description

Find the latest devres of *dev* which has the same release function as *new\_res* and for which *match* return 1. If found, *new\_res* is freed; otherwise, *new\_res* is added atomically.

## RETURNS

Pointer to found or added devres.

## devres\_remove

### LINUX

Kernel Hackers Manual March 2019

## Name

`devres_remove` — Find a device resource and remove it

## Synopsis

```
void * devres_remove (struct device * dev, dr_release_t
release, dr_match_t match, void * match_data);
```

## Arguments

*dev*

Device to find resource from

*release*

Look for resources associated with this release function

*match*

Match function (optional)

*match\_data*

Data for the match function

## Description

Find the latest devres of *dev* associated with *release* and for which *match* returns 1. If *match* is NULL, it's considered to match all. If found, the resource is removed atomically and returned.

## RETURNS

Pointer to removed devres on success, NULL if not found.

## devres\_destroy

**LINUX**

## Name

`devres_destroy` — Find a device resource and destroy it

## Synopsis

```
int devres_destroy (struct device * dev, dr_release_t release,  
dr_match_t match, void * match_data);
```

## Arguments

*dev*

Device to find resource from

*release*

Look for resources associated with this release function

*match*

Match function (optional)

*match\_data*

Data for the match function

## Description

Find the latest devres of *dev* associated with *release* and for which *match* returns 1. If *match* is NULL, it's considered to match all. If found, the resource is removed atomically and freed.

## RETURNS

0 if devres is found and freed, -ENOENT if not found.

# devres\_open\_group

## LINUX

Kernel Hackers Manual March 2019

### Name

`devres_open_group` — Open a new devres group

### Synopsis

```
void * devres_open_group (struct device * dev, void * id,
gfp_t gfp);
```

### Arguments

*dev*

Device to open devres group for

*id*

Separator ID

*gfp*

Allocation flags

### Description

Open a new devres group for *dev* with *id*. For *id*, using a pointer to an object which won't be used for another group is recommended. If *id* is NULL, address-wise unique ID is created.

## RETURNS

ID of the new group, NULL on failure.

# devres\_close\_group

## LINUX

Kernel Hackers Manual March 2019

## Name

`devres_close_group` — Close a devres group

## Synopsis

```
void devres_close_group (struct device * dev, void * id);
```

## Arguments

*dev*

Device to close devres group for

*id*

ID of target group, can be NULL

## Description

Close the group identified by *id*. If *id* is NULL, the latest open group is selected.

# devres\_remove\_group

## LINUX

Kernel Hackers Manual March 2019

### Name

`devres_remove_group` — Remove a devres group

### Synopsis

```
void devres_remove_group (struct device * dev, void * id);
```

### Arguments

*dev*

Device to remove group for

*id*

ID of target group, can be NULL

### Description

Remove the group identified by *id*. If *id* is NULL, the latest open group is selected. Note that removing a group doesn't affect any other resources.

# devres\_release\_group

## LINUX

## Name

`devres_release_group` — Release resources in a devres group

## Synopsis

```
int devres_release_group (struct device * dev, void * id);
```

## Arguments

*dev*

Device to release group for

*id*

ID of target group, can be NULL

## Description

Release all resources in the group identified by *id*. If *id* is NULL, the latest open group is selected. The selected group and groups properly nested inside the selected group are removed.

## RETURNS

The number of released non-group resources.

## devm\_kzalloc

**LINUX**

## Name

`devm_kzalloc` — Resource-managed kzalloc

## Synopsis

```
void * devm_kzalloc (struct device * dev, size_t size, gfp_t  
gfp);
```

## Arguments

*dev*

Device to allocate memory for

*size*

Allocation size

*gfp*

Allocation gfp flags

## Description

Managed kzalloc. Memory allocated with this function is automatically freed on driver detach. Like all other devres resources, guaranteed alignment is unsigned long long.

## RETURNS

Pointer to allocated memory on success, NULL on failure.

# devm\_kfree

## LINUX

Kernel Hackers Manual March 2019

### Name

devm\_kfree — Resource-managed kfree

### Synopsis

```
void devm_kfree (struct device * dev, void * p);
```

### Arguments

*dev*

Device this memory belongs to

*p*

Memory to free

### Description

Free memory allocated with `dev_kzalloc`.

# Chapter 2. Device drivers infrastructure

## 2.1. Device Drivers Base

### driver\_for\_each\_device

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`driver_for_each_device` — Iterator for devices bound to a driver.

#### Synopsis

```
int driver_for_each_device (struct device_driver * drv, struct
device * start, void * data, int (*fn) (struct device *, void
*));
```

#### Arguments

*drv*

Driver we're iterating.

*start*

Device to begin with

*data*

Data to pass to the callback.

*fn*

Function to call for each device.

## Description

Iterate over the *drv*'s list of devices calling *fn* for each one.

# driver\_find\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`driver_find_device` — device iterator for locating a particular device.

## Synopsis

```
struct device * driver_find_device (struct device_driver *  
drv, struct device * start, void * data, int (*match) (struct  
device *dev, void *data));
```

## Arguments

*drv*

The device's driver

*start*

Device to begin with

*data*

Data to pass to match function

*match*

Callback function to check device

## Description

This is similar to the `driver_for_each_device` function above, but it returns a reference to a device that is 'found' for later use, as determined by the *match* callback.

The callback should return 0 if the device doesn't match and non-zero if it does. If the callback returns non-zero, this function will return to the caller and not iterate over any more devices.

## driver\_create\_file

### LINUX

Kernel Hackers Manual March 2019

### Name

`driver_create_file` — create sysfs file for driver.

### Synopsis

```
int driver_create_file (struct device_driver * drv, struct
driver_attribute * attr);
```

## Arguments

*drv*

driver.

*attr*

driver attribute descriptor.

## driver\_remove\_file

### LINUX

Kernel Hackers Manual March 2019

## Name

`driver_remove_file` — remove sysfs file for driver.

## Synopsis

```
void driver_remove_file (struct device_driver * drv, struct  
driver_attribute * attr);
```

## Arguments

*drv*

driver.

*attr*

driver attribute descriptor.

# driver\_add\_kobj

## LINUX

Kernel Hackers Manual March 2019

### Name

`driver_add_kobj` — add a kobject below the specified driver

### Synopsis

```
int driver_add_kobj (struct device_driver * drv, struct
kobject * kobj, const char * fmt, ...);
```

### Arguments

*drv*

requesting device driver

*kobj*

kobject to add below this driver

*fmt*

format string that names the kobject

...

variable arguments

### Description

You really don't want to do this, this is only here due to one looney iseries driver, go poke those developers if you are annoyed about this...

# get\_driver

## LINUX

Kernel Hackers Manual March 2019

### Name

`get_driver` — increment driver reference count.

### Synopsis

```
struct device_driver * get_driver (struct device_driver *  
drv);
```

### Arguments

*drv*  
driver.

# put\_driver

## LINUX

Kernel Hackers Manual March 2019

### Name

`put_driver` — decrement driver's refcount.

## Synopsis

```
void put_driver (struct device_driver * drv);
```

## Arguments

*drv*

driver.

## driver\_register

### LINUX

Kernel Hackers Manual March 2019

## Name

`driver_register` — register driver with bus

## Synopsis

```
int driver_register (struct device_driver * drv);
```

## Arguments

*drv*

driver to register

## Description

We pass off most of the work to the `bus_add_driver` call, since most of the things we have to do deal with the bus structures.

# driver\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

`driver_unregister` — remove driver from system.

## Synopsis

```
void driver_unregister (struct device_driver * drv);
```

## Arguments

*drv*

driver.

## Description

Again, we pass off most of the work to the bus-level call.

# driver\_find

## LINUX

Kernel Hackers Manual March 2019

### Name

`driver_find` — locate driver on a bus by its name.

### Synopsis

```
struct device_driver * driver_find (const char * name, struct  
bus_type * bus);
```

### Arguments

*name*

name of the driver.

*bus*

bus to scan for the driver.

### Description

Call `kset_find_obj` to iterate over list of drivers on a bus to find driver by name.  
Return driver if found.

Note that `kset_find_obj` increments driver's reference count.

# dev\_driver\_string

## LINUX

Kernel Hackers Manual March 2019

### Name

`dev_driver_string` — Return a device's driver name, if at all possible

### Synopsis

```
const char * dev_driver_string (const struct device * dev);
```

### Arguments

*dev*

struct device to get the name of

### Description

Will return the device's driver's name if it is bound to a device. If the device is not bound to a device, it will return the name of the bus it is attached to. If it is not attached to a bus either, an empty string will be returned.

# device\_create\_file

## LINUX

## Name

`device_create_file` — create sysfs attribute file for device.

## Synopsis

```
int device_create_file (struct device * dev, struct
device_attribute * attr);
```

## Arguments

*dev*

device.

*attr*

device attribute descriptor.

# device\_remove\_file

## LINUX

## Name

`device_remove_file` — remove sysfs attribute file.

## Synopsis

```
void device_remove_file (struct device * dev, struct  
device_attribute * attr);
```

## Arguments

*dev*

device.

*attr*

device attribute descriptor.

## device\_create\_bin\_file

### LINUX

Kernel Hackers Manual March 2019

## Name

`device_create_bin_file` — create sysfs binary attribute file for device.

## Synopsis

```
int device_create_bin_file (struct device * dev, struct  
bin_attribute * attr);
```

## Arguments

*dev*

device.

*attr*

device binary attribute descriptor.

# device\_remove\_bin\_file

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_remove_bin_file` — remove sysfs binary attribute file

## Synopsis

```
void device_remove_bin_file (struct device * dev, struct  
bin_attribute * attr);
```

## Arguments

*dev*

device.

*attr*

device binary attribute descriptor.

# device\_schedule\_callback\_owner

## LINUX

Kernel Hackers Manual March 2019

### Name

`device_schedule_callback_owner` — helper to schedule a callback for a device

### Synopsis

```
int device_schedule_callback_owner (struct device * dev, void  
(*func) (struct device *), struct module * owner);
```

### Arguments

*dev*

device.

*func*

callback function to invoke later.

*owner*

module owning the callback routine

### Description

Attribute methods must not unregister themselves or their parent device (which would amount to the same thing). Attempts to do so will deadlock, since unregistration is mutually exclusive with driver callbacks.

Instead methods can call this routine, which will attempt to allocate and schedule a workqueue request to call back *func* with *dev* as its argument in the workqueue's process context. *dev* will be pinned until *func* returns.

This routine is usually called via the inline `device_schedule_callback`, which automatically sets *owner* to `THIS_MODULE`.

Returns 0 if the request was submitted, `-ENOMEM` if storage could not be allocated, `-ENODEV` if a reference to *owner* isn't available.

## NOTE

This routine won't work if `CONFIG_SYSFS` isn't set! It uses an underlying `sysfs` routine (since it is intended for use by attribute methods), and if `sysfs` isn't available you'll get nothing but `-ENOSYS`.

# device\_initialize

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_initialize` — init device structure.

## Synopsis

```
void device_initialize (struct device * dev);
```

## Arguments

*dev*

device.

## Description

This prepares the device for use by other layers by initializing its fields. It is the first half of `device_register`, if called by that function, though it can also be called separately, so one may use *dev*'s fields. In particular, `get_device/put_device` may be used for reference counting of *dev* after calling this function.

## NOTE

Use `put_device` to give up your reference instead of freeing *dev* directly once you have called this function.

## dev\_set\_name

### LINUX

Kernel Hackers Manual March 2019

## Name

`dev_set_name` — set a device name

## Synopsis

```
int dev_set_name (struct device * dev, const char * fmt,
...);
```

## Arguments

*dev*

device

*fmt*

format string for the device's name

...

variable arguments

## device\_add

### LINUX

Kernel Hackers Manual March 2019

### Name

`device_add` — add device to device hierarchy.

### Synopsis

```
int device_add (struct device * dev);
```

### Arguments

*dev*

device.

### Description

This is part 2 of `device_register`, though may be called separately if `device_initialize` has been called separately.

This adds *dev* to the kobject hierarchy via `kobject_add`, adds it to the global and sibling lists for the device, then adds it to the other relevant subsystems of the driver model.

## NOTE

Never directly free `dev` after calling this function, even if it returned an error!  
Always use `put_device` to give up your reference instead.

# device\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_register` — register a device with the system.

## Synopsis

```
int device_register (struct device * dev);
```

## Arguments

*dev*

pointer to the device structure

## Description

This happens in two clean steps - initialize the device and add it to the system. The two steps can be called separately, but this is the easiest and most common. I.e. you should only call the two helpers separately if have a clearly defined need to use and refcount the device before it is added to the hierarchy.

## NOTE

*\_Never\_* directly free *dev* after calling this function, even if it returned an error!  
Always use `put_device` to give up the reference initialized in this function instead.

# get\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`get_device` — increment reference count for device.

## Synopsis

```
struct device * get_device (struct device * dev);
```

## Arguments

*dev*

device.

## Description

This simply forwards the call to `kobject_get`, though we do take care to provide for the case that we get a NULL pointer passed in.

# put\_device

## LINUX

Kernel Hackers Manual March 2019

### Name

`put_device` — decrement reference count.

### Synopsis

```
void put_device (struct device * dev);
```

### Arguments

*dev*

device in question.

# device\_del

## LINUX

Kernel Hackers Manual March 2019

### Name

`device_del` — delete device from system.

## Synopsis

```
void device_del (struct device * dev);
```

## Arguments

*dev*

device.

## Description

This is the first part of the device unregistration sequence. This removes the device from the lists we control from here, has it removed from the other driver model subsystems it was added to in `device_add`, and removes it from the kobject hierarchy.

## NOTE

this should be called manually `_iff_ device_add` was also called manually.

# device\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_unregister` — unregister device from system.

## Synopsis

```
void device_unregister (struct device * dev);
```

## Arguments

*dev*

device going away.

## Description

We do this in two parts, like we do `device_register`. First, we remove it from all the subsystems with `device_del`, then we decrement the reference count via `put_device`. If that is the final reference count, the device will be cleaned up via `device_release` above. Otherwise, the structure will stick around until the final reference to the device is dropped.

# device\_for\_each\_child

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_for_each_child` — device child iterator.

## Synopsis

```
int device_for_each_child (struct device * parent, void *  
data, int (*fn) (struct device *dev, void *data));
```

## Arguments

*parent*

parent struct device.

*data*

data for the callback.

*fn*

function to be called for each device.

## Description

Iterate over *parent*'s child devices, and call *fn* for each, passing it *data*.

We check the return of *fn* each time. If it returns anything other than 0, we break out and return that value.

# device\_find\_child

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_find_child` — device iterator for locating a particular device.

## Synopsis

```
struct device * device_find_child (struct device * parent,  
void * data, int (*match) (struct device *dev, void *data));
```

## Arguments

*parent*

parent struct device

*data*

Data to pass to match function

*match*

Callback function to check device

## Description

This is similar to the `device_for_each_child` function above, but it returns a reference to a device that is 'found' for later use, as determined by the *match* callback.

The callback should return 0 if the device doesn't match and non-zero if it does. If the callback returns non-zero and a reference to the current device can be obtained, this function will return to the caller and not iterate over any more devices.

## \_\_root\_device\_register

**LINUX**

Kernel Hackers Manual March 2019

## Name

`__root_device_register` — allocate and register a root device

## Synopsis

```
struct device * __root_device_register (const char * name,
struct module * owner);
```

## Arguments

*name*

root device name

*owner*

owner module of the root device, usually THIS\_MODULE

## Description

This function allocates a root device and registers it using `device_register`. In order to free the returned device, use `root_device_unregister`.

Root devices are dummy devices which allow other devices to be grouped under `/sys/devices`. Use this function to allocate a root device and then use it as the parent of any device which should appear under `/sys/devices/{name}`

The `/sys/devices/{name}` directory will also contain a 'module' symlink which points to the *owner* directory in sysfs.

## Note

You probably want to use `root_device_register`.

## root\_device\_unregister

**LINUX**

## Name

`root_device_unregister` — unregister and free a root device

## Synopsis

```
void root_device_unregister (struct device * dev);
```

## Arguments

*dev*

device going away

## Description

This function unregisters and cleans up a device that was created by `root_device_register`.

# device\_create\_vargs

## LINUX

## Name

`device_create_vargs` — creates a device and registers it with sysfs

## Synopsis

```
struct device * device_create_vargs (struct class * class,
struct device * parent, dev_t devt, void * drvdata, const char
* fmt, va_list args);
```

## Arguments

*class*

pointer to the struct class that this device should be registered to

*parent*

pointer to the parent struct device of this new device, if any

*devt*

the dev\_t for the char device to be added

*drvdata*

the data to be added to the device for callbacks

*fmt*

string for the device's name

*args*

va\_list for the device's name

## Description

This function can be used by char device classes. A struct device will be created in sysfs, registered to the specified class.

A “dev” file will be created, showing the dev\_t for the device, if the dev\_t is not 0,0. If a pointer to a parent struct device is passed in, the newly created struct device will be a child of that device in sysfs. The pointer to the struct device will be returned from the call. Any further sysfs files that might be required can be created using this pointer.

## Note

the struct class passed to this function must have previously been created with a call to `class_create`.

# device\_create

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_create` — creates a device and registers it with sysfs

## Synopsis

```
struct device * device_create (struct class * class, struct
device * parent, dev_t devt, void * drvdata, const char * fmt,
...);
```

## Arguments

*class*

pointer to the struct class that this device should be registered to

*parent*

pointer to the parent struct device of this new device, if any

*devt*

the `dev_t` for the char device to be added

*drvdata*

the data to be added to the device for callbacks

*fmt*

string for the device's name

...

variable arguments

## Description

This function can be used by char device classes. A struct device will be created in sysfs, registered to the specified class.

A “dev” file will be created, showing the dev\_t for the device, if the dev\_t is not 0,0. If a pointer to a parent struct device is passed in, the newly created struct device will be a child of that device in sysfs. The pointer to the struct device will be returned from the call. Any further sysfs files that might be required can be created using this pointer.

## Note

the struct class passed to this function must have previously been created with a call to `class_create`.

# device\_destroy

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_destroy` — removes a device that was created with `device_create`

## Synopsis

```
void device_destroy (struct class * class, dev_t devt);
```

## Arguments

*class*

pointer to the struct class that this device was registered with

*devt*

the dev\_t of the device that was previously registered

## Description

This call unregisters and cleans up a device that was created with a call to `device_create`.

# device\_rename

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_rename` — renames a device

## Synopsis

```
int device_rename (struct device * dev, char * new_name);
```

## Arguments

*dev*

the pointer to the struct device to be renamed

*new\_name*

the new name of the device

## Description

It is the responsibility of the caller to provide mutual exclusion between two different calls of `device_rename` on the same device to ensure that `new_name` is valid and won't conflict with other devices.

## device\_move

### LINUX

Kernel Hackers Manual March 2019

## Name

`device_move` — moves a device to a new parent

## Synopsis

```
int device_move (struct device * dev, struct device *  
new_parent, enum dpm_order dpm_order);
```

## Arguments

*dev*

the pointer to the struct device to be moved

*new\_parent*

the new parent of the device (can be NULL)

*dpm\_order*

how to reorder the dpm\_list

## \_\_class\_create

**LINUX**

Kernel Hackers Manual March 2019

### Name

`__class_create` — create a struct class structure

### Synopsis

```
struct class * __class_create (struct module * owner, const
char * name, struct lock_class_key * key);
```

## Arguments

*owner*

pointer to the module that is to “own” this struct class

*name*

pointer to a string for the name of this class.

*key*

the lock\_class\_key for this class; used by mutex lock debugging

## Description

This is used to create a struct class pointer that can then be used in calls to `device_create`.

Note, the pointer created here is to be destroyed when finished by making a call to `class_destroy`.

## class\_destroy

### LINUX

Kernel Hackers Manual March 2019

### Name

`class_destroy` — destroys a struct class structure

### Synopsis

```
void class_destroy (struct class * cls);
```

### Arguments

*cls*

pointer to the struct class that is to be destroyed

## Description

Note, the pointer to be destroyed must have been created with a call to `class_create`.

# class\_dev\_iter\_init

## LINUX

Kernel Hackers Manual March 2019

## Name

`class_dev_iter_init` — initialize class device iterator

## Synopsis

```
void class_dev_iter_init (struct class_dev_iter * iter, struct  
class * class, struct device * start, const struct device_type  
* type);
```

## Arguments

*iter*

class iterator to initialize

*class*

the class we wanna iterate over

*start*

the device to start iterating from, if any

*type*

device\_type of the devices to iterate over, NULL for all

## Description

Initialize class iterator *iter* such that it iterates over devices of *class*. If *start* is set, the list iteration will start there, otherwise if it is NULL, the iteration starts at the beginning of the list.

## class\_dev\_iter\_next

### LINUX

Kernel Hackers Manual March 2019

## Name

`class_dev_iter_next` — iterate to the next device

## Synopsis

```
struct device * class_dev_iter_next (struct class_dev_iter *
iter);
```

## Arguments

*iter*

class iterator to proceed

## Description

Proceed *iter* to the next device and return it. Returns NULL if iteration is complete.

The returned device is referenced and won't be released till iterator is proceed to the next device or exited. The caller is free to do whatever it wants to do with the device including calling back into class code.

## class\_dev\_iter\_exit

**LINUX**

Kernel Hackers Manual March 2019

### Name

`class_dev_iter_exit` — finish iteration

### Synopsis

```
void class_dev_iter_exit (struct class_dev_iter * iter);
```

### Arguments

*iter*

class iterator to finish

### Description

Finish an iteration. Always call this function after iteration is complete whether the iteration ran till the end or not.

## class\_for\_each\_device

**LINUX**

## Name

`class_for_each_device` — device iterator

## Synopsis

```
int class_for_each_device (struct class * class, struct device
* start, void * data, int (*fn) (struct device *, void *));
```

## Arguments

*class*

the class we're iterating

*start*

the device to start with in the list, if any.

*data*

data for the callback

*fn*

function to be called for each device

## Description

Iterate over *class*'s list of devices, and call *fn* for each, passing it *data*. If *start* is set, the list iteration will start there, otherwise if it is NULL, the iteration starts at the beginning of the list.

We check the return of *fn* each time. If it returns anything other than 0, we break out and return that value.

*fn* is allowed to do anything including calling back into class code. There's no locking restriction.

# class\_find\_device

**LINUX**

Kernel Hackers Manual March 2019

## Name

`class_find_device` — device iterator for locating a particular device

## Synopsis

```
struct device * class_find_device (struct class * class,  
struct device * start, void * data, int (*match) (struct  
device *, void *));
```

## Arguments

*class*

the class we're iterating

*start*

Device to begin with

*data*

data for the match function

*match*

function to check device

## Description

This is similar to the `class_for_each_dev` function above, but it returns a reference to a device that is 'found' for later use, as determined by the `match` callback.

The callback should return 0 if the device doesn't match and non-zero if it does. If the callback returns non-zero, this function will return to the caller and not iterate over any more devices.

Note, you will need to drop the reference with `put_device` after use.

`fn` is allowed to do anything including calling back into class code. There's no locking restriction.

## class\_compat\_register

### LINUX

Kernel Hackers Manual March 2019

### Name

`class_compat_register` — register a compatibility class

### Synopsis

```
struct class_compat * class_compat_register (const char *
name);
```

### Arguments

*name*

the name of the class

## Description

Compatibility class are meant as a temporary user-space compatibility workaround when converting a family of class devices to a bus devices.

# class\_compat\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

`class_compat_unregister` — unregister a compatibility class

## Synopsis

```
void class_compat_unregister (struct class_compat * cls);
```

## Arguments

*cls*

the class to unregister

# class\_compat\_create\_link

## LINUX

## Name

`class_compat_create_link` — create a compatibility class device link to a bus device

## Synopsis

```
int class_compat_create_link (struct class_compat * cls,
struct device * dev, struct device * device_link);
```

## Arguments

*cls*

the compatibility class

*dev*

the target bus device

*device\_link*

an optional device to which a “device” link should be created

## `class_compat_remove_link`

### LINUX

## Name

`class_compat_remove_link` — remove a compatibility class device link to a bus device

## Synopsis

```
void class_compat_remove_link (struct class_compat * cls,  
struct device * dev, struct device * device_link);
```

## Arguments

*cls*

the compatibility class

*dev*

the target bus device

*device\_link*

an optional device to which a “device” link was previously created

## request\_firmware

### LINUX

Kernel Hackers Manual March 2019

## Name

`request_firmware` — send firmware request and wait for it

## Synopsis

```
int request_firmware (const struct firmware ** firmware_p,  
const char * name, struct device * device);
```

## Arguments

*firmware\_p*

pointer to firmware image

*name*

name of firmware file

*device*

device for which firmware is being loaded

## Description

*firmware\_p* will be used to return a firmware image by the name of *name* for device *device*.

Should be called from user context where sleeping is allowed.

*name* will be used as \$FIRMWARE in the uevent environment and should be distinctive enough not to be confused with any other firmware image for this or any other device.

## release\_firmware

### LINUX

Kernel Hackers Manual March 2019

## Name

`release_firmware` — release the resource associated with a firmware image

## Synopsis

```
void release_firmware (const struct firmware * fw);
```

## Arguments

*fw*

firmware resource to release

# request\_firmware\_nowait

## LINUX

Kernel Hackers Manual March 2019

## Name

request\_firmware\_nowait —

## Synopsis

```
int request_firmware_nowait (struct module * module, int
uevent, const char * name, struct device * device, void *
context, void (*cont) (const struct firmware *fw, void
*context));
```

## Arguments

*module*

module requesting the firmware

*uevent*

sends uevent to copy the firmware image if this flag is non-zero else the firmware copy must be done manually.

*name*

name of firmware file

*device*

device for which firmware is being loaded

*context*

will be passed over to *cont*, and *fw* may be `NULL` if firmware request fails.

*cont*

function will be called asynchronously when the firmware request is over.

## Description

Asynchronous variant of `request_firmware` for user contexts where it is not possible to sleep for long time. It can't be called in atomic contexts.

# transport\_class\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`transport_class_register` — register an initial transport class

## Synopsis

```
int transport_class_register (struct transport_class *
tclass);
```

## Arguments

*tclass*

a pointer to the transport class structure to be initialised

## Description

The transport class contains an embedded class which is used to identify it. The caller should initialise this structure with zeros and then generic class must have been initialised with the actual transport class unique name. There's a macro `DECLARE_TRANSPORT_CLASS` to do this (declared classes still must be registered).

Returns 0 on success or error on failure.

# transport\_class\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

`transport_class_unregister` — unregister a previously registered class

## Synopsis

```
void transport_class_unregister (struct transport_class *  
tclass);
```

## Arguments

*tclass*

The transport class to unregister

## Description

Must be called prior to deallocating the memory for the transport class.

# anon\_transport\_class\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`anon_transport_class_register` — register an anonymous class

## Synopsis

```
int anon_transport_class_register (struct anon_transport_class
* atc);
```

## Arguments

*atc*

The anon transport class to register

## Description

The anonymous transport class contains both a transport class and a container. The idea of an anonymous class is that it never actually has any device attributes associated with it (and thus saves on container storage). So it can only be used for triggering events. Use `prezero` and then use `DECLARE_ANON_TRANSPORT_CLASS` to initialise the anon transport class storage.

# anon\_transport\_class\_unregister

**LINUX**

Kernel Hackers Manual March 2019

## Name

`anon_transport_class_unregister` — unregister an anon class

## Synopsis

```
void anon_transport_class_unregister (struct  
anon_transport_class * atc);
```

## Arguments

*atc*

Pointer to the anon transport class to unregister

## Description

Must be called prior to deallocating the memory for the anon transport class.

# transport\_setup\_device

**LINUX**

## Name

`transport_setup_device` — declare a new dev for transport class association but don't make it visible yet.

## Synopsis

```
void transport_setup_device (struct device * dev);
```

## Arguments

*dev*

the generic device representing the entity being added

## Description

Usually, *dev* represents some component in the HBA system (either the HBA itself or a device remote across the HBA bus). This routine is simply a trigger point to see if any set of transport classes wishes to associate with the added device. This allocates storage for the class device and initialises it, but does not yet add it to the system or add attributes to it (you do this with `transport_add_device`). If you have no need for a separate setup and add operations, use `transport_register_device` (see `transport_class.h`).

## `transport_add_device`

**LINUX**

## Name

`transport_add_device` — declare a new dev for transport class association

## Synopsis

```
void transport_add_device (struct device * dev);
```

## Arguments

*dev*

the generic device representing the entity being added

## Description

Usually, *dev* represents some component in the HBA system (either the HBA itself or a device remote across the HBA bus). This routine is simply a trigger point used to add the device to the system and register attributes for it.

# transport\_configure\_device

## LINUX

## Name

`transport_configure_device` — configure an already set up device

## Synopsis

```
void transport_configure_device (struct device * dev);
```

## Arguments

*dev*

generic device representing device to be configured

## Description

The idea of configure is simply to provide a point within the setup process to allow the transport class to extract information from a device after it has been setup. This is used in SCSI because we have to have a setup device to begin using the HBA, but after we send the initial inquiry, we use configure to extract the device parameters. The device need not have been added to be configured.

# transport\_remove\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`transport_remove_device` — remove the visibility of a device

## Synopsis

```
void transport_remove_device (struct device * dev);
```

## Arguments

*dev*

generic device to remove

## Description

This call removes the visibility of the device (to the user from sysfs), but does not destroy it. To eliminate a device entirely you must also call `transport_destroy_device`. If you don't need to do remove and destroy as separate operations, use `transport_unregister_device` (see `transport_class.h`) which will perform both calls for you.

# transport\_destroy\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`transport_destroy_device` — destroy a removed device

## Synopsis

```
void transport_destroy_device (struct device * dev);
```

## Arguments

*dev*

device to eliminate from the transport class.

## Description

This call triggers the elimination of storage associated with the transport classdev.

Note: all it really does is relinquish a reference to the classdev. The memory will not be freed until the last reference goes to zero. Note also that the classdev retains a reference count on dev, so dev too will remain for as long as the transport class device remains around.

# sysdev\_driver\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`sysdev_driver_register` — Register auxillary driver

## Synopsis

```
int sysdev_driver_register (struct sysdev_class * cls, struct
sysdev_driver * drv);
```

## Arguments

*cls*

Device class driver belongs to.

*drv*

Driver.

## Description

*drv* is inserted into *cls->drivers* to be called on each operation on devices of that class. The refcount of *cls* is incremented.

# sysdev\_driver\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

`sysdev_driver_unregister` — Remove an auxillary driver.

## Synopsis

```
void sysdev_driver_unregister (struct sysdev_class * cls,  
struct sysdev_driver * drv);
```

## Arguments

*cls*

Class driver belongs to.

*drv*

Driver.

# sysdev\_register

## LINUX

Kernel Hackers Manual March 2019

### Name

`sysdev_register` — add a system device to the tree

### Synopsis

```
int sysdev_register (struct sys_device * sysdev);
```

### Arguments

*sysdev*

device in question

# sysdev\_suspend

## LINUX

Kernel Hackers Manual March 2019

### Name

`sysdev_suspend` — Suspend all system devices.

## Synopsis

```
int sysdev_suspend (pm_message_t state);
```

## Arguments

*state*

Power state to enter.

## Description

We perform an almost identical operation as `sysdev_shutdown` above, though calling `->suspend` instead. Interrupts are disabled when this called. Devices are responsible for both saving state and quiescing or powering down the device.

This is only called by the device PM core, so we let them handle all synchronization.

# sysdev\_resume

## LINUX

Kernel Hackers Manual March 2019

## Name

`sysdev_resume` — Bring system devices back to life.

## Synopsis

```
int sysdev_resume ( void );
```

## Arguments

*void*

no arguments

## Description

Similar to `sysdev_suspend`, but we iterate the list forwards to guarantee that parent devices are resumed before their children.

## Note

Interrupts are disabled when called.

# platform\_get\_resource

## LINUX

Kernel Hackers Manual March 2019

## Name

`platform_get_resource` — get a resource for a device

## Synopsis

```
struct resource * platform_get_resource (struct  
platform_device * dev, unsigned int type, unsigned int num);
```

## Arguments

*dev*

platform device

*type*

resource type

*num*

resource index

## platform\_get\_irq

**LINUX**

Kernel Hackers Manual March 2019

## Name

`platform_get_irq` — get an IRQ for a device

## Synopsis

```
int platform_get_irq (struct platform_device * dev, unsigned
int num);
```

## Arguments

*dev*

platform device

*num*

IRQ number index

## platform\_get\_resource\_byname

### LINUX

Kernel Hackers Manual March 2019

### Name

`platform_get_resource_byname` — get a resource for a device by name

### Synopsis

```
struct resource * platform_get_resource_byname (struct  
platform_device * dev, unsigned int type, const char * name);
```

### Arguments

*dev*

platform device

*type*

resource type

*name*

resource name

# platform\_get\_irq\_byname

## LINUX

Kernel Hackers Manual March 2019

### Name

`platform_get_irq_byname` — get an IRQ for a device

### Synopsis

```
int platform_get_irq_byname (struct platform_device * dev,  
const char * name);
```

### Arguments

*dev*

platform device

*name*

IRQ name

# platform\_add\_devices

## LINUX

Kernel Hackers Manual March 2019

### Name

`platform_add_devices` — add a numbers of platform devices

## Synopsis

```
int platform_add_devices (struct platform_device ** devs, int
num);
```

## Arguments

*devs*

array of platform devices to add

*num*

number of platform devices in array

## platform\_device\_put

### LINUX

Kernel Hackers Manual March 2019

## Name

platform\_device\_put —

## Synopsis

```
void platform_device_put (struct platform_device * pdev);
```

## Arguments

*pdev*

platform device to free

## Description

Free all memory associated with a platform device. This function must *\_only\_* be externally called in error cases. All other usage is a bug.

# platform\_device\_alloc

## LINUX

Kernel Hackers Manual March 2019

## Name

platform\_device\_alloc —

## Synopsis

```
struct platform_device * platform_device_alloc (const char *  
name, int id);
```

## Arguments

*name*

base name of the device we're adding

*id*

instance id

## Description

Create a platform device object which can have other objects attached to it, and which will have attached objects freed when it is released.

# platform\_device\_add\_resources

## LINUX

Kernel Hackers Manual March 2019

## Name

`platform_device_add_resources` —

## Synopsis

```
int platform_device_add_resources (struct platform_device *  
pdev, struct resource * res, unsigned int num);
```

## Arguments

*pdev*

platform device allocated by `platform_device_alloc` to add resources to

*res*

set of resources that needs to be allocated for the device

*num*

number of resources

## Description

Add a copy of the resources to the platform device. The memory associated with the resources will be freed when the platform device is released.

# platform\_device\_add\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`platform_device_add_data` —

## Synopsis

```
int platform_device_add_data (struct platform_device * pdev,  
const void * data, size_t size);
```

## Arguments

*pdev*

platform device allocated by `platform_device_alloc` to add resources to

*data*

platform specific data for this platform device

*size*

size of platform specific data

## Description

Add a copy of platform specific data to the platform device's `platform_data` pointer. The memory associated with the platform data will be freed when the platform device is released.

# platform\_device\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`platform_device_add` — add a platform device to device hierarchy

## Synopsis

```
int platform_device_add (struct platform_device * pdev);
```

## Arguments

*pdev*

platform device we're adding

## Description

This is part 2 of `platform_device_register`, though may be called separately `_iff_ pdev` was allocated by `platform_device_alloc`.

# platform\_device\_del

## LINUX

Kernel Hackers Manual March 2019

### Name

`platform_device_del` — remove a platform-level device

### Synopsis

```
void platform_device_del (struct platform_device * pdev);
```

### Arguments

*pdev*

platform device we're removing

### Description

Note that this function will also release all memory- and port-based resources owned by the device (*dev->resource*). This function must *\_only\_* be externally called in error cases. All other usage is a bug.

# platform\_device\_register

## LINUX

## Name

`platform_device_register` — add a platform-level device

## Synopsis

```
int platform_device_register (struct platform_device * pdev);
```

## Arguments

*pdev*

platform device we're adding

# platform\_device\_unregister

## LINUX

## Name

`platform_device_unregister` — unregister a platform-level device

## Synopsis

```
void platform_device_unregister (struct platform_device *  
pdev);
```

## Arguments

*pdev*

platform device we're unregistering

## Description

Unregistration is done in 2 steps. First we release all resources and remove it from the subsystem, then we drop reference count by calling `platform_device_put`.

# platform\_device\_register\_simple

## LINUX

Kernel Hackers Manual March 2019

## Name

`platform_device_register_simple` —

## Synopsis

```
struct platform_device * platform_device_register_simple
(const char * name, int id, struct resource * res, unsigned
int num);
```

## Arguments

*name*

base name of the device we're adding

*id*

instance id

*res*

set of resources that needs to be allocated for the device

*num*

number of resources

## Description

This function creates a simple platform device that requires minimal resource and memory management. Canned release function freeing memory allocated for the device allows drivers using such devices to be unloaded without waiting for the last reference to the device to be dropped.

This interface is primarily intended for use with legacy drivers which probe hardware directly. Because such drivers create sysfs device nodes themselves, rather than letting system infrastructure handle such device enumeration tasks, they don't fully conform to the Linux driver model. In particular, when such drivers are built as modules, they can't be "hotplugged".

# platform\_driver\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

platform\_driver\_register —

## Synopsis

```
int platform_driver_register (struct platform_driver * drv);
```

## Arguments

*drv*

platform driver structure

# platform\_driver\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

platform\_driver\_unregister —

## Synopsis

```
void platform_driver_unregister (struct platform_driver *  
drv);
```

## Arguments

*drv*

platform driver structure

# platform\_driver\_probe

## LINUX

Kernel Hackers Manual March 2019

### Name

`platform_driver_probe` — register driver for non-hotpluggable device

### Synopsis

```
int __init_or_module platform_driver_probe (struct
platform_driver * drv, int (*probe) (struct platform_device
*)) ;
```

### Arguments

*drv*

platform driver structure

*probe*

the driver probe routine, probably from an `__init` section

### Description

Use this instead of `platform_driver_register` when you know the device is not hotpluggable and has already been registered, and you want to remove its run-once `probe` infrastructure from memory after the driver has bound to the device.

One typical use for this would be with drivers for controllers integrated into system-on-chip processors, where the controller devices have been configured as part of board setup.

Returns zero if the driver registered and bound to a device, else returns a negative error code and with the driver not registered.

# bus\_for\_each\_dev

## LINUX

Kernel Hackers Manual March 2019

### Name

`bus_for_each_dev` — device iterator.

### Synopsis

```
int bus_for_each_dev (struct bus_type * bus, struct device *  
start, void * data, int (*fn) (struct device *, void *));
```

### Arguments

*bus*

bus type.

*start*

device to start iterating from.

*data*

data for the callback.

*fn*

function to be called for each device.

## Description

Iterate over *bus*'s list of devices, and call *fn* for each, passing it *data*. If *start* is not NULL, we use that device to begin iterating from.

We check the return of *fn* each time. If it returns anything other than 0, we break out and return that value.

## NOTE

The device that returns a non-zero value is not retained in any way, nor is its refcount incremented. If the caller needs to retain this data, it should do so, and increment the reference count in the supplied callback.

# bus\_find\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`bus_find_device` — device iterator for locating a particular device.

## Synopsis

```
struct device * bus_find_device (struct bus_type * bus, struct
device * start, void * data, int (*match) (struct device *dev,
void *data));
```

## Arguments

*bus*

bus type

*start*

Device to begin with

*data*

Data to pass to match function

*match*

Callback function to check device

## Description

This is similar to the `bus_for_each_dev` function above, but it returns a reference to a device that is 'found' for later use, as determined by the *match* callback.

The callback should return 0 if the device doesn't match and non-zero if it does. If the callback returns non-zero, this function will return to the caller and not iterate over any more devices.

# bus\_find\_device\_by\_name

## LINUX

Kernel Hackers Manual March 2019

## Name

`bus_find_device_by_name` — device iterator for locating a particular device of a specific name

## Synopsis

```
struct device * bus_find_device_by_name (struct bus_type *  
bus, struct device * start, const char * name);
```

## Arguments

*bus*

bus type

*start*

Device to begin with

*name*

name of the device to match

## Description

This is similar to the `bus_find_device` function above, but it handles searching by a name automatically, no need to write another `strcmp` matching function.

## `bus_for_each_drv`

### LINUX

Kernel Hackers Manual March 2019

## Name

`bus_for_each_drv` — driver iterator

## Synopsis

```
int bus_for_each_drv (struct bus_type * bus, struct
device_driver * start, void * data, int (*fn) (struct
device_driver *, void *));
```

## Arguments

*bus*

bus we're dealing with.

*start*

driver to start iterating on.

*data*

data to pass to the callback.

*fn*

function to call for each driver.

## Description

This is nearly identical to the device iterator above. We iterate over each driver that belongs to *bus*, and call *fn* for each. If *fn* returns anything but 0, we break out and return it. If *start* is not NULL, we use it as the head of the list.

## NOTE

we don't return the driver that returns a non-zero value, nor do we leave the reference count incremented for that driver. If the caller needs to know that info, it must set it in the callback. It must also be sure to increment the refcount so it doesn't disappear before returning to the caller.

## bus\_rescan\_devices

**LINUX**

Kernel Hackers Manual March 2019

## Name

`bus_rescan_devices` — rescan devices on the bus for possible drivers

## Synopsis

```
int bus_rescan_devices (struct bus_type * bus);
```

## Arguments

*bus*

the bus to scan.

## Description

This function will look for devices on the bus with no driver attached and rescan it against existing drivers to see if it matches any by calling `device_attach` for the unbound devices.

# device\_reprobe

## LINUX

Kernel Hackers Manual March 2019

## Name

`device_reprobe` — remove driver for a device and probe for a new driver

## Synopsis

```
int device_reprobe (struct device * dev);
```

## Arguments

*dev*

the device to reprobe

## Description

This function detaches the attached driver (if any) for the given device and restarts the driver probing process. It is intended to use if probing criteria changed during a devices lifetime and driver attachment should change accordingly.

# bus\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`bus_register` — register a bus with the system.

## Synopsis

```
int bus_register (struct bus_type * bus);
```

## Arguments

*bus*

bus.

## Description

Once we have that, we registered the bus with the kobject infrastructure, then register the children subsystems it has: the devices and drivers that belong to the bus.

# bus\_unregister

## LINUX

Kernel Hackers Manual March 2019

## Name

`bus_unregister` — remove a bus from the system

## Synopsis

```
void bus_unregister (struct bus_type * bus);
```

## Arguments

*bus*

bus.

## Description

Unregister the child subsystems and the bus itself. Finally, we call `bus_put` to release the refcount

## 2.2. Device Drivers Power Management

### dpm\_resume\_noirq

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`dpm_resume_noirq` — Execute “early resume” callbacks for non-sysdev devices.

#### Synopsis

```
void dpm_resume_noirq (pm_message_t state);
```

#### Arguments

*state*

PM transition of the system being carried out.

#### Description

Call the “noirq” resume handlers for all devices marked as DPM\_OFF\_IRQ and enable device drivers to receive interrupts.

### dpm\_resume\_end

**LINUX**

## Name

`dpm_resume_end` — Execute “resume” callbacks and complete system transition.

## Synopsis

```
void dpm_resume_end (pm_message_t state);
```

## Arguments

*state*

PM transition of the system being carried out.

## Description

Execute “resume” callbacks for all devices and complete the PM transition of the system.

# dpm\_suspend\_noirq

## LINUX

## Name

`dpm_suspend_noirq` — Execute “late suspend” callbacks for non-sysdev devices.

## Synopsis

```
int dpm_suspend_noirq (pm_message_t state);
```

## Arguments

*state*

PM transition of the system being carried out.

## Description

Prevent device drivers from receiving interrupts and call the “noirq” suspend handlers for all non-sysdev devices.

# dpm\_suspend\_start

## LINUX

Kernel Hackers Manual March 2019

## Name

dpm\_suspend\_start — Prepare devices for PM transition and suspend them.

## Synopsis

```
int dpm_suspend_start (pm_message_t state);
```

## Arguments

*state*

PM transition of the system being carried out.

## Description

Prepare all non-sysdev devices for system PM transition and execute “suspend” callbacks for them.

## 2.3. Device Drivers ACPI Support

### acpi\_bus\_register\_driver

**LINUX**

Kernel Hackers Manual March 2019

## Name

`acpi_bus_register_driver` — register a driver with the ACPI bus

## Synopsis

```
int acpi_bus_register_driver (struct acpi_driver * driver);
```

## Arguments

*driver*

driver being registered

## Description

Registers a driver with the ACPI bus. Searches the namespace for all devices that match the driver's criteria and binds. Returns zero for success or a negative error status for failure.

# acpi\_bus\_unregister\_driver

## LINUX

Kernel Hackers Manual March 2019

## Name

`acpi_bus_unregister_driver` — unregisters a driver with the APIC bus

## Synopsis

```
void acpi_bus_unregister_driver (struct acpi_driver * driver);
```

## Arguments

*driver*

driver to unregister

## Description

Unregisters a driver with the ACPI bus. Searches the namespace for all devices that match the driver's criteria and unbinds.

# acpi\_bus\_driver\_init

## LINUX

Kernel Hackers Manual March 2019

### Name

`acpi_bus_driver_init` — add a device to a driver

### Synopsis

```
int acpi_bus_driver_init (struct acpi_device * device, struct  
acpi_driver * driver);
```

### Arguments

*device*

the device to add and initialize

*driver*

driver for the device

### Description

Used to initialize a device via its device driver. Called whenever a driver is bound to a device. Invokes the driver's `add` ops.

## 2.4. Device drivers PnP support

### pnp\_register\_protocol

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`pnp_register_protocol` — adds a pnp protocol to the pnp layer

#### Synopsis

```
int pnp_register_protocol (struct pnp_protocol * protocol);
```

#### Arguments

*protocol*

pointer to the corresponding `pnp_protocol` structure

#### Ex protocols

ISAPNP, PNPBIOS, etc

### pnp\_unregister\_protocol

**LINUX**

## Name

`pnp_unregister_protocol` — removes a pnp protocol from the pnp layer

## Synopsis

```
void pnp_unregister_protocol (struct pnp_protocol * protocol);
```

## Arguments

*protocol*

pointer to the corresponding `pnp_protocol` structure

# pnp\_request\_card\_device

## LINUX

## Name

`pnp_request_card_device` — Searches for a PnP device under the specified card

## Synopsis

```
struct pnp_dev * pnp_request_card_device (struct pnp_card_link  
* clink, const char * id, struct pnp_dev * from);
```

## Arguments

*clink*

pointer to the card link, cannot be NULL

*id*

pointer to a PnP ID structure that explains the rules for finding the device

*from*

Starting place to search from. If NULL it will start from the beginning.

## pnnp\_release\_card\_device

### LINUX

Kernel Hackers Manual March 2019

### Name

`pnnp_release_card_device` — call this when the driver no longer needs the device

### Synopsis

```
void pnnp_release_card_device (struct pnp_dev * dev);
```

### Arguments

*dev*

pointer to the PnP device stucture

# pnp\_register\_card\_driver

## LINUX

Kernel Hackers Manual March 2019

### Name

`pnp_register_card_driver` — registers a PnP card driver with the PnP Layer

### Synopsis

```
int pnp_register_card_driver (struct pnp_card_driver * drv);
```

### Arguments

*drv*

pointer to the driver to register

# pnp\_unregister\_card\_driver

## LINUX

Kernel Hackers Manual March 2019

### Name

`pnp_unregister_card_driver` — unregisters a PnP card driver from the PnP Layer

## Synopsis

```
void pnp_unregister_card_driver (struct pnp_card_driver *  
drv);
```

## Arguments

*drv*

pointer to the driver to unregister

## pnp\_add\_id

### LINUX

Kernel Hackers Manual March 2019

## Name

`pnp_add_id` — adds an EISA id to the specified device

## Synopsis

```
struct pnp_id * pnp_add_id (struct pnp_dev * dev, char * id);
```

## Arguments

*dev*

pointer to the desired device

*id*

pointer to an EISA id string

## pnp\_start\_dev

### LINUX

Kernel Hackers Manual March 2019

### Name

`pnp_start_dev` — low-level start of the PnP device

### Synopsis

```
int pnp_start_dev (struct pnp_dev * dev);
```

### Arguments

*dev*

pointer to the desired device

### Description

assumes that resources have already been allocated

# pnp\_stop\_dev

## LINUX

Kernel Hackers Manual March 2019

### Name

`pnp_stop_dev` — low-level disable of the PnP device

### Synopsis

```
int pnp_stop_dev (struct pnp_dev * dev);
```

### Arguments

*dev*

pointer to the desired device

### Description

does not free resources

# pnp\_activate\_dev

## LINUX

Kernel Hackers Manual March 2019

### Name

`pnp_activate_dev` — activates a PnP device for use

## Synopsis

```
int pnp_activate_dev (struct pnp_dev * dev);
```

## Arguments

*dev*

pointer to the desired device

## Description

does not validate or set resources so be careful.

## pnp\_disable\_dev

### LINUX

Kernel Hackers Manual March 2019

## Name

`pnp_disable_dev` — disables device

## Synopsis

```
int pnp_disable_dev (struct pnp_dev * dev);
```

## Arguments

*dev*

pointer to the desired device

## Description

inform the correct pnp protocol so that resources can be used by other devices

# pnp\_is\_active

## LINUX

Kernel Hackers Manual March 2019

## Name

`pnp_is_active` — Determines if a device is active based on its current resources

## Synopsis

```
int pnp_is_active (struct pnp_dev * dev);
```

## Arguments

*dev*

pointer to the desired PnP device

## 2.5. Userspace IO devices

### uio\_event\_notify

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`uio_event_notify` — trigger an interrupt event

#### Synopsis

```
void uio_event_notify (struct uio_info * info);
```

#### Arguments

*info*

UIO device capabilities

### \_\_uio\_register\_device

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`__uio_register_device` — register a new userspace IO device

## Synopsis

```
int __uio_register_device (struct module * owner, struct
device * parent, struct uio_info * info);
```

## Arguments

*owner*

module that creates the new device

*parent*

parent device

*info*

UIO device capabilities

## Description

returns zero on success or a negative error code.

## uio\_unregister\_device

**LINUX**

Kernel Hackers Manual March 2019

## Name

`uio_unregister_device` — unregister a industrial IO device

## Synopsis

```
void uio_unregister_device (struct uio_info * info);
```

## Arguments

*info*

UIO device capabilities

## struct uio\_mem

### LINUX

Kernel Hackers Manual March 2019

## Name

struct uio\_mem — description of a UIO memory region

## Synopsis

```
struct uio_mem {  
    const char * name;  
    unsigned long addr;  
    unsigned long size;  
    int memtype;  
    void __iomem * internal_addr;  
    struct uio_map * map;  
};
```

## Members

name

name of the memory region for identification

addr

address of the device's memory

size

size of IO

memtype

type of memory addr points to

internal\_addr

ioremap-ped version of addr, for driver internal use

map

for use by the UIO core only.

## struct uio\_port

### LINUX

Kernel Hackers Manual March 2019

## Name

struct uio\_port — description of a UIO port region

## Synopsis

```
struct uio_port {  
    const char * name;  
    unsigned long start;  
    unsigned long size;  
    int porttype;  
};
```

```
struct uio_portio * portio;  
};
```

## Members

name

name of the port region for identification

start

start of port region

size

size of port region

porttype

type of port (see `UIO_PORT_*` below)

portio

for use by the UIO core only.

## struct uio\_info

### LINUX

Kernel Hackers Manual March 2019

## Name

struct uio\_info — UIO device capabilities

## Synopsis

```
struct uio_info {  
    struct uio_device * uio_dev;  
    const char * name;  
    const char * version;  
};
```

```
struct uio_mem mem[MAX_UIO_MAPS];
struct uio_port port[MAX_UIO_PORT_REGIONS];
long irq;
unsigned long irq_flags;
void * priv;
irqreturn_t (* handler) (int irq, struct uio_info *dev_info);
int (* mmap) (struct uio_info *info, struct vm_area_struct *vma);
int (* open) (struct uio_info *info, struct inode *inode);
int (* release) (struct uio_info *info, struct inode *inode);
int (* irqcontrol) (struct uio_info *info, s32 irq_on);
};
```

## Members

`uio_dev`

the UIO device this info belongs to

`name`

device name

`version`

device driver version

`mem[MAX_UIO_MAPS]`

list of mappable memory regions, size==0 for end of list

`port[MAX_UIO_PORT_REGIONS]`

list of port regions, size==0 for end of list

`irq`

interrupt number or UIO\_IRQ\_CUSTOM

`irq_flags`

flags for `request_irq`

`priv`

optional private data

`handler`

the device's irq handler

mmap

mmap operation for this uio device

open

open operation for this uio device

release

release operation for this uio device

irqcontrol

disable/enable irqs when 0/1 is written to /dev/uioX

# Chapter 3. Parallel Port Devices

## parport\_yield

**LINUX**

Kernel Hackers Manual March 2019

### Name

`parport_yield` — relinquish a parallel port temporarily

### Synopsis

```
int parport_yield (struct pardevice * dev);
```

### Arguments

*dev*

a device on the parallel port

### Description

This function relinquishes the port if it would be helpful to other drivers to do so. Afterwards it tries to reclaim the port using `parport_claim`, and the return value is the same as for `parport_claim`. If it fails, the port is left unclaimed and it is the driver's responsibility to reclaim the port.

The `parport_yield` and `parport_yield_blocking` functions are for marking points in the driver at which other drivers may claim the port and use their devices. Yielding the port is similar to releasing it and reclaiming it, but is more efficient because no action is taken if there are no other devices needing the port. In fact, nothing is done even if there are other devices waiting but the current device is still

within its “timeslice”. The default timeslice is half a second, but it can be adjusted via the `/proc` interface.

## parport\_yield\_blocking

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_yield_blocking` — relinquish a parallel port temporarily

### Synopsis

```
int parport_yield_blocking (struct pardevice * dev);
```

### Arguments

*dev*

a device on the parallel port

### Description

This function relinquishes the port if it would be helpful to other drivers to do so. Afterwards it tries to reclaim the port using `parport_claim_or_block`, and the return value is the same as for `parport_claim_or_block`.

# parport\_wait\_event

## LINUX

Kernel Hackers Manual March 2019

### Name

`parport_wait_event` — wait for an event on a parallel port

### Synopsis

```
int parport_wait_event (struct parport * port, signed long  
timeout);
```

### Arguments

*port*

port to wait on

*timeout*

time to wait (in jiffies)

### Description

This function waits for up to *timeout* jiffies for an interrupt to occur on a parallel port. If the port timeout is set to zero, it returns immediately.

If an interrupt occurs before the timeout period elapses, this function returns zero immediately. If it times out, it returns one. An error code less than zero indicates an error (most likely a pending signal), and the calling code should finish what it's doing as soon as it can.

# parport\_wait\_peripheral

## LINUX

Kernel Hackers Manual March 2019

### Name

`parport_wait_peripheral` — wait for status lines to change in 35ms

### Synopsis

```
int parport_wait_peripheral (struct parport * port, unsigned
char mask, unsigned char result);
```

### Arguments

*port*

port to watch

*mask*

status lines to watch

*result*

desired values of chosen status lines

### Description

This function waits until the masked status lines have the desired values, or until 35ms have elapsed (see IEEE 1284-1994 page 24 to 25 for why this value in particular is hardcoded). The *mask* and *result* parameters are bitmasks, with the bits defined by the constants in `parport.h`: `PARPORT_STATUS_BUSY`, and so on.

The port is polled quickly to start off with, in anticipation of a fast response from the peripheral. This fast polling time is configurable (using `/proc`), and defaults to

500usec. If the timeout for this port (see `parport_set_timeout`) is zero, the fast polling time is 35ms, and this function does not call `schedule`.

If the timeout for this port is non-zero, after the fast polling fails it uses `parport_wait_event` to wait for up to 10ms, waking up if an interrupt occurs.

## parport\_negotiate

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_negotiate` — negotiate an IEEE 1284 mode

### Synopsis

```
int parport_negotiate (struct parport * port, int mode);
```

### Arguments

*port*

port to use

*mode*

mode to negotiate to

### Description

Use this to negotiate to a particular IEEE 1284 transfer mode. The *mode* parameter should be one of the constants in `parport.h` starting `IEEE1284_MODE_xxx`.

The return value is 0 if the peripheral has accepted the negotiation to the mode specified, -1 if the peripheral is not IEEE 1284 compliant (or not present), or 1 if the peripheral has rejected the negotiation.

## parport\_write

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_write` — write a block of data to a parallel port

### Synopsis

```
ssize_t parport_write (struct parport * port, const void *  
buffer, size_t len);
```

### Arguments

*port*

port to write to

*buffer*

data buffer (in kernel space)

*len*

number of bytes of data to transfer

## Description

This will write up to *len* bytes of *buffer* to the port specified, using the IEEE 1284 transfer mode most recently negotiated to (using `parport_negotiate`), as long as that mode supports forward transfers (host to peripheral).

It is the caller's responsibility to ensure that the first *len* bytes of *buffer* are valid.

This function returns the number of bytes transferred (if zero or positive), or else an error code.

## parport\_read

### LINUX

Kernel Hackers Manual March 2019

## Name

`parport_read` — read a block of data from a parallel port

## Synopsis

```
ssize_t parport_read (struct parport * port, void * buffer,
size_t len);
```

## Arguments

*port*

port to read from

*buffer*

data buffer (in kernel space)

*len*

number of bytes of data to transfer

## Description

This will read up to *len* bytes of *buffer* to the port specified, using the IEEE 1284 transfer mode most recently negotiated to (using `parport_negotiate`), as long as that mode supports reverse transfers (peripheral to host).

It is the caller's responsibility to ensure that the first *len* bytes of *buffer* are available to write to.

This function returns the number of bytes transferred (if zero or positive), or else an error code.

# parport\_set\_timeout

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_set_timeout` — set the inactivity timeout for a device

## Synopsis

```
long parport_set_timeout (struct pardevice * dev, long  
inactivity);
```

## Arguments

*dev*

device on a port

*inactivity*

inactivity timeout (in jiffies)

## Description

This sets the inactivity timeout for a particular device on a port. This affects functions like `parport_wait_peripheral`. The special value 0 means not to call `schedule` while dealing with this device.

The return value is the previous inactivity timeout.

Any callers of `parport_wait_event` for this device are woken up.

# parport\_register\_driver

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_register_driver` — register a parallel port device driver

## Synopsis

```
int parport_register_driver (struct parport_driver * drv);
```

## Arguments

*drv*

structure describing the driver

## Description

This can be called by a parallel port device driver in order to receive notifications about ports being found in the system, as well as ports no longer available.

The `drv` structure is allocated by the caller and must not be deallocated until after calling `parport_unregister_driver`.

The driver's `attach` function may block. The port that `attach` is given will be valid for the duration of the callback, but if the driver wants to take a copy of the pointer it must call `parport_get_port` to do so. Calling `parport_register_device` on that port will do this for you.

The driver's `detach` function may block. The port that `detach` is given will be valid for the duration of the callback, but if the driver wants to take a copy of the pointer it must call `parport_get_port` to do so.

Returns 0 on success. Currently it always succeeds.

## parport\_unregister\_driver

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_unregister_driver` — deregister a parallel port device driver

### Synopsis

```
void parport_unregister_driver (struct parport_driver * drv);
```

## Arguments

*drv*

structure describing the driver that was given to `parport_register_driver`

## Description

This should be called by a parallel port device driver that has registered itself using `parport_register_driver` when it is about to be unloaded.

When it returns, the driver's `attach` routine will no longer be called, and for each port that `attach` was called for, the `detach` routine will have been called.

All the driver's `attach` and `detach` calls are guaranteed to have finished by the time this function returns.

## parport\_get\_port

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_get_port` — increment a port's reference count

### Synopsis

```
struct parport * parport_get_port (struct parport * port);
```

## Arguments

*port*

the port

## Description

This ensures that a struct `parport` pointer remains valid until the matching `parport_put_port` call.

# parport\_put\_port

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_put_port` — decrement a port's reference count

## Synopsis

```
void parport_put_port (struct parport * port);
```

## Arguments

*port*

the port

## Description

This should be called once for each call to `parport_get_port`, once the port is no longer needed.

# parport\_register\_port

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_register_port` — register a parallel port

## Synopsis

```
struct parport * parport_register_port (unsigned long base,
int irq, int dma, struct parport_operations * ops);
```

## Arguments

*base*

base I/O address

*irq*

IRQ line

*dma*

DMA channel

*ops*

pointer to the port driver's port operations structure

## Description

When a parallel port (lowlevel) driver finds a port that should be made available to parallel port device drivers, it should call `parport_register_port`. The *base*, *irq*, and *dma* parameters are for the convenience of port drivers, and for ports where they aren't meaningful needn't be set to anything special. They can be altered afterwards by adjusting the relevant members of the `parport` structure that is returned and represents the port. They should not be tampered with after calling `parport_announce_port`, however.

If there are parallel port device drivers in the system that have registered themselves using `parport_register_driver`, they are not told about the port at this time; that is done by `parport_announce_port`.

The *ops* structure is allocated by the caller, and must not be deallocated before calling `parport_remove_port`.

If there is no memory to allocate a new `parport` structure, this function will return `NULL`.

## parport\_announce\_port

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_announce_port` — tell device drivers about a parallel port

### Synopsis

```
void parport_announce_port (struct parport * port);
```

## Arguments

*port*

parallel port to announce

## Description

After a port driver has registered a parallel port with `parport_register_port`, and performed any necessary initialisation or adjustments, it should call `parport_announce_port` in order to notify all device drivers that have called `parport_register_driver`. Their attach functions will be called, with *port* as the parameter.

# parport\_remove\_port

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_remove_port` — deregister a parallel port

## Synopsis

```
void parport_remove_port (struct parport * port);
```

## Arguments

*port*

parallel port to deregister

## Description

When a parallel port driver is forcibly unloaded, or a parallel port becomes inaccessible, the port driver must call this function in order to deal with device drivers that still want to use it.

The `parport` structure associated with the port has its operations structure replaced with one containing 'null' operations that return errors or just don't do anything.

Any drivers that have registered themselves using `parport_register_driver` are notified that the port is no longer accessible by having their `detach` routines called with `port` as the parameter.

## parport\_register\_device

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_register_device` — register a device on a parallel port

### Synopsis

```
struct pardevice * parport_register_device (struct parport *  
port, const char * name, int (*pf) (void *), void (*kf) (void  
*), void (*irq_func) (void *), int flags, void * handle);
```

### Arguments

*port*

port to which the device is attached

*name*

a name to refer to the device

*pf*

preemption callback

*kf*

kick callback (wake-up)

*irq\_func*

interrupt handler

*flags*

registration flags

*handle*

data for callback functions

## Description

This function, called by parallel port device drivers, declares that a device is connected to a port, and tells the system all it needs to know.

The *name* is allocated by the caller and must not be deallocated until the caller calls *parport\_unregister\_device* for that device.

The preemption callback function, *pf*, is called when this device driver has claimed access to the port but another device driver wants to use it. It is given *handle* as its parameter, and should return zero if it is willing for the system to release the port to another driver on its behalf. If it wants to keep control of the port it should return non-zero, and no action will be taken. It is good manners for the driver to try to release the port at the earliest opportunity after its preemption callback rejects a preemption attempt. Note that if a preemption callback is happy for preemption to go ahead, there is no need to release the port; it is done automatically. This function may not block, as it may be called from interrupt context. If the device driver does not support preemption, *pf* can be `NULL`.

The wake-up (“kick”) callback function, *kf*, is called when the port is available to be claimed for exclusive access; that is, *parport\_claim* is guaranteed to succeed when called from inside the wake-up callback function. If the driver wants to claim the port it should do so; otherwise, it need not take any action. This function may not block, as it may be called from interrupt context. If the device driver does not want to be explicitly invited to claim the port in this way, *kf* can be `NULL`.

The interrupt handler, `irq_func`, is called when an interrupt arrives from the parallel port. Note that if a device driver wants to use interrupts it should use `parport_enable_irq`, and can also check the `irq` member of the `parport` structure representing the port.

The parallel port (lowlevel) driver is the one that has called `request_irq` and whose interrupt handler is called first. This handler does whatever needs to be done to the hardware to acknowledge the interrupt (for PC-style ports there is nothing special to be done). It then tells the IEEE 1284 code about the interrupt, which may involve reacting to an IEEE 1284 event depending on the current IEEE 1284 phase. After this, it calls `irq_func`. Needless to say, `irq_func` will be called from interrupt context, and may not block.

The `PARPORT_DEV_EXCL` flag is for preventing port sharing, and so should only be used when sharing the port with other device drivers is impossible and would lead to incorrect behaviour. Use it sparingly! Normally, `flags` will be zero.

This function returns a pointer to a structure that represents the device on the port, or `NULL` if there is not enough memory to allocate space for that structure.

## parport\_unregister\_device

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_unregister_device` — deregister a device on a parallel port

### Synopsis

```
void parport_unregister_device (struct pardevice * dev);
```

## Arguments

*dev*

pointer to structure representing device

## Description

This undoes the effect of `parport_register_device`.

# parport\_find\_number

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_find_number` — find a parallel port by number

## Synopsis

```
struct parport * parport_find_number (int number);
```

## Arguments

*number*

parallel port number

## Description

This returns the parallel port with the specified number, or `NULL` if there is none.

There is an implicit `parport_get_port` done already; to throw away the reference to the port that `parport_find_number` gives you, use `parport_put_port`.

## parport\_find\_base

### LINUX

Kernel Hackers Manual March 2019

### Name

`parport_find_base` — find a parallel port by base address

### Synopsis

```
struct parport * parport_find_base (unsigned long base);
```

### Arguments

*base*

base I/O address

### Description

This returns the parallel port with the specified base address, or `NULL` if there is none.

There is an implicit `parport_get_port` done already; to throw away the reference to the port that `parport_find_base` gives you, use `parport_put_port`.

# parport\_claim

## LINUX

Kernel Hackers Manual March 2019

### Name

`parport_claim` — claim access to a parallel port device

### Synopsis

```
int parport_claim (struct pardevice * dev);
```

### Arguments

*dev*

pointer to structure representing a device on the port

### Description

This function will not block and so can be used from interrupt context. If `parport_claim` succeeds in claiming access to the port it returns zero and the port is available to use. It may fail (returning non-zero) if the port is in use by another driver and that driver is not willing to relinquish control of the port.

# parport\_claim\_or\_block

## LINUX

## Name

`parport_claim_or_block` — claim access to a parallel port device

## Synopsis

```
int parport_claim_or_block (struct pardevice * dev);
```

## Arguments

*dev*

pointer to structure representing a device on the port

## Description

This behaves like `parport_claim`, but will block if necessary to wait for the port to be free. A return value of 1 indicates that it slept; 0 means that it succeeded without needing to sleep. A negative error code indicates failure.

# parport\_release

## LINUX

## Name

`parport_release` — give up access to a parallel port device

## Synopsis

```
void parport_release (struct pardevice * dev);
```

## Arguments

*dev*

pointer to structure representing parallel port device

## Description

This function cannot fail, but it should not be called without the port claimed. Similarly, if the port is already claimed you should not try claiming it again.

# parport\_open

## LINUX

Kernel Hackers Manual March 2019

## Name

`parport_open` — find a device by canonical device number

## Synopsis

```
struct pardevice * parport_open (int devnum, const char *  
name);
```

## Arguments

*devnum*

canonical device number

*name*

name to associate with the device

## Description

This function is similar to `parport_register_device`, except that it locates a device by its number rather than by the port it is attached to.

All parameters except for *devnum* are the same as for `parport_register_device`. The return value is the same as for `parport_register_device`.

## parport\_close

### LINUX

Kernel Hackers Manual March 2019

## Name

`parport_close` — close a device opened with `parport_open`

## Synopsis

```
void parport_close (struct pardevice * dev);
```

## **Arguments**

*dev*

device to close

## **Description**

This is to `parport_open` as `parport_unregister_device` is to `parport_register_device`.

# Chapter 4. Message-based devices

## 4.1. Fusion message devices

### mpt\_register

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`mpt_register` — Register protocol-specific main callback handler.

#### Synopsis

```
u8 mpt_register (MPT_CALLBACK cbfunc, MPT_DRIVER_CLASS
dclass);
```

#### Arguments

*cbfunc*

callback function pointer

*dclass*

Protocol driver's class (MPT\_DRIVER\_CLASS enum value)

#### Description

This routine is called by a protocol-specific driver (SCSI host, LAN, SCSI target) to register its reply callback routine. Each protocol-specific driver must do this before it will be able to use any IOC resources, such as obtaining request frames.

## NOTES

The SCSI protocol driver currently calls this routine thrice in order to register separate callbacks; one for “normal” SCSI IO; one for MptScsiTaskMgmt requests; one for Scan/DV requests.

Returns u8 valued “handle” in the range (and S.O.D. order) {N,...,7,6,5,...,1} if successful. A return value of MPT\_MAX\_PROTOCOL\_DRIVERS (including zero!) should be considered an error by the caller.

## mpt\_deregister

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_deregister` — Deregister a protocol drivers resources.

### Synopsis

```
void mpt_deregister (u8 cb_idx);
```

### Arguments

*cb\_idx*

previously registered callback handle

### Description

Each protocol-specific driver should call this routine when its module is unloaded.

# mpt\_event\_register

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_event_register` — Register protocol-specific event callback handler.

### Synopsis

```
int mpt_event_register (u8 cb_idx, MPT_EVHANDLER ev_cbfunc);
```

### Arguments

*cb\_idx*

previously registered (via `mpt_register`) callback handle

*ev\_cbfunc*

callback function

### Description

This routine can be called by one or more protocol-specific drivers if/when they choose to be notified of MPT events.

Returns 0 for success.

# mpt\_event\_deregister

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_event_deregister` — Deregister protocol-specific event callback handler

### Synopsis

```
void mpt_event_deregister (u8 cb_idx);
```

### Arguments

*cb\_idx*

previously registered callback handle

### Description

Each protocol-specific driver should call this routine when it does not (or can no longer) handle events, or when its module is unloaded.

# mpt\_reset\_register

## LINUX

## Name

`mpt_reset_register` — Register protocol-specific IOC reset handler.

## Synopsis

```
int mpt_reset_register (u8 cb_idx, MPT_RESETHANDLER  
reset_func);
```

## Arguments

*cb\_idx*

previously registered (via `mpt_register`) callback handle

*reset\_func*

reset function

## Description

This routine can be called by one or more protocol-specific drivers if/when they choose to be notified of IOC resets.

Returns 0 for success.

## `mpt_reset_deregister`

**LINUX**

## Name

`mpt_reset_deregister` — Deregister protocol-specific IOC reset handler.

## Synopsis

```
void mpt_reset_deregister (u8 cb_idx);
```

## Arguments

`cb_idx`

previously registered callback handle

## Description

Each protocol-specific driver should call this routine when it does not (or can no longer) handle IOC reset handling, or when its module is unloaded.

# mpt\_device\_driver\_register

## LINUX

## Name

`mpt_device_driver_register` — Register device driver hooks

## Synopsis

```
int mpt_device_driver_register (struct mpt_pci_driver *  
dd_cbfunc, u8 cb_idx);
```

## Arguments

*dd\_cbfunc*

driver callbacks struct

*cb\_idx*

MPT protocol driver index

## mpt\_device\_driver\_deregister

### LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_device_driver_deregister` — DeRegister device driver hooks

## Synopsis

```
void mpt_device_driver_deregister (u8 cb_idx);
```

## Arguments

*cb\_idx*

MPT protocol driver index

# mpt\_get\_msg\_frame

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_get_msg_frame` — Obtain an MPT request frame from the pool

## Synopsis

```
MPT_FRAME_HDR* mpt_get_msg_frame (u8 cb_idx, MPT_ADAPTER *  
ioc);
```

## Arguments

*cb\_idx*

Handle of registered MPT protocol driver

*ioc*

Pointer to MPT adapter structure

## Description

Obtain an MPT request frame from the pool (of 1024) that are allocated per MPT adapter.

Returns pointer to a MPT request frame or `NULL` if none are available or IOC is not active.

## mpt\_put\_msg\_frame

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_put_msg_frame` — Send a protocol-specific MPT request frame to an IOC

### Synopsis

```
void mpt_put_msg_frame (u8 cb_idx, MPT_ADAPTER * ioc,  
MPT_FRAME_HDR * mf);
```

### Arguments

*cb\_idx*

Handle of registered MPT protocol driver

*ioc*

Pointer to MPT adapter structure

*mf*

Pointer to MPT request frame

## Description

This routine posts an MPT request frame to the request post FIFO of a specific MPT adapter.

# mpt\_put\_msg\_frame\_hi\_pri

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_put_msg_frame_hi_pri` — Send a hi-pri protocol-specific MPT request frame

## Synopsis

```
void mpt_put_msg_frame_hi_pri (u8 cb_idx, MPT_ADAPTER * ioc,  
MPT_FRAME_HDR * mf);
```

## Arguments

*cb\_idx*

Handle of registered MPT protocol driver

*ioc*

Pointer to MPT adapter structure

*mf*

Pointer to MPT request frame

## Description

Send a protocol-specific MPT request frame to an IOC using hi-priority request queue.

This routine posts an MPT request frame to the request post FIFO of a specific MPT adapter.

# mpt\_free\_msg\_frame

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_free_msg_frame` — Place MPT request frame back on FreeQ.

## Synopsis

```
void mpt_free_msg_frame (MPT_ADAPTER * ioc, MPT_FRAME_HDR *  
mf);
```

## Arguments

*ioc*

Pointer to MPT adapter structure

*mf*

Pointer to MPT request frame

## Description

This routine places a MPT request frame back on the MPT adapter's FreeQ.

# mpt\_send\_handshake\_request

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_send_handshake_request` — Send MPT request via doorbell handshake method.

### Synopsis

```
int mpt_send_handshake_request (u8 cb_idx, MPT_ADAPTER * ioc,  
int reqBytes, u32 * req, int sleepFlag);
```

### Arguments

*cb\_idx*

Handle of registered MPT protocol driver

*ioc*

Pointer to MPT adapter structure

*reqBytes*

Size of the request in bytes

*req*

Pointer to MPT request frame

*sleepFlag*

Use schedule if CAN\_SLEEP else use udelay.

## Description

This routine is used exclusively to send MptScsiTaskMgmt requests since they are required to be sent via doorbell handshake.

## NOTE

It is the callers responsibility to byte-swap fields in the request which are greater than 1 byte in size.

Returns 0 for success, non-zero for failure.

# mpt\_verify\_adapter

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_verify_adapter` — Given IOC identifier, set pointer to its adapter structure.

## Synopsis

```
int mpt_verify_adapter (int iocid, MPT_ADAPTER ** iocpp);
```

## Arguments

*iocid*

IOC unique identifier (integer)

*iocpp*

Pointer to pointer to IOC adapter

## Description

Given a unique IOC identifier, set pointer to the associated MPT adapter structure.

Returns iocid and sets iocpp if iocid is found. Returns -1 if iocid is not found.

## mpt\_attach

### LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_attach` — Install a PCI intelligent MPT adapter.

## Synopsis

```
int mpt_attach (struct pci_dev * pdev, const struct  
pci_device_id * id);
```

## Arguments

*pdev*

Pointer to `pci_dev` structure

*id*

PCI device ID information

## Description

This routine performs all the steps necessary to bring the IOC of a MPT adapter to a OPERATIONAL state. This includes registering memory regions, registering the interrupt, and allocating request and reply memory pools.

This routine also pre-fetches the LAN MAC address of a Fibre Channel MPT adapter.

Returns 0 for success, non-zero for failure.

## TODO

Add support for polled controllers

# mpt\_detach

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_detach` — Remove a PCI intelligent MPT adapter.

## Synopsis

```
void mpt_detach (struct pci_dev * pdev);
```

## Arguments

*pdev*

Pointer to `pci_dev` structure

## mpt\_suspend

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_suspend` — Fusion MPT base driver suspend routine.

### Synopsis

```
int mpt_suspend (struct pci_dev * pdev, pm_message_t state);
```

### Arguments

*pdev*

Pointer to `pci_dev` structure

*state*

new state to enter

## mpt\_resume

### LINUX

## Name

`mpt_resume` — Fusion MPT base driver resume routine.

## Synopsis

```
int mpt_resume (struct pci_dev * pdev);
```

## Arguments

*pdev*

Pointer to `pci_dev` structure

# mpt\_GetIocState

## LINUX

## Name

`mpt_GetIocState` — Get the current state of a MPT adapter.

## Synopsis

```
u32 mpt_GetIocState (MPT_ADAPTER * ioc, int cooked);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*cooked*

Request raw or cooked IOC state

## Description

Returns all IOC Doorbell register bits if `cooked==0`, else just the Doorbell bits in `MPI_IOC_STATE_MASK`.

# mpt\_alloc\_fw\_memory

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_alloc_fw_memory` — allocate firmware memory

## Synopsis

```
int mpt_alloc_fw_memory (MPT_ADAPTER * ioc, int size);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*size*

total FW bytes

## Description

If memory has already been allocated, the same (cached) value is returned.

Return 0 if successfull, or non-zero for failure

# mpt\_free\_fw\_memory

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_free_fw_memory` — free firmware memory

## Synopsis

```
void mpt_free_fw_memory (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

## Description

If `alt_img` is NULL, delete from `ioc` structure. Else, delete a secondary image in same format.

# mptbase\_sas\_persist\_operation

## LINUX

Kernel Hackers Manual March 2019

### Name

`mptbase_sas_persist_operation` — Perform operation on SAS Persistent Table

### Synopsis

```
int mptbase_sas_persist_operation (MPT_ADAPTER * ioc, u8  
persist_opcode);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*persist\_opcode*

see below

### Description

MPI\_SAS\_OP\_CLEAR\_NOT\_PRESENT - Free all persist TargetID mappings for devices not currently present. MPI\_SAS\_OP\_CLEAR\_ALL\_PERSISTENT - Clear all persist TargetID mappings

## NOTE

Don't use not this function during interrupt time.

Returns 0 for success, non-zero error

# mpt\_raid\_phys\_disk\_pg0

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_raid_phys_disk_pg0` — returns phys disk page zero

## Synopsis

```
int mpt_raid_phys_disk_pg0 (MPT_ADAPTER * ioc, u8  
phys_disk_num, RaidPhysDiskPage0_t * phys_disk);
```

## Arguments

*ioc*

Pointer to a Adapter Structure

*phys\_disk\_num*

io unit unique phys disk num generated by the ioc

*phys\_disk*

requested payload data returned

## Return

0 on success -EFAULT if read of config page header fails or data pointer not NULL  
-ENOMEM if pci\_alloc failed

# mpt\_raid\_phys\_disk\_get\_num\_paths

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_raid_phys_disk_get_num_paths` — returns number paths associated to this `phys_num`

## Synopsis

```
int mpt_raid_phys_disk_get_num_paths (MPT_ADAPTER * ioc, u8  
phys_disk_num);
```

## Arguments

*ioc*

Pointer to a Adapter Structure

*phys\_disk\_num*

io unit unique phys disk num generated by the ioc

## Return

returns number paths

# mpt\_raid\_phys\_disk\_pg1

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_raid_phys_disk_pg1` — returns phys disk page 1

### Synopsis

```
int mpt_raid_phys_disk_pg1 (MPT_ADAPTER * ioc, u8
phys_disk_num, RaidPhysDiskPage1_t * phys_disk);
```

### Arguments

*ioc*

Pointer to a Adapter Structure

*phys\_disk\_num*

io unit unique phys disk num generated by the ioc

*phys\_disk*

requested payload data returned

### Return

0 on success -EFAULT if read of config page header fails or data pointer not NULL  
-ENOMEM if pci\_alloc failed

# mpt\_findImVolumes

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_findImVolumes` — Identify IDs of hidden disks and RAID Volumes

### Synopsis

```
int mpt_findImVolumes (MPT_ADAPTER * ioc);
```

### Arguments

*ioc*

Pointer to a Adapter Strucutre

### Return

0 on success -EFAULT if read of config page header fails or data pointer not NULL  
-ENOMEM if pci\_alloc failed

## mpt\_config

## LINUX

## Name

`mpt_config` — Generic function to issue config message

## Synopsis

```
int mpt_config (MPT_ADAPTER * ioc, CONFIGPARMS * pCfg);
```

## Arguments

*ioc*

Pointer to an adapter structure

*pCfg*

Pointer to a configuration structure. Struct contains action, page address, direction, physical address and pointer to a configuration page header Page header is updated.

## Description

Returns 0 for success -EPERM if not allowed due to ISR context -EAGAIN if no msg frames currently available -EFAULT for non-successful reply or no reply (timeout)

## `mpt_print_ioc_summary`

**LINUX**

## Name

`mpt_print_ioc_summary` — Write ASCII summary of IOC to a buffer.

## Synopsis

```
void mpt_print_ioc_summary (MPT_ADAPTER * ioc, char * buffer,  
int * size, int len, int showlan);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*buffer*

Pointer to buffer where IOC summary info should be written

*size*

Pointer to number of bytes we wrote (set by this routine)

*len*

Offset at which to start writing in buffer

*showlan*

Display LAN stuff?

## Description

This routine writes (english readable) ASCII text, which represents a summary of IOC information, to a buffer.

# mpt\_set\_taskmgmt\_in\_progress\_flag

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_set_taskmgmt_in_progress_flag` — set flags associated with task management

### Synopsis

```
int mpt_set_taskmgmt_in_progress_flag (MPT_ADAPTER * ioc);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

### Description

Returns 0 for SUCCESS or -1 if FAILED.

If -1 is return, then it was not possible to set the flags

# mpt\_clear\_taskmgmt\_in\_progress\_flag

## LINUX

## Name

`mpt_clear_taskmgmt_in_progress_flag` — clear flags associated with task management

## Synopsis

```
void mpt_clear_taskmgmt_in_progress_flag (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

# mpt\_halt\_firmware

## LINUX

## Name

`mpt_halt_firmware` — Halts the firmware if it is operational and panic the kernel

## Synopsis

```
void mpt_halt_firmware (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

# mpt\_SoftResetHandler

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_SoftResetHandler` — Issues a less expensive reset

## Synopsis

```
int mpt_SoftResetHandler (MPT_ADAPTER * ioc, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sleepFlag*

Indicates if sleep or schedule must be called.

## Description

Returns 0 for SUCCESS or -1 if FAILED.

Message Unit Reset - instructs the IOC to reset the Reply Post and Free FIFO's. All the Message Frames on Reply Free FIFO are discarded. All posted buffers are freed, and event notification is turned off. IOC doesn't reply to any outstanding request. This will transfer IOC to READY state.

## mpt\_HardResetHandler

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_HardResetHandler` — Generic reset handler

### Synopsis

```
int mpt_HardResetHandler (MPT_ADAPTER * ioc, int sleepFlag);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sleepFlag*

Indicates if sleep or schedule must be called.

### Description

Issues SCSI Task Management call based on input arg values. If TaskMgmt fails, returns associated SCSI request.

## Remark

`_HardResetHandler` can be invoked from an interrupt thread (timer) or a non-interrupt thread. In the former, must not call `schedule`.

## Note

A return of -1 is a FATAL error case, as it means a FW reload/initialization failed.

Returns 0 for SUCCESS or -1 if FAILED.

# mpt\_set\_debug\_level

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_set_debug_level` — global setting of the `mpt_debug_level` found via `/sys/module/mptbase/parameters/mpt_debug_level`

## Synopsis

```
int mpt_set_debug_level (const char * val, struct kernel_param
* kp);
```

## Arguments

*val*

-- undescribed --

*kp*

## Description

Returns

# mpt\_get\_cb\_idx

**LINUX**

Kernel Hackers Manual March 2019

## Name

`mpt_get_cb_idx` — obtain `cb_idx` for registered driver

## Synopsis

```
u8 mpt_get_cb_idx (MPT_DRIVER_CLASS dclass);
```

## Arguments

*dclass*

class driver enum

## Description

Returns `cb_idx`, or zero means it wasn't found

# mpt\_is\_discovery\_complete

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_is_discovery_complete` — determine if discovery has completed

### Synopsis

```
int mpt_is_discovery_complete (MPT_ADAPTER * ioc);
```

### Arguments

*ioc*

per adapter instance

### Description

Returns 1 when discovery completed, else zero.

# mpt\_fault\_reset\_work

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_fault_reset_work` — work performed on workq after ioc fault

## Synopsis

```
void mpt_fault_reset_work (struct work_struct * work);
```

## Arguments

*work*

input argument, used to derive ioc

## mpt\_interrupt

### LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_interrupt` — MPT adapter (IOC) specific interrupt handler.

## Synopsis

```
irqreturn_t mpt_interrupt (int irq, void * bus_id);
```

## Arguments

*irq*

irq number (not used)

*bus\_id*

bus identifier cookie == pointer to MPT\_ADAPTER structure

## Description

This routine is registered via the `request_irq` kernel API call, and handles all interrupts generated from a specific MPT adapter (also referred to as a IO Controller or IOC). This routine must clear the interrupt from the adapter and does so by reading the reply FIFO. Multiple replies may be processed per single call to this routine.

This routine handles register-level access of the adapter but dispatches (calls) a protocol-specific callback routine to handle the protocol-specific details of the MPT request completion.

## mptbase\_reply

### LINUX

Kernel Hackers Manual March 2019

### Name

`mptbase_reply` — MPT base driver's callback routine

### Synopsis

```
int mptbase_reply (MPT_ADAPTER * ioc, MPT_FRAME_HDR * req,
MPT_FRAME_HDR * reply);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*req*

Pointer to original MPT request frame

*reply*

Pointer to MPT reply frame (NULL if TurboReply)

## Description

MPT base driver's callback routine; all base driver "internal" request/reply processing is routed here. Currently used for EventNotification and EventAck handling.

Returns 1 indicating original alloc'd request frame ptr should be freed, or 0 if it shouldn't.

## mpt\_add\_sge

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_add_sge` — Place a simple 32 bit SGE at address `pAddr`.

### Synopsis

```
void mpt_add_sge (void * pAddr, u32 flagslength, dma_addr_t  
  dma_addr);
```

## Arguments

*pAddr*

virtual address for SGE

*flagslength*

SGE flags and data transfer length

*dma\_addr*

Physical address

## Description

This routine places a MPT request frame back on the MPT adapter's FreeQ.

# mpt\_add\_sge\_64bit

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_add_sge_64bit` — Place a simple 64 bit SGE at address `pAddr`.

## Synopsis

```
void mpt_add_sge_64bit (void * pAddr, u32 flagslength,  
dma_addr_t dma_addr);
```

## Arguments

*pAddr*

virtual address for SGE

*flagslength*

SGE flags and data transfer length

*dma\_addr*

Physical address

## Description

This routine places a MPT request frame back on the MPT adapter's FreeQ.

# mpt\_add\_sge\_64bit\_1078

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_add_sge_64bit_1078` — Place a simple 64 bit SGE at address `pAddr` (1078 workaround).

## Synopsis

```
void mpt_add_sge_64bit_1078 (void * pAddr, u32 flagslength,  
dma_addr_t dma_addr);
```

## Arguments

*pAddr*

virtual address for SGE

*flagslength*

SGE flags and data transfer length

*dma\_addr*

Physical address

## Description

This routine places a MPT request frame back on the MPT adapter's FreeQ.

# mpt\_add\_chain

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_add_chain` — Place a 32 bit chain SGE at address `pAddr`.

## Synopsis

```
void mpt_add_chain (void * pAddr, u8 next, u16 length,  
dma_addr_t dma_addr);
```

## Arguments

*pAddr*

virtual address for SGE

*next*

nextChainOffset value (u32's)

*length*

length of next SGL segment

*dma\_addr*

Physical address

## mpt\_add\_chain\_64bit

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_add_chain_64bit` — Place a 64 bit chain SGE at address `pAddr`.

### Synopsis

```
void mpt_add_chain_64bit (void * pAddr, u8 next, u16 length,  
dma_addr_t dma_addr);
```

## Arguments

*pAddr*

virtual address for SGE

*next*

nextChainOffset value (u32's)

*length*

length of next SGL segment

*dma\_addr*

Physical address

## mpt\_host\_page\_access\_control

### LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_host_page_access_control` — control the IOC's Host Page Buffer access

### Synopsis

```
int mpt_host_page_access_control (MPT_ADAPTER * ioc, u8  
access_control_value, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT adapter structure

*access\_control\_value*

define bits below

*sleepFlag*

Specifies whether the process can sleep

## Description

Provides mechanism for the host driver to control the IOC's Host Page Buffer access.

Access Control Value - bits[15:12] 0h Reserved 1h Enable Access {  
MPI\_DB\_HPBACK\_ENABLE\_ACCESS } 2h Disable Access {  
MPI\_DB\_HPBACK\_DISABLE\_ACCESS } 3h Free Buffer {  
MPI\_DB\_HPBACK\_FREE\_BUFFER }

Returns 0 for success, non-zero for failure.

## mpt\_host\_page\_alloc

### LINUX

Kernel Hackers Manual March 2019

### Name

mpt\_host\_page\_alloc — allocate system memory for the fw

## Synopsis

```
int mpt_host_page_alloc (MPT_ADAPTER * ioc, pIOCInit_t
ioc_init);
```

## Arguments

*ioc*

Pointer to pointer to IOC adapter

*ioc\_init*

Pointer to ioc init config page

## Description

If we already allocated memory in past, then resend the same pointer. Returns 0 for success, non-zero for failure.

# mpt\_get\_product\_name

## LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_get\_product\_name — returns product string

## Synopsis

```
void mpt_get_product_name (u16 vendor, u16 device, u8
revision, char * prod_name);
```

## Arguments

*vendor*

pci vendor id

*device*

pci device id

*revision*

pci revision id

*prod\_name*

string returned

## Description

Returns product string displayed when driver loads, in `/proc/mpt/summary` and `/sysfs/class/scsi_host/host<X>/version_product`

## convert\_to\_kb

### LINUX

Kernel Hackers Manual March 2019

## Name

`convert_to_kb` — map in memory mapped io

## Synopsis

```
convert_to_kb ( x );
```

## Arguments

*x*  
-- undescribed --

## mpt\_do\_ioc\_recovery

### LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_do_ioc_recovery` — Initialize or recover MPT adapter.

## Synopsis

```
int mpt_do_ioc_recovery (MPT_ADAPTER * ioc, u32 reason, int  
sleepFlag);
```

## Arguments

*ioc*  
Pointer to MPT adapter structure

*reason*  
Event word / reason

*sleepFlag*

Use schedule if CAN\_SLEEP else use udelay.

## Description

This routine performs all the steps necessary to bring the IOC to a OPERATIONAL state.

This routine also pre-fetches the LAN MAC address of a Fibre Channel MPT adapter.

## Returns

0 for success -1 if failed to get board READY -2 if READY but IOCFacts Failed -3 if READY but PrimeIOCFifos Failed -4 if READY but IOCInit Failed -5 if failed to enable\_device and/or request\_selected\_regions -6 if failed to upload firmware

# mpt\_detect\_bound\_ports

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_detect_bound_ports` — Search for matching PCI bus/dev\_function

## Synopsis

```
void mpt_detect_bound_ports (MPT_ADAPTER * ioc, struct pci_dev  
* pdev);
```

## Arguments

*ioc*

Pointer to MPT adapter structure

*pdev*

Pointer to (struct pci\_dev) structure

## Description

Search for PCI bus/dev\_function which matches PCI bus/dev\_function (+/-1) for newly discovered 929, 929X, 1030 or 1035.

If match on PCI dev\_function +/-1 is found, bind the two MPT adapters using alt\_ioc pointer fields in their MPT\_ADAPTER structures.

# mpt\_adapter\_disable

## LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_adapter\_disable — Disable misbehaving MPT adapter.

## Synopsis

```
void mpt_adapter_disable (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT adapter structure

# mpt\_adapter\_dispose

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_adapter_dispose` — Free all resources associated with an MPT adapter

## Synopsis

```
void mpt_adapter_dispose (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT adapter structure

## Description

This routine unregisters h/w resources and frees all alloc'd memory associated with a MPT adapter structure.

# MptDisplayIocCapabilities

## LINUX

Kernel Hackers Manual March 2019

### Name

`MptDisplayIocCapabilities` — Display IOC's capabilities.

### Synopsis

```
void MptDisplayIocCapabilities (MPT_ADAPTER * ioc);
```

### Arguments

*ioc*

Pointer to MPT adapter structure

# MakeIocReady

## LINUX

Kernel Hackers Manual March 2019

### Name

`MakeIocReady` — Get IOC to a READY state, using KickStart if needed.

## Synopsis

```
int MakeIocReady (MPT_ADAPTER * ioc, int force, int  
sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*force*

Force hard KickStart of IOC

*sleepFlag*

Specifies whether the process can sleep

## Returns

1 - DIAG reset and READY 0 - READY initially OR soft reset and READY -1 -  
Any failure on KickStart -2 - Msg Unit Reset Failed -3 - IO Unit Reset Failed -4 -  
IOC owned by a PEER

## GetlocFacts

### LINUX

Kernel Hackers Manual March 2019

## Name

`GetIocFacts` — Send IOCFacts request to MPT adapter.

## Synopsis

```
int GetIocFacts (MPT_ADAPTER * ioc, int sleepFlag, int
reason);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sleepFlag*

Specifies whether the process can sleep

*reason*

If recovery, only update facts.

## Description

Returns 0 for success, non-zero for failure.

## GetPortFacts

### LINUX

Kernel Hackers Manual March 2019

### Name

GetPortFacts — Send PortFacts request to MPT adapter.

## Synopsis

```
int GetPortFacts (MPT_ADAPTER * ioc, int portnum, int  
sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*portnum*

Port number

*sleepFlag*

Specifies whether the process can sleep

## Description

Returns 0 for success, non-zero for failure.

## SendIocInit

### LINUX

Kernel Hackers Manual March 2019

## Name

SendIocInit — Send IOCIInit request to MPT adapter.

## Synopsis

```
int SendIocInit (MPT_ADAPTER * ioc, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sleepFlag*

Specifies whether the process can sleep

## Description

Send IOcInit followed by PortEnable to bring IOC to OPERATIONAL state.

Returns 0 for success, non-zero for failure.

# SendPortEnable

## LINUX

Kernel Hackers Manual March 2019

## Name

SendPortEnable — Send PortEnable request to MPT adapter port.

## Synopsis

```
int SendPortEnable (MPT_ADAPTER * ioc, int portnum, int  
sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*portnum*

Port number to enable

*sleepFlag*

Specifies whether the process can sleep

## Description

Send PortEnable to bring IOC to OPERATIONAL state.

Returns 0 for success, non-zero for failure.

## mpt\_do\_upload

### LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_do_upload` — Construct and Send FWUpload request to MPT adapter port.

## Synopsis

```
int mpt_do_upload (MPT_ADAPTER * ioc, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sleepFlag*

Specifies whether the process can sleep

## Description

Returns 0 for success, >0 for handshake failure <0 for fw upload failure.

## Remark

If bound IOC and a successful FWUpload was performed on the bound IOC, the second image is discarded and memory is free'd. Both channels must upload to prevent IOC from running in degraded mode.

# mpt\_downloadboot

## LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_downloadboot — DownloadBoot code

## Synopsis

```
int mpt_downloadboot (MPT_ADAPTER * ioc, MpiFwHeader_t *
pFwHeader, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*pFwHeader*

Pointer to firmware header info

*sleepFlag*

Specifies whether the process can sleep

## Description

FwDownloadBoot requires Programmed IO access.

Returns 0 for success -1 FW Image size is 0 -2 No valid cached\_fw Pointer <0 for fw upload failure.

## KickStart

### LINUX

Kernel Hackers Manual March 2019

### Name

KickStart — Perform hard reset of MPT adapter.

### Synopsis

```
int KickStart (MPT_ADAPTER * ioc, int force, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*force*

Force hard reset

*sleepFlag*

Specifies whether the process can sleep

## Description

This routine places MPT adapter in diagnostic mode via the WriteSequence register, and then performs a hard reset of adapter via the Diagnostic register.

## Inputs

sleepflag - CAN\_SLEEP (non-interrupt thread) or NO\_SLEEP (interrupt thread, use mdelay) force - 1 if doorbell active, board fault state board operational, IOC\_RECOVERY or IOC\_BRINGUP and there is an alt\_ioc. 0 else

## Returns

1 - hard reset, READY 0 - no reset due to History bit, READY -1 - no reset due to History bit but not READY OR reset but failed to come READY -2 - no reset, could not enter DIAG mode -3 - reset but bad FW bit

## mpt\_diag\_reset

**LINUX**

## Name

`mpt_diag_reset` — Perform hard reset of the adapter.

## Synopsis

```
int mpt_diag_reset (MPT_ADAPTER * ioc, int ignore, int  
sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*ignore*

Set if to honor and clear to ignore the reset history bit

*sleepFlag*

CAN\_SLEEP if called in a non-interrupt thread, else set to NO\_SLEEP (use  
mdelay instead)

## Description

This routine places the adapter in diagnostic mode via the WriteSequence register and then performs a hard reset of adapter via the Diagnostic register. Adapter should be in ready state upon successful completion.

## Returns

1 hard reset successful 0 no reset performed because reset history bit set -2 enabling  
diagnostic mode failed -3 diagnostic reset failed

# SendIocReset

## LINUX

Kernel Hackers Manual March 2019

### Name

`SendIocReset` — Send IOCRreset request to MPT adapter.

### Synopsis

```
int SendIocReset (MPT_ADAPTER * ioc, u8 reset_type, int
sleepFlag);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*reset\_type*

reset type, expected values are MPI\_FUNCTION\_IOC\_MESSAGE\_UNIT\_RESET  
or MPI\_FUNCTION\_IO\_UNIT\_RESET

*sleepFlag*

Specifies whether the process can sleep

### Description

Send IOCRreset request to the MPT adapter.

Returns 0 for success, non-zero for failure.

# initChainBuffers

## LINUX

Kernel Hackers Manual March 2019

### Name

`initChainBuffers` — Allocate memory for and initialize chain buffers

### Synopsis

```
int initChainBuffers (MPT_ADAPTER * ioc);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

### Description

Allocates memory for and initializes chain buffers, chain buffer control arrays and spinlock.

## PrimelocFifos

## LINUX

## Name

`PrimeIocFifos` — Initialize IOC request and reply FIFOs.

## Synopsis

```
int PrimeIocFifos (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to `MPT_ADAPTER` structure

## Description

This routine allocates memory for the MPT reply and request frame pools (if necessary), and primes the IOC reply FIFO with reply frames.

Returns 0 for success, non-zero for failure.

# mpt\_handshake\_req\_reply\_wait

## LINUX

## Name

`mpt_handshake_req_reply_wait` — Send MPT request to and receive reply from IOC via doorbell handshake method.

## Synopsis

```
int mpt_handshake_req_reply_wait (MPT_ADAPTER * ioc, int
reqBytes, u32 * req, int replyBytes, u16 * u16reply, int
maxwait, int sleepFlag);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*reqBytes*

Size of the request in bytes

*req*

Pointer to MPT request frame

*replyBytes*

Expected size of the reply in bytes

*u16reply*

Pointer to area where reply should be written

*maxwait*

Max wait time for a reply (in seconds)

*sleepFlag*

Specifies whether the process can sleep

## NOTES

It is the callers responsibility to byte-swap fields in the request which are greater than 1 byte in size. It is also the callers responsibility to byte-swap response fields which are greater than 1 byte in size.

Returns 0 for success, non-zero for failure.

# WaitForDoorbellAck

## LINUX

Kernel Hackers Manual March 2019

### Name

`WaitForDoorbellAck` — Wait for IOC doorbell handshake acknowledge

### Synopsis

```
int WaitForDoorbellAck (MPT_ADAPTER * ioc, int howlong, int sleepFlag);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*howlong*

How long to wait (in seconds)

*sleepFlag*

Specifies whether the process can sleep

### Description

This routine waits (up to ~2 seconds max) for IOC doorbell handshake ACKnowledge, indicated by the IOP\_DOORBELL\_STATUS bit in its IntStatus register being clear.

Returns a negative value on failure, else wait loop count.

# WaitForDoorbellInt

## LINUX

Kernel Hackers Manual March 2019

### Name

`WaitForDoorbellInt` — Wait for IOC to set its doorbell interrupt bit

### Synopsis

```
int WaitForDoorbellInt (MPT_ADAPTER * ioc, int howlong, int sleepFlag);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*howlong*

How long to wait (in seconds)

*sleepFlag*

Specifies whether the process can sleep

### Description

This routine waits (up to ~2 seconds max) for IOC doorbell interrupt (MPI\_HIS\_DOORBELL\_INTERRUPT) to be set in the IntStatus register.

Returns a negative value on failure, else wait loop count.

# WaitForDoorbellReply

## LINUX

Kernel Hackers Manual March 2019

### Name

`WaitForDoorbellReply` — Wait for and capture an IOC handshake reply.

### Synopsis

```
int WaitForDoorbellReply (MPT_ADAPTER * ioc, int howlong, int sleepFlag);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*howlong*

How long to wait (in seconds)

*sleepFlag*

Specifies whether the process can sleep

### Description

This routine polls the IOC for a handshake reply, 16 bits at a time. Reply is cached to IOC private area large enough to hold a maximum of 128 bytes of reply data.

Returns a negative value on failure, else size of reply in WORDS.

# GetLanConfigPages

**LINUX**

Kernel Hackers Manual March 2019

## Name

`GetLanConfigPages` — Fetch LANConfig pages.

## Synopsis

```
int GetLanConfigPages (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

## Return

0 for success -ENOMEM if no memory available -EPERM if not allowed due to ISR context -EAGAIN if no msg frames currently available -EFAULT for non-successful reply or no reply (timeout)

# GetloUnitPage2

**LINUX**

## Name

`GetIoUnitPage2` — Retrieve BIOS version and boot order information.

## Synopsis

```
int GetIoUnitPage2 (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

## Returns

0 for success -ENOMEM if no memory available -EPERM if not allowed due to ISR context -EAGAIN if no msg frames currently available -EFAULT for non-successful reply or no reply (timeout)

# mpt\_GetScsiPortSettings

## LINUX

## Name

`mpt_GetScsiPortSettings` — read SCSI Port Page 0 and 2

## Synopsis

```
int mpt_GetScsiPortSettings (MPT_ADAPTER * ioc, int portnum);
```

## Arguments

*ioc*

Pointer to a Adapter Strucutre

*portnum*

IOC port number

## Return

-EFAULT if read of config page header fails or if no nvram If read of SCSI Port Page 0 fails, NVRAM = MPT\_HOST\_NVRAM\_INVALID (0xFFFFFFFF)

## Adapter settings

async, narrow Return 1 If read of SCSI Port Page 2 fails, Adapter settings valid NVRAM = MPT\_HOST\_NVRAM\_INVALID (0xFFFFFFFF) Return 1 Else Both valid Return 0 CHECK - what type of locking mechanisms should be used???

## mpt\_readScsiDevicePageHeaders

### LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_readScsiDevicePageHeaders — save version and length of SDP1

## Synopsis

```
int mpt_readScsiDevicePageHeaders (MPT_ADAPTER * ioc, int
portnum);
```

## Arguments

*ioc*

Pointer to a Adapter Strucutre

*portnum*

IOC port number

## Return

-EFAULT if read of config page header fails or 0 if success.

# mpt\_inactive\_raid\_list\_free

## LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_inactive\_raid\_list\_free — This clears this link list.

## Synopsis

```
void mpt_inactive_raid_list_free (MPT_ADAPTER * ioc);
```

## Arguments

*ioc*

pointer to per adapter structure

# mpt\_inactive\_raid\_volumes

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_inactive_raid_volumes` — sets up link list of `phy_disk_nums` for devices belonging in an inactive volume

## Synopsis

```
void mpt_inactive_raid_volumes (MPT_ADAPTER * ioc, u8 channel,  
u8 id);
```

## Arguments

*ioc*

pointer to per adapter structure

*channel*

volume channel

*id*

volume target id

# mpt\_sort\_ioc\_pg2

## LINUX

Kernel Hackers Manual March 2019

### Name

`mpt_sort_ioc_pg2` — compare function for sorting volumes in ascending order

### Synopsis

```
int mpt_sort_ioc_pg2 (const void * a, const void * b);
```

### Arguments

*a*

`ioc_pg2` raid volume page

*b*

`ioc_pg2` raid volume page

### Return

0 same, 1 (a is bigger), -1 (b is bigger)

# SendEventNotification

## LINUX

Kernel Hackers Manual March 2019

### Name

`SendEventNotification` — Send EventNotification (on or off) request to adapter

### Synopsis

```
int SendEventNotification (MPT_ADAPTER * ioc, u8 EvSwitch, int  
sleepFlag);
```

### Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*EvSwitch*

Event switch flags

*sleepFlag*

Specifies whether the process can sleep

# SendEventAck

## LINUX

## Name

`SendEventAck` — Send EventAck request to MPT adapter.

## Synopsis

```
int SendEventAck (MPT_ADAPTER * ioc, EventNotificationReply_t
* evnp);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*evnp*

Pointer to original EventNotification request

# mpt\_ioc\_reset

## LINUX

## Name

`mpt_ioc_reset` — Base cleanup for hard reset

## Synopsis

```
int mpt_ioc_reset (MPT_ADAPTER * ioc, int reset_phase);
```

## Arguments

*ioc*

Pointer to the adapter structure

*reset\_phase*

Indicates pre- or post-reset functionality

## Remark

Frees resources with internally generated commands.

# procmpt\_create

## LINUX

Kernel Hackers Manual March 2019

## Name

`procmpt_create` — Create MPT\_PROCFS\_MPTBASEDIR entries.

## Synopsis

```
int procmpt_create ( void );
```

## Arguments

*void*

no arguments

## Description

Returns 0 for success, non-zero for failure.

# procmpt\_destroy

## LINUX

Kernel Hackers Manual March 2019

## Name

`procmpt_destroy` — Tear down `MPT_PROCFS_MPTBASEDIR` entries.

## Synopsis

```
void procmpt_destroy ( void );
```

## Arguments

*void*

no arguments

## Description

Returns 0 for success, non-zero for failure.

# procmpt\_summary\_read

## LINUX

Kernel Hackers Manual March 2019

### Name

`procmpt_summary_read` — Handle read request of a summary file

### Synopsis

```
int procmpt_summary_read (char * buf, char ** start, off_t  
offset, int request, int * eof, void * data);
```

### Arguments

*buf*

Pointer to area to write information

*start*

Pointer to start pointer

*offset*

Offset to start writing

*request*

Amount of read data requested

*eof*

Pointer to EOF integer

*data*

Pointer

## Description

Handles read request from `/proc/mpt/summary` or `/proc/mpt/iocN/summary`.  
Returns number of characters written to process performing the read.

# procmpt\_version\_read

## LINUX

Kernel Hackers Manual March 2019

## Name

`procmpt_version_read` — Handle read request from `/proc/mpt/version`.

## Synopsis

```
int procmpt_version_read (char * buf, char ** start, off_t
offset, int request, int * eof, void * data);
```

## Arguments

*buf*

Pointer to area to write information

*start*

Pointer to start pointer

*offset*

Offset to start writing

*request*

Amount of read data requested

*eof*

Pointer to EOF integer

*data*

Pointer

## Description

Returns number of characters written to process performing the read.

# procmpt\_iocinfo\_read

**LINUX**

Kernel Hackers Manual March 2019

## Name

`procmpt_iocinfo_read` — Handle read request from `/proc/mpt/iocN/info`.

## Synopsis

```
int procmpt_iocinfo_read (char * buf, char ** start, off_t  
offset, int request, int * eof, void * data);
```

## Arguments

*buf*

Pointer to area to write information

*start*

Pointer to start pointer

*offset*

Offset to start writing

*request*

Amount of read data requested

*eof*

Pointer to EOF integer

*data*

Pointer

## Description

Returns number of characters written to process performing the read.

# ProcessEventNotification

**LINUX**

Kernel Hackers Manual March 2019

## Name

ProcessEventNotification — Route EventNotificationReply to all event handlers

## Synopsis

```
int ProcessEventNotification (MPT_ADAPTER * ioc,  
EventNotificationReply_t * pEventReply, int * evHandlers);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*pEventReply*

Pointer to EventNotification reply frame

*evHandlers*

Pointer to integer, number of event handlers

## Description

Routes a received EventNotificationReply to all currently registered event handlers.  
Returns sum of event handlers return values.

# mpt\_fc\_log\_info

## LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_fc\_log\_info — Log information returned from Fibre Channel IOC.

## Synopsis

```
void mpt_fc_log_info (MPT_ADAPTER * ioc, u32 log_info);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*log\_info*

U32 LogInfo reply word from the IOC

## Description

Refer to lsi/mpi\_log\_fc.h.

## mpt\_spi\_log\_info

### LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_spi\_log\_info — Log information returned from SCSI Parallel IOC.

## Synopsis

```
void mpt_spi_log_info (MPT_ADAPTER * ioc, u32 log_info);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*log\_info*

U32 LogInfo word from the IOC

## Description

Refer to lsi/sp\_log.h.

# mpt\_sas\_log\_info

## LINUX

Kernel Hackers Manual March 2019

## Name

mpt\_sas\_log\_info — Log information returned from SAS IOC.

## Synopsis

```
void mpt_sas_log_info (MPT_ADAPTER * ioc, u32 log_info);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*log\_info*

U32 LogInfo reply word from the IOC

## Description

Refer to lsi/mpi\_log\_sas.h.

# mpt\_iocstatus\_info\_config

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_iocstatus_info_config` — IOCSTATUS information for config pages

## Synopsis

```
void mpt_iocstatus_info_config (MPT_ADAPTER * ioc, u32  
ioc_status, MPT_FRAME_HDR * mf);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*ioc\_status*

U32 IOCStatus word from IOC

*mf*

Pointer to MPT request frame

## Description

Refer to `lsi/mpi.h`.

# mpt\_iocstatus\_info

## LINUX

Kernel Hackers Manual March 2019

## Name

`mpt_iocstatus_info` — IOCSTATUS information returned from IOC.

## Synopsis

```
void mpt_iocstatus_info (MPT_ADAPTER * ioc, u32 ioc_status,  
MPT_FRAME_HDR * mf);
```

## Arguments

*ioc*

Pointer to `MPT_ADAPTER` structure

*ioc\_status*

U32 IOCStatus word from IOC

*mf*

Pointer to MPT request frame

## Description

Refer to `lsi/mpi.h`.

# fusion\_init

## LINUX

Kernel Hackers Manual March 2019

### Name

`fusion_init` — Fusion MPT base driver initialization routine.

### Synopsis

```
int fusion_init ( void );
```

### Arguments

*void*

no arguments

### Description

Returns 0 for success, non-zero for failure.

# fusion\_exit

## LINUX

## Name

`fusion_exit` — Perform driver unload cleanup.

## Synopsis

```
void __exit fusion_exit ( void );
```

## Arguments

*void*

no arguments

## Description

This routine frees all resources associated with each MPT adapter and removes all `MPT_PROCFS_MPTBASEDIR` entries.

# mptscsih\_info

## LINUX

## Name

`mptscsih_info` — Return information about MPT adapter

## Synopsis

```
const char * mptscsih_info (struct Scsi_Host * SHost);
```

## Arguments

*SHost*

Pointer to Scsi\_Host structure

## Description

(linux scsi\_host\_template.info routine)

Returns pointer to buffer where information was written.

# mptscsih\_proc\_info

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptscsih_proc_info` — Return information about MPT adapter

## Synopsis

```
int mptscsih_proc_info (struct Scsi_Host * host, char *  
buffer, char ** start, off_t offset, int length, int func);
```

## Arguments

*host*

scsi host struct

*buffer*

if write, user data; if read, buffer for user

*start*

returns the buffer address

*offset*

if write, 0; if read, the current offset into the buffer from the previous read.

*length*

if write, return length;

*func*

write = 1; read = 0

## Description

(linux scsi\_host\_template.info routine)

# mptscsih\_qcmd

## LINUX

Kernel Hackers Manual March 2019

## Name

mptscsih\_qcmd — Primary Fusion MPT SCSI initiator IO start routine.

## Synopsis

```
int mptscsih_qcmd (struct scsi_cmnd * SCpnt, void (*done)
(struct scsi_cmnd *));
```

## Arguments

*SCpnt*

Pointer to `scsi_cmnd` structure

*done*

Pointer SCSI mid-layer IO completion function

## Description

(linux `scsi_host_template.queuecommand` routine) This is the primary SCSI IO start routine. Create a MPI SCSIIORequest from a linux `scsi_cmnd` request and send it to the IOC.

Returns 0. (rtn value discarded by linux scsi mid-layer)

## mptscsih\_IssueTaskMgmt

### LINUX

Kernel Hackers Manual March 2019

### Name

`mptscsih_IssueTaskMgmt` — Generic send Task Management function.

## Synopsis

```
int mptscsih_IssueTaskMgmt (MPT_SCSI_HOST * hd, u8 type, u8  
channel, u8 id, int lun, int ctx2abort, ulong timeout);
```

## Arguments

*hd*

Pointer to MPT\_SCSI\_HOST structure

*type*

Task Management type

*channel*

channel number for task management

*id*

Logical Target ID for reset (if appropriate)

*lun*

Logical Unit for reset (if appropriate)

*ctx2abort*

Context for the task to be aborted (if appropriate)

*timeout*

timeout for task management control

## Remark

`_HardResetHandler` can be invoked from an interrupt thread (timer) or a non-interrupt thread. In the former, must not call `schedule`.

Not all fields are meaningful for all task types.

Returns 0 for SUCCESS, or FAILED.

# mptscsih\_abort

## LINUX

Kernel Hackers Manual March 2019

### Name

`mptscsih_abort` — Abort linux scsi\_cmnd routine, new\_eh variant

### Synopsis

```
int mptscsih_abort (struct scsi_cmnd * SCpnt);
```

### Arguments

*SCpnt*

Pointer to scsi\_cmnd structure, IO to be aborted

### Description

(linux scsi\_host\_template.eh\_abort\_handler routine)

Returns SUCCESS or FAILED.

# mptscsih\_dev\_reset

## LINUX

## Name

`mptscsih_dev_reset` — Perform a SCSI TARGET\_RESET! new\_eh variant

## Synopsis

```
int mptscsih_dev_reset (struct scsi_cmnd * SCpnt);
```

## Arguments

*SCpnt*

Pointer to `scsi_cmnd` structure, IO which reset is due to

## Description

(linux `scsi_host_template.eh_dev_reset_handler` routine)

Returns SUCCESS or FAILED.

# mptscsih\_bus\_reset

## LINUX

## Name

`mptscsih_bus_reset` — Perform a SCSI BUS\_RESET! new\_eh variant

## Synopsis

```
int mptscsih_bus_reset (struct scsi_cmnd * SCpnt);
```

## Arguments

*SCpnt*

Pointer to scsi\_cmnd structure, IO which reset is due to

## Description

(linux scsi\_host\_template.eh\_bus\_reset\_handler routine)

Returns SUCCESS or FAILED.

# mptscsih\_host\_reset

## LINUX

Kernel Hackers Manual March 2019

## Name

mptscsih\_host\_reset — Perform a SCSI host adapter RESET (new\_eh variant)

## Synopsis

```
int mptscsih_host_reset (struct scsi_cmnd * SCpnt);
```

## Arguments

*SCpnt*

Pointer to `scsi_cmnd` structure, IO which reset is due to

## Description

(linux `scsi_host_template.eh_host_reset_handler` routine)

Returns SUCCESS or FAILED.

# mptscsih\_taskmgmt\_complete

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptscsih_taskmgmt_complete` — Registered with Fusion MPT base driver

## Synopsis

```
int mptscsih_taskmgmt_complete (MPT_ADAPTER * ioc,  
MPT_FRAME_HDR * mf, MPT_FRAME_HDR * mr);
```

## Arguments

*ioc*

Pointer to `MPT_ADAPTER` structure

*mf*

Pointer to SCSI task mgmt request frame

*mr*

Pointer to SCSI task mgmt reply frame

## Description

This routine is called from `mptbase.c::mpt_interrupt` at the completion of any SCSI task management request. This routine is registered with the MPT (base) driver at driver load/init time via the `mpt_register` API call.

Returns 1 indicating alloc'd request frame ptr should be freed.

# mptscsih\_is\_phys\_disk

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptscsih_is_phys_disk` —

## Synopsis

```
int mptscsih_is_phys_disk (MPT_ADAPTER * ioc, u8 channel, u8
id);
```

## Arguments

*ioc*

-- undescribed --

*channel*

-- undescribed --

*id*

-- undescribed --

## Description

# mptscsih\_get\_scsi\_lookup

**LINUX**

Kernel Hackers Manual March 2019

## Name

mptscsih\_get\_scsi\_lookup —

## Synopsis

```
struct scsi_cmnd * mptscsih_get_scsi_lookup (MPT_ADAPTER *  
ioc, int i);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*i*

index into the array

## Description

Returns the `scsi_cmd` pointer

## Description

Returns the `scsi_cmd` pointer

# mptscsih\_do\_cmd

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptscsih_do_cmd` — Do internal command.

## Synopsis

```
int mptscsih_do_cmd (MPT SCSI_HOST * hd, INTERNAL_CMD * io);
```

## Arguments

*hd*

MPT SCSI\_HOST pointer

*io*

INTERNAL\_CMD pointer.

## Description

Issue the specified internally generated command and do command specific cleanup. For bus scan / DV only.

## NOTES

If command is Inquiry and status is good, initialize a target structure, save the data

## Remark

Single threaded access only.

## Return

< 0 if an illegal command or no resources

0 if good

> 0 if command complete but some type of completion error.

# mptscsih\_info\_scsiio

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptscsih_info_scsiio` — debug print info on reply frame

## Synopsis

```
void mptscsih_info_scsiio (MPT_ADAPTER * ioc, struct scsi_cmnd  
* sc, SCSIIOReply_t * pScsiReply);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sc*

original scsi cmnd pointer

*pScsiReply*

Pointer to MPT reply frame

## Description

MPT\_DEBUG\_REPLY needs to be enabled to obtain this info

Refer to lsi/mpi.h.

## **\_scsih\_setup\_eedp**

### **LINUX**

Kernel Hackers Manual March 2019

## **Name**

`_scsih_setup_eedp` — setup MPI request for EEDP transfer

## **Synopsis**

```
int _scsih_setup_eedp (MPT_ADAPTER * ioc, struct scsi_cmnd *  
scmd, SCSIIO32Request_t * mpi_request);
```

## Arguments

*ioc*

-- undescribed --

*scmd*

pointer to scsi command object

*mpi\_request*

pointer to the SCSI\_IO request message frame

## Description

Supporting protection 1 only.

Returns nothing

# **\_scsih\_read\_capacity\_16**

## **LINUX**

Kernel Hackers Manual March 2019

## **Name**

`_scsih_read_capacity_16` — send READ\_CAPACITY\_16 to target

## **Synopsis**

```
int _scsih_read_capacity_16 (MPT SCSI_HOST * hd, int id, int  
channel, u32 lun, void * data, u32 length);
```

## Arguments

*hd*  
-- undescribed --

*id*  
-- undescribed --

*channel*  
-- undescribed --

*lun*  
-- undescribed --

*data*  
-- undescribed --

*length*  
-- undescribed --

## Description

# mptscsih\_getclear\_scsi\_lookup

## LINUX

Kernel Hackers Manual March 2019

## Name

mptscsih\_getclear\_scsi\_lookup —

## Synopsis

```
struct scsi_cmnd * mptscsih_getclear_scsi_lookup (MPT_ADAPTER
* ioc, int i);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*i*

index into the array

## Description

Returns the scsi\_cmd pointer

## Description

Returns the scsi\_cmd pointer

# mptscsih\_set\_scsi\_lookup

## LINUX

Kernel Hackers Manual March 2019

## Name

mptscsih\_set\_scsi\_lookup —

## Synopsis

```
void mptscsih_set_scsi_lookup (MPT_ADAPTER * ioc, int i,
struct scsi_cmnd * scmd);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*i*

index into the array

*scmd*

scsi\_cmnd pointer

## Description

writes a scmd entry into the ScsiLookup[] array list

# SCPNT\_TO\_LOOKUP\_IDX

## LINUX

Kernel Hackers Manual March 2019

## Name

SCPNT\_TO\_LOOKUP\_IDX — searches for a given scmd in the ScsiLookup[] array list

## Synopsis

```
int SCPNT_TO_LOOKUP_IDX (MPT_ADAPTER * ioc, struct scsi_cmnd *  
sc);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*sc*

scsi\_cmnd pointer

## mptscsih\_get\_completion\_code

### LINUX

Kernel Hackers Manual March 2019

## Name

mptscsih\_get\_completion\_code —

## Synopsis

```
int mptscsih_get_completion_code (MPT_ADAPTER * ioc,  
MPT_FRAME_HDR * req, MPT_FRAME_HDR * reply);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*req*

-- undescribed --

*reply*

-- undescribed --

## mptscsih\_synchronize\_cache

### LINUX

Kernel Hackers Manual March 2019

## Name

`mptscsih_synchronize_cache` — Send SYNCHRONIZE\_CACHE to all disks.

## Synopsis

```
void mptscsih_synchronize_cache (struct scsi_device * sdev,
MPT SCSI_HOST * hd, VirtDevice * vdevice);
```

## Arguments

*sdev*

-- undescribed --

*hd*

Pointer to a SCSI HOST structure

*vdevice*

virtual target device

## Description

Uses the ISR, but with special processing. MUST be single-threaded.

# mptctl\_syscall\_down

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptctl_syscall_down` — Down the MPT adapter syscall semaphore.

## Synopsis

```
int mptctl_syscall_down (MPT_ADAPTER * ioc, int nonblock);
```

## Arguments

*ioc*

Pointer to MPT adapter

*nonblock*

boolean, non-zero if O\_NONBLOCK is set

## Description

All of the ioctl commands can potentially sleep, which is illegal with a spinlock held, thus we perform mutual exclusion here.

Returns negative errno on error, or zero for success.

# mptspi\_setTargetNegoParms

## LINUX

Kernel Hackers Manual March 2019

## Name

mptspi\_setTargetNegoParms — Update the target negotiation parameters

## Synopsis

```
void mptspi_setTargetNegoParms (MPT_SCSI_HOST * hd, VirtTarget
* target, struct scsi_device * sdev);
```

## Arguments

*hd*

Pointer to a SCSI Host Structure

*target*

per target private data

*sdev*

SCSI device

## Description

Update the target negotiation parameters based on the the Inquiry data, adapter capabilities, and NVRAM settings.

# mptspi\_writeIOCPage4

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptspi_writeIOCPage4` — write IOC Page 4

## Synopsis

```
int mptspi_writeIOCPage4 (MPT SCSI_HOST * hd, u8 channel, u8  
id);
```

## Arguments

*hd*

Pointer to a SCSI Host Structure

*channel*

channel number

*id*

write IOC Page4 for this ID & Bus

## Return

-EAGAIN if unable to obtain a Message Frame or 0 if success.

## Remark

We do not wait for a return, write pages sequentially.

# mptspi\_initTarget

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptspi_initTarget` — Target, LUN alloc/free functionality.

## Synopsis

```
void mptspi_initTarget (MPT_SCSI_HOST * hd, VirtTarget *  
vtarget, struct scsi_device * sdev);
```

## Arguments

*hd*

Pointer to MPT\_SCSI\_HOST structure

*vtarget*

per target private data

*sdev*

SCSI device

## NOTE

It's only SAFE to call this routine if data points to sane & valid STANDARD INQUIRY data!

Allocate and initialize memory for this target. Save inquiry data.

# mptspi\_is\_raid

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptspi_is_raid` — Determines whether target is belonging to volume

## Synopsis

```
int mptspi_is_raid (struct _MPT_SCSI_HOST * hd, u32 id);
```

## Arguments

*hd*

Pointer to a SCSI HOST structure

*id*

target device id

## Return

non-zero = true zero = false

# mptspi\_print\_write\_nego

## LINUX

Kernel Hackers Manual March 2019

### Name

`mptspi_print_write_nego` — negotiation parameters debug info that is being sent

### Synopsis

```
void mptspi_print_write_nego (struct _MPT_SCSI_HOST * hd,  
struct scsi_target * starget, u32 ii);
```

### Arguments

*hd*

Pointer to a SCSI HOST structure

*starget*

SCSI target

*ii*

negotiation parameters

# mptspi\_print\_read\_nego

## LINUX

Kernel Hackers Manual March 2019

### Name

`mptspi_print_read_nego` — negotiation parameters debug info that is being read

### Synopsis

```
void mptspi_print_read_nego (struct _MPT_SCSI_HOST * hd,  
struct scsi_target * starget, u32 ii);
```

### Arguments

*hd*

Pointer to a SCSI HOST structure

*starget*

SCSI target

*ii*

negotiation parameters

# mptspi\_dv\_renegotiate\_work

## LINUX

## Name

`mptspi_dv_renegotiate_work` —

## Synopsis

```
void mptspi_dv_renegotiate_work (struct work_struct * work);
```

## Arguments

*work*

-- undescribed --

# mptspi\_ioc\_reset

## LINUX

## Name

`mptspi_ioc_reset` —

## Synopsis

```
int mptspi_ioc_reset (MPT_ADAPTER * ioc, int reset_phase);
```

## Arguments

```
ioc  
-- undescrbed --  
  
reset_phase  
-- undescrbed --
```

## mptspi\_resume

### LINUX

Kernel Hackers Manual March 2019

## Name

mptspi\_resume —

## Synopsis

```
int mptspi_resume (struct pci_dev * pdev);
```

## Arguments

```
pdev  
-- undescrbed --
```

# mptspi\_probe

## LINUX

Kernel Hackers Manual March 2019

### Name

`mptspi_probe` — Installs scsi devices per bus.

### Synopsis

```
int mptspi_probe (struct pci_dev * pdev, const struct
pci_device_id * id);
```

### Arguments

*pdev*

Pointer to `pci_dev` structure

*id*

-- undescribed --

### Description

Returns 0 for success, non-zero for failure.

# mptspi\_init

## LINUX

## Name

`mptspi_init` — Register MPT adapter(s) as SCSI host(s) with SCSI mid-layer.

## Synopsis

```
int mptspi_init ( void );
```

## Arguments

*void*

no arguments

## Description

Returns 0 for success, non-zero for failure.

# mptspi\_exit

## LINUX

## Name

`mptspi_exit` — Unregisters MPT adapter(s)

## Synopsis

```
void __exit mptspi_exit ( void);
```

## Arguments

*void*

no arguments

## Description

# mptfc\_set\_sdev\_queue\_depth

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptfc_set_sdev_queue_depth` — global setting of the `mpt_sdev_queue_depth` found via `/sys/module/mptfc/parameters/mpt_sdev_queue_depth`

## Synopsis

```
int mptfc_set_sdev_queue_depth (const char * val, struct  
kernel_param * kp);
```

## Arguments

*val*  
-- undescribed --  
*kp*

## Description

Returns

# mptfc\_init

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptfc_init` — Register MPT adapter(s) as SCSI host(s) with SCSI mid-layer.

## Synopsis

```
int mptfc_init ( void );
```

## Arguments

*void*  
no arguments

## Description

Returns 0 for success, non-zero for failure.

# mptfc\_remove

## LINUX

Kernel Hackers Manual March 2019

## Name

`mptfc_remove` — Remove fc infrastructure for devices

## Synopsis

```
void __devexit mptfc_remove (struct pci_dev * pdev);
```

## Arguments

*pdev*

Pointer to `pci_dev` structure

# mptfc\_exit

## LINUX

## Name

`mptfc_exit` — Unregisters MPT adapter(s)

## Synopsis

```
void __exit mptfc_exit ( void );
```

## Arguments

*void*

no arguments

## Description

# lan\_reply

## LINUX

## Name

`lan_reply` — Handle all data sent from the hardware.

## Synopsis

```
int lan_reply (MPT_ADAPTER * ioc, MPT_FRAME_HDR * mf,  
MPT_FRAME_HDR * reply);
```

## Arguments

*ioc*

Pointer to MPT\_ADAPTER structure

*mf*

Pointer to original MPT request frame (NULL if TurboReply)

*reply*

Pointer to MPT reply frame

## Description

Returns 1 indicating original alloc'd request frame ptr should be freed, or 0 if it shouldn't.

## 4.2. I2O message devices

### i2o\_driver\_notify\_controller\_add

**LINUX**

## Name

`i2o_driver_notify_controller_add` — Send notification of added controller

## Synopsis

```
void i2o_driver_notify_controller_add (struct i2o_driver *  
drv, struct i2o_controller * c);
```

## Arguments

*drv*

I2O driver

*c*

I2O controller

## Description

Send notification of added controller to a single registered driver.

## `i2o_driver_notify_controller_remove`

**LINUX**

## Name

`i2o_driver_notify_controller_remove` — Send notification of removed controller

## Synopsis

```
void i2o_driver_notify_controller_remove (struct i2o_driver *  
drv, struct i2o_controller * c);
```

## Arguments

*drv*

I2O driver

*c*

I2O controller

## Description

Send notification of removed controller to a single registered driver.

## `i2o_driver_notify_device_add`

**LINUX**

## Name

`i2o_driver_notify_device_add` — Send notification of added device

## Synopsis

```
void i2o_driver_notify_device_add (struct i2o_driver * drv,  
struct i2o_device * i2o_dev);
```

## Arguments

*drv*

I2O driver

*i2o\_dev*

the added i2o\_device

## Description

Send notification of added device to a single registered driver.

# i2o\_driver\_notify\_device\_remove

## LINUX

## Name

`i2o_driver_notify_device_remove` — Send notification of removed

device

## Synopsis

```
void i2o_driver_notify_device_remove (struct i2o_driver * drv,  
struct i2o_device * i2o_dev);
```

## Arguments

*drv*

I2O driver

*i2o\_dev*

the added i2o\_device

## Description

Send notification of removed device to a single registered driver.

# i2o\_msg\_out\_to\_virt

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_msg_out_to_virt` — Turn an I2O message to a virtual address

## Synopsis

```
struct i2o_message * i2o_msg_out_to_virt (struct  
i2o_controller * c, u32 m);
```

## Arguments

*c*

controller

*m*

message engine value

## Description

Turn a receive message from an I2O controller bus address into a Linux virtual address. The shared page frame is a linear block so we simply have to shift the offset. This function does not work for sender side messages as they are ioremap objects provided by the I2O controller.

## i2o\_msg\_in\_to\_virt

**LINUX**

Kernel Hackers Manual March 2019

## Name

`i2o_msg_in_to_virt` — Turn an I2O message to a virtual address

## Synopsis

```
struct i2o_message __iomem * i2o_msg_in_to_virt (struct
i2o_controller * c, u32 m);
```

## Arguments

*c*

controller

*m*

message engine value

## Description

Turn a send message from an I2O controller bus address into a Linux virtual address. The shared page frame is a linear block so we simply have to shift the offset. This function does not work for receive side messages as they are kmalloc objects in a different pool.

## i2o\_msg\_get

**LINUX**

Kernel Hackers Manual March 2019

## Name

`i2o_msg_get` — obtain an I2O message from the IOP

## Synopsis

```
struct i2o_message * i2o_msg_get (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

This function tries to get a message frame. If no message frame is available do not wait until one is available (see also `i2o_msg_get_wait`). The returned pointer to the message frame is not in I/O memory, it is allocated from a mempool. But because a MFA is allocated from the controller too it is guaranteed that `i2o_msg_post` will never fail.

On a success a pointer to the message frame is returned. If the message queue is empty -EBUSY is returned and if no memory is available -ENOMEM is returned.

## i2o\_msg\_post

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_msg_post` — Post I2O message to I2O controller

## Synopsis

```
void i2o_msg_post (struct i2o_controller * c, struct
i2o_message * msg);
```

## Arguments

*c*

I2O controller to which the message should be send

*msg*

message returned by `i2o_msg_get`

## Description

Post the message to the I2O controller and return immediately.

# i2o\_msg\_post\_wait

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_msg_post_wait` — Post and wait a message and wait until return

## Synopsis

```
int i2o_msg_post_wait (struct i2o_controller * c, struct
i2o_message * msg, unsigned long timeout);
```

## Arguments

*c*

controller

*msg*

message to post

*timeout*

time in seconds to wait

## Description

This API allows an OSM to post a message and then be told whether or not the system received a successful reply. If the message times out then the value '-ETIMEDOUT' is returned.

Returns 0 on success or negative error code on failure.

## i2o\_msg\_nop\_mfa

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_msg_nop_mfa` — Returns a fetched MFA back to the controller

## Synopsis

```
void i2o_msg_nop_mfa (struct i2o_controller * c, u32 mfa);
```

## Arguments

*c*

I2O controller from which the MFA was fetched

*mfa*

MFA which should be returned

## Description

This function must be used for preserved messages, because `i2o_msg_nop` also returns the allocated memory back to the `msg_pool` mempool.

# i2o\_msg\_nop

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_msg_nop` — Returns a message which is not used

## Synopsis

```
void i2o_msg_nop (struct i2o_controller * c, struct
i2o_message * msg);
```

## Arguments

*c*

I2O controller from which the message was created

*msg*

message which should be returned

## Description

If you fetch a message via `i2o_msg_get`, and can't use it, you must return the message with this function. Otherwise the MFA is lost as well as the allocated memory from the mempool.

# i2o\_flush\_reply

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_flush_reply` — Flush reply from I2O controller

## Synopsis

```
void i2o_flush_reply (struct i2o_controller * c, u32 m);
```

## Arguments

*c*

I2O controller

*m*

the message identifier

## Description

The I2O controller must be informed that the reply message is not needed anymore. If you forget to flush the reply, the message frame can't be used by the controller anymore and is therefore lost.

# i2o\_iop\_free

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_free` — Free the `i2o_controller` struct

## Synopsis

```
void i2o_iop_free (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller to free

# i2o\_msg\_get\_wait

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_msg_get_wait` — obtain an I2O message from the IOP

### Synopsis

```
struct i2o_message * i2o_msg_get_wait (struct i2o_controller *  
c, int wait);
```

### Arguments

*c*

I2O controller

*wait*

how long to wait until timeout

### Description

This function waits up to *wait* seconds for a message slot to be available.

On a success the message is returned and the pointer to the message is set in `msg`. The returned message is the physical page frame offset address from the read port (see the i2o spec). If no message is available returns `I2O_QUEUE_EMPTY` and `msg` is leaved untouched.

# i2o\_cntxt\_list\_add

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_cntxt_list_add` — Append a pointer to context list and return a id

### Synopsis

```
u32 i2o_cntxt_list_add (struct i2o_controller * c, void *  
ptr);
```

### Arguments

*c*  
controller to which the context list belong

*ptr*  
pointer to add to the context list

### Description

Because the context field in I2O is only 32-bit large, on 64-bit the pointer is too large to fit in the context field. The `i2o_cntxt_list` functions therefore map pointers to context fields.

Returns context id > 0 on success or 0 on failure.

# i2o\_cntxt\_list\_remove

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_cntxt_list_remove` — Remove a pointer from the context list

### Synopsis

```
u32 i2o_cntxt_list_remove (struct i2o_controller * c, void *  
ptr);
```

### Arguments

*c*

controller to which the context list belong

*ptr*

pointer which should be removed from the context list

### Description

Removes a previously added pointer from the context list and returns the matching context id.

Returns context id on succes or 0 on failure.

# i2o\_cntxt\_list\_get

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_cntxt_list_get` — Get a pointer from the context list and remove it

### Synopsis

```
void * i2o_cntxt_list_get (struct i2o_controller * c, u32
context);
```

### Arguments

*c*

controller to which the context list belong

*context*

context id to which the pointer belong

### Description

Returns pointer to the matching context id on success or NULL on failure.

# i2o\_cntxt\_list\_get\_ptr

## LINUX

## Name

`i2o_cntxt_list_get_ptr` — Get a context id from the context list

## Synopsis

```
u32 i2o_cntxt_list_get_ptr (struct i2o_controller * c, void *  
ptr);
```

## Arguments

*c*

controller to which the context list belong

*ptr*

pointer to which the context id should be fetched

## Description

Returns context id which matches to the pointer on succes or 0 on failure.

# i2o\_find\_iop

## LINUX

## Name

`i2o_find_iop` — Find an I2O controller by id

## Synopsis

```
struct i2o_controller * i2o_find_iop (int unit);
```

## Arguments

*unit*

unit number of the I2O controller to search for

## Description

Lookup the I2O controller on the controller list.

Returns pointer to the I2O controller on success or NULL if not found.

## i2o\_iop\_find\_device

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_find_device` — Find a I2O device on an I2O controller

## Synopsis

```
struct i2o_device * i2o_iop_find_device (struct i2o_controller  
* c, ul6 tid);
```

## Arguments

*c*

I2O controller where the I2O device hangs on

*tid*

TID of the I2O device to search for

## Description

Searches the devices of the I2O controller for a device with TID *tid* and returns it.

Returns a pointer to the I2O device if found, otherwise NULL.

## i2o\_status\_get

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_status_get` — Get the status block from the I2O controller

## Synopsis

```
int i2o_status_get (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

Issue a status query on the controller. This updates the attached status block. The status block could then be accessed through `c->status_block`.

Returns 0 on success or negative error code on failure.

# i2o\_event\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_event_register` — Turn on/off event notification for a I2O device

## Synopsis

```
int i2o_event_register (struct i2o_device * dev, struct  
i2o_driver * drv, int tcntxt, u32 evt_mask);
```

## Arguments

*dev*

I2O device which should receive the event registration request

*drv*

driver which want to get notified

*tcntxt*

transaction context to use with this notifier

`evt_mask`

mask of events

## Description

Create and posts an event registration message to the task. No reply is waited for, or expected. If you do not want further notifications, call the `i2o_event_register` again with a `evt_mask` of 0.

Returns 0 on success or negative error code on failure.

# i2o\_iop\_quiesce

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_quiesce` — quiesce controller

## Synopsis

```
int i2o_iop_quiesce (struct i2o_controller * c);
```

## Arguments

`c`

controller

## Description

Quiesce an IOP. Causes IOP to make external operation quiescent (i2o 'READY' state). Internal operation of the IOP continues normally.

Returns 0 on success or negative error code on failure.

## i2o\_iop\_enable

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_enable` — move controller from ready to OPERATIONAL

## Synopsis

```
int i2o_iop_enable (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

Enable IOP. This allows the IOP to resume external operations and reverses the effect of a quiesce. Returns zero or an error code if an error occurs.

# i2o\_iop\_quiesce\_all

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_iop_quiesce_all` — Quiesce all I2O controllers on the system

### Synopsis

```
void i2o_iop_quiesce_all ( void );
```

### Arguments

*void*

no arguments

### Description

Quiesce all I2O controllers which are connected to the system.

# i2o\_iop\_enable\_all

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_iop_enable_all` — Enables all controllers on the system

## Synopsis

```
void i2o_iop_enable_all ( void );
```

## Arguments

*void*

no arguments

## Description

Enables all I2O controllers which are connected to the system.

## i2o\_iop\_clear

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_clear` — Bring I2O controller into HOLD state

## Synopsis

```
int i2o_iop_clear (struct i2o_controller * c);
```

## Arguments

*c*

controller

## Description

Clear an IOP to HOLD state, ie. terminate external operations, clear all input queues and prepare for a system restart. IOP's internal operation continues normally and the outbound queue is alive. The IOP is not expected to rebuild its LCT.

Returns 0 on success or negative error code on failure.

# i2o\_iop\_init\_outbound\_queue

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_init_outbound_queue` — setup the outbound message queue

## Synopsis

```
int i2o_iop_init_outbound_queue (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

Clear and (re)initialize IOP's outbound queue and post the message frames to the IOP.

Returns 0 on success or negative error code on failure.

## i2o\_iop\_reset

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_reset` — reset an I2O controller

## Synopsis

```
int i2o_iop_reset (struct i2o_controller * c);
```

## Arguments

`c`  
controller to reset

## Description

Reset the IOP into INIT state and wait until IOP gets into RESET state. Terminate all external operations, clear IOP's inbound and outbound queues, terminate all DDMs, and reload the IOP's operating environment and all local DDMs. The IOP rebuilds its LCT.

## i2o\_iop\_activate

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_iop_activate` — Bring controller up to HOLD

### Synopsis

```
int i2o_iop_activate (struct i2o_controller * c);
```

### Arguments

`c`  
controller

### Description

This function brings an I2O controller into HOLD state. The adapter is reset if necessary and then the queues and resource table are read.

Returns 0 on success or negative error code on failure.

## i2o\_iop\_systab\_set

### LINUX

## Name

`i2o_iop_systab_set` — Set the I2O System Table of the specified IOP

## Synopsis

```
int i2o_iop_systab_set (struct i2o_controller * c);
```

## Arguments

`c`

I2O controller to which the system table should be send

## Description

Before the systab could be set `i2o_systab_build` must be called.

Returns 0 on success or negative error code on failure.

# i2o\_iop\_online

## LINUX

## Name

`i2o_iop_online` — Bring a controller online into OPERATIONAL state.

## Synopsis

```
int i2o_iop_online (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

Send the system table and enable the I2O controller.

Returns 0 on success or negative error code on failure.

## i2o\_iop\_remove

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_remove` — Remove the I2O controller from the I2O core

## Synopsis

```
void i2o_iop_remove (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

Remove the I2O controller from the I2O core. If devices are attached to the controller remove these also and finally reset the controller.

# i2o\_systab\_build

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_systab_build` — Build system table

## Synopsis

```
int i2o_systab_build ( void );
```

## Arguments

*void*

no arguments

## Description

The system table contains information about all the IOPs in the system (duh) and is used by the Executives on the IOPs to establish peer2peer connections. We're not supporting peer2peer at the moment, but this will be needed down the road for things like lan2lan forwarding.

Returns 0 on success or negative error code on failure.

## i2o\_parse\_hrt

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_parse_hrt` — Parse the hardware resource table.

## Synopsis

```
int i2o_parse_hrt (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

We don't do anything with it except dumping it (in debug mode).

Returns 0.

# i2o\_iop\_release

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_iop_release` — release the memory for a I2O controller

### Synopsis

```
void i2o_iop_release (struct device * dev);
```

### Arguments

*dev*

I2O controller which should be released

### Description

Release the allocated memory. This function is called if refcount of device reaches 0 automatically.

# i2o\_iop\_alloc

## LINUX

## Name

`i2o_iop_alloc` — Allocate and initialize a `i2o_controller` struct

## Synopsis

```
struct i2o_controller * i2o_iop_alloc ( void );
```

## Arguments

*void*

no arguments

## Description

Allocate the necessary memory for a `i2o_controller` struct and initialize the lists and message mempool.

Returns a pointer to the I2O controller or a negative error code on failure.

# i2o\_iop\_add

## LINUX

## Name

`i2o_iop_add` — Initialize the I2O controller and add him to the I2O core

## Synopsis

```
int i2o_iop_add (struct i2o_controller * c);
```

## Arguments

*c*  
controller

## Description

Initialize the I2O controller and if no error occurs add him to the I2O core.

Returns 0 on success or negative error code on failure.

## i2o\_iop\_init

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_init` — I2O main initialization function

## Synopsis

```
int i2o_iop_init ( void );
```

## Arguments

*void*

no arguments

## Description

Initialize the I2O drivers (OSM) functions, register the Executive OSM, initialize the I2O PCI part and finally initialize I2O device stuff.

Returns 0 on success or negative error code on failure.

# i2o\_iop\_exit

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_iop_exit` — I2O main exit function

## Synopsis

```
void __exit i2o_iop_exit ( void );
```

## Arguments

*void*

no arguments

## Description

Removes I2O controllers from PCI subsystem and shut down OSMs.

# i2o\_config\_init

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_config_init` — Configuration OSM initialization function

## Synopsis

```
int i2o_config_init ( void );
```

## Arguments

*void*

no arguments

## Description

Registers Configuration OSM in the I2O core and if old `ioctl`'s are compiled in initialize them.

Returns 0 on success or negative error code on failure.

# i2o\_config\_exit

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_config_exit` — Configuration OSM exit function

### Synopsis

```
void i2o_config_exit ( void );
```

### Arguments

*void*

no arguments

### Description

If old `ioctl`'s are compiled in exit remove them and unregisters Configuration OSM from I2O core.

# i2o\_msg\_post\_wait\_mem

## LINUX

## Name

`i2o_msg_post_wait_mem` — Post and wait a message with DMA buffers

## Synopsis

```
int i2o_msg_post_wait_mem (struct i2o_controller * c, struct
i2o_message * msg, unsigned long timeout, struct i2o_dma *
dma);
```

## Arguments

*c*

controller

*msg*

message to post

*timeout*

time in seconds to wait

*dma*

i2o\_dma struct of the DMA buffer to free on failure

## Description

This API allows an OSM to post a message and then be told whether or not the system received a successful reply. If the message times out then the value '-ETIMEDOUT' is returned. This is a special case. In this situation the message may (should) complete at an indefinite time in the future. When it completes it will use the memory buffer attached to the request. If -ETIMEDOUT is returned then the memory buffer must not be freed. Instead the event completion will free them for you. In all other cases the buffer are your problem.

Returns 0 on success, negative error code on timeout or positive error code from reply.

## **i2o\_exec\_lct\_get**

### **LINUX**

Kernel Hackers Manual March 2019

### **Name**

`i2o_exec_lct_get` — Get the IOP's Logical Configuration Table

### **Synopsis**

```
int i2o_exec_lct_get (struct i2o_controller * c);
```

### **Arguments**

*c*

I2O controller from which the LCT should be fetched

### **Description**

Send a LCT NOTIFY request to the controller, and wait I2O\_TIMEOUT\_LCT\_GET seconds until arrival of response. If the LCT is too large, retry it.

Returns 0 on success or negative error code on failure.

# i2o\_exec\_wait\_alloc

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_exec_wait_alloc` — Allocate a `i2o_exec_wait` struct and initialize it

### Synopsis

```
struct i2o_exec_wait * i2o_exec_wait_alloc ( void );
```

### Arguments

*void*

no arguments

### Description

Allocate the `i2o_exec_wait` struct and initialize the wait.

Returns `i2o_exec_wait` pointer on success or negative error code on failure.

# i2o\_exec\_wait\_free

## LINUX

## Name

`i2o_exec_wait_free` — Free an `i2o_exec_wait` struct

## Synopsis

```
void i2o_exec_wait_free (struct i2o_exec_wait * wait);
```

## Arguments

*wait*

I2O wait data which should be cleaned up

# i2o\_msg\_post\_wait\_complete

## LINUX

## Name

`i2o_msg_post_wait_complete` — Reply to a `i2o_msg_post` request from IOP

## Synopsis

```
int i2o_msg_post_wait_complete (struct i2o_controller * c, u32  
m, struct i2o_message * msg, u32 context);
```

## Arguments

*c*

I2O controller which answers

*m*

message id

*msg*

pointer to the I2O reply message

*context*

transaction context of request

## Description

This function is called in interrupt context only. If the reply reached before the timeout, the `i2o_exec_wait` struct is filled with the message and the task will be waked up. The task is now responsible for returning the message `m` back to the controller! If the message reaches us after the timeout clean up the `i2o_exec_wait` struct (including allocated DMA buffer).

Return 0 on success and if the message `m` should not be given back to the I2O controller, or `>0` on success and if the message should be given back afterwards. Returns negative error code on failure. In this case the message must also be given back to the controller.

## i2o\_exec\_show\_vendor\_id

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_exec_show_vendor_id` — Displays Vendor ID of controller

## Synopsis

```
ssize_t i2o_exec_show_vendor_id (struct device * d, struct
device_attribute * attr, char * buf);
```

## Arguments

*d*

device of which the Vendor ID should be displayed

*attr*

device\_attribute to display

*buf*

buffer into which the Vendor ID should be printed

## Description

Returns number of bytes printed into buffer.

## i2o\_exec\_show\_product\_id

**LINUX**

Kernel Hackers Manual March 2019

## Name

i2o\_exec\_show\_product\_id — Displays Product ID of controller

## Synopsis

```
ssize_t i2o_exec_show_product_id (struct device * d, struct
device_attribute * attr, char * buf);
```

## Arguments

*d*

device of which the Product ID should be displayed

*attr*

device\_attribute to display

*buf*

buffer into which the Product ID should be printed

## Description

Returns number of bytes printed into buffer.

## i2o\_exec\_probe

**LINUX**

Kernel Hackers Manual March 2019

## Name

i2o\_exec\_probe — Called if a new I2O device (executive class) appears

## Synopsis

```
int i2o_exec_probe (struct device * dev);
```

## Arguments

*dev*

I2O device which should be probed

## Description

Registers event notification for every event from Executive device. The return is always 0, because we want all devices of class Executive.

Returns 0 on success.

## i2o\_exec\_remove

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_exec_remove` — Called on I2O device removal

## Synopsis

```
int i2o_exec_remove (struct device * dev);
```

## Arguments

*dev*

I2O device which was removed

## Description

Unregisters event notification from Executive I2O device.

Returns 0 on success.

# i2o\_exec\_lct\_notify

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_exec_lct_notify` — Send a asynchronous LCT NOTIFY request

## Synopsis

```
int i2o_exec_lct_notify (struct i2o_controller * c, u32  
change_ind);
```

## Arguments

*c*

I2O controller to which the request should be send

*change\_ind*

change indicator

## Description

This function sends a LCT NOTIFY request to the I2O controller with the change indicator *change\_ind*. If the *change\_ind* == 0 the controller replies immediately after the request. If *change\_ind* > 0 the reply is send after change indicator of the LCT is > *change\_ind*.

## i2o\_exec\_lct\_modified

### LINUX

Kernel Hackers Manual March 2019

## Name

*i2o\_exec\_lct\_modified* — Called on LCT NOTIFY reply

## Synopsis

```
void i2o_exec_lct_modified (struct work_struct * _work);
```

## Arguments

*\_work*

work struct for a specific controller

## Description

This function handles asynchronous LCT NOTIFY replies. It parses the new LCT and if the buffer for the LCT was too small sends a LCT NOTIFY again, otherwise send LCT NOTIFY to get informed on next LCT change.

## i2o\_exec\_reply

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_exec_reply` — I2O Executive reply handler

## Synopsis

```
int i2o_exec_reply (struct i2o_controller * c, u32 m, struct
i2o_message * msg);
```

## Arguments

*c*

I2O controller from which the reply comes

*m*

message id

*msg*

pointer to the I2O reply message

## Description

This function is always called from interrupt context. If a POST WAIT reply was received, pass it to the complete function. If a LCT NOTIFY reply was received, a new event is created to handle the update.

Returns 0 on success and if the reply should not be flushed or > 0 on success and if the reply should be flushed. Returns negative error code on failure and if the reply should be flushed.

## i2o\_exec\_event

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_exec_event` — Event handling function

## Synopsis

```
void i2o_exec_event (struct work_struct * work);
```

## Arguments

*work*

Work item in occurring event

## Description

Handles events send by the Executive device. At the moment does not do anything useful.

# i2o\_exec\_init

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_exec_init` — Registers the Exec OSM

### Synopsis

```
int i2o_exec_init ( void );
```

### Arguments

*void*

no arguments

### Description

Registers the Exec OSM in the I2O core.

Returns 0 on success or negative error code on failure.

# i2o\_exec\_exit

## LINUX

## Name

`i2o_exec_exit` — Removes the Exec OSM

## Synopsis

```
void i2o_exec_exit ( void );
```

## Arguments

*void*

no arguments

## Description

Unregisters the Exec OSM from the I2O core.

# i2o\_bus\_scan

## LINUX

## Name

`i2o_bus_scan` — Scan the bus for new devices

## Synopsis

```
int i2o_bus_scan (struct i2o_device * dev);
```

## Arguments

*dev*

I2O device of the bus, which should be scanned

## Description

Scans the bus dev for new / removed devices. After the scan a new LCT will be fetched automatically.

Returns 0 on success or negative error code on failure.

## i2o\_bus\_store\_scan

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_bus_store_scan` — Scan the I2O Bus Adapter

## Synopsis

```
ssize_t i2o_bus_store_scan (struct device * d, struct  
device_attribute * attr, const char * buf, size_t count);
```

## Arguments

<i>d</i>	device which should be scanned
<i>attr</i>	device_attribute
<i>buf</i>	output buffer
<i>count</i>	buffer size

## Description

Returns count.

# i2o\_bus\_probe

## LINUX

Kernel Hackers ManualMarch 2019

## Name

`i2o_bus_probe` — verify if dev is a I2O Bus Adapter device and install it

## Synopsis

```
int i2o_bus_probe (struct device * dev);
```

## Arguments

*dev*

device to verify if it is a I2O Bus Adapter device

## Description

Because we want all Bus Adapters always return 0. Except when we fail. Then we are sad.

Returns 0, except when we fail to excel.

# i2o\_bus\_remove

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_bus_remove` — remove the I2O Bus Adapter device from the system again

## Synopsis

```
int i2o_bus_remove (struct device * dev);
```

## Arguments

*dev*

I2O Bus Adapter device which should be removed

## Description

Always returns 0.

# i2o\_bus\_init

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_bus_init` — Bus Adapter OSM initialization function

## Synopsis

```
int i2o_bus_init ( void );
```

## Arguments

*void*

no arguments

## Description

Only register the Bus Adapter OSM in the I2O core.

Returns 0 on success or negative error code on failure.

# i2o\_bus\_exit

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_bus_exit` — Bus Adapter OSM exit function

### Synopsis

```
void __exit i2o_bus_exit ( void );
```

### Arguments

*void*

no arguments

### Description

Unregisters Bus Adapter OSM from I2O core.

# i2o\_device\_claim

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_device_claim` — claim a device for use by an OSM

## Synopsis

```
int i2o_device_claim (struct i2o_device * dev);
```

## Arguments

*dev*

I2O device to claim

## Description

Do the leg work to assign a device to a given OSM. If the claim succeeds, the owner is the primary. If the attempt fails a negative errno code is returned. On success zero is returned.

# i2o\_device\_claim\_release

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_device_claim_release` — release a device that the OSM is using

## Synopsis

```
int i2o_device_claim_release (struct i2o_device * dev);
```

## Arguments

*dev*

device to release

## Description

Drop a claim by an OSM on a given I2O device.

AC - some devices seem to want to refuse an unclaim until they have finished internal processing. It makes sense since you don't want a new device to go reconfiguring the entire system until you are done. Thus we are prepared to wait briefly.

Returns 0 on success or negative error code on failure.

## i2o\_device\_issue\_claim

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_device_issue_claim` — claim or release a device

### Synopsis

```
int i2o_device_issue_claim (struct i2o_device * dev, u32 cmd,
u32 type);
```

## Arguments

*dev*

I2O device to claim or release

*cmd*

claim or release command

*type*

type of claim

## Description

Issue I2O UTIL\_CLAIM or UTIL\_RELEASE messages. The message to be sent is set by *cmd*. *dev* is the I2O device which should be claim or released and the *type* is the claim type (see the I2O spec).

Returns 0 on success or negative error code on failure.

# i2o\_device\_release

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_device_release` — release the memory for a I2O device

## Synopsis

```
void i2o_device_release (struct device * dev);
```

## Arguments

*dev*

I2O device which should be released

## Description

Release the allocated memory. This function is called if refcount of device reaches 0 automatically.

# i2o\_device\_show\_class\_id

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_device_show_class_id` — Displays class id of I2O device

## Synopsis

```
ssize_t i2o_device_show_class_id (struct device * dev, struct  
device_attribute * attr, char * buf);
```

## Arguments

*dev*

device of which the class id should be displayed

*attr*

pointer to device attribute

*buf*

buffer into which the class id should be printed

## Description

Returns the number of bytes which are printed into the buffer.

# i2o\_device\_show\_tid

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_device_show_tid` — Displays TID of I2O device

## Synopsis

```
ssize_t i2o_device_show_tid (struct device * dev, struct
device_attribute * attr, char * buf);
```

## Arguments

*dev*

device of which the TID should be displayed

*attr*

pointer to device attribute

*buf*

buffer into which the TID should be printed

## Description

Returns the number of bytes which are printed into the buffer.

# i2o\_device\_alloc

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_device_alloc` — Allocate a I2O device and initialize it

## Synopsis

```
struct i2o_device * i2o_device_alloc ( void );
```

## Arguments

*void*

no arguments

## Description

Allocate the memory for a I2O device and initialize locks and lists

Returns the allocated I2O device or a negative error code if the device could not be allocated.

# i2o\_device\_add

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_device_add` — allocate a new I2O device and add it to the IOP

### Synopsis

```
int i2o_device_add (struct i2o_controller * c, i2o_lct_entry *  
entry);
```

### Arguments

*c*

I2O controller that the device is on

*entry*

LCT entry of the I2O device

### Description

Allocate a new I2O device and initialize it with the LCT entry. The device is appended to the device list of the controller.

Returns zero on success, or a -ve errno.

# i2o\_device\_remove

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_device_remove` — remove an I2O device from the I2O core

### Synopsis

```
void i2o_device_remove (struct i2o_device * i2o_dev);
```

### Arguments

*i2o\_dev*

I2O device which should be released

### Description

Is used on I2O controller removal or LCT modification, when the device is removed from the system. Note that the device could still hang around until the refcount reaches 0.

# i2o\_device\_parse\_lct

## LINUX

## Name

`i2o_device_parse_lct` — Parse a previously fetched LCT and create devices

## Synopsis

```
int i2o_device_parse_lct (struct i2o_controller * c);
```

## Arguments

`c`

I2O controller from which the LCT should be parsed.

## Description

The Logical Configuration Table tells us what we can talk to on the board. For every entry we create an I2O device, which is registered in the I2O core.

Returns 0 on success or negative error code on failure.

# i2o\_bus\_match

## LINUX

## Name

`i2o_bus_match` — Tell if I2O device class id matches the class ids of the I2O driver (OSM)

## Synopsis

```
int i2o_bus_match (struct device * dev, struct device_driver *  
drv);
```

## Arguments

*dev*

device which should be verified

*drv*

the driver to match against

## Description

Used by the bus to check if the driver wants to handle the device.

Returns 1 if the class ids of the driver match the class id of the device, otherwise 0.

# i2o\_driver\_dispatch

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_driver_dispatch` — dispatch an I2O reply message

## Synopsis

```
int i2o_driver_dispatch (struct i2o_controller * c, u32 m);
```

## Arguments

*c*

I2O controller of the message

*m*

I2O message number

## Description

The reply is delivered to the driver from which the original message was. This function is only called from interrupt context.

Returns 0 on success and the message should not be flushed. Returns > 0 on success and if the message should be flushed afterwards. Returns negative error code on failure (the message will be flushed too).

## i2o\_driver\_init

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_driver_init` — initialize I2O drivers (OSMs)

### Synopsis

```
int i2o_driver_init ( void );
```

## Arguments

*void*

no arguments

## Description

Registers the I2O bus and allocate memory for the array of OSMs.

Returns 0 on success or negative error code on failure.

# i2o\_driver\_exit

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_driver_exit` — clean up I2O drivers (OSMs)

## Synopsis

```
void i2o_driver_exit ( void );
```

## Arguments

*void*

no arguments

## Description

Unregisters the I2O bus and frees driver array.

## i2o\_pci\_free

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_pci_free` — Frees the DMA memory for the I2O controller

## Synopsis

```
void i2o_pci_free (struct i2o_controller * c);
```

## Arguments

`c`

I2O controller to free

## Description

Remove all allocated DMA memory and unmap memory IO regions. If MTRR is enabled, also remove it again.

# i2o\_pci\_alloc

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_pci_alloc` — Allocate DMA memory, map IO memory for I2O controller

### Synopsis

```
int i2o_pci_alloc (struct i2o_controller * c);
```

### Arguments

*c*

I2O controller

### Description

Allocate DMA memory for a PCI (or in theory AGP) I2O controller. All IO mappings are also done here. If MTRR is enabled, also do add memory regions here.

Returns 0 on success or negative error code on failure.

# i2o\_pci\_interrupt

## LINUX

## Name

`i2o_pci_interrupt` — Interrupt handler for I2O controller

## Synopsis

```
irqreturn_t i2o_pci_interrupt (int irq, void * dev_id);
```

## Arguments

*irq*

interrupt line

*dev\_id*

pointer to the I2O controller

## Description

Handle an interrupt from a PCI based I2O controller. This turns out to be rather simple. We keep the controller pointer in the cookie.

# i2o\_pci\_irq\_enable

## LINUX

## Name

`i2o_pci_irq_enable` — Allocate interrupt for I2O controller

## Synopsis

```
int i2o_pci_irq_enable (struct i2o_controller * c);
```

## Arguments

*c*

i2o\_controller that the request is for

## Description

Allocate an interrupt for the I2O controller, and activate interrupts on the I2O controller.

Returns 0 on success or negative error code on failure.

## i2o\_pci\_irq\_disable

### LINUX

Kernel Hackers Manual March 2019

## Name

i2o\_pci\_irq\_disable — Free interrupt for I2O controller

## Synopsis

```
void i2o_pci_irq_disable (struct i2o_controller * c);
```

## Arguments

*c*

I2O controller

## Description

Disable interrupts in I2O controller and then free interrupt.

## i2o\_pci\_probe

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_pci_probe` — Probe the PCI device for an I2O controller

## Synopsis

```
int i2o_pci_probe (struct pci_dev * pdev, const struct  
pci_device_id * id);
```

## Arguments

*pdev*

PCI device to test

*id*

id which matched with the PCI device id table

## Description

Probe the PCI device for any device which is a member of the Intelligent, I2O class or an Adaptec Zero Channel Controller. We attempt to set up each such device and register it with the core.

Returns 0 on success or negative error code on failure.

# i2o\_pci\_remove

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_pci_remove` — Removes a I2O controller from the system

## Synopsis

```
void __devexit i2o_pci_remove (struct pci_dev * pdev);
```

## Arguments

*pdev*

I2O controller which should be removed

## Description

Reset the I2O controller, disable interrupts and remove all allocated resources.

# i2o\_pci\_init

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_pci_init` — registers I2O PCI driver in PCI subsystem

### Synopsis

```
int i2o_pci_init ( void );
```

### Arguments

*void*

no arguments

### Description

Returns > 0 on success or negative error code on failure.

# i2o\_pci\_exit

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_pci_exit` — unregisters I2O PCI driver from PCI subsystem

## Synopsis

```
void __exit i2o_pci_exit ( void);
```

## Arguments

*void*

no arguments

## i2o\_block\_device\_free

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_device_free` — free the memory of the I2O Block device

## Synopsis

```
void i2o_block_device_free (struct i2o_block_device * dev);
```

## Arguments

*dev*

I2O Block device, which should be cleaned up

## Description

Frees the request queue, gendisk and the `i2o_block_device` structure.

# i2o\_block\_remove

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_remove` — remove the I2O Block device from the system again

## Synopsis

```
int i2o_block_remove (struct device * dev);
```

## Arguments

*dev*

I2O Block device which should be removed

## Description

Remove gendisk from system and free all allocated memory.

Always returns 0.

# i2o\_block\_device\_flush

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_block_device_flush` — Flush all dirty data of I2O device `dev`

### Synopsis

```
int i2o_block_device_flush (struct i2o_device * dev);
```

### Arguments

*dev*

I2O device which should be flushed

### Description

Flushes all dirty data on device `dev`.

Returns 0 on success or negative error code on failure.

# i2o\_block\_device\_mount

## LINUX

## Name

`i2o_block_device_mount` — Mount (load) the media of device `dev`

## Synopsis

```
int i2o_block_device_mount (struct i2o_device * dev, u32
media_id);
```

## Arguments

*dev*

I2O device which should receive the mount request

*media\_id*

Media Identifier

## Description

Load a media into drive. Identifier should be set to -1, because the spec does not support any other value.

Returns 0 on success or negative error code on failure.

# i2o\_block\_device\_lock

**LINUX**

## Name

`i2o_block_device_lock` — Locks the media of device `dev`

## Synopsis

```
int i2o_block_device_lock (struct i2o_device * dev, u32  
media_id);
```

## Arguments

*dev*

I2O device which should receive the lock request

*media\_id*

Media Identifier

## Description

Lock media of device `dev` to prevent removal. The media identifier should be set to -1, because the spec does not support any other value.

Returns 0 on success or negative error code on failure.

## `i2o_block_device_unlock`

**LINUX**

## Name

`i2o_block_device_unlock` — Unlocks the media of device `dev`

## Synopsis

```
int i2o_block_device_unlock (struct i2o_device * dev, u32
media_id);
```

## Arguments

*dev*

I2O device which should receive the unlocked request

*media\_id*

Media Identifier

## Description

Unlocks the media in device `dev`. The media identifier should be set to -1, because the spec does not support any other value.

Returns 0 on success or negative error code on failure.

## `i2o_block_device_power`

**LINUX**

## Name

`i2o_block_device_power` — Power management for device `dev`

## Synopsis

```
int i2o_block_device_power (struct i2o_block_device * dev, u8  
op);
```

## Arguments

*dev*

I2O device which should receive the power management request

*op*

Operation to send

## Description

Send a power management request to the device `dev`.

Returns 0 on success or negative error code on failure.

## `i2o_block_request_alloc`

**LINUX**

## Name

`i2o_block_request_alloc` — Allocate an I2O block request struct

## Synopsis

```
struct i2o_block_request * i2o_block_request_alloc ( void );
```

## Arguments

*void*

no arguments

## Description

Allocates an I2O block request struct and initialize the list.

Returns a `i2o_block_request` pointer on success or negative error code on failure.

# i2o\_block\_request\_free

## LINUX

## Name

`i2o_block_request_free` — Frees a I2O block request

## Synopsis

```
void i2o_block_request_free (struct i2o_block_request * ireq);
```

## Arguments

*ireq*

I2O block request which should be freed

## Description

Frees the allocated memory (give it back to the request mempool).

## i2o\_block\_sglist\_alloc

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_sglist_alloc` — Allocate the SG list and map it

## Synopsis

```
int i2o_block_sglist_alloc (struct i2o_controller * c, struct  
i2o_block_request * ireq, u32 ** mptr);
```

## Arguments

*c*

I2O controller to which the request belongs

*ireq*

I2O block request

*mptr*

message body pointer

## Description

Builds the SG list and map it to be accessible by the controller.

Returns 0 on failure or 1 on success.

## i2o\_block\_sglist\_free

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_sglist_free` — Frees the SG list

## Synopsis

```
void i2o_block_sglist_free (struct i2o_block_request * ireq);
```

## Arguments

*ireq*

I2O block request from which the SG should be freed

## Description

Frees the SG list from the I2O block request.

# i2o\_block\_prep\_req\_fn

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_prep_req_fn` — Allocates I2O block device specific struct

## Synopsis

```
int i2o_block_prep_req_fn (struct request_queue * q, struct  
request * req);
```

## Arguments

*q*

request queue for the request

*req*

the request to prepare

## Description

Allocate the necessary `i2o_block_request` struct and connect it to the request. This is needed that we not lose the SG list later on.

Returns `BLKPREP_OK` on success or `BLKPREP_DEFER` on failure.

## `i2o_block_delayed_request_fn`

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_delayed_request_fn` — delayed request queue function

## Synopsis

```
void i2o_block_delayed_request_fn (struct work_struct * work);
```

## Arguments

*work*

the delayed request with the queue to start

## Description

If the request queue is stopped for a disk, and there is no open request, a new event is created, which calls this function to start the queue after

`I2O_BLOCK_REQUEST_TIME`. Otherwise the queue will never be started again.

# i2o\_block\_end\_request

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_block_end_request` — Post-processing of completed commands

### Synopsis

```
void i2o_block_end_request (struct request * req, int error,  
int nr_bytes);
```

### Arguments

*req*

request which should be completed

*error*

0 for success, < 0 for error

*nr\_bytes*

number of bytes to complete

### Description

Mark the request as complete. The lock must not be held when entering.

# i2o\_block\_reply

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_block_reply` — Block OSM reply handler.

### Synopsis

```
int i2o_block_reply (struct i2o_controller * c, u32 m, struct  
i2o_message * msg);
```

### Arguments

*c*

I2O controller from which the message arrives

*m*

message id of reply

*msg*

the actual I2O message reply

### Description

This function gets all the message replies.

# i2o\_block\_open

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_block_open` — Open the block device

### Synopsis

```
int i2o_block_open (struct block_device * bdev, fmode_t mode);
```

### Arguments

*bdev*

block device being opened

*mode*

file open mode

### Description

Power up the device, mount and lock the media. This function is called, if the block device is opened for access.

Returns 0 on success or negative error code on failure.

# i2o\_block\_release

## LINUX

## Name

`i2o_block_release` — Release the I2O block device

## Synopsis

```
int i2o_block_release (struct gendisk * disk, fmode_t mode);
```

## Arguments

*disk*

gendisk device being released

*mode*

file open mode

## Description

Unlock and unmount the media, and power down the device. Gets called if the block device is closed.

Returns 0 on success or negative error code on failure.

## i2o\_block\_ioctl

**LINUX**

## Name

`i2o_block_ioctl` — Issue device specific ioctl calls.

## Synopsis

```
int i2o_block_ioctl (struct block_device * bdev, fmode_t mode,  
unsigned int cmd, unsigned long arg);
```

## Arguments

*bdev*

block device being opened

*mode*

file open mode

*cmd*

ioctl command

*arg*

arg

## Description

Handles ioctl request for the block device.

Return 0 on success or negative error on failure.

# i2o\_block\_media\_changed

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_block_media_changed` — Have we seen a media change?

### Synopsis

```
int i2o_block_media_changed (struct gendisk * disk);
```

### Arguments

*disk*

gendisk which should be verified

### Description

Verifies if the media has changed.

Returns 1 if the media was changed or 0 otherwise.

# i2o\_block\_transfer

## LINUX

## Name

`i2o_block_transfer` — Transfer a request to/from the I2O controller

## Synopsis

```
int i2o_block_transfer (struct request * req);
```

## Arguments

*req*

the request which should be transfered

## Description

This function converts the request into a I2O message. The necessary DMA buffers are allocated and after everything is setup post the message to the I2O controller. No cleanup is done by this function. It is done on the interrupt side when the reply arrives.

Return 0 on success or negative error code on failure.

# i2o\_block\_request\_fn

## LINUX

## Name

`i2o_block_request_fn` — request queue handling function

## Synopsis

```
void i2o_block_request_fn (struct request_queue * q);
```

## Arguments

*q*

request queue from which the request could be fetched

## Description

Takes the next request from the queue, transfers it and if no error occurs dequeue it from the queue. On arrival of the reply the message will be processed further. If an error occurs requeue the request.

# i2o\_block\_device\_alloc

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_device_alloc` — Allocate memory for a I2O Block device

## Synopsis

```
struct i2o_block_device * i2o_block_device_alloc ( void);
```

## Arguments

*void*

no arguments

## Description

Allocate memory for the `i2o_block_device` struct, gendisk and request queue and initialize them as far as no additional information is needed.

Returns a pointer to the allocated I2O Block device on succes or a negative error code on failure.

## i2o\_block\_probe

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_block_probe` — verify if dev is a I2O Block device and install it

## Synopsis

```
int i2o_block_probe (struct device * dev);
```

## Arguments

*dev*

device to verify if it is a I2O Block device

## Description

We only verify if the `user_tid` of the device is `0xffff` and then install the device. Otherwise it is used by some other device (e. g. RAID).

Returns 0 on success or negative error code on failure.

## i2o\_block\_init

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_block_init` — Block OSM initialization function

### Synopsis

```
int i2o_block_init ( void );
```

### Arguments

*void*

no arguments

### Description

Allocate the slab and mempool for request structs, registers `i2o_block` block device and finally register the Block OSM in the I2O core.

Returns 0 on success or negative error code on failure.

# i2o\_block\_exit

## LINUX

Kernel Hackers Manual March 2019

### Name

i2o\_block\_exit — Block OSM exit function

### Synopsis

```
void __exit i2o_block_exit ( void );
```

### Arguments

*void*

no arguments

### Description

Unregisters Block OSM from I2O core, unregisters i2o\_block block device and frees the mempool and slab.

# i2o\_scsi\_get\_host

## LINUX

## Name

`i2o_scsi_get_host` — Get an I2O SCSI host

## Synopsis

```
struct i2o_scsi_host * i2o_scsi_get_host (struct  
i2o_controller * c);
```

## Arguments

*c*

I2O controller to for which to get the SCSI host

## Description

If the I2O controller already exists as SCSI host, the SCSI host is returned, otherwise the I2O controller is added to the SCSI core.

Returns pointer to the I2O SCSI host on success or NULL on failure.

# i2o\_scsi\_remove

## LINUX

## Name

`i2o_scsi_remove` — Remove I2O device from SCSI core

## Synopsis

```
int i2o_scsi_remove (struct device * dev);
```

## Arguments

*dev*

device which should be removed

## Description

Removes the I2O device from the SCSI core again.

Returns 0 on success.

## i2o\_scsi\_probe

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_scsi_probe` — verify if dev is a I2O SCSI device and install it

## Synopsis

```
int i2o_scsi_probe (struct device * dev);
```

## Arguments

*dev*

device to verify if it is a I2O SCSI device

## Description

Retrieve channel, id and lun for I2O device. If everthing goes well register the I2O device as SCSI device on the I2O SCSI controller.

Returns 0 on success or negative error code on failure.

# i2o\_scsi\_reply

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_scsi_reply` — SCSI OSM message reply handler

## Synopsis

```
int i2o_scsi_reply (struct i2o_controller * c, u32 m, struct  
i2o_message * msg);
```

## Arguments

*c*

controller issuing the reply

*m*

message id for flushing

*msg*

the message from the controller

## Description

Process reply messages (interrupts in normal scsi controller think). We can get a variety of messages to process. The normal path is scsi command completions. We must also deal with IOP failures, the reply to a bus reset and the reply to a LUN query.

Returns 0 on success and if the reply should not be flushed or > 0 on success and if the reply should be flushed. Returns negative error code on failure and if the reply should be flushed.

# i2o\_scsi\_notify\_device\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_scsi_notify_device_add` — Retrieve notifications of added devices

## Synopsis

```
void i2o_scsi_notify_device_add (struct i2o_device * i2o_dev);
```

## Arguments

*i2o\_dev*

the I2O device which was added

## Description

If a I2O device is added we catch the notification, because I2O classes other than SCSI peripheral will not be received through `i2o_scsi_probe`.

# i2o\_scsi\_notify\_device\_remove

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_scsi_notify_device_remove` — Retrieve notifications of removed devices

## Synopsis

```
void i2o_scsi_notify_device_remove (struct i2o_device *  
i2o_dev);
```

## Arguments

*i2o\_dev*

the I2O device which was removed

## Description

If a I2O device is removed, we catch the notification to remove the corresponding SCSI device.

# i2o\_scsi\_notify\_controller\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_scsi_notify_controller_add` — Retrieve notifications of added controllers

## Synopsis

```
void i2o_scsi_notify_controller_add (struct i2o_controller *  
c);
```

## Arguments

`c`  
the controller which was added

## Description

If a I2O controller is added, we catch the notification to add a corresponding `Scsi_Host`.

# i2o\_scsi\_notify\_controller\_remove

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_scsi_notify_controller_remove` — Retrieve notifications of removed controllers

### Synopsis

```
void i2o_scsi_notify_controller_remove (struct i2o_controller  
* c);
```

### Arguments

*c*

the controller which was removed

### Description

If a I2O controller is removed, we catch the notification to remove the corresponding Scsi\_Host.

# i2o\_scsi\_queuecommand

## LINUX

## Name

`i2o_scsi_queuecommand` — queue a SCSI command

## Synopsis

```
int i2o_scsi_queuecommand (struct scsi_cmnd * SCpnt, void  
(*done) (struct scsi_cmnd *));
```

## Arguments

*SCpnt*

scsi command pointer

*done*

callback for completion

## Description

Issue a scsi command asynchronously. Return 0 on success or 1 if we hit an error (normally message queue congestion). The only minor complication here is that I2O deals with the device addressing so we have to map the bus/dev/lun back to an I2O handle as well as faking absent devices ourself.

## Locks

takes the controller lock on error path only

# i2o\_scsi\_abort

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_scsi_abort` — abort a running command

### Synopsis

```
int i2o_scsi_abort (struct scsi_cmnd * SCpnt);
```

### Arguments

*SCpnt*

command to abort

### Description

Ask the I2O controller to abort a command. This is an asynchronous process and our callback handler will see the command complete with an aborted message if it succeeds.

Returns 0 if the command is successfully aborted or negative error code on failure.

# i2o\_scsi\_bios\_param

## LINUX

## Name

`i2o_scsi_bios_param` — Invent disk geometry

## Synopsis

```
int i2o_scsi_bios_param (struct scsi_device * sdev, struct  
block_device * dev, sector_t capacity, int * ip);
```

## Arguments

*sdev*

scsi device

*dev*

block layer device

*capacity*

size in sectors

*ip*

geometry array

## Description

This is anyone's guess quite frankly. We use the same rules everyone else appears to and hope. It seems to work.

# i2o\_scsi\_init

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_scsi_init` — SCSI OSM initialization function

### Synopsis

```
int i2o_scsi_init ( void );
```

### Arguments

*void*

no arguments

### Description

Register SCSI OSM into I2O core.

Returns 0 on success or negative error code on failure.

# i2o\_scsi\_exit

## LINUX

## Name

`i2o_scsi_exit` — SCSI OSM exit function

## Synopsis

```
void __exit i2o_scsi_exit ( void );
```

## Arguments

*void*

no arguments

## Description

Unregisters SCSI OSM from I2O core.

# i2o\_get\_class\_name

## LINUX

## Name

`i2o_get_class_name` — do i2o class name lookup

## Synopsis

```
const char * i2o_get_class_name (int class);
```

## Arguments

*class*

class number

## Description

Return a descriptive string for an i2o class.

# i2o\_proc\_create\_entries

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_proc_create_entries` — Creates proc dir entries

## Synopsis

```
int i2o_proc_create_entries (struct proc_dir_entry * dir,  
i2o_proc_entry * i2o_pe, void * data);
```

## Arguments

*dir*

proc dir entry under which the entries should be placed

*i2o\_pe*

pointer to the entries which should be added

*data*

pointer to I2O controller or device

## Description

Create proc dir entries for a I2O controller or I2O device.

Returns 0 on success or negative error code on failure.

# i2o\_proc\_subdir\_remove

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_proc_subdir_remove` — Remove child entries from a proc entry

## Synopsis

```
void i2o_proc_subdir_remove (struct proc_dir_entry * dir);
```

## Arguments

*dir*

proc dir entry from which the childs should be removed

## Description

Iterate over each i2o proc entry under *dir* and remove it. If the child also has entries, remove them too.

# i2o\_proc\_device\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_proc_device_add` — Add an I2O device to the proc dir

## Synopsis

```
void i2o_proc_device_add (struct proc_dir_entry * dir, struct  
i2o_device * dev);
```

## Arguments

*dir*

proc dir entry to which the device should be added

*dev*

I2O device which should be added

## Description

Add an I2O device to the proc dir entry `dir` and create the entries for the device depending on the class of the I2O device.

# i2o\_proc\_iop\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_proc_iop_add` — Add an I2O controller to the i2o proc tree

## Synopsis

```
int i2o_proc_iop_add (struct proc_dir_entry * dir, struct
i2o_controller * c);
```

## Arguments

*dir*

parent proc dir entry

*c*

I2O controller which should be added

## Description

Add the entries to the parent proc dir entry. Also each device is added to the controllers proc dir entry.

Returns 0 on success or negative error code on failure.

# i2o\_proc\_iop\_remove

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_proc_iop_remove` — Removes an I2O controller from the i2o proc tree

### Synopsis

```
void i2o_proc_iop_remove (struct proc_dir_entry * dir, struct
i2o_controller * c);
```

### Arguments

*dir*

parent proc dir entry

*c*

I2O controller which should be removed

### Description

Iterate over each i2o proc entry and search controller `c`. If it is found remove it from the tree.

# i2o\_proc\_fs\_create

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2o_proc_fs_create` — Create the i2o proc fs.

### Synopsis

```
int i2o_proc_fs_create ( void );
```

### Arguments

*void*

no arguments

### Description

Iterate over each I2O controller and create the entries for it.

Returns 0 on success or negative error code on failure.

# i2o\_proc\_fs\_destroy

## LINUX

## Name

`i2o_proc_fs_destroy` — Cleanup the all i2o proc entries

## Synopsis

```
int __exit i2o_proc_fs_destroy ( void );
```

## Arguments

*void*

no arguments

## Description

Iterate over each I2O controller and remove the entries for it.

Returns 0 on success or negative error code on failure.

# i2o\_proc\_init

## LINUX

## Name

`i2o_proc_init` — Init function for procfs

## Synopsis

```
int i2o_proc_init ( void );
```

## Arguments

*void*

no arguments

## Description

Registers Proc OSM and creates procfs entries.

Returns 0 on success or negative error code on failure.

## i2o\_proc\_exit

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2o_proc_exit` — Exit function for procfs

## Synopsis

```
void __exit i2o_proc_exit ( void );
```

## **Arguments**

*void*

no arguments

## **Description**

Unregisters Proc OSM and removes procfs entries.

# Chapter 5. Sound Devices

## snd\_register\_device

**LINUX**

Kernel Hackers Manual March 2019

### Name

`snd_register_device` — Register the ALSA device file for the card

### Synopsis

```
int snd_register_device (int type, struct snd_card * card, int  
dev, const struct file_operations * f_ops, void *  
private_data, const char * name);
```

### Arguments

*type*

the device type, SNDRV\_DEVICE\_TYPE\_XXX

*card*

the card instance

*dev*

the device index

*f\_ops*

the file operations

*private\_data*

user pointer for `f_ops->open`

*name*

the device file name

## Description

Registers an ALSA device file for the given card. The operators have to be set in `reg` parameter.

This function uses the card's device pointer to link to the correct struct device.

Returns zero if successful, or a negative error code on failure.

# snd\_printk

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_printk` — `printk` wrapper

## Synopsis

```
snd_printk ( fmt,  args... );
```

## Arguments

*fmt*

format string

*args...*

variable arguments

## Description

Works like `printk` but prints the file and the line of the caller when configured with `CONFIG_SND_VERBOSE_PRINTK`.

# snd\_printd

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_printd` — debug `printk`

## Synopsis

```
snd_printd ( fmt,  args... );
```

## Arguments

*fmt*

format string

*args...*

variable arguments

## Description

Works like `snd_printk` for debugging purposes. Ignored when `CONFIG_SND_DEBUG` is not set.

# snd\_BUG

## LINUX

Kernel Hackers Manual March 2019

### Name

snd\_BUG — give a BUG warning message and stack trace

### Synopsis

```
snd_BUG (void);
```

### Arguments

None

### Description

Calls `WARN` if `CONFIG_SND_DEBUG` is set. Ignored when `CONFIG_SND_DEBUG` is not set.

# snd\_BUG\_ON

## LINUX

Kernel Hackers Manual March 2019

### Name

snd\_BUG\_ON — debugging check macro

## Synopsis

```
snd_BUG_ON ( cond );
```

## Arguments

*cond*

condition to evaluate

## Description

When `CONFIG_SND_DEBUG` is set, this macro evaluates the given condition, and call `WARN` and returns the value if it's non-zero.

When `CONFIG_SND_DEBUG` is not set, this just returns zero, and the given condition is ignored.

## NOTE

the argument won't be evaluated at all when `CONFIG_SND_DEBUG=n`. Thus, don't put any statement that influences on the code behavior, such as pre/post increment, to the argument of this macro. If you want to evaluate and give a warning, use standard `WARN_ON`.

## snd\_printdd

### LINUX

Kernel Hackers Manual March 2019

## Name

`snd_printdd` — debug printk

## Synopsis

```
snd_printdd ( format,  args...);
```

## Arguments

*format*

format string

*args...*

variable arguments

## Description

Works like `snd_printk` for debugging purposes. Ignored when `CONFIG_SND_DEBUG_VERBOSE` is not set.

# register\_sound\_special\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`register_sound_special_device` — register a special sound node

## Synopsis

```
int register_sound_special_device (const struct  
file_operations * fops, int unit, struct device * dev);
```

## Arguments

*fops*

File operations for the driver

*unit*

Unit number to allocate

*dev*

device pointer

## Description

Allocate a special sound device by minor number from the sound subsystem. The allocated number is returned on succes. On failure a negative error code is returned.

# register\_sound\_mixer

## LINUX

Kernel Hackers Manual March 2019

## Name

`register_sound_mixer` — register a mixer device

## Synopsis

```
int register_sound_mixer (const struct file_operations * fops,
int dev);
```

## Arguments

*fops*

File operations for the driver

*dev*

Unit number to allocate

## Description

Allocate a mixer device. Unit is the number of the mixer requested. Pass -1 to request the next free mixer unit. On success the allocated number is returned, on failure a negative error code is returned.

# register\_sound\_midi

## LINUX

Kernel Hackers Manual March 2019

## Name

`register_sound_midi` — register a midi device

## Synopsis

```
int register_sound_midi (const struct file_operations * fops,
int dev);
```

## Arguments

*fops*

File operations for the driver

*dev*

Unit number to allocate

## Description

Allocate a midi device. Unit is the number of the midi device requested. Pass -1 to request the next free midi unit. On success the allocated number is returned, on failure a negative error code is returned.

# register\_sound\_dsp

## LINUX

Kernel Hackers Manual March 2019

## Name

`register_sound_dsp` — register a DSP device

## Synopsis

```
int register_sound_dsp (const struct file_operations * fops,
int dev);
```

## Arguments

*fops*

File operations for the driver

*dev*

Unit number to allocate

## Description

Allocate a DSP device. Unit is the number of the DSP requested. Pass -1 to request the next free DSP unit. On success the allocated number is returned, on failure a negative error code is returned.

This function allocates both the audio and dsp device entries together and will always allocate them as a matching pair - eg dsp3/audio3

# unregister\_sound\_special

## LINUX

Kernel Hackers Manual March 2019

## Name

`unregister_sound_special` — unregister a special sound device

## Synopsis

```
void unregister_sound_special (int unit);
```

## Arguments

*unit*

unit number to allocate

## Description

Release a sound device that was allocated with `register_sound_special`. The unit passed is the return value from the register function.

# unregister\_sound\_mixer

## LINUX

Kernel Hackers Manual March 2019

## Name

`unregister_sound_mixer` — unregister a mixer

## Synopsis

```
void unregister_sound_mixer (int unit);
```

## Arguments

*unit*

unit number to allocate

## Description

Release a sound device that was allocated with `register_sound_mixer`. The `unit` passed is the return value from the register function.

# unregister\_sound\_midi

## LINUX

Kernel Hackers Manual March 2019

## Name

`unregister_sound_midi` — unregister a midi device

## Synopsis

```
void unregister_sound_midi (int unit);
```

## Arguments

*unit*

unit number to allocate

## Description

Release a sound device that was allocated with `register_sound_midi`. The `unit` passed is the return value from the register function.

# unregister\_sound\_dsp

## LINUX

Kernel Hackers Manual March 2019

### Name

`unregister_sound_dsp` — unregister a DSP device

### Synopsis

```
void unregister_sound_dsp (int unit);
```

### Arguments

*unit*

unit number to allocate

### Description

Release a sound device that was allocated with `register_sound_dsp`. The `unit` passed is the return value from the register function.

Both of the allocated units are released together automatically.

# snd\_pcm\_playback\_ready

## LINUX

## Name

`snd_pcm_playback_ready` — check whether the playback buffer is available

## Synopsis

```
int snd_pcm_playback_ready (struct snd_pcm_substream *  
    substream);
```

## Arguments

*substream*

the pcm substream instance

## Description

Checks whether enough free space is available on the playback buffer.

Returns non-zero if available, or zero if not.

# snd\_pcm\_capture\_ready

## LINUX

## Name

`snd_pcm_capture_ready` — check whether the capture buffer is available

## Synopsis

```
int snd_pcm_capture_ready (struct snd_pcm_substream *
    substream);
```

## Arguments

*substream*

the pcm substream instance

## Description

Checks whether enough capture data is available on the capture buffer.

Returns non-zero if available, or zero if not.

# snd\_pcm\_playback\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_playback_data` — check whether any data exists on the playback buffer

## Synopsis

```
int snd_pcm_playback_data (struct snd_pcm_substream *
    substream);
```

## Arguments

*substream*

the pcm substream instance

## Description

Checks whether any data exists on the playback buffer. If `stop_threshold` is bigger or equal to `boundary`, then this function returns always non-zero.

Returns non-zero if exists, or zero if not.

# snd\_pcm\_playback\_empty

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_playback_empty` — check whether the playback buffer is empty

## Synopsis

```
int snd_pcm_playback_empty (struct snd_pcm_substream *  
substream);
```

## Arguments

*substream*

the pcm substream instance

## Description

Checks whether the playback buffer is empty.

Returns non-zero if empty, or zero if not.

# snd\_pcm\_capture\_empty

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_capture_empty` — check whether the capture buffer is empty

## Synopsis

```
int snd_pcm_capture_empty (struct snd_pcm_substream *
    substream);
```

## Arguments

*substream*

the pcm substream instance

## Description

Checks whether the capture buffer is empty.

Returns non-zero if empty, or zero if not.

# snd\_pcm\_format\_cpu\_endian

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_format_cpu_endian` — Check the PCM format is CPU-endian

### Synopsis

```
int snd_pcm_format_cpu_endian (snd_pcm_format_t format);
```

### Arguments

*format*

the format to check

### Description

Returns 1 if the given PCM format is CPU-endian, 0 if opposite, or a negative error code if endian not specified.

# snd\_pcm\_new\_stream

## LINUX

## Name

`snd_pcm_new_stream` — create a new PCM stream

## Synopsis

```
int snd_pcm_new_stream (struct snd_pcm * pcm, int stream, int  
substream_count);
```

## Arguments

*pcm*

the pcm instance

*stream*

the stream direction, `SNDRV_PCM_STREAM_XXX`

*substream\_count*

the number of substreams

## Description

Creates a new stream for the pcm. The corresponding stream on the pcm must have been empty before calling this, i.e. zero must be given to the argument of `snd_pcm_new`.

Returns zero if successful, or a negative error code on failure.

## `snd_pcm_new`

**LINUX**

## Name

`snd_pcm_new` — create a new PCM instance

## Synopsis

```
int snd_pcm_new (struct snd_card * card, const char * id, int
device, int playback_count, int capture_count, struct snd_pcm
** rpcm);
```

## Arguments

*card*

the card instance

*id*

the id string

*device*

the device index (zero based)

*playback\_count*

the number of substreams for playback

*capture\_count*

the number of substreams for capture

*rpcm*

the pointer to store the new pcm instance

## Description

Creates a new PCM instance.

The pcm operators have to be set afterwards to the new instance via `snd_pcm_set_ops`.

Returns zero if successful, or a negative error code on failure.

## snd\_device\_new

### LINUX

Kernel Hackers Manual March 2019

### Name

`snd_device_new` — create an ALSA device component

### Synopsis

```
int snd_device_new (struct snd_card * card, snd_device_type_t
type, void * device_data, struct snd_device_ops * ops);
```

### Arguments

*card*

the card instance

*type*

the device type, `SNDRV_DEV_XXX`

*device\_data*

the data pointer of this device

*ops*

the operator table

## Description

Creates a new device component for the given data pointer. The device will be assigned to the card and managed together by the card.

The data pointer plays a role as the identifier, too, so the pointer address must be unique and unchanged.

Returns zero if successful, or a negative error code on failure.

## snd\_device\_free

### LINUX

Kernel Hackers Manual March 2019

## Name

`snd_device_free` — release the device from the card

## Synopsis

```
int snd_device_free (struct snd_card * card, void *  
device_data);
```

## Arguments

*card*

the card instance

*device\_data*

the data pointer to release

## Description

Removes the device from the list on the card and invokes the callbacks, `dev_disconnect` and `dev_free`, corresponding to the state. Then release the device.

Returns zero if successful, or a negative error code on failure or if the device not found.

# snd\_device\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_device_register` — register the device

## Synopsis

```
int snd_device_register (struct snd_card * card, void *
device_data);
```

## Arguments

*card*

the card instance

*device\_data*

the data pointer to register

## Description

Registers the device which was already created via `snd_device_new`. Usually this is called from `snd_card_register`, but it can be called later if any new devices are created after invocation of `snd_card_register`.

Returns zero if successful, or a negative error code on failure or if the device not found.

## snd\_iprintf

### LINUX

Kernel Hackers Manual March 2019

### Name

`snd_iprintf` — `printf` on the `procfs` buffer

### Synopsis

```
int snd_iprintf (struct snd_info_buffer * buffer, const char *  
fmt, ...);
```

### Arguments

*buffer*

the `procfs` buffer

*fmt*

the `printf` format

...

variable arguments

## Description

Outputs the string on the procfs buffer just like `printf`.

Returns the size of output string.

# snd\_info\_get\_line

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_info_get_line` — read one line from the procfs buffer

## Synopsis

```
int snd_info_get_line (struct snd_info_buffer * buffer, char *  
line, int len);
```

## Arguments

*buffer*

the procfs buffer

*line*

the buffer to store

*len*

the max. buffer size - 1

## Description

Reads one line from the buffer and stores the string.

Returns zero if successful, or 1 if error or EOF.

# snd\_info\_get\_str

## LINUX

Kernel Hackers Manual March 2019

## Name

snd\_info\_get\_str — parse a string token

## Synopsis

```
const char * snd_info_get_str (char * dest, const char * src,  
int len);
```

## Arguments

*dest*

the buffer to store the string token

*src*

the original string

*len*

the max. length of token - 1

## Description

Parses the original string and copy a token to the given string buffer.

Returns the updated pointer of the original string so that it can be used for the next call.

## snd\_info\_create\_module\_entry

### LINUX

Kernel Hackers Manual March 2019

## Name

`snd_info_create_module_entry` — create an info entry for the given module

## Synopsis

```
struct snd_info_entry * snd_info_create_module_entry (struct
module * module, const char * name, struct snd_info_entry *
parent);
```

## Arguments

*module*

the module pointer

*name*

the file name

*parent*

the parent directory

## Description

Creates a new info entry and assigns it to the given module.

Returns the pointer of the new instance, or NULL on failure.

# snd\_info\_create\_card\_entry

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_info_create_card_entry` — create an info entry for the given card

## Synopsis

```
struct snd_info_entry * snd_info_create_card_entry (struct
snd_card * card, const char * name, struct snd_info_entry *
parent);
```

## Arguments

*card*

the card instance

*name*

the file name

*parent*

the parent directory

## Description

Creates a new info entry and assigns it to the given card.

Returns the pointer of the new instance, or NULL on failure.

# snd\_card\_proc\_new

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_card_proc_new` — create an info entry for the given card

## Synopsis

```
int snd_card_proc_new (struct snd_card * card, const char *  
name, struct snd_info_entry ** entryp);
```

## Arguments

*card*

the card instance

*name*

the file name

*entryp*

the pointer to store the new info entry

## Description

Creates a new info entry and assigns it to the given card. Unlike `snd_info_create_card_entry`, this function registers the info entry as an ALSA device component, so that it can be unregistered/released without explicit call. Also, you don't have to register this entry via `snd_info_register`, since this will be registered by `snd_card_register` automatically.

The parent is assumed as `card->proc_root`.

For releasing this entry, use `snd_device_free` instead of `snd_info_free_entry`.

Returns zero if successful, or a negative error code on failure.

## snd\_info\_free\_entry

### LINUX

Kernel Hackers Manual March 2019

### Name

`snd_info_free_entry` — release the info entry

### Synopsis

```
void snd_info_free_entry (struct snd_info_entry * entry);
```

### Arguments

*entry*

the info entry

## Description

Releases the info entry. Don't call this after registered.

# snd\_info\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_info_register` — register the info entry

## Synopsis

```
int snd_info_register (struct snd_info_entry * entry);
```

## Arguments

*entry*

the info entry

## Description

Registers the proc info entry.

Returns zero if successful, or a negative error code on failure.

# snd\_rawmidi\_receive

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_rawmidi_receive` — receive the input data from the device

### Synopsis

```
int snd_rawmidi_receive (struct snd_rawmidi_substream *  
    substream, const unsigned char * buffer, int count);
```

### Arguments

*substream*

the rawmidi substream

*buffer*

the buffer pointer

*count*

the data size to read

### Description

Reads the data from the internal buffer.

Returns the size of read data, or a negative error code on failure.

# snd\_rawmidi\_transmit\_empty

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_rawmidi_transmit_empty` — check whether the output buffer is empty

### Synopsis

```
int snd_rawmidi_transmit_empty (struct snd_rawmidi_substream *  
    substream);
```

### Arguments

*substream*

the rawmidi substream

### Description

Returns 1 if the internal output buffer is empty, 0 if not.

# snd\_rawmidi\_transmit\_peek

## LINUX

## Name

`snd_rawmidi_transmit_peek` — copy data from the internal buffer

## Synopsis

```
int snd_rawmidi_transmit_peek (struct snd_rawmidi_substream *  
    substream, unsigned char * buffer, int count);
```

## Arguments

*substream*

the rawmidi substream

*buffer*

the buffer pointer

*count*

data size to transfer

## Description

Copies data from the internal output buffer to the given buffer.

Call this in the interrupt handler when the midi output is ready, and call `snd_rawmidi_transmit_ack` after the transmission is finished.

Returns the size of copied data, or a negative error code on failure.

# snd\_rawmidi\_transmit\_ack

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_rawmidi_transmit_ack` — acknowledge the transmission

### Synopsis

```
int snd_rawmidi_transmit_ack (struct snd_rawmidi_substream *  
    substream, int count);
```

### Arguments

*substream*

the rawmidi substream

*count*

the tranferred count

### Description

Advances the hardware pointer for the internal output buffer with the given size and updates the condition. Call after the transmission is finished.

Returns the advanced size if successful, or a negative error code on failure.

# snd\_rawmidi\_transmit

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_rawmidi_transmit` — copy from the buffer to the device

### Synopsis

```
int snd_rawmidi_transmit (struct snd_rawmidi_substream *  
    substream, unsigned char * buffer, int count);
```

### Arguments

*substream*

the rawmidi substream

*buffer*

the buffer pointer

*count*

the data size to transfer

### Description

Copies data from the buffer to the device and advances the pointer.

Returns the copied size if successful, or a negative error code on failure.

# snd\_rawmidi\_new

## LINUX

Kernel Hackers Manual March 2019

### Name

snd\_rawmidi\_new — create a rawmidi instance

### Synopsis

```
int snd_rawmidi_new (struct snd_card * card, char * id, int  
device, int output_count, int input_count, struct snd_rawmidi  
** rrawmidi);
```

### Arguments

*card*

the card instance

*id*

the id string

*device*

the device index

*output\_count*

the number of output streams

*input\_count*

the number of input streams

*rrawmidi*

the pointer to store the new rawmidi instance

## Description

Creates a new rawmidi instance. Use `snd_rawmidi_set_ops` to set the operators to the new instance.

Returns zero if successful, or a negative error code on failure.

# snd\_rawmidi\_set\_ops

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_rawmidi_set_ops` — set the rawmidi operators

## Synopsis

```
void snd_rawmidi_set_ops (struct snd_rawmidi * rmidi, int  
stream, struct snd_rawmidi_ops * ops);
```

## Arguments

*rmidi*

the rawmidi instance

*stream*

the stream direction, `SNDRV_RAWMIDI_STREAM_XXX`

*ops*

the operator table

## Description

Sets the rawmidi operators for the given stream direction.

# snd\_request\_card

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_request_card` — try to load the card module

## Synopsis

```
void snd_request_card (int card);
```

## Arguments

*card*

the card number

## Description

Tries to load the module “snd-card-X” for the given card number via `request_module`. Returns immediately if already loaded.

# snd\_lookup\_minor\_data

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_lookup_minor_data` — get user data of a registered device

### Synopsis

```
void * snd_lookup_minor_data (unsigned int minor, int type);
```

### Arguments

*minor*

the minor number

*type*

device type (SNDRV\_DEVICE\_TYPE\_XXX)

### Description

Checks that a minor device with the specified type is registered, and returns its user data pointer.

# snd\_register\_device\_for\_dev

## LINUX

## Name

`snd_register_device_for_dev` — Register the ALSA device file for the card

## Synopsis

```
int snd_register_device_for_dev (int type, struct snd_card *  
card, int dev, const struct file_operations * f_ops, void *  
private_data, const char * name, struct device * device);
```

## Arguments

*type*

the device type, SNDRV\_DEVICE\_TYPE\_XXX

*card*

the card instance

*dev*

the device index

*f\_ops*

the file operations

*private\_data*

user pointer for `f_ops->open`

*name*

the device file name

*device*

the struct device to link this new device to

## Description

Registers an ALSA device file for the given card. The operators have to be set in `reg` parameter.

Returns zero if successful, or a negative error code on failure.

# snd\_unregister\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_unregister_device` — unregister the device on the given card

## Synopsis

```
int snd_unregister_device (int type, struct snd_card * card,  
int dev);
```

## Arguments

*type*

the device type, `SNDRV_DEVICE_TYPE_XXX`

*card*

the card instance

*dev*

the device index

## Description

Unregisters the device file already registered via `snd_register_device`.

Returns zero if successful, or a negative error code on failure

# copy\_to\_user\_fromio

## LINUX

Kernel Hackers Manual March 2019

## Name

`copy_to_user_fromio` — copy data from mmio-space to user-space

## Synopsis

```
int copy_to_user_fromio (void __user * dst, const volatile
void __iomem * src, size_t count);
```

## Arguments

*dst*

the destination pointer on user-space

*src*

the source pointer on mmio

*count*

the data size to copy in bytes

## Description

Copies the data from mmio-space to user-space.

Returns zero if successful, or non-zero on failure.

# copy\_from\_user\_toio

## LINUX

Kernel Hackers Manual March 2019

## Name

`copy_from_user_toio` — copy data from user-space to mmio-space

## Synopsis

```
int copy_from_user_toio (volatile void __iomem * dst, const  
void __user * src, size_t count);
```

## Arguments

*dst*

the destination pointer on mmio-space

*src*

the source pointer on user-space

*count*

the data size to copy in bytes

## Description

Copies the data from user-space to mmio-space.

Returns zero if successful, or non-zero on failure.

# snd\_pcm\_lib\_preallocate\_free\_for\_all

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_lib_preallocate_free_for_all` — release all pre-allocated buffers on the pcm

## Synopsis

```
int snd_pcm_lib_preallocate_free_for_all (struct snd_pcm *
pcm);
```

## Arguments

*pcm*

the pcm instance

## Description

Releases all the pre-allocated buffers on the given pcm.

Returns zero if successful, or a negative error code on failure.

# snd\_pcm\_lib\_preallocate\_pages

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_lib_preallocate_pages` — pre-allocation for the given DMA type

### Synopsis

```
int snd_pcm_lib_preallocate_pages (struct snd_pcm_substream *  
    substream, int type, struct device * data, size_t size, size_t  
    max);
```

### Arguments

*substream*

the pcm substream instance

*type*

DMA type (SNDRV\_DMA\_TYPE\_\*)

*data*

DMA type dependant data

*size*

the requested pre-allocation size in bytes

*max*

the max. allowed pre-allocation size

## Description

Do pre-allocation for the given DMA buffer type.

When `substream->dma_buf_id` is set, the function tries to look for the reserved buffer, and the buffer is not freed but reserved at destruction time. The `dma_buf_id` must be unique for all systems (in the same DMA buffer type) e.g. using `snd_dma_pci_buf_id`.

Returns zero if successful, or a negative error code on failure.

# snd\_pcm\_lib\_preallocate\_pages\_for\_all

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_lib_preallocate_pages_for_all` — pre-allocation for continous memory type (all substreams)

## Synopsis

```
int snd_pcm_lib_preallocate_pages_for_all (struct snd_pcm *
pcm, int type, void * data, size_t size, size_t max);
```

## Arguments

*pcm*

the pcm instance

*type*

DMA type (SNDRV\_DMA\_TYPE\_\*)

*data*

DMA type dependant data

*size*

the requested pre-allocation size in bytes

*max*

the max. allowed pre-allocation size

## Description

Do pre-allocation to all substreams of the given pcm for the specified DMA type.

Returns zero if successful, or a negative error code on failure.

# snd\_pcm\_sgbuf\_ops\_page

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_sgbuf_ops_page` — get the page struct at the given offset

## Synopsis

```
struct page * snd_pcm_sgbuf_ops_page (struct snd_pcm_substream  
* substream, unsigned long offset);
```

## Arguments

*substream*

the pcm substream instance

*offset*

the buffer offset

## Description

Returns the page struct at the given buffer offset. Used as the page callback of PCM ops.

# snd\_pcm\_lib\_malloc\_pages

## LINUX

Kernel Hackers Manual March 2019

## Name

snd\_pcm\_lib\_malloc\_pages — allocate the DMA buffer

## Synopsis

```
int snd_pcm_lib_malloc_pages (struct snd_pcm_substream *
substream, size_t size);
```

## Arguments

*substream*

the substream to allocate the DMA buffer to

*size*

the requested buffer size in bytes

## Description

Allocates the DMA buffer on the BUS type given earlier to `snd_pcm_lib_preallocate_xxx_pages`.

Returns 1 if the buffer is changed, 0 if not changed, or a negative code on failure.

# snd\_pcm\_lib\_free\_pages

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_lib_free_pages` — release the allocated DMA buffer.

## Synopsis

```
int snd_pcm_lib_free_pages (struct snd_pcm_substream *  
    substream);
```

## Arguments

*substream*

the substream to release the DMA buffer

## Description

Releases the DMA buffer allocated via `snd_pcm_lib_malloc_pages`.

Returns zero if successful, or a negative error code on failure.

# snd\_card\_create

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_card_create` — create and initialize a soundcard structure

## Synopsis

```
int snd_card_create (int idx, const char * xid, struct module
* module, int extra_size, struct snd_card ** card_ret);
```

## Arguments

*idx*

card index (address) [0 ... (SNDRV\_CARDS-1)]

*xid*

card identification (ASCII string)

*module*

top level module for locking

*extra\_size*

allocate this extra size after the main soundcard structure

*card\_ret*

the pointer to store the created card instance

## Description

Creates and initializes a soundcard structure.

The function allocates `snd_card` instance via `kzalloc` with the given space for the driver to use freely. The allocated struct is stored in the given `card_ret` pointer.

Returns zero if successful or a negative error code.

# snd\_card\_disconnect

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_card_disconnect` — disconnect all APIs from the file-operations (user space)

## Synopsis

```
int snd_card_disconnect (struct snd_card * card);
```

## Arguments

*card*

soundcard structure

## Description

Disconnects all APIs from the file-operations (user space).

Returns zero, otherwise a negative error code.

## Note

The current implementation replaces all active file->f\_op with special dummy file operations (they do nothing except release).

# snd\_card\_set\_id

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_card_set_id` — set card identification name

## Synopsis

```
void snd_card_set_id (struct snd_card * card, const char *
nid);
```

## Arguments

*card*

soundcard structure

*nid*

new identification string

## Description

This function sets the card identification and checks for name collisions.

# snd\_card\_register

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_card_register` — register the soundcard

## Synopsis

```
int snd_card_register (struct snd_card * card);
```

## Arguments

*card*

soundcard structure

## Description

This function registers all the devices assigned to the soundcard. Until calling this, the ALSA control interface is blocked from the external accesses. Thus, you should call this function at the end of the initialization of the card.

Returns zero otherwise a negative error code if the register failed.

# snd\_component\_add

## LINUX

Kernel Hackers Manual March 2019

### Name

snd\_component\_add — add a component string

### Synopsis

```
int snd_component_add (struct snd_card * card, const char *  
component);
```

### Arguments

*card*

soundcard structure

*component*

the component id string

### Description

This function adds the component id string to the supported list. The component can be referred from the alsa-lib.

Returns zero otherwise a negative error code.

# snd\_card\_file\_add

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_card_file_add` — add the file to the file list of the card

### Synopsis

```
int snd_card_file_add (struct snd_card * card, struct file *  
file);
```

### Arguments

*card*

soundcard structure

*file*

file pointer

### Description

This function adds the file to the file linked-list of the card. This linked-list is used to keep tracking the connection state, and to avoid the release of busy resources by hotplug.

Returns zero or a negative error code.

# snd\_card\_file\_remove

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_card_file_remove` — remove the file from the file list

### Synopsis

```
int snd_card_file_remove (struct snd_card * card, struct file  
* file);
```

### Arguments

*card*

soundcard structure

*file*

file pointer

### Description

This function removes the file formerly added to the card via `snd_card_file_add` function. If all files are removed and `snd_card_free_when_closed` was called beforehand, it processes the pending release of resources.

Returns zero or a negative error code.

# snd\_power\_wait

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_power_wait` — wait until the power-state is changed.

### Synopsis

```
int snd_power_wait (struct snd_card * card, unsigned int
power_state);
```

### Arguments

*card*

soundcard structure

*power\_state*

expected power state

### Description

Waits until the power-state is changed.

### Note

the power lock must be active before call.

# snd\_dma\_program

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_dma_program` — program an ISA DMA transfer

### Synopsis

```
void snd_dma_program (unsigned long dma, unsigned long addr,  
unsigned int size, unsigned short mode);
```

### Arguments

*dma*

the dma number

*addr*

the physical address of the buffer

*size*

the DMA transfer size

*mode*

the DMA transfer mode, `DMA_MODE_XXX`

### Description

Programs an ISA DMA transfer for the given buffer.

# snd\_dma\_disable

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_dma_disable` — stop the ISA DMA transfer

### Synopsis

```
void snd_dma_disable (unsigned long dma);
```

### Arguments

*dma*

the dma number

### Description

Stops the ISA DMA transfer.

# snd\_dma\_pointer

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_dma_pointer` — return the current pointer to DMA transfer buffer in bytes

## Synopsis

```
unsigned int snd_dma_pointer (unsigned long dma, unsigned int
size);
```

## Arguments

*dma*

the dma number

*size*

the dma transfer size

## Description

Returns the current pointer in DMA tranfer buffer in bytes

# snd\_ctl\_new1

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_ctl_new1` — create a control instance from the template

## Synopsis

```
struct snd_kcontrol * snd_ctl_new1 (const struct
snd_kcontrol_new * ncontrol, void * private_data);
```

## Arguments

*ncontrol*

the initialization record

*private\_data*

the private data to set

## Description

Allocates a new struct `snd_kcontrol` instance and initialize from the given template. When the access field of `ncontrol` is 0, it's assumed as `READWRITE` access. When the count field is 0, it's assumes as one.

Returns the pointer of the newly generated instance, or `NULL` on failure.

## snd\_ctl\_free\_one

### LINUX

Kernel Hackers Manual March 2019

### Name

`snd_ctl_free_one` — release the control instance

### Synopsis

```
void snd_ctl_free_one (struct snd_kcontrol * kcontrol);
```

## Arguments

*kcontrol*

the control instance

## Description

Releases the control instance created via `snd_ctl_new` or `snd_ctl_new1`. Don't call this after the control was added to the card.

# snd\_ctl\_add

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_ctl_add` — add the control instance to the card

## Synopsis

```
int snd_ctl_add (struct snd_card * card, struct snd_kcontrol *  
kcontrol);
```

## Arguments

*card*

the card instance

*kcontrol*

the control instance to add

## Description

Adds the control instance created via `snd_ctl_new` or `snd_ctl_new1` to the given card. Assigns also an unique numid used for fast search.

Returns zero if successful, or a negative error code on failure.

It frees automatically the control which cannot be added.

## snd\_ctl\_remove

### LINUX

Kernel Hackers Manual March 2019

### Name

`snd_ctl_remove` — remove the control from the card and release it

### Synopsis

```
int snd_ctl_remove (struct snd_card * card, struct
snd_kcontrol * kcontrol);
```

### Arguments

*card*

the card instance

*kcontrol*

the control instance to remove

## Description

Removes the control from the card and then releases the instance. You don't need to call `snd_ctl_free_one`. You must be in the write lock - `down_write(card->controls_rwsem)`.

Returns 0 if successful, or a negative error code on failure.

# snd\_ctl\_remove\_id

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_ctl_remove_id` — remove the control of the given id and release it

## Synopsis

```
int snd_ctl_remove_id (struct snd_card * card, struct
snd_ctl_elem_id * id);
```

## Arguments

*card*

the card instance

*id*

the control id to remove

## Description

Finds the control instance with the given id, removes it from the card list and releases it.

Returns 0 if successful, or a negative error code on failure.

# snd\_ctl\_rename\_id

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_ctl_rename_id` — replace the id of a control on the card

## Synopsis

```
int snd_ctl_rename_id (struct snd_card * card, struct  
snd_ctl_elem_id * src_id, struct snd_ctl_elem_id * dst_id);
```

## Arguments

*card*

the card instance

*src\_id*

the old id

*dst\_id*

the new id

## Description

Finds the control with the old id from the card, and replaces the id with the new one.

Returns zero if successful, or a negative error code on failure.

# snd\_ctl\_find\_numid

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_ctl_find_numid` — find the control instance with the given number-id

## Synopsis

```
struct snd_kcontrol * snd_ctl_find_numid (struct snd_card *
card, unsigned int numid);
```

## Arguments

*card*

the card instance

*numid*

the number-id to search

## Description

Finds the control instance with the given number-id from the card.

Returns the pointer of the instance if found, or NULL if not.

The caller must down `card->controls_rwsem` before calling this function (if the race condition can happen).

## snd\_ctl\_find\_id

### LINUX

Kernel Hackers Manual March 2019

### Name

`snd_ctl_find_id` — find the control instance with the given id

### Synopsis

```
struct snd_kcontrol * snd_ctl_find_id (struct snd_card * card,  
struct snd_ctl_elem_id * id);
```

### Arguments

*card*

the card instance

*id*

the id to search

### Description

Finds the control instance with the given id from the card.

Returns the pointer of the instance if found, or NULL if not.

The caller must down `card->controls_rwsem` before calling this function (if the race condition can happen).

# snd\_pcm\_set\_ops

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_set_ops` — set the PCM operators

### Synopsis

```
void snd_pcm_set_ops (struct snd_pcm * pcm, int direction,  
struct snd_pcm_ops * ops);
```

### Arguments

*pcm*

the pcm instance

*direction*

stream direction, `SNDRV_PCM_STREAM_XXX`

*ops*

the operator table

### Description

Sets the given PCM operators to the pcm instance.

# snd\_pcm\_set\_sync

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_set_sync` — set the PCM sync id

### Synopsis

```
void snd_pcm_set_sync (struct snd_pcm_substream * substream);
```

### Arguments

*substream*

the pcm substream

### Description

Sets the PCM sync identifier for the card.

# snd\_interval\_refine

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_interval_refine` — refine the interval value of configurator

## Synopsis

```
int snd_interval_refine (struct snd_interval * i, const struct
snd_interval * v);
```

## Arguments

*i*

the interval value to refine

*v*

the interval value to refer to

## Description

Refines the interval value with the reference value. The interval is changed to the range satisfying both intervals. The interval status (min, max, integer, etc.) are evaluated.

Returns non-zero if the value is changed, zero if not changed.

## snd\_interval\_ratnum

### LINUX

Kernel Hackers Manual March 2019

### Name

snd\_interval\_ratnum — refine the interval value

## Synopsis

```
int snd_interval_ratnum (struct snd_interval * i, unsigned int
rats_count, struct snd_ratnum * rats, unsigned int * nump,
unsigned int * denp);
```

## Arguments

*i*

interval to refine

*rats\_count*

number of ratnum\_t

*rats*

ratnum\_t array

*nump*

pointer to store the resultant numerator

*denp*

pointer to store the resultant denominator

## Description

Returns non-zero if the value is changed, zero if not changed.

## snd\_interval\_list

**LINUX**

## Name

`snd_interval_list` — refine the interval value from the list

## Synopsis

```
int snd_interval_list (struct snd_interval * i, unsigned int  
count, unsigned int * list, unsigned int mask);
```

## Arguments

*i*

the interval value to refine

*count*

the number of elements in the list

*list*

the value list

*mask*

the bit-mask to evaluate

## Description

Refines the interval value from the list. When mask is non-zero, only the elements corresponding to bit 1 are evaluated.

Returns non-zero if the value is changed, zero if not changed.

# snd\_pcm\_hw\_rule\_add

## LINUX

Kernel Hackers Manual March 2019

### Name

snd\_pcm\_hw\_rule\_add — add the hw-constraint rule

### Synopsis

```
int snd_pcm_hw_rule_add (struct snd_pcm_runtime * runtime,
unsigned int cond, int var, snd_pcm_hw_rule_func_t func, void
* private, int dep, ...);
```

### Arguments

*runtime*

the pcm runtime instance

*cond*

condition bits

*var*

the variable to evaluate

*func*

the evaluation function

*private*

the private data pointer passed to function

*dep*

the dependent variables

...

variable arguments

## Description

Returns zero if successful, or a negative error code on failure.

# snd\_pcm\_hw\_constraint\_integer

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_hw_constraint_integer` — apply an integer constraint to an interval

## Synopsis

```
int snd_pcm_hw_constraint_integer (struct snd_pcm_runtime *
runtime, snd_pcm_hw_param_t var);
```

## Arguments

*runtime*

PCM runtime instance

*var*

hw\_params variable to apply the integer constraint

## Description

Apply the constraint of integer to an interval parameter.

# snd\_pcm\_hw\_constraint\_minmax

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_hw_constraint_minmax` — apply a min/max range constraint to an interval

## Synopsis

```
int snd_pcm_hw_constraint_minmax (struct snd_pcm_runtime *  
runtime, snd_pcm_hw_param_t var, unsigned int min, unsigned  
int max);
```

## Arguments

*runtime*

PCM runtime instance

*var*

hw\_params variable to apply the range

*min*

the minimal value

*max*

the maximal value

## Description

Apply the min/max range constraint to an interval parameter.

# snd\_pcm\_hw\_constraint\_list

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_hw_constraint_list` — apply a list of constraints to a parameter

## Synopsis

```
int snd_pcm_hw_constraint_list (struct snd_pcm_runtime *
runtime, unsigned int cond, snd_pcm_hw_param_t var, struct
snd_pcm_hw_constraint_list * l);
```

## Arguments

*runtime*

PCM runtime instance

*cond*

condition bits

*var*

hw\_params variable to apply the list constraint

*l*

list

## Description

Apply the list of constraints to an interval parameter.

# snd\_pcm\_hw\_constraint\_ratnums

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_hw_constraint_ratnums` — apply ratnums constraint to a parameter

## Synopsis

```
int snd_pcm_hw_constraint_ratnums (struct snd_pcm_runtime *  
runtime, unsigned int cond, snd_pcm_hw_param_t var, struct  
snd_pcm_hw_constraint_ratnums * r);
```

## Arguments

*runtime*

PCM runtime instance

*cond*

condition bits

*var*

hw\_params variable to apply the ratnums constraint

*r*

struct snd\_ratnums constraints

# snd\_pcm\_hw\_constraint\_ratdens

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_hw_constraint_ratdens` — apply ratdens constraint to a parameter

### Synopsis

```
int snd_pcm_hw_constraint_ratdens (struct snd_pcm_runtime *  
runtime, unsigned int cond, snd_pcm_hw_param_t var, struct  
snd_pcm_hw_constraint_ratdens * r);
```

### Arguments

*runtime*

PCM runtime instance

*cond*

condition bits

*var*

hw\_params variable to apply the ratdens constraint

*r*

struct snd\_ratdens constraints

# snd\_pcm\_hw\_constraint\_msbits

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_hw_constraint_msbits` — add a hw constraint msbits rule

### Synopsis

```
int snd_pcm_hw_constraint_msbits (struct snd_pcm_runtime *  
runtime, unsigned int cond, unsigned int width, unsigned int  
msbits);
```

### Arguments

*runtime*

PCM runtime instance

*cond*

condition bits

*width*

sample bits width

*msbits*

msbits width

# snd\_pcm\_hw\_constraint\_step

## LINUX

Kernel Hackers Manual March 2019

### Name

snd\_pcm\_hw\_constraint\_step — add a hw constraint step rule

### Synopsis

```
int snd_pcm_hw_constraint_step (struct snd_pcm_runtime *  
runtime, unsigned int cond, snd_pcm_hw_param_t var, unsigned  
long step);
```

### Arguments

*runtime*

PCM runtime instance

*cond*

condition bits

*var*

hw\_params variable to apply the step constraint

*step*

step size

# snd\_pcm\_hw\_constraint\_pow2

**LINUX**

Kernel Hackers Manual March 2019

## Name

snd\_pcm\_hw\_constraint\_pow2 — add a hw constraint power-of-2 rule

## Synopsis

```
int snd_pcm_hw_constraint_pow2 (struct snd_pcm_runtime *  
runtime, unsigned int cond, snd_pcm_hw_param_t var);
```

## Arguments

*runtime*

PCM runtime instance

*cond*

condition bits

*var*

hw\_params variable to apply the power-of-2 constraint

# snd\_pcm\_hw\_param\_value

**LINUX**

## Name

`snd_pcm_hw_param_value` — return *params* field *var* value

## Synopsis

```
int snd_pcm_hw_param_value (const struct snd_pcm_hw_params *
    params, snd_pcm_hw_param_t var, int * dir);
```

## Arguments

*params*

the `hw_params` instance

*var*

parameter to retrieve

*dir*

pointer to the direction (-1,0,1) or `NULL`

## Description

Return the value for field *var* if it's fixed in configuration space defined by *params*. Return `-EINVAL` otherwise.

## `snd_pcm_hw_param_first`

**LINUX**

## Name

`snd_pcm_hw_param_first` — refine config space and return minimum value

## Synopsis

```
int snd_pcm_hw_param_first (struct snd_pcm_substream * pcm,  
struct snd_pcm_hw_params * params, snd_pcm_hw_param_t var, int  
* dir);
```

## Arguments

*pcm*

PCM instance

*params*

the `hw_params` instance

*var*

parameter to retrieve

*dir*

pointer to the direction (-1,0,1) or `NULL`

## Description

Inside configuration space defined by *params* remove from *var* all values > minimum. Reduce configuration space accordingly. Return the minimum.

# snd\_pcm\_hw\_param\_last

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_hw_param_last` — refine config space and return maximum value

## Synopsis

```
int snd_pcm_hw_param_last (struct snd_pcm_substream * pcm,
struct snd_pcm_hw_params * params, snd_pcm_hw_param_t var, int
* dir);
```

## Arguments

*pcm*

PCM instance

*params*

the `hw_params` instance

*var*

parameter to retrieve

*dir*

pointer to the direction (-1,0,1) or `NULL`

## Description

Inside configuration space defined by *params* remove from *var* all values < maximum. Reduce configuration space accordingly. Return the maximum.

# snd\_pcm\_lib\_ioctl

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_lib_ioctl` — a generic PCM ioctl callback

### Synopsis

```
int snd_pcm_lib_ioctl (struct snd_pcm_substream * substream,  
unsigned int cmd, void * arg);
```

### Arguments

*substream*

the pcm substream instance

*cmd*

ioctl command

*arg*

ioctl argument

### Description

Processes the generic ioctl commands for PCM. Can be passed as the ioctl callback for PCM ops.

Returns zero if successful, or a negative error code on failure.

# snd\_pcm\_period\_elapsed

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_pcm_period_elapsed` — update the pcm status for the next period

## Synopsis

```
void snd_pcm_period_elapsed (struct snd_pcm_substream *
    substream);
```

## Arguments

*substream*

the pcm substream instance

## Description

This function is called from the interrupt handler when the PCM has processed the period size. It will update the current pointer, wake up sleepers, etc.

Even if more than one periods have elapsed since the last call, you have to call this only once.

# snd\_hwdep\_new

## LINUX

## Name

`snd_hwdep_new` — create a new hwdep instance

## Synopsis

```
int snd_hwdep_new (struct snd_card * card, char * id, int  
device, struct snd_hwdep ** rhwdep);
```

## Arguments

*card*

the card instance

*id*

the id string

*device*

the device index (zero-based)

*rhwdep*

the pointer to store the new hwdep instance

## Description

Creates a new hwdep instance with the given index on the card. The callbacks (hwdep->ops) must be set on the returned instance after this call manually by the caller.

Returns zero if successful, or a negative error code on failure.

# snd\_pcm\_stop

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_pcm_stop` — try to stop all running streams in the substream group

### Synopsis

```
int snd_pcm_stop (struct snd_pcm_substream * substream, int
state);
```

### Arguments

*substream*

the PCM substream instance

*state*

PCM state after stopping the stream

### Description

The state of each stream is then changed to the given state unconditionally.

# snd\_pcm\_suspend

## LINUX

## Name

`snd_pcm_suspend` — trigger SUSPEND to all linked streams

## Synopsis

```
int snd_pcm_suspend (struct snd_pcm_substream * substream);
```

## Arguments

*substream*

the PCM substream

## Description

After this call, all streams are changed to SUSPENDED state.

# snd\_pcm\_suspend\_all

## LINUX

## Name

`snd_pcm_suspend_all` — trigger SUSPEND to all substreams in the given pcm

## Synopsis

```
int snd_pcm_suspend_all (struct snd_pcm * pcm);
```

## Arguments

*pcm*

the PCM instance

## Description

After this call, all streams are changed to SUSPENDED state.

# snd\_malloc\_pages

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_malloc_pages` — allocate pages with the given size

## Synopsis

```
void * snd_malloc_pages (size_t size, gfp_t gfp_flags);
```

## Arguments

*size*

the size to allocate in bytes

*gfp\_flags*

the allocation conditions, GFP\_XXX

## Description

Allocates the physically contiguous pages with the given size.

Returns the pointer of the buffer, or NULL if no enough memory.

# snd\_free\_pages

## LINUX

Kernel Hackers Manual March 2019

## Name

snd\_free\_pages — release the pages

## Synopsis

```
void snd_free_pages (void * ptr, size_t size);
```

## Arguments

*ptr*

the buffer pointer to release

*size*

the allocated buffer size

## Description

Releases the buffer allocated via `snd_malloc_pages`.

# snd\_dma\_alloc\_pages

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_dma_alloc_pages` — allocate the buffer area according to the given type

## Synopsis

```
int snd_dma_alloc_pages (int type, struct device * device,
size_t size, struct snd_dma_buffer * dmab);
```

## Arguments

*type*

the DMA buffer type

*device*

the device pointer

*size*

the buffer size to allocate

*dmab*

buffer allocation record to store the allocated data

## Description

Calls the memory-allocator function for the corresponding buffer type.

Returns zero if the buffer with the given size is allocated successfully, other a negative value at error.

# snd\_dma\_alloc\_pages\_fallback

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_dma_alloc_pages_fallback` — allocate the buffer area according to the given type with fallback

## Synopsis

```
int snd_dma_alloc_pages_fallback (int type, struct device *  
device, size_t size, struct snd_dma_buffer * dmab);
```

## Arguments

*type*

the DMA buffer type

*device*

the device pointer

*size*

the buffer size to allocate

*dmab*

buffer allocation record to store the allocated data

## Description

Calls the memory-allocator function for the corresponding buffer type. When no space is left, this function reduces the size and tries to allocate again. The size actually allocated is stored in `res_size` argument.

Returns zero if the buffer with the given size is allocated successfully, other a negative value at error.

# snd\_dma\_free\_pages

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_dma_free_pages` — release the allocated buffer

## Synopsis

```
void snd_dma_free_pages (struct snd_dma_buffer * dmab);
```

## Arguments

*dmab*

the buffer allocation record to release

## Description

Releases the allocated buffer via `snd_dma_alloc_pages`.

# snd\_dma\_get\_reserved\_buf

## LINUX

Kernel Hackers Manual March 2019

## Name

`snd_dma_get_reserved_buf` — get the reserved buffer for the given device

## Synopsis

```
size_t snd_dma_get_reserved_buf (struct snd_dma_buffer * dmab,  
unsigned int id);
```

## Arguments

*dmab*

the buffer allocation record to store

*id*

the buffer id

## Description

Looks for the reserved-buffer list and re-uses if the same buffer is found in the list. When the buffer is found, it's removed from the free list.

Returns the size of buffer if the buffer is found, or zero if not found.

# snd\_dma\_reserve\_buf

## LINUX

Kernel Hackers Manual March 2019

### Name

`snd_dma_reserve_buf` — reserve the buffer

### Synopsis

```
int snd_dma_reserve_buf (struct snd_dma_buffer * dmab,  
unsigned int id);
```

### Arguments

*dmab*

the buffer to reserve

*id*

the buffer id

### Description

Reserves the given buffer as a reserved buffer.

Returns zero if successful, or a negative code at error.

# Chapter 6. 16x50 UART Driver

## uart\_handle\_dcd\_change

**LINUX**

Kernel Hackers Manual March 2019

### Name

`uart_handle_dcd_change` — handle a change of carrier detect state

### Synopsis

```
void uart_handle_dcd_change (struct uart_port * uport,  
unsigned int status);
```

### Arguments

*uport*

uart\_port structure for the open port

*status*

new carrier detect status, nonzero if active

## uart\_handle\_cts\_change

**LINUX**

## Name

`uart_handle_cts_change` — handle a change of clear-to-send state

## Synopsis

```
void uart_handle_cts_change (struct uart_port * uport,  
unsigned int status);
```

## Arguments

*uport*

uart\_port structure for the open port

*status*

new clear to send status, nonzero if active

# uart\_update\_timeout

## LINUX

## Name

`uart_update_timeout` — update per-port FIFO timeout.

## Synopsis

```
void uart_update_timeout (struct uart_port * port, unsigned
int cflag, unsigned int baud);
```

## Arguments

*port*

uart\_port structure describing the port

*cflag*

termios cflag value

*baud*

speed of the port

## Description

Set the port FIFO timeout value. The *cflag* value should reflect the actual hardware settings.

# uart\_get\_baud\_rate

## LINUX

Kernel Hackers Manual March 2019

## Name

uart\_get\_baud\_rate — return baud rate for a particular port

## Synopsis

```
unsigned int uart_get_baud_rate (struct uart_port * port,  
struct ktermios * termios, struct ktermios * old, unsigned int  
min, unsigned int max);
```

## Arguments

*port*

uart\_port structure describing the port in question.

*termios*

desired termios settings.

*old*

old termios (or NULL)

*min*

minimum acceptable baud rate

*max*

maximum acceptable baud rate

## Description

Decode the termios structure into a numeric baud rate, taking account of the magic 38400 baud rate (with `spd_*` flags), and mapping the B0 rate to 9600 baud.

If the new baud rate is invalid, try the old termios setting. If it's still invalid, we try 9600 baud.

Update the *termios* structure to reflect the baud rate we're actually going to be using. Don't do this for the case where B0 is requested ("hang up").

# uart\_get\_divisor

## LINUX

Kernel Hackers Manual March 2019

### Name

`uart_get_divisor` — return uart clock divisor

### Synopsis

```
unsigned int uart_get_divisor (struct uart_port * port,  
unsigned int baud);
```

### Arguments

*port*

uart\_port structure describing the port.

*baud*

desired baud rate

### Description

Calculate the uart clock divisor for the port.

# uart\_parse\_options

## LINUX

## Name

`uart_parse_options` — Parse serial port baud/parity/bits/flow contro.

## Synopsis

```
void uart_parse_options (char * options, int * baud, int *  
parity, int * bits, int * flow);
```

## Arguments

*options*

pointer to option string

*baud*

pointer to an 'int' variable for the baud rate.

*parity*

pointer to an 'int' variable for the parity.

*bits*

pointer to an 'int' variable for the number of data bits.

*flow*

pointer to an 'int' variable for the flow control character.

## Description

`uart_parse_options` decodes a string containing the serial console options. The format of the string is <baud><parity><bits><flow>.

**eg**

115200n8r

## uart\_set\_options

### LINUX

Kernel Hackers Manual March 2019

### Name

`uart_set_options` — setup the serial console parameters

### Synopsis

```
int uart_set_options (struct uart_port * port, struct console
* co, int baud, int parity, int bits, int flow);
```

### Arguments

*port*pointer to the serial ports `uart_port` structure*co*

console pointer

*baud*

baud rate

*parity*

parity character - 'n' (none), 'o' (odd), 'e' (even)

*bits*

number of data bits

*flow*

flow control character - 'r' (rts)

## uart\_register\_driver

### LINUX

Kernel Hackers Manual March 2019

### Name

`uart_register_driver` — register a driver with the uart core layer

### Synopsis

```
int uart_register_driver (struct uart_driver * drv);
```

### Arguments

*drv*

low level driver structure

### Description

Register a uart driver with the core driver. We in turn register with the tty layer, and initialise the core driver per-port state.

We have a proc file in `/proc/tty/driver` which is named after the normal driver.

`drv->port` should be `NULL`, and the per-port structures should be registered using `uart_add_one_port` after this call has succeeded.

## uart\_unregister\_driver

### LINUX

Kernel Hackers Manual March 2019

### Name

`uart_unregister_driver` — remove a driver from the uart core layer

### Synopsis

```
void uart_unregister_driver (struct uart_driver * drv);
```

### Arguments

*drv*

low level driver structure

### Description

Remove all references to a driver from the core driver. The low level driver must have removed all its ports via the `uart_remove_one_port` if it registered them with `uart_add_one_port`. (ie, `drv->port == NULL`)

# uart\_add\_one\_port

## LINUX

Kernel Hackers Manual March 2019

### Name

`uart_add_one_port` — attach a driver-defined port structure

### Synopsis

```
int uart_add_one_port (struct uart_driver * drv, struct
uart_port * uport);
```

### Arguments

*drv*

pointer to the uart low level driver structure for this port

*uport*

uart port structure to use for this port.

### Description

This allows the driver to register its own `uart_port` structure with the core driver. The main purpose is to allow the low level uart drivers to expand `uart_port`, rather than having yet more levels of structures.

# uart\_remove\_one\_port

## LINUX

## Name

`uart_remove_one_port` — detach a driver defined port structure

## Synopsis

```
int uart_remove_one_port (struct uart_driver * drv, struct
uart_port * uport);
```

## Arguments

*drv*

pointer to the uart low level driver structure for this port

*uport*

uart port structure for this port

## Description

This unhooks (and hangs up) the specified port structure from the core driver. No further calls will be made to the low-level code for this port.

## `serial8250_suspend_port`

### LINUX

## Name

`serial8250_suspend_port` — suspend one serial port

## Synopsis

```
void serial8250_suspend_port (int line);
```

## Arguments

*line*

serial line number

## Description

Suspend one serial port.

# serial8250\_resume\_port

## LINUX

## Name

`serial8250_resume_port` — resume one serial port

## Synopsis

```
void serial8250_resume_port (int line);
```

## Arguments

*line*

serial line number

## Description

Resume one serial port.

# serial8250\_register\_port

## LINUX

Kernel Hackers Manual March 2019

## Name

`serial8250_register_port` — register a serial port

## Synopsis

```
int serial8250_register_port (struct uart_port * port);
```

## Arguments

*port*

serial port template

## Description

Configure the serial port specified by the request. If the port exists and is in use, it is hung up and unregistered first.

The port is then probed and if necessary the IRQ is autodetected. If this fails an error is returned.

On success the port is ready to use and the line number is returned.

# serial8250\_unregister\_port

## LINUX

Kernel Hackers Manual March 2019

## Name

`serial8250_unregister_port` — remove a 16x50 serial port at runtime

## Synopsis

```
void serial8250_unregister_port (int line);
```

## Arguments

*line*

serial line number

## **Description**

Remove one serial port. This may not be called from interrupt context. We hand the port back to the our control.

# Chapter 7. Frame Buffer Library

The frame buffer drivers depend heavily on four data structures. These structures are declared in `include/linux/fb.h`. They are `fb_info`, `fb_var_screeninfo`, `fb_fix_screeninfo` and `fb_monospecs`. The last three can be made available to and from userland.

`fb_info` defines the current state of a particular video card. Inside `fb_info`, there exists a `fb_ops` structure which is a collection of needed functions to make `fbdev` and `fbcon` work. `fb_info` is only visible to the kernel.

`fb_var_screeninfo` is used to describe the features of a video card that are user defined. With `fb_var_screeninfo`, things such as depth and the resolution may be defined.

The next structure is `fb_fix_screeninfo`. This defines the properties of a card that are created when a mode is set and can't be changed otherwise. A good example of this is the start of the frame buffer memory. This "locks" the address of the frame buffer memory, so that it cannot be changed or moved.

The last structure is `fb_monospecs`. In the old API, there was little importance for `fb_monospecs`. This allowed for forbidden things such as setting a mode of 800x600 on a fix frequency monitor. With the new API, `fb_monospecs` prevents such things, and if used correctly, can prevent a monitor from being cooked. `fb_monospecs` will not be useful until kernels 2.5.x.

## 7.1. Frame Buffer Memory

### `register_framebuffer`

**LINUX**

Kernel Hackers Manual March 2019

#### **Name**

`register_framebuffer` — registers a frame buffer device

## Synopsis

```
int register_framebuffer (struct fb_info * fb_info);
```

## Arguments

*fb\_info*

frame buffer info structure

## Description

Registers a frame buffer device *fb\_info*.

Returns negative errno on error, or zero for success.

# unregister\_framebuffer

## LINUX

Kernel Hackers Manual March 2019

## Name

`unregister_framebuffer` — releases a frame buffer device

## Synopsis

```
int unregister_framebuffer (struct fb_info * fb_info);
```

## Arguments

*fb\_info*

frame buffer info structure

## Description

Unregisters a frame buffer device *fb\_info*.

Returns negative *errno* on error, or zero for success.

This function will also notify the framebuffer console to release the driver.

This is meant to be called within a driver's `module_exit` function. If this is called outside `module_exit`, ensure that the driver implements `fb_open` and `fb_release` to check that no processes are using the device.

## fb\_set\_suspend

### LINUX

Kernel Hackers Manual March 2019

### Name

`fb_set_suspend` — low level driver signals suspend

### Synopsis

```
void fb_set_suspend (struct fb_info * info, int state);
```

## Arguments

*info*

framebuffer affected

*state*

0 = resuming, !=0 = suspending

## Description

This is meant to be used by low level drivers to signal suspend/resume to the core & clients. It must be called with the console semaphore held

# fb\_get\_options

## LINUX

Kernel Hackers Manual March 2019

## Name

`fb_get_options` — get kernel boot parameters

## Synopsis

```
int fb_get_options (char * name, char ** option);
```

## Arguments

*name*

framebuffer name as it would appear in the boot parameter line  
(video=<name>:<options>)

*option*

the option will be stored here

**NOTE**

Needed to maintain backwards compatibility

## 7.2. Frame Buffer Colormap

### fb\_alloc\_cmap

**LINUX**

Kernel Hackers Manual March 2019

**Name**

fb\_alloc\_cmap — allocate a colormap

**Synopsis**

```
int fb_alloc_cmap (struct fb_cmap * cmap, int len, int
transp);
```

**Arguments***cmap*

frame buffer colormap structure

*len*

length of *cmap*

*transp*

boolean, 1 if there is transparency, 0 otherwise

## Description

Allocates memory for a colormap *cmap*. *len* is the number of entries in the palette.

Returns negative `errno` on error, or zero on success.

# fb\_dealloc\_cmap

## LINUX

Kernel Hackers Manual March 2019

## Name

`fb_dealloc_cmap` — deallocate a colormap

## Synopsis

```
void fb_dealloc_cmap (struct fb_cmap * cmap);
```

## Arguments

*cmap*

frame buffer colormap structure

## Description

Deallocates a colormap that was previously allocated with `fb_alloc_cmap`.

# fb\_copy\_cmap

## LINUX

Kernel Hackers Manual March 2019

## Name

`fb_copy_cmap` — copy a colormap

## Synopsis

```
int fb_copy_cmap (const struct fb_cmap * from, struct fb_cmap
* to);
```

## Arguments

*from*

frame buffer colormap structure

*to*

frame buffer colormap structure

## Description

Copy contents of colormap from *from* to *to*.

# fb\_set\_cmap

## LINUX

Kernel Hackers Manual March 2019

### Name

`fb_set_cmap` — set the colormap

### Synopsis

```
int fb_set_cmap (struct fb_cmap * cmap, struct fb_info *  
info);
```

### Arguments

*cmap*

frame buffer colormap structure

*info*

frame buffer info structure

### Description

Sets the colormap *cmap* for a screen of device *info*.

Returns negative `errno` on error, or zero on success.

# fb\_default\_cmap

## LINUX

## Name

`fb_default_cmap` — get default colormap

## Synopsis

```
const struct fb_cmap * fb_default_cmap (int len);
```

## Arguments

*len*

size of palette for a depth

## Description

Gets the default colormap for a specific screen depth. *len* is the size of the palette for a particular screen depth.

Returns pointer to a frame buffer colormap structure.

# fb\_invert\_cmaps

## LINUX

## Name

`fb_invert_cmaps` — invert all defaults colormaps

## Synopsis

```
void fb_invert_cmaps ( void );
```

## Arguments

*void*

no arguments

## Description

Invert all default colormaps.

# 7.3. Frame Buffer Video Mode Database

## fb\_try\_mode

**LINUX**

Kernel Hackers Manual March 2019

## Name

`fb_try_mode` — test a video mode

## Synopsis

```
int fb_try_mode (struct fb_var_screeninfo * var, struct  
fb_info * info, const struct fb_videomode * mode, unsigned int
```

```
bpp);
```

## Arguments

*var*

frame buffer user defined part of display

*info*

frame buffer info structure

*mode*

frame buffer video mode structure

*bpp*

color depth in bits per pixel

## Description

Tries a video mode to test it's validity for device *info*.

Returns 1 on success.

# fb\_delete\_videomode

## LINUX

Kernel Hackers Manual March 2019

## Name

fb\_delete\_videomode —

## Synopsis

```
void fb_delete_videomode (const struct fb_videomode * mode,
struct list_head * head);
```

## Arguments

*mode*

videomode to remove

*head*

struct list\_head of modelist

## NOTES

Will remove all matching mode entries

## fb\_find\_mode

### LINUX

Kernel Hackers Manual March 2019

## Name

`fb_find_mode` — finds a valid video mode

## Synopsis

```
int fb_find_mode (struct fb_var_screeninfo * var, struct
fb_info * info, const char * mode_option, const struct
```

```
fb_videomode * db, unsigned int dbsize, const struct
fb_videomode * default_mode, unsigned int default_bpp);
```

## Arguments

*var*

frame buffer user defined part of display

*info*

frame buffer info structure

*mode\_option*

string video mode to find

*db*

video mode database

*dbsize*

size of *db*

*default\_mode*

default video mode to fall back to

*default\_bpp*

default color depth in bits per pixel

## Description

Finds a suitable video mode, starting with the specified mode in *mode\_option* with fallback to *default\_mode*. If *default\_mode* fails, all modes in the video mode database will be tried.

Valid mode specifiers for *mode\_option*:

```
<xres>x<yres>[M][R][<bpp>][@<refresh>][i][m] or
<name>[<bpp>][@<refresh>]
```

with <xres>, <yres>, <bpp> and <refresh> decimal numbers and <name> a string.

If 'M' is present after yres (and before refresh/bpp if present), the function will compute the timings using VESA(tm) Coordinated Video Timings (CVT). If 'R' is present after 'M', will compute with reduced blanking (for flatpanels). If 'i' is present, compute interlaced mode. If 'm' is present, add margins equal to 1.8% of xres rounded down to 8 pixels, and 1.8% of yres. The char 'i' and 'm' must be after 'M' and 'R'. Example:

1024x768MR-860m - Reduced blank with margins at 60Hz.

## NOTE

The passed struct *var* is *\_not\_* cleared! This allows you to supply values for e.g. the grayscale and accel\_flags fields.

Returns zero for failure, 1 if using specified *mode\_option*, 2 if using specified *mode\_option* with an ignored refresh rate, 3 if default mode is used, 4 if fall back to any valid mode.

## fb\_var\_to\_videomode

### LINUX

Kernel Hackers Manual March 2019

### Name

`fb_var_to_videomode` — convert `fb_var_screeninfo` to `fb_videomode`

### Synopsis

```
void fb_var_to_videomode (struct fb_videomode * mode, const
struct fb_var_screeninfo * var);
```

## Arguments

*mode*

pointer to struct fb\_videomode

*var*

pointer to struct fb\_var\_screeninfo

## fb\_videomode\_to\_var

### LINUX

Kernel Hackers Manual March 2019

## Name

`fb_videomode_to_var` — convert `fb_videomode` to `fb_var_screeninfo`

## Synopsis

```
void fb_videomode_to_var (struct fb_var_screeninfo * var,  
const struct fb_videomode * mode);
```

## Arguments

*var*

pointer to struct fb\_var\_screeninfo

*mode*

pointer to struct fb\_videomode

# fb\_mode\_is\_equal

## LINUX

Kernel Hackers Manual March 2019

### Name

`fb_mode_is_equal` — compare 2 videomodes

### Synopsis

```
int fb_mode_is_equal (const struct fb_videomode * mode1, const
struct fb_videomode * mode2);
```

### Arguments

*mode1*

first videomode

*mode2*

second videomode

### RETURNS

1 if equal, 0 if not

# fb\_find\_best\_mode

## LINUX

## Name

`fb_find_best_mode` — find best matching videomode

## Synopsis

```
const struct fb_videomode * fb_find_best_mode (const struct
fb_var_screeninfo * var, struct list_head * head);
```

## Arguments

*var*

pointer to struct `fb_var_screeninfo`

*head*

pointer to struct `list_head` of modelist

## RETURNS

struct `fb_videomode`, NULL if none found

## IMPORTANT

This function assumes that all modelist entries in `info->modelist` are valid.

## NOTES

Finds best matching videomode which has an equal or greater dimension than `var->xres` and `var->yres`. If more than 1 videomode is found, will return the videomode with the highest refresh rate

# fb\_find\_nearest\_mode

## LINUX

Kernel Hackers Manual March 2019

### Name

`fb_find_nearest_mode` — find closest videomode

### Synopsis

```
const struct fb_videomode * fb_find_nearest_mode (const struct
fb_videomode * mode, struct list_head * head);
```

### Arguments

*mode*

pointer to struct fb\_videomode

*head*

pointer to modelist

### Description

Finds best matching videomode, smaller or greater in dimension. If more than 1 videomode is found, will return the videomode with the closest refresh rate.

# fb\_match\_mode

## LINUX

## Name

`fb_match_mode` — find a videomode which exactly matches the timings in `var`

## Synopsis

```
const struct fb_videomode * fb_match_mode (const struct
fb_var_screeninfo * var, struct list_head * head);
```

## Arguments

*var*

pointer to struct `fb_var_screeninfo`

*head*

pointer to struct `list_head` of modelist

## RETURNS

struct `fb_videomode`, NULL if none found

# fb\_add\_videomode

## LINUX

## Name

`fb_add_videomode` —

## Synopsis

```
int fb_add_videomode (const struct fb_videomode * mode, struct
list_head * head);
```

## Arguments

*mode*

videomode to add

*head*

struct list\_head of modelist

## NOTES

Will only add unmatched mode entries

## fb\_destroy\_modelist

### LINUX

Kernel Hackers Manual March 2019

## Name

fb\_destroy\_modelist —

## Synopsis

```
void fb_destroy_modelist (struct list_head * head);
```

## Arguments

*head*

struct list\_head of modelist

# fb\_videomode\_to\_modelist

## LINUX

Kernel Hackers Manual March 2019

## Name

fb\_videomode\_to\_modelist —

## Synopsis

```
void fb_videomode_to_modelist (const struct fb_videomode *
modedb, int num, struct list_head * head);
```

## Arguments

*modedb*

array of struct fb\_videomode

*num*

number of entries in array

*head*

struct list\_head of modelist

## 7.4. Frame Buffer Macintosh Video Mode Database

### mac\_vmode\_to\_var

**LINUX**

Kernel Hackers Manual March 2019

#### Name

`mac_vmode_to_var` — converts vmode/cmode pair to var structure

#### Synopsis

```
int mac_vmode_to_var (int vmode, int cmode, struct
fb_var_screeninfo * var);
```

#### Arguments

*vmode*

MacOS video mode

*cmode*

MacOS color mode

*var*

frame buffer video mode structure

#### Description

Converts a MacOS vmode/cmode pair to a frame buffer video mode structure.

Returns negative errno on error, or zero for success.

# mac\_map\_monitor\_sense

## LINUX

Kernel Hackers Manual March 2019

### Name

`mac_map_monitor_sense` — Convert monitor sense to vmode

### Synopsis

```
int mac_map_monitor_sense (int sense);
```

### Arguments

*sense*

Macintosh monitor sense number

### Description

Converts a Macintosh monitor sense number to a MacOS vmode number.

Returns MacOS vmode video mode number.

# mac\_find\_mode

## LINUX

## Name

`mac_find_mode` — find a video mode

## Synopsis

```
int mac_find_mode (struct fb_var_screeninfo * var, struct
fb_info * info, const char * mode_option, unsigned int
default_bpp);
```

## Arguments

*var*

frame buffer user defined part of display

*info*

frame buffer info structure

*mode\_option*

video mode name (see `mac_modedb[]`)

*default\_bpp*

default color depth in bits per pixel

## Description

Finds a suitable video mode. Tries to set mode specified by *mode\_option*. If the name of the wanted mode begins with 'mac', the Mac video mode database will be used, otherwise it will fall back to the standard video mode database.

## Note

Function marked as `__init` and can only be used during system boot.

Returns error code from `fb_find_mode` (see `fb_find_mode` function).

## **7.5. Frame Buffer Fonts**

Refer to the file `drivers/video/console/fonts.c` for more information.

# Chapter 8. Input Subsystem

## struct ff\_replay

**LINUX**

Kernel Hackers Manual March 2019

### Name

struct ff\_replay — defines scheduling of the force-feedback effect

### Synopsis

```
struct ff_replay {  
    __u16 length;  
    __u16 delay;  
};
```

### Members

length

duration of the effect

delay

delay before effect should start playing

## struct ff\_trigger

**LINUX**

## Name

`struct ff_trigger` — defines what triggers the force-feedback effect

## Synopsis

```
struct ff_trigger {
    __u16 button;
    __u16 interval;
};
```

## Members

`button`

number of the button triggering the effect

`interval`

controls how soon the effect can be re-triggered

# struct ff\_envelope

## LINUX

## Name

`struct ff_envelope` — generic force-feedback effect envelope

## Synopsis

```
struct ff_envelope {
    __u16 attack_length;
```

```

__u16 attack_level;
__u16 fade_length;
__u16 fade_level;
};

```

## Members

`attack_length`

duration of the attack (ms)

`attack_level`

level at the beginning of the attack

`fade_length`

duration of fade (ms)

`fade_level`

level at the end of fade

## Description

The `attack_level` and `fade_level` are absolute values; when applying envelope force-feedback core will convert to positive/negative value based on polarity of the default level of the effect. Valid range for the attack and fade levels is 0x0000 - 0x7fff

## struct `ff_constant_effect`

### LINUX

Kernel Hackers Manual March 2019

## Name

`struct ff_constant_effect` — defines parameters of a constant

force-feedback effect

## Synopsis

```
struct ff_constant_effect {
    __s16 level;
    struct ff_envelope envelope;
};
```

## Members

level

strength of the effect; may be negative

envelope

envelope data

## struct ff\_ramp\_effect

### LINUX

Kernel Hackers Manual March 2019

## Name

struct ff\_ramp\_effect — defines parameters of a ramp force-feedback effect

## Synopsis

```
struct ff_ramp_effect {
    __s16 start_level;
    __s16 end_level;
    struct ff_envelope envelope;
};
```

## Members

`start_level`

beginning strength of the effect; may be negative

`end_level`

final strength of the effect; may be negative

`envelope`

envelope data

## struct ff\_condition\_effect

### LINUX

Kernel Hackers Manual March 2019

## Name

`struct ff_condition_effect` — defines a spring or friction force-feedback effect

## Synopsis

```
struct ff_condition_effect {
    __u16 right_saturation;
    __u16 left_saturation;
    __s16 right_coeff;
    __s16 left_coeff;
    __u16 deadband;
    __s16 center;
};
```

## Members

`right_saturation`

maximum level when joystick moved all way to the right

`left_saturation`

same for the left side

`right_coeff`

controls how fast the force grows when the joystick moves to the right

`left_coeff`

same for the left side

`deadband`

size of the dead zone, where no force is produced

`center`

position of the dead zone

## struct `ff_periodic_effect`

### LINUX

Kernel Hackers Manual March 2019

### Name

`struct ff_periodic_effect` — defines parameters of a periodic force-feedback effect

### Synopsis

```
struct ff_periodic_effect {
    __u16 waveform;
    __u16 period;
    __s16 magnitude;
```

```

__s16 offset;
__u16 phase;
struct ff_envelope envelope;
__u32 custom_len;
__s16 * custom_data;
};

```

## Members

waveform

kind of the effect (wave)

period

period of the wave (ms)

magnitude

peak value

offset

mean value of the wave (roughly)

phase

'horizontal' shift

envelope

envelope data

custom\_len

number of samples (FF\_CUSTOM only)

custom\_data

buffer of samples (FF\_CUSTOM only)

## Description

Known waveforms - FF\_SQUARE, FF\_TRIANGLE, FF\_SINE, FF\_SAW\_UP, FF\_SAW\_DOWN, FF\_CUSTOM. The exact syntax FF\_CUSTOM is undefined for the time being as no driver supports it yet.

## Note

the data pointed by `custom_data` is copied by the driver. You can therefore dispose of the memory after the upload/update.

# struct ff\_rumble\_effect

## LINUX

Kernel Hackers Manual March 2019

## Name

`struct ff_rumble_effect` — defines parameters of a periodic force-feedback effect

## Synopsis

```
struct ff_rumble_effect {
    __u16 strong_magnitude;
    __u16 weak_magnitude;
};
```

## Members

`strong_magnitude`

magnitude of the heavy motor

`weak_magnitude`

magnitude of the light one

## Description

Some rumble pads have two motors of different weight. `Strong_magnitude` represents the magnitude of the vibration generated by the heavy one.

# struct ff\_effect

## LINUX

Kernel Hackers Manual March 2019

## Name

struct ff\_effect — defines force feedback effect

## Synopsis

```
struct ff_effect {
    __u16 type;
    __s16 id;
    __u16 direction;
    struct ff_trigger trigger;
    struct ff_replay replay;
    union u;
};
```

## Members

type

type of the effect (FF\_CONSTANT, FF\_PERIODIC, FF\_RAMP, FF\_SPRING, FF\_FRICTION, FF\_DAMPER, FF\_RUMBLE, FF\_INERTIA, or FF\_CUSTOM)

id

an unique id assigned to an effect

direction

direction of the effect

trigger

trigger conditions (struct ff\_trigger)

replay

scheduling of the effect (struct ff\_replay)

u

effect-specific structure (one of ff\_constant\_effect, ff\_ramp\_effect, ff\_periodic\_effect, ff\_condition\_effect, ff\_rumble\_effect) further defining effect parameters

## Description

This structure is sent through `ioctl` from the application to the driver. To create a new effect application should set its `id` to -1; the kernel will return assigned `id` which can later be used to update or delete this effect.

## Direction of the effect is encoded as follows

0 deg -> 0x0000 (down) 90 deg -> 0x4000 (left) 180 deg -> 0x8000 (up) 270 deg -> 0xC000 (right)

## struct input\_dev

### LINUX

Kernel Hackers Manual March 2019

## Name

struct input\_dev — represents an input device

## Synopsis

```
struct input_dev {
    const char * name;
    const char * phys;
    const char * uniq;
    struct input_id id;
```

```

unsigned long evbit[BITS_TO_LONGS(EV_CNT)];
unsigned long keybit[BITS_TO_LONGS(KEY_CNT)];
unsigned long relbit[BITS_TO_LONGS(REL_CNT)];
unsigned long absbit[BITS_TO_LONGS(ABS_CNT)];
unsigned long msckbit[BITS_TO_LONGS(MSC_CNT)];
unsigned long ledbit[BITS_TO_LONGS(LED_CNT)];
unsigned long sndbit[BITS_TO_LONGS(SND_CNT)];
unsigned long ffbbit[BITS_TO_LONGS(FF_CNT)];
unsigned long swbit[BITS_TO_LONGS(SW_CNT)];
unsigned int keycodemax;
unsigned int keycodesize;
void * keycode;
int (* setkeycode) (struct input_dev *dev, int scancode, int keycode);
int (* getkeycode) (struct input_dev *dev, int scancode, int *keycode);
struct ff_device * ff;
unsigned int repeat_key;
struct timer_list timer;
int sync;
int abs[ABS_MAX + 1];
int rep[REP_MAX + 1];
unsigned long key[BITS_TO_LONGS(KEY_CNT)];
unsigned long led[BITS_TO_LONGS(LED_CNT)];
unsigned long snd[BITS_TO_LONGS(SND_CNT)];
unsigned long sw[BITS_TO_LONGS(SW_CNT)];
int absmax[ABS_MAX + 1];
int absmin[ABS_MAX + 1];
int absfuzz[ABS_MAX + 1];
int absflat[ABS_MAX + 1];
int (* open) (struct input_dev *dev);
void (* close) (struct input_dev *dev);
int (* flush) (struct input_dev *dev, struct file *file);
int (* event) (struct input_dev *dev, unsigned int type, unsigned int code, int value);
struct input_handle * grab;
spinlock_t event_lock;
struct mutex mutex;
unsigned int users;
bool going_away;
struct device dev;
struct list_head h_list;
struct list_head node;
};

```

## Members

name

name of the device

phys

physical path to the device in the system hierarchy

uniq

unique identification code for the device (if device has it)

id

id of the device (struct input\_id)

evbit[BITS\_TO\_LONGS(EV\_CNT)]

bitmap of types of events supported by the device (EV\_KEY, EV\_REL, etc.)

keybit[BITS\_TO\_LONGS(KEY\_CNT)]

bitmap of keys/buttons this device has

relbit[BITS\_TO\_LONGS(REL\_CNT)]

bitmap of relative axes for the device

absbit[BITS\_TO\_LONGS(ABS\_CNT)]

bitmap of absolute axes for the device

mscbit[BITS\_TO\_LONGS(MSC\_CNT)]

bitmap of miscellaneous events supported by the device

ledbit[BITS\_TO\_LONGS(LED\_CNT)]

bitmap of leds present on the device

sndbit[BITS\_TO\_LONGS(SND\_CNT)]

bitmap of sound effects supported by the device

ffbit[BITS\_TO\_LONGS(FF\_CNT)]

bitmap of force feedback effects supported by the device

swbit[BITS\_TO\_LONGS(SW\_CNT)]

bitmap of switches present on the device

keycodemax

size of keycode table

keycodesize

size of elements in keycode table

keycode

map of scancodes to keycodes for this device

setkeycode

optional method to alter current keymap, used to implement sparse keymaps. If not supplied default mechanism will be used

getkeycode

optional method to retrieve current keymap. If not supplied default mechanism will be used

ff

force feedback structure associated with the device if device supports force feedback effects

repeat\_key

stores key code of the last key pressed; used to implement software autorepeat

timer

timer for software autorepeat

sync

set to 1 when there were no new events since last EV\_SYNC

abs[ABS\_MAX + 1]

current values for reports from absolute axes

rep[REP\_MAX + 1]

current values for autorepeat parameters (delay, rate)

key[BITS\_TO\_LONGS(KEY\_CNT)]

reflects current state of device's keys/buttons

led[BITS\_TO\_LONGS(LED\_CNT)]

reflects current state of device's LEDs

snd[BITS\_TO\_LONGS(SND\_CNT)]

reflects current state of sound effects

sw[BITS\_TO\_LONGS(SW\_CNT)]

reflects current state of device's switches

absmax[ABS\_MAX + 1]

maximum values for events coming from absolute axes

absmin[ABS\_MAX + 1]

minimum values for events coming from absolute axes

absfuzz[ABS\_MAX + 1]

describes noisiness for axes

absflat[ABS\_MAX + 1]

size of the center flat position (used by joydev)

open

this method is called when the very first user calls `input_open_device`. The driver must prepare the device to start generating events (start polling thread, request an IRQ, submit URB, etc.)

close

this method is called when the very last user calls `input_close_device`.

flush

purges the device. Most commonly used to get rid of force feedback effects loaded into the device when disconnecting from it

event

event handler for events sent `_to_` the device, like `EV_LED` or `EV_SND`. The device is expected to carry out the requested action (turn on a LED, play sound, etc.) The call is protected by `event_lock` and must not sleep

grab

input handle that currently has the device grabbed (via `EVIOCGRAB` ioctl). When a handle grabs a device it becomes sole recipient for all input events coming from the device

`event_lock`

this spinlock is taken when input core receives and processes a new event for the device (in `input_event`). Code that accesses and/or modifies parameters of a device (such as `keymap` or `absmin`, `absmax`, `absfuzz`, etc.) after device has been registered with input core must take this lock.

`mutex`

serializes calls to `open`, `close` and `flush` methods

`users`

stores number of users (input handlers) that opened this device. It is used by `input_open_device` and `input_close_device` to make sure that `dev->open` is only called when the first user opens device and `dev->close` is called when the very last user closes the device

`going_away`

marks devices that are in a middle of unregistering and causes `input_open_device*()` fail with `-ENODEV`.

`dev`

driver model's view of this device

`h_list`

list of input handles associated with the device. When accessing the list `dev->mutex` must be held

`node`

used to place the device onto `input_dev_list`

## struct input\_handler

**LINUX**

Kernel Hackers Manual March 2019

### Name

`struct input_handler` — implements one of interfaces for input devices

## Synopsis

```
struct input_handler {
    void * private;
    void (* event) (struct input_handle *handle, unsigned int type, unsigned
    int (* connect) (struct input_handler *handler, struct input_dev *dev,
    void (* disconnect) (struct input_handle *handle);
    void (* start) (struct input_handle *handle);
    const struct file_operations * fops;
    int minor;
    const char * name;
    const struct input_device_id * id_table;
    const struct input_device_id * blacklist;
    struct list_head h_list;
    struct list_head node;
};
```

## Members

private

driver-specific data

event

event handler. This method is being called by input core with interrupts disabled and dev->event\_lock spinlock held and so it may not sleep

connect

called when attaching a handler to an input device

disconnect

disconnects a handler from input device

start

starts handler for given handle. This function is called by input core right after connect method and also when a process that “grabbed” a device releases it

fops

file operations this driver implements

minor

beginning of range of 32 minors for devices this driver can provide

`name`

name of the handler, to be shown in `/proc/bus/input/handlers`

`id_table`

pointer to a table of `input_device_ids` this driver can handle

`blacklist`

pointer to a table of `input_device_ids` this driver should ignore even if they match `id_table`

`h_list`

list of input handles associated with the handler

`node`

for placing the driver onto `input_handler_list`

## Description

Input handlers attach to input devices and create input handles. There are likely several handlers attached to any given input device at the same time. All of them will get their copy of input event generated by the device.

Note that input core serializes calls to `connect` and `disconnect` methods.

## struct input\_handle

### LINUX

Kernel Hackers Manual March 2019

### Name

`struct input_handle` — links input device with an input handler

### Synopsis

```
struct input_handle {
```

```
void * private;
int open;
const char * name;
struct input_dev * dev;
struct input_handler * handler;
struct list_head d_node;
struct list_head h_node;
};
```

## Members

private

handler-specific data

open

counter showing whether the handle is 'open', i.e. should deliver events from its device

name

name given to the handle by handler that created it

dev

input device the handle is attached to

handler

handler that works with the device through this handle

d\_node

used to put the handle on device's list of attached handles

h\_node

used to put the handle on handler's list of handles from which it gets events

## struct ff\_device

**LINUX**

## Name

`struct ff_device` — force-feedback part of an input device

## Synopsis

```
struct ff_device {
    int (* upload) (struct input_dev *dev, struct ff_effect *effect, struct :
    int (* erase) (struct input_dev *dev, int effect_id);
    int (* playback) (struct input_dev *dev, int effect_id, int value);
    void (* set_gain) (struct input_dev *dev, u16 gain);
    void (* set_autocenter) (struct input_dev *dev, u16 magnitude);
    void (* destroy) (struct ff_device *);
    void * private;
    unsigned long ffbits[BITS_TO_LONGS(FF_CNT)];
    struct mutex mutex;
    int max_effects;
    struct ff_effect * effects;
    struct file * effect_owners[];
};
```

## Members

`upload`

Called to upload an new effect into device

`erase`

Called to erase an effect from device

`playback`

Called to request device to start playing specified effect

`set_gain`

Called to set specified gain

`set_autocenter`

Called to auto-center device

`destroy`

called by input core when parent input device is being destroyed

`private`

driver-specific data, will be freed automatically

`ffbit[BITS_TO_LONGS(FF_CNT)]`

bitmap of force feedback capabilities truly supported by device (not emulated like ones in `input_dev->ffbit`)

`mutex`

mutex for serializing access to the device

`max_effects`

maximum number of effects supported by device

`effects`

pointer to an array of effects currently loaded into device

`effect_owners[]`

array of effect owners; when file handle owning an effect gets closed the effect is automatically erased

## Description

Every force-feedback device must implement `upload` and `playback` methods; `erase` is optional. `set_gain` and `set_autocenter` need only be implemented if driver sets up `FF_GAIN` and `FF_AUTOCENTER` bits.

Note that `playback`, `set_gain` and `set_autocenter` are called with `dev->event_lock` spinlock held and interrupts off and thus may not sleep.

## input\_event

**LINUX**

## Name

`input_event` — report new input event

## Synopsis

```
void input_event (struct input_dev * dev, unsigned int type,  
unsigned int code, int value);
```

## Arguments

*dev*

device that generated the event

*type*

type of the event

*code*

event code

*value*

value of the event

## Description

This function should be used by drivers implementing various input devices. See also `input_inject_event`.

# input\_inject\_event

## LINUX

Kernel Hackers Manual March 2019

### Name

`input_inject_event` — send input event from input handler

### Synopsis

```
void input_inject_event (struct input_handle * handle,  
unsigned int type, unsigned int code, int value);
```

### Arguments

*handle*

input handle to send event through

*type*

type of the event

*code*

event code

*value*

value of the event

### Description

Similar to `input_event` but will ignore event if device is “grabbed” and handle injecting event is not the one that owns the device.

# input\_grab\_device

## LINUX

Kernel Hackers Manual March 2019

### Name

`input_grab_device` — grabs device for exclusive use

### Synopsis

```
int input_grab_device (struct input_handle * handle);
```

### Arguments

*handle*

input handle that wants to own the device

### Description

When a device is grabbed by an input handle all events generated by the device are delivered only to this handle. Also events injected by other input handles are ignored while device is grabbed.

# input\_release\_device

## LINUX

## Name

`input_release_device` — release previously grabbed device

## Synopsis

```
void input_release_device (struct input_handle * handle);
```

## Arguments

*handle*

input handle that owns the device

## Description

Releases previously grabbed device so that other input handles can start receiving input events. Upon release all handlers attached to the device have their `start` method called so they have a change to synchronize device state with the rest of the system.

# input\_open\_device

## LINUX

## Name

`input_open_device` — open input device

## Synopsis

```
int input_open_device (struct input_handle * handle);
```

## Arguments

*handle*

handle through which device is being accessed

## Description

This function should be called by input handlers when they want to start receive events from given input device.

# input\_close\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_close_device` — close input device

## Synopsis

```
void input_close_device (struct input_handle * handle);
```

## Arguments

*handle*

handle through which device is being accessed

## Description

This function should be called by input handlers when they want to stop receive events from given input device.

# input\_get\_keycode

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_get_keycode` — retrieve keycode currently mapped to a given scancode

## Synopsis

```
int input_get_keycode (struct input_dev * dev, int scancode,  
int * keycode);
```

## Arguments

*dev*

input device which keymap is being queried

*scancode*

scancode (or its equivalent for device in question) for which keycode is needed

*keycode**result*

## Description

This function should be called by anyone interested in retrieving current keymap. Presently keyboard and evdev handlers use it.

# input\_set\_keycode

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_set_keycode` — assign new keycode to a given scancode

## Synopsis

```
int input_set_keycode (struct input_dev * dev, int scancode,
int keycode);
```

## Arguments

*dev*

input device which keymap is being updated

*scancode*

scancode (or its equivalent for device in question)

*keycode*

new keycode to be assigned to the scancode

## Description

This function should be called by anyone needing to update current keymap. Presently keyboard and evdev handlers use it.

# input\_allocate\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_allocate_device` — allocate memory for new input device

## Synopsis

```
struct input_dev * input_allocate_device ( void );
```

## Arguments

*void*

no arguments

## Description

Returns prepared struct `input_dev` or `NULL`.

## NOTE

Use `input_free_device` to free devices that have not been registered;  
`input_unregister_device` should be used for already registered devices.

# input\_free\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_free_device` — free memory occupied by `input_dev` structure

## Synopsis

```
void input_free_device (struct input_dev * dev);
```

## Arguments

*dev*

input device to free

## Description

This function should only be used if `input_register_device` was not called yet or if it failed. Once device was registered use `input_unregister_device` and memory will be freed once last reference to the device is dropped.

Device should be allocated by `input_allocate_device`.

## NOTE

If there are references to the input device then memory will not be freed until last reference is dropped.

# input\_set\_capability

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_set_capability` — mark device as capable of a certain event

## Synopsis

```
void input_set_capability (struct input_dev * dev, unsigned  
int type, unsigned int code);
```

## Arguments

*dev*

device that is capable of emitting or accepting event

*type*

type of the event (EV\_KEY, EV\_REL, etc...)

*code*

event code

## Description

In addition to setting up corresponding bit in appropriate capability bitmap the function also adjusts `dev->evbit`.

# input\_register\_device

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_register_device` — register device with input core

## Synopsis

```
int input_register_device (struct input_dev * dev);
```

## Arguments

*dev*

device to be registered

## Description

This function registers device with input core. The device must be allocated with `input_allocate_device` and all it's capabilities set up before registering. If function fails the device must be freed with `input_free_device`. Once device has been successfully registered it can be unregistered with `input_unregister_device`; `input_free_device` should not be called in this case.

# input\_unregister\_device

**LINUX**

Kernel Hackers Manual March 2019

## Name

`input_unregister_device` — unregister previously registered device

## Synopsis

```
void input_unregister_device (struct input_dev * dev);
```

## Arguments

*dev*

device to be unregistered

## Description

This function unregisters an input device. Once device is unregistered the caller should not try to access it as it may get freed at any moment.

# input\_register\_handler

**LINUX**

## Name

`input_register_handler` — register a new input handler

## Synopsis

```
int input_register_handler (struct input_handler * handler);
```

## Arguments

*handler*

handler to be registered

## Description

This function registers a new input handler (interface) for input devices in the system and attaches it to all input devices that are compatible with the handler.

# input\_unregister\_handler

## LINUX

## Name

`input_unregister_handler` — unregisters an input handler

## Synopsis

```
void input_unregister_handler (struct input_handler *  
    handler);
```

## Arguments

*handler*

handler to be unregistered

## Description

This function disconnects a handler from its input devices and removes it from lists of known handlers.

# input\_register\_handle

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_register_handle` — register a new input handle

## Synopsis

```
int input_register_handle (struct input_handle * handle);
```

## Arguments

*handle*

handle to register

## Description

This function puts a new input handle onto device's and handler's lists so that events can flow through it once it is opened using `input_open_device`.

This function is supposed to be called from handler's `connect` method.

# input\_unregister\_handle

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_unregister_handle` — unregister an input handle

## Synopsis

```
void input_unregister_handle (struct input_handle * handle);
```

## Arguments

*handle*

handle to unregister

## Description

This function removes input handle from device's and handler's lists.

This function is supposed to be called from handler's `disconnect` method.

# input\_ff\_upload

## LINUX

Kernel Hackers Manual March 2019

## Name

`input_ff_upload` — upload effect into force-feedback device

## Synopsis

```
int input_ff_upload (struct input_dev * dev, struct ff_effect  
* effect, struct file * file);
```

## Arguments

*dev*

input device

*effect*

effect to be uploaded

*file*

owner of the effect

# input\_ff\_erase

## LINUX

Kernel Hackers Manual March 2019

### Name

`input_ff_erase` — erase a force-feedback effect from device

### Synopsis

```
int input_ff_erase (struct input_dev * dev, int effect_id,  
struct file * file);
```

### Arguments

*dev*

input device to erase effect from

*effect\_id*

id of the ffect to be erased

*file*

purported owner of the request

### Description

This function erases a force-feedback effect from specified device. The effect will only be erased if it was uploaded through the same file handle that is requesting erase.

# input\_ff\_event

## LINUX

Kernel Hackers Manual March 2019

### Name

`input_ff_event` — generic handler for force-feedback events

### Synopsis

```
int input_ff_event (struct input_dev * dev, unsigned int type,
unsigned int code, int value);
```

### Arguments

*dev*

input device to send the effect to

*type*

event type (anything but EV\_FF is ignored)

*code*

event code

*value*

event value

# input\_ff\_create

## LINUX

## Name

`input_ff_create` — create force-feedback device

## Synopsis

```
int input_ff_create (struct input_dev * dev, int max_effects);
```

## Arguments

*dev*

input device supporting force-feedback

*max\_effects*

maximum number of effects supported by the device

## Description

This function allocates all necessary memory for a force feedback portion of an input device and installs all default handlers. *dev->ffbit* should be already set up before calling this function. Once ff device is created you need to setup its upload, erase, playback and other handlers before registering input device

## `input_ff_destroy`

**LINUX**

## Name

`input_ff_destroy` — frees force feedback portion of input device

## Synopsis

```
void input_ff_destroy (struct input_dev * dev);
```

## Arguments

*dev*

input device supporting force feedback

## Description

This function is only needed in error path as input core will automatically free force feedback structures when device is destroyed.

# input\_ff\_create\_memless

## LINUX

## Name

`input_ff_create_memless` — create memoryless force-feedback device

## Synopsis

```
int input_ff_create_memless (struct input_dev * dev, void *  
data, int (*play_effect) (struct input_dev *, void *, struct  
ff_effect *));
```

## Arguments

*dev*

input device supporting force-feedback

*data*

driver-specific data to be passed into *play\_effect*

*play\_effect*

driver-specific method for playing FF effect

# Chapter 9. Serial Peripheral Interface (SPI)

SPI is the "Serial Peripheral Interface", widely used with embedded systems because it is a simple and efficient interface: basically a multiplexed shift register. Its three signal wires hold a clock (SCK, often in the range of 1-20 MHz), a "Master Out, Slave In" (MOSI) data line, and a "Master In, Slave Out" (MISO) data line. SPI is a full duplex protocol; for each bit shifted out the MOSI line (one per clock) another is shifted in on the MISO line. Those bits are assembled into words of various sizes on the way to and from system memory. An additional chipselect line is usually active-low (nCS); four signals are normally used for each peripheral, plus sometimes an interrupt.

The SPI bus facilities listed here provide a generalized interface to declare SPI busses and devices, manage them according to the standard Linux driver model, and perform input/output operations. At this time, only "master" side interfaces are supported, where Linux talks to SPI peripherals and does not implement such a peripheral itself. (Interfaces to support implementing SPI slaves would necessarily look different.)

The programming interface is structured around two kinds of driver, and two kinds of device. A "Controller Driver" abstracts the controller hardware, which may be as simple as a set of GPIO pins or as complex as a pair of FIFOs connected to dual DMA engines on the other side of the SPI shift register (maximizing throughput). Such drivers bridge between whatever bus they sit on (often the platform bus) and SPI, and expose the SPI side of their device as a struct spi\_master. SPI devices are children of that master, represented as a struct spi\_device and manufactured from struct spi\_board\_info descriptors which are usually provided by board-specific initialization code. A struct spi\_driver is called a "Protocol Driver", and is bound to a spi\_device using normal driver model calls.

The I/O model is a set of queued messages. Protocol drivers submit one or more struct spi\_message objects, which are processed and completed asynchronously. (There are synchronous wrappers, however.) Messages are built from one or more struct spi\_transfer objects, each of which wraps a full duplex SPI transfer. A variety of protocol tweaking options are needed, because different chips adopt very different policies for how they use the bits transferred with SPI.

## struct spi\_device

**LINUX**

## Name

`struct spi_device` — Master side proxy for an SPI slave device

## Synopsis

```
struct spi_device {
    struct device dev;
    struct spi_master * master;
    u32 max_speed_hz;
    u8 chip_select;
    u8 mode;
#define SPI_CPHA 0x01
#define SPI_CPOL 0x02
#define SPI_MODE_0 (0|0)
#define SPI_MODE_1 (0|SPI_CPHA)
#define SPI_MODE_2 (SPI_CPOL|0)
#define SPI_MODE_3 (SPI_CPOL|SPI_CPHA)
#define SPI_CS_HIGH 0x04
#define SPI_LSB_FIRST 0x08
#define SPI_3WIRE 0x10
#define SPI_LOOP 0x20
#define SPI_NO_CS 0x40
#define SPI_READY 0x80
    u8 bits_per_word;
    int irq;
    void * controller_state;
    void * controller_data;
    char modalias[SPI_NAME_SIZE];
};
```

## Members

`dev`

Driver model representation of the device.

`master`

SPI controller used with the device.

`max_speed_hz`

Maximum clock rate to be used with this chip (on this board); may be changed by the device's driver. The `spi_transfer.speed_hz` can override this for each transfer.

`chip_select`

Chipselect, distinguishing chips handled by *master*.

`mode`

The spi mode defines how data is clocked out and in. This may be changed by the device's driver. The “active low” default for chipselect mode can be overridden (by specifying `SPI_CS_HIGH`) as can the “MSB first” default for each word in a transfer (by specifying `SPI_LSB_FIRST`).

`bits_per_word`

Data transfers involve one or more words; word sizes like eight or 12 bits are common. In-memory wordsizes are powers of two bytes (e.g. 20 bit samples use 32 bits). This may be changed by the device's driver, or left at the default (0) indicating protocol words are eight bit bytes. The `spi_transfer.bits_per_word` can override this for each transfer.

`irq`

Negative, or the number passed to `request_irq` to receive interrupts from this device.

`controller_state`

Controller's runtime state

`controller_data`

Board-specific definitions for controller, such as FIFO initialization parameters; from `board_info.controller_data`

`modalias[SPI_NAME_SIZE]`

Name of the driver to use with this device, or an alias for that name. This appears in the sysfs “modalias” attribute for driver coldplugging, and in uevents used for hotplugging

## Description

A *spi\_device* is used to interchange data between an SPI slave (usually a discrete chip) and CPU memory.

In *dev*, the `platform_data` is used to hold information about this device that's meaningful to the device's protocol driver, but not to its controller. One example might be an identifier for a chip variant with slightly different functionality; another might be information about how this particular board wires the chip's pins.

## struct spi\_driver

### LINUX

Kernel Hackers Manual March 2019

### Name

`struct spi_driver` — Host side “protocol” driver

### Synopsis

```
struct spi_driver {
    const struct spi_device_id * id_table;
    int (* probe) (struct spi_device *spi);
    int (* remove) (struct spi_device *spi);
    void (* shutdown) (struct spi_device *spi);
    int (* suspend) (struct spi_device *spi, pm_message_t mesg);
    int (* resume) (struct spi_device *spi);
    struct device_driver driver;
};
```

### Members

`id_table`

List of SPI devices supported by this driver

`probe`

Binds this driver to the spi device. Drivers can verify that the device is actually present, and may need to configure characteristics (such as `bits_per_word`) which weren't needed for the initial configuration done during system setup.

remove

Unbinds this driver from the spi device

shutdown

Standard shutdown callback used during system state transitions such as powerdown/halt and kexec

suspend

Standard suspend callback used during system state transitions

resume

Standard resume callback used during system state transitions

driver

SPI device drivers should initialize the name and owner field of this structure.

## Description

This represents the kind of device driver that uses SPI messages to interact with the hardware at the other end of a SPI link. It's called a "protocol" driver because it works through messages rather than talking directly to SPI hardware (which is what the underlying SPI controller driver does to pass those messages). These protocols are defined in the specification for the device(s) supported by the driver.

As a rule, those device protocols represent the lowest level interface supported by a driver, and it will support upper level interfaces too. Examples of such upper levels include frameworks like MTD, networking, MMC, RTC, filesystem character device nodes, and hardware monitoring.

## spi\_unregister\_driver

**LINUX**

Kernel Hackers Manual March 2019

### Name

spi\_unregister\_driver — reverse effect of spi\_register\_driver

## Synopsis

```
void spi_unregister_driver (struct spi_driver * sdrv);
```

## Arguments

*sdrv*

the driver to unregister

## Context

can sleep

## struct spi\_master

### LINUX

Kernel Hackers Manual March 2019

## Name

struct spi\_master — interface to SPI master controller

## Synopsis

```
struct spi_master {  
    struct device dev;  
    s16 bus_num;  
    u16 num_chipselect;  
    u16 dma_alignment;  
    u16 mode_bits;  
    u16 flags;  
#define SPI_MASTER_HALF_DUPLEX BIT(0)  
#define SPI_MASTER_NO_RX BIT(1)
```

```
#define SPI_MASTER_NO_TX BIT(2)
int (* setup) (struct spi_device *spi);
int (* transfer) (struct spi_device *spi, struct spi_message *mesg);
void (* cleanup) (struct spi_device *spi);
};
```

## Members

dev

device interface to this driver

bus\_num

board-specific (and often SOC-specific) identifier for a given SPI controller.

num\_chipselect

chipselects are used to distinguish individual SPI slaves, and are numbered from zero to num\_chipselects. each slave has a chipselect signal, but it's common that not every chipselect is connected to a slave.

dma\_alignment

SPI controller constraint on DMA buffers alignment.

mode\_bits

flags understood by this controller driver

flags

other constraints relevant to this driver

setup

updates the device mode and clocking records used by a device's SPI controller; protocol code may call this. This must fail if an unrecognized or unsupported mode is requested. It's always safe to call this unless transfers are pending on the device whose settings are being modified.

transfer

adds a message to the controller's transfer queue.

cleanup

frees controller-specific state

## Description

Each SPI master controller can communicate with one or more *spi\_device* children. These make a small bus, sharing MOSI, MISO and SCK signals but not chip select signals. Each device may be configured to use a different clock rate, since those shared signals are ignored unless the chip is selected.

The driver for an SPI controller manages access to those devices through a queue of *spi\_message* transactions, copying data between CPU memory and an SPI slave device. For each such message it queues, it calls the message's completion function when the transaction completes.

## struct spi\_transfer

### LINUX

Kernel Hackers Manual March 2019

### Name

`struct spi_transfer` — a read/write buffer pair

### Synopsis

```
struct spi_transfer {
    const void * tx_buf;
    void * rx_buf;
    unsigned len;
    dma_addr_t tx_dma;
    dma_addr_t rx_dma;
    unsigned cs_change:1;
    u8 bits_per_word;
    u16 delay_usecs;
    u32 speed_hz;
    struct list_head transfer_list;
};
```

## Members

`tx_buf`

data to be written (dma-safe memory), or NULL

`rx_buf`

data to be read (dma-safe memory), or NULL

`len`

size of rx and tx buffers (in bytes)

`tx_dma`

DMA address of `tx_buf`, if `spi_message.is_dma_mapped`

`rx_dma`

DMA address of `rx_buf`, if `spi_message.is_dma_mapped`

`cs_change`

affects chipselect after this transfer completes

`bits_per_word`

select a `bits_per_word` other than the device default for this transfer. If 0 the default (from `spi_device`) is used.

`delay_usecs`

microseconds to delay after this transfer before (optionally) changing the chipselect status, then starting the next transfer or completing this `spi_message`.

`speed_hz`

Select a speed other than the device default for this transfer. If 0 the default (from `spi_device`) is used.

`transfer_list`

transfers are sequenced through `spi_message.transfers`

## Description

SPI transfers always write the same number of bytes as they read. Protocol drivers should always provide `rx_buf` and/or `tx_buf`. In some cases, they may also want

to provide DMA addresses for the data being transferred; that may reduce overhead, when the underlying driver uses `dma`.

If the transmit buffer is null, zeroes will be shifted out while filling `rx_buf`. If the receive buffer is null, the data shifted in will be discarded. Only “len” bytes shift out (or in). It’s an error to try to shift out a partial word. (For example, by shifting out three bytes with word size of sixteen or twenty bits; the former uses two bytes per word, the latter uses four bytes.)

In-memory data values are always in native CPU byte order, translated from the wire byte order (big-endian except with `SPI_LSB_FIRST`). So for example when `bits_per_word` is sixteen, buffers are  $2N$  bytes long ( $len = 2N$ ) and hold  $N$  sixteen bit words in CPU byte order.

When the word size of the SPI transfer is not a power-of-two multiple of eight bits, those in-memory words include extra bits. In-memory words are always seen by protocol drivers as right-justified, so the undefined (rx) or unused (tx) bits are always the most significant bits.

All SPI transfers start with the relevant chipselect active. Normally it stays selected until after the last transfer in a message. Drivers can affect the chipselect signal using `cs_change`.

(i) If the transfer isn’t the last one in the message, this flag is used to make the chipselect briefly go inactive in the middle of the message. Toggling chipselect in this way may be needed to terminate a chip command, letting a single `spi_message` perform all of group of chip transactions together.

(ii) When the transfer is the last one in the message, the chip may stay selected until the next transfer. On multi-device SPI busses with nothing blocking messages going to other devices, this is just a performance hint; starting a message to another device deselects this one. But in other cases, this can be used to ensure correctness. Some devices need protocol transactions to be built from a series of `spi_message` submissions, where the content of one message is determined by the results of previous messages and where the whole transaction ends when the chipselect goes inactive.

The code that submits an `spi_message` (and its `spi_transfers`) to the lower layers is responsible for managing its memory. Zero-initialize every field you don’t set up explicitly, to insulate against future API updates. After you submit a message and its transfers, ignore them until its completion callback.

# struct spi\_message

## LINUX

Kernel Hackers Manual March 2019

### Name

struct spi\_message — one multi-segment SPI transaction

### Synopsis

```
struct spi_message {
    struct list_head transfers;
    struct spi_device * spi;
    unsigned is_dma_mapped:1;
    void (* complete) (void *context);
    void * context;
    unsigned actual_length;
    int status;
    struct list_head queue;
    void * state;
};
```

### Members

transfers

list of transfer segments in this transaction

spi

SPI device to which the transaction is queued

is\_dma\_mapped

if true, the caller provided both dma and cpu virtual addresses for each transfer buffer

complete

called to report transaction completions

context

the argument to `complete` when it's called

actual\_length

the total number of bytes that were transferred in all successful segments

status

zero for success, else negative errno

queue

for use by whichever driver currently owns the message

state

for use by whichever driver currently owns the message

## Description

A *spi\_message* is used to execute an atomic sequence of data transfers, each represented by a struct *spi\_transfer*. The sequence is “atomic” in the sense that no other *spi\_message* may use that SPI bus until that sequence completes. On some systems, many such sequences can execute as as single programmed DMA transfer. On all systems, these messages are queued, and might complete after transactions to other devices. Messages sent to a given *spi\_device* are always executed in FIFO order.

The code that submits an *spi\_message* (and its *spi\_transfers*) to the lower layers is responsible for managing its memory. Zero-initialize every field you don't set up explicitly, to insulate against future API updates. After you submit a message and its transfers, ignore them until its completion callback.

## spi\_write

**LINUX**

## Name

`spi_write` — SPI synchronous write

## Synopsis

```
int spi_write (struct spi_device * spi, const u8 * buf, size_t  
len);
```

## Arguments

*spi*

device to which data will be written

*buf*

data buffer

*len*

data buffer size

## Context

can sleep

## Description

This writes the buffer and returns zero or a negative error code. Callable only from contexts that can sleep.

# spi\_read

## LINUX

Kernel Hackers Manual March 2019

### Name

`spi_read` — SPI synchronous read

### Synopsis

```
int spi_read (struct spi_device * spi, u8 * buf, size_t len);
```

### Arguments

*spi*

device from which data will be read

*buf*

data buffer

*len*

data buffer size

### Context

can sleep

### Description

This reads the buffer and returns zero or a negative error code. Callable only from contexts that can sleep.

# spi\_w8r8

## LINUX

Kernel Hackers Manual March 2019

### Name

`spi_w8r8` — SPI synchronous 8 bit write followed by 8 bit read

### Synopsis

```
ssize_t spi_w8r8 (struct spi_device * spi, u8 cmd);
```

### Arguments

*spi*

device with which data will be exchanged

*cmd*

command to be written before data is read back

### Context

can sleep

### Description

This returns the (unsigned) eight bit number returned by the device, or else a negative error code. Callable only from contexts that can sleep.

# spi\_w8r16

## LINUX

Kernel Hackers Manual March 2019

### Name

`spi_w8r16` — SPI synchronous 8 bit write followed by 16 bit read

### Synopsis

```
ssize_t spi_w8r16 (struct spi_device * spi, u8 cmd);
```

### Arguments

*spi*

device with which data will be exchanged

*cmd*

command to be written before data is read back

### Context

can sleep

### Description

This returns the (unsigned) sixteen bit number returned by the device, or else a negative error code. Callable only from contexts that can sleep.

The number is returned in wire-order, which is at least sometimes big-endian.

# struct spi\_board\_info

## LINUX

Kernel Hackers Manual March 2019

### Name

struct spi\_board\_info — board-specific template for a SPI device

### Synopsis

```
struct spi_board_info {
    char modalias[SPI_NAME_SIZE];
    const void * platform_data;
    void * controller_data;
    int irq;
    u32 max_speed_hz;
    u16 bus_num;
    u16 chip_select;
    u8 mode;
};
```

### Members

modalias[SPI\_NAME\_SIZE]

Initializes spi\_device.modalias; identifies the driver.

platform\_data

Initializes spi\_device.platform\_data; the particular data stored there is driver-specific.

controller\_data

Initializes spi\_device.controller\_data; some controllers need hints about hardware setup, e.g. for DMA.

irq

Initializes spi\_device.irq; depends on how the board is wired.

`max_speed_hz`

Initializes `spi_device.max_speed_hz`; based on limits from the chip datasheet and board-specific signal quality issues.

`bus_num`

Identifies which `spi_master` parents the `spi_device`; unused by `spi_new_device`, and otherwise depends on board wiring.

`chip_select`

Initializes `spi_device.chip_select`; depends on how the board is wired.

`mode`

Initializes `spi_device.mode`; based on the chip datasheet, board wiring (some devices support both 3WIRE and standard modes), and possibly presence of an inverter in the chipselect path.

## Description

When adding new SPI devices to the device tree, these structures serve as a partial device template. They hold information which can't always be determined by drivers. Information that `probe` can establish (such as the default transfer wordsize) is not included here.

These structures are used in two places. Their primary role is to be stored in tables of board-specific device descriptors, which are declared early in board initialization and then used (much later) to populate a controller's device tree after the that controller's driver initializes. A secondary (and atypical) role is as a parameter to `spi_new_device` call, which happens after those controller drivers are active in some dynamic board configuration models.

## `spi_register_board_info`

**LINUX**

## Name

`spi_register_board_info` — register SPI devices for a given board

## Synopsis

```
int spi_register_board_info (struct spi_board_info const *  
info, unsigned n);
```

## Arguments

*info*

array of chip descriptors

*n*

how many descriptors are provided

## Context

can sleep

## Description

Board-specific early init code calls this (probably during `arch_initcall`) with segments of the SPI device table. Any device nodes are created later, after the relevant parent SPI controller (`bus_num`) is defined. We keep this table of devices forever, so that reloading a controller driver will not make Linux forget about these hard-wired devices.

Other code can also call this, e.g. a particular add-on board might provide SPI devices through its expansion connector, so code initializing that board would naturally declare its SPI devices.

The board info passed can safely be `__initdata` ... but be careful of any embedded pointers (`platform_data`, etc), they're copied as-is.

# spi\_register\_driver

**LINUX**

Kernel Hackers Manual March 2019

## Name

`spi_register_driver` — register a SPI driver

## Synopsis

```
int spi_register_driver (struct spi_driver * sdrv);
```

## Arguments

*sdrv*

the driver to register

## Context

can sleep

# spi\_alloc\_device

**LINUX**

## Name

`spi_alloc_device` — Allocate a new SPI device

## Synopsis

```
struct spi_device * spi_alloc_device (struct spi_master *  
master);
```

## Arguments

*master*

Controller to which device is connected

## Context

can sleep

## Description

Allows a driver to allocate and initialize a `spi_device` without registering it immediately. This allows a driver to directly fill the `spi_device` with device parameters before calling `spi_add_device` on it.

Caller is responsible to call `spi_add_device` on the returned `spi_device` structure to add it to the SPI master. If the caller needs to discard the `spi_device` without adding it, then it should call `spi_dev_put` on it.

Returns a pointer to the new device, or NULL.

# spi\_add\_device

**LINUX**

Kernel Hackers Manual March 2019

## Name

`spi_add_device` — Add `spi_device` allocated with `spi_alloc_device`

## Synopsis

```
int spi_add_device (struct spi_device * spi);
```

## Arguments

*spi*

`spi_device` to register

## Description

Companion function to `spi_alloc_device`. Devices allocated with `spi_alloc_device` can be added onto the spi bus with this function.

Returns 0 on success; negative `errno` on failure

# spi\_new\_device

**LINUX**

## Name

`spi_new_device` — instantiate one new SPI device

## Synopsis

```
struct spi_device * spi_new_device (struct spi_master *  
master, struct spi_board_info * chip);
```

## Arguments

*master*

Controller to which device is connected

*chip*

Describes the SPI device

## Context

can sleep

## Description

On typical mainboards, this is purely internal; and it's not needed after board init creates the hard-wired devices. Some development platforms may not be able to use `spi_register_board_info` though, and this is exported so that for example a USB or parport based adapter driver could add devices (which it would learn about out-of-band).

Returns the new device, or NULL.

# spi\_alloc\_master

## LINUX

Kernel Hackers Manual March 2019

### Name

`spi_alloc_master` — allocate SPI master controller

### Synopsis

```
struct spi_master * spi_alloc_master (struct device * dev,  
unsigned size);
```

### Arguments

*dev*

the controller, possibly using the `platform_bus`

*size*

how much zeroed driver-private data to allocate; the pointer to this memory is in the `driver_data` field of the returned device, accessible with `spi_master_get_devdata`.

### Context

can sleep

### Description

This call is used only by SPI master controller drivers, which are the only ones directly touching chip registers. It's how they allocate an `spi_master` structure, prior to calling `spi_register_master`.

This must be called from context that can sleep. It returns the SPI master structure on success, else NULL.

The caller is responsible for assigning the bus number and initializing the master's methods before calling `spi_register_master`; and (after errors adding the device) calling `spi_master_put` to prevent a memory leak.

## spi\_register\_master

### LINUX

Kernel Hackers Manual March 2019

### Name

`spi_register_master` — register SPI master controller

### Synopsis

```
int spi_register_master (struct spi_master * master);
```

### Arguments

*master*

initialized master, originally from `spi_alloc_master`

### Context

can sleep

## Description

SPI master controllers connect to their drivers using some non-SPI bus, such as the platform bus. The final stage of `probe` in that code includes calling `spi_register_master` to hook up to this SPI bus glue.

SPI controllers use board specific (often SOC specific) bus numbers, and board-specific addressing for SPI devices combines those numbers with chip select numbers. Since SPI does not directly support dynamic device identification, boards need configuration tables telling which chip is at which address.

This must be called from context that can sleep. It returns zero on success, else a negative error code (dropping the master's refcount). After a successful return, the caller is responsible for calling `spi_unregister_master`.

## spi\_unregister\_master

### LINUX

Kernel Hackers Manual March 2019

### Name

`spi_unregister_master` — unregister SPI master controller

### Synopsis

```
void spi_unregister_master (struct spi_master * master);
```

### Arguments

*master*

the master being unregistered

## Context

can sleep

## Description

This call is used only by SPI master controller drivers, which are the only ones directly touching chip registers.

This must be called from context that can sleep.

# spi\_busnum\_to\_master

## LINUX

Kernel Hackers Manual March 2019

## Name

`spi_busnum_to_master` — look up master associated with `bus_num`

## Synopsis

```
struct spi_master * spi_busnum_to_master (u16 bus_num);
```

## Arguments

*bus\_num*

the master's bus number

## Context

can sleep

## Description

This call may be used with devices that are registered after arch init time. It returns a refcounted pointer to the relevant spi\_master (which the caller must release), or NULL if there is no such master registered.

## spi\_setup

### LINUX

Kernel Hackers Manual March 2019

### Name

spi\_setup — setup SPI mode and clock rate

### Synopsis

```
int spi_setup (struct spi_device * spi);
```

### Arguments

*spi*

the device whose settings are being modified

### Context

can sleep, and no requests are queued to the device

## Description

SPI protocol drivers may need to update the transfer mode if the device doesn't work with its default. They may likewise need to update clock rates or word sizes from initial values. This function changes those settings, and must be called from a context that can sleep. Except for `SPI_CS_HIGH`, which takes effect immediately, the changes take effect the next time the device is selected and data is transferred to or from it. When this function returns, the spi device is deselected.

Note that this call will fail if the protocol driver specifies an option that the underlying controller or its driver does not support. For example, not all hardware supports wire transfers using nine bit words, LSB-first wire encoding, or active-high chipselects.

## spi\_async

### LINUX

Kernel Hackers Manual March 2019

### Name

`spi_async` — asynchronous SPI transfer

### Synopsis

```
int spi_async (struct spi_device * spi, struct spi_message *
message);
```

### Arguments

*spi*

device with which data will be exchanged

*message*

describes the data transfers, including completion callback

## Context

any (irqs may be blocked, etc)

## Description

This call may be used in\_irq and other contexts which can't sleep, as well as from task contexts which can sleep.

The completion callback is invoked in a context which can't sleep. Before that invocation, the value of `message->status` is undefined. When the callback is issued, `message->status` holds either zero (to indicate complete success) or a negative error code. After that callback returns, the driver which issued the transfer request may deallocate the associated memory; it's no longer in use by any SPI core or controller driver code.

Note that although all messages to a `spi_device` are handled in FIFO order, messages may go to different devices in other orders. Some device might be higher priority, or have various "hard" access time requirements, for example.

On detection of any fault during the transfer, processing of the entire message is aborted, and the device is deselected. Until returning from the associated message completion callback, no other `spi_message` queued to that device will be processed. (This rule applies equally to all the synchronous transfer calls, which are wrappers around this core asynchronous primitive.)

## spi\_sync

**LINUX**

Kernel Hackers Manual March 2019

## Name

`spi_sync` — blocking/synchronous SPI data transfers

## Synopsis

```
int spi_sync (struct spi_device * spi, struct spi_message *  
message);
```

## Arguments

*spi*

device with which data will be exchanged

*message*

describes the data transfers

## Context

can sleep

## Description

This call may only be used from a context that may sleep. The sleep is non-interruptible, and has no timeout. Low-overhead controller drivers may DMA directly into and out of the message buffers.

Note that the SPI device's chip select is active during the message, and then is normally disabled between messages. Drivers for some frequently-used devices may want to minimize costs of selecting a chip, by leaving it selected in anticipation that the next message will go to the same chip. (That may increase power usage.)

Also, the caller is guaranteeing that the memory associated with the message will not be freed before this call returns.

It returns zero on success, else a negative error code.

# spi\_write\_then\_read

## LINUX

Kernel Hackers Manual March 2019

## Name

`spi_write_then_read` — SPI synchronous write followed by read

## Synopsis

```
int spi_write_then_read (struct spi_device * spi, const u8 *  
txbuf, unsigned n_tx, u8 * rxbuf, unsigned n_rx);
```

## Arguments

*spi*

device with which data will be exchanged

*txbuf*

data to be written (need not be dma-safe)

*n\_tx*

size of txbuf, in bytes

*rxbuf*

buffer into which data will be read (need not be dma-safe)

*n\_rx*

size of rxbuf, in bytes

## Context

can sleep

## **Description**

This performs a half duplex MicroWire style transaction with the device, sending txbuf and then reading rxbuf. The return value is zero for success, else a negative errno status code. This call may only be used from a context that may sleep.

Parameters to this routine are always copied using a small buffer; portable code should never use this for more than 32 bytes. Performance-sensitive or bulk transfer code should instead use `spi_{async,sync}()` calls with dma-safe buffers.

# Chapter 10. I<sup>2</sup>C and SMBus Subsystem

I<sup>2</sup>C (or without fancy typography, "I2C") is an acronym for the "Inter-IC" bus, a simple bus protocol which is widely used where low data rate communications suffice. Since it's also a licensed trademark, some vendors use another name (such as "Two-Wire Interface", TWI) for the same bus. I2C only needs two signals (SCL for clock, SDA for data), conserving board real estate and minimizing signal quality issues. Most I2C devices use seven bit addresses, and bus speeds of up to 400 kHz; there's a high speed extension (3.4 MHz) that's not yet found wide use. I2C is a multi-master bus; open drain signaling is used to arbitrate between masters, as well as to handshake and to synchronize clocks from slower clients.

The Linux I2C programming interfaces support only the master side of bus interactions, not the slave side. The programming interface is structured around two kinds of driver, and two kinds of device. An I2C "Adapter Driver" abstracts the controller hardware; it binds to a physical device (perhaps a PCI device or platform\_device) and exposes a struct `i2c_adapter` representing each I2C bus segment it manages. On each I2C bus segment will be I2C devices represented by a struct `i2c_client`. Those devices will be bound to a struct `i2c_driver`, which should follow the standard Linux driver model. (At this writing, a legacy model is more widely used.) There are functions to perform various I2C protocol operations; at this writing all such functions are usable only from task context.

The System Management Bus (SMBus) is a sibling protocol. Most SMBus systems are also I2C conformant. The electrical constraints are tighter for SMBus, and it standardizes particular protocol messages and idioms. Controllers that support I2C can also support most SMBus operations, but SMBus controllers don't support all the protocol options that an I2C controller will. There are functions to perform various SMBus protocol operations, either using I2C primitives or by issuing SMBus commands to `i2c_adapter` devices which don't support those I2C operations.

## struct `i2c_driver`

**LINUX**

Kernel Hackers Manual March 2019

### Name

`struct i2c_driver` — represent an I2C device driver

## Synopsis

```
struct i2c_driver {
    unsigned int class;
    int (* attach_adapter) (struct i2c_adapter *);
    int (* detach_adapter) (struct i2c_adapter *);
    int (* probe) (struct i2c_client *, const struct i2c_device_id *);
    int (* remove) (struct i2c_client *);
    void (* shutdown) (struct i2c_client *);
    int (* suspend) (struct i2c_client *, pm_message_t mesg);
    int (* resume) (struct i2c_client *);
    int (* command) (struct i2c_client *client, unsigned int cmd, void *arg);
    struct device_driver driver;
    const struct i2c_device_id * id_table;
    int (* detect) (struct i2c_client *, int kind, struct i2c_board_info *);
    const struct i2c_client_address_data * address_data;
    struct list_head clients;
};
```

## Members

class

What kind of i2c device we instantiate (for detect)

attach\_adapter

Callback for bus addition (for legacy drivers)

detach\_adapter

Callback for bus removal (for legacy drivers)

probe

Callback for device binding

remove

Callback for device unbinding

shutdown

Callback for device shutdown

suspend

Callback for device suspend

`resume`

Callback for device resume

`command`

Callback for bus-wide signaling (optional)

`driver`

Device driver model driver

`id_table`

List of I2C devices supported by this driver

`detect`

Callback for device detection

`address_data`

The I2C addresses to probe, ignore or force (for detect)

`clients`

List of detected clients we created (for i2c-core use only)

## Description

The `driver.owner` field should be set to the module owner of this driver. The `driver.name` field should be set to the name of this driver.

For automatic device detection, both `detect` and `address_data` must be defined. `class` should also be set, otherwise only devices forced with module parameters will be created. The detect function must fill at least the name field of the `i2c_board_info` structure it is handed upon successful detection, and possibly also the flags field.

If `detect` is missing, the driver will still work fine for enumerated devices. Detected devices simply won't be supported. This is expected for the many I2C/SMBus devices which can't be detected reliably, and the ones which can always be enumerated in practice.

The `i2c_client` structure which is handed to the `detect` callback is not a real `i2c_client`. It is initialized just enough so that you can call `i2c_smbus_read_byte_data` and friends on it. Don't do anything else with it. In particular, calling `dev_dbg` and friends on it is not allowed.

# struct i2c\_client

## LINUX

Kernel Hackers Manual March 2019

### Name

struct i2c\_client — represent an I2C slave device

### Synopsis

```
struct i2c_client {
    unsigned short flags;
    unsigned short addr;
    char name[I2C_NAME_SIZE];
    struct i2c_adapter * adapter;
    struct i2c_driver * driver;
    struct device dev;
    int irq;
    struct list_head detected;
};
```

### Members

flags

I2C\_CLIENT\_TEN indicates the device uses a ten bit chip address;  
I2C\_CLIENT\_PEC indicates it uses SMBus Packet Error Checking

addr

Address used on the I2C bus connected to the parent adapter.

name[I2C\_NAME\_SIZE]

Indicates the type of the device, usually a chip name that's generic enough to hide second-sourcing and compatible revisions.

adapter

manages the bus segment hosting this I2C device

driver

device's driver, hence pointer to access routines

dev

Driver model device node for the slave.

irq

indicates the IRQ generated by this device (if any)

detected

member of an `i2c_driver.clients` list or `i2c-core's userspace_devices` list

## Description

An `i2c_client` identifies a single device (i.e. chip) connected to an i2c bus. The behaviour exposed to Linux is defined by the driver managing the device.

## struct i2c\_board\_info

### LINUX

Kernel Hackers Manual March 2019

### Name

`struct i2c_board_info` — template for device creation

### Synopsis

```
struct i2c_board_info {
    char type[I2C_NAME_SIZE];
    unsigned short flags;
    unsigned short addr;
    void * platform_data;
```

```
    struct dev_archdata * archdata;
    int irq;
};
```

## Members

type[I2C\_NAME\_SIZE]

chip type, to initialize i2c\_client.name

flags

to initialize i2c\_client.flags

addr

stored in i2c\_client.addr

platform\_data

stored in i2c\_client.dev.platform\_data

archdata

copied into i2c\_client.dev.archdata

irq

stored in i2c\_client.irq

## Description

I2C doesn't actually support hardware probing, although controllers and devices may be able to use I2C\_SMBUS\_QUICK to tell whether or not there's a device at a given address. Drivers commonly need more information than that, such as chip type, configuration, associated IRQ, and so on.

i2c\_board\_info is used to build tables of information listing I2C devices that are present. This information is used to grow the driver model tree. For mainboards this is done statically using i2c\_register\_board\_info; bus numbers identify adapters that aren't yet available. For add-on boards, i2c\_new\_device does this dynamically with the adapter already known.

# I2C\_BOARD\_INFO

## LINUX

Kernel Hackers Manual March 2019

### Name

`I2C_BOARD_INFO` — macro used to list an i2c device and its address

### Synopsis

```
I2C_BOARD_INFO ( dev_type, dev_addr );
```

### Arguments

*dev\_type*

identifies the device type

*dev\_addr*

the device's address on the bus.

### Description

This macro initializes essential fields of a struct `i2c_board_info`, declaring what has been provided on a particular board. Optional fields (such as associated `irq`, or device-specific `platform_data`) are provided using conventional syntax.

## i2c\_lock\_adapter

## LINUX

## Name

`i2c_lock_adapter` — Prevent access to an I2C bus segment

## Synopsis

```
void i2c_lock_adapter (struct i2c_adapter * adapter);
```

## Arguments

*adapter*

Target I2C bus segment

# i2c\_unlock\_adapter

## LINUX

## Name

`i2c_unlock_adapter` — Reauthorize access to an I2C bus segment

## Synopsis

```
void i2c_unlock_adapter (struct i2c_adapter * adapter);
```

## Arguments

*adapter*

Target I2C bus segment

## struct i2c\_msg

### LINUX

Kernel Hackers Manual March 2019

## Name

struct i2c\_msg — an I2C transaction segment beginning with START

## Synopsis

```
struct i2c_msg {
    __u16 addr;
    __u16 flags;
#define I2C_M_TEN    0x0010
#define I2C_M_RD     0x0001
#define I2C_M_NOSTART 0x4000
#define I2C_M_REV_DIR_ADDR 0x2000
#define I2C_M_IGNORE_NAK 0x1000
#define I2C_M_NO_RD_ACK 0x0800
#define I2C_M_RECV_LEN 0x0400
    __u16 len;
    __u8 * buf;
};
```

## Members

*addr*

Slave address, either seven or ten bits. When this is a ten bit address, I2C\_M\_TEN must be set in *flags* and the adapter must support

I2C\_FUNC\_10BIT\_ADDR.

flags

I2C\_M\_RD is handled by all adapters. No other flags may be provided unless the adapter exported the relevant I2C\_FUNC\_\* flags through `i2c_check_functionality`.

len

Number of data bytes in *buf* being read from or written to the I2C slave address. For read transactions where I2C\_M\_RECV\_LEN is set, the caller guarantees that this buffer can hold up to 32 bytes in addition to the initial length byte sent by the slave (plus, if used, the SMBus PEC); and this value will be incremented by the number of block data bytes received.

buf

The buffer into which data is read, or from which it's written.

## Description

An `i2c_msg` is the low level representation of one segment of an I2C transaction. It is visible to drivers in the `i2c_transfer()` procedure, to userspace from `i2c-dev`, and to I2C adapter drivers through the `i2c_adapter.master_xfer()` method.

Except when I2C “protocol mangling” is used, all I2C adapters implement the standard rules for I2C transactions. Each transaction begins with a START. That is followed by the slave address, and a bit encoding read versus write. Then follow all the data bytes, possibly including a byte with SMBus PEC. The transfer terminates with a NAK, or when all those bytes have been transferred and ACKed. If this is the last message in a group, it is followed by a STOP. Otherwise it is followed by the next `i2c_msg` transaction segment, beginning with a (repeated) START.

Alternatively, when the adapter supports I2C\_FUNC\_PROTOCOL\_MANGLING then passing certain *flags* may have changed those standard protocol behaviors. Those flags are only for use with broken/nonconforming slaves, and with adapters which are known to support the specific mangling options they need (one or more of IGNORE\_NAK, NO\_RD\_ACK, NOSTART, and REV\_DIR\_ADDR).

# i2c\_register\_board\_info

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_register_board_info` — statically declare I2C devices

## Synopsis

```
int i2c_register_board_info (int busnum, struct i2c_board_info
const * info, unsigned len);
```

## Arguments

*busnum*

identifies the bus to which these devices belong

*info*

vector of i2c device descriptors

*len*

how many descriptors in the vector; may be zero to reserve the specified bus number.

## Description

Systems using the Linux I2C driver stack can declare tables of board info while they initialize. This should be done in board-specific init code near `arch_initcall` time, or equivalent, before any I2C adapter driver is registered. For example, mainboard init code could define several devices, as could the init code for each daughtercard in a board stack.

The I2C devices will be created later, after the adapter for the relevant bus has been registered. After that moment, standard driver model tools are used to bind “new style” I2C drivers to the devices. The bus number for any device declared using this routine is not available for dynamic allocation.

The board info passed can safely be `__initdata`, but be careful of embedded pointers (for `platform_data`, functions, etc) since that won’t be copied.

## i2c\_verify\_client

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_verify_client` — return parameter as `i2c_client`, or `NULL`

### Synopsis

```
struct i2c_client * i2c_verify_client (struct device * dev);
```

### Arguments

*dev*

device, probably from some driver model iterator

### Description

When traversing the driver model tree, perhaps using driver model iterators like `device_for_each_child()`, you can’t assume very much about the nodes you find. Use this function to avoid oopses caused by wrongly treating some non-I2C device as an `i2c_client`.

# i2c\_new\_device

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_new_device` — instantiate an i2c device

### Synopsis

```
struct i2c_client * i2c_new_device (struct i2c_adapter * adap,  
struct i2c_board_info const * info);
```

### Arguments

*adap*

the adapter managing the device

*info*

describes one I2C device; `bus_num` is ignored

### Context

can sleep

### Description

Create an i2c device. Binding is handled through driver model `probe/remove` methods. A driver may be bound to this device when we return from this function, or any later moment (e.g. maybe hotplugging will load the driver module). This call

is not appropriate for use by mainboard initialization logic, which usually runs during an `arch_initcall` long before any `i2c_adapter` could exist.

This returns the new `i2c` client, which may be saved for later use with `i2c_unregister_device`; or `NULL` to indicate an error.

## i2c\_unregister\_device

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_unregister_device` — reverse effect of `i2c_new_device`

### Synopsis

```
void i2c_unregister_device (struct i2c_client * client);
```

### Arguments

*client*

value returned from `i2c_new_device`

### Context

can sleep

# i2c\_new\_dummy

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_new_dummy` — return a new i2c device bound to a dummy driver

### Synopsis

```
struct i2c_client * i2c_new_dummy (struct i2c_adapter *  
adapter, u16 address);
```

### Arguments

*adapter*

the adapter managing the device

*address*

seven bit address to be used

### Context

can sleep

### Description

This returns an I2C client bound to the “dummy” driver, intended for use with devices that consume multiple addresses. Examples of such chips include various EEPROMS (like 24c04 and 24c08 models).

These dummy devices have two main uses. First, most I2C and SMBus calls except `i2c_transfer` need a client handle; the dummy will be that handle. And second, this prevents the specified address from being bound to a different driver.

This returns the new i2c client, which should be saved for later use with `i2c_unregister_device`; or NULL to indicate an error.

## i2c\_add\_adapter

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_add_adapter` — declare i2c adapter, use dynamic bus number

### Synopsis

```
int i2c_add_adapter (struct i2c_adapter * adapter);
```

### Arguments

*adapter*

the adapter to add

### Context

can sleep

### Description

This routine is used to declare an I2C adapter when its bus number doesn't matter. Examples: for I2C adapters dynamically added by USB links or PCI plugin cards.

When this returns zero, a new bus number was allocated and stored in `adap->nr`, and the specified adapter became available for clients. Otherwise, a negative `errno` value is returned.

## i2c\_add\_numbered\_adapter

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_add_numbered_adapter` — declare i2c adapter, use static bus number

### Synopsis

```
int i2c_add_numbered_adapter (struct i2c_adapter * adap);
```

### Arguments

*adap*

the adapter to register (with `adap->nr` initialized)

### Context

can sleep

### Description

This routine is used to declare an I2C adapter when its bus number matters. For example, use it for I2C adapters from system-on-chip CPUs, or otherwise built in to

the system's mainboard, and where `i2c_board_info` is used to properly configure I2C devices.

If no devices have pre-been declared for this bus, then be sure to register the adapter before any dynamically allocated ones. Otherwise the required bus ID may not be available.

When this returns zero, the specified adapter became available for clients using the bus number provided in `adap->nr`. Also, the table of I2C devices pre-declared using `i2c_register_board_info` is scanned, and the appropriate driver model device nodes are created. Otherwise, a negative `errno` value is returned.

## i2c\_del\_adapter

### LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_del_adapter` — unregister I2C adapter

### Synopsis

```
int i2c_del_adapter (struct i2c_adapter * adap);
```

### Arguments

*adap*

the adapter being unregistered

### Context

can sleep

## Description

This unregisters an I2C adapter which was previously registered by *i2c\_add\_adapter* or *i2c\_add\_numbered\_adapter*.

# i2c\_del\_driver

## LINUX

Kernel Hackers Manual March 2019

## Name

*i2c\_del\_driver* — unregister I2C driver

## Synopsis

```
void i2c_del_driver (struct i2c_driver * driver);
```

## Arguments

*driver*

the driver being unregistered

## Context

can sleep

# i2c\_use\_client

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_use_client` — increments the reference count of the i2c client structure

### Synopsis

```
struct i2c_client * i2c_use_client (struct i2c_client *  
client);
```

### Arguments

*client*

the client being referenced

### Description

Each live reference to a client should be refcounted. The driver model does that automatically as part of driver binding, so that most drivers don't

### need to do this explicitly

they hold a reference until they're unbound from the device.

A pointer to the client with the incremented reference counter is returned.

# i2c\_release\_client

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_release_client` — release a use of the i2c client structure

### Synopsis

```
void i2c_release_client (struct i2c_client * client);
```

### Arguments

*client*

the client being no longer referenced

### Description

Must be called when a user of a client is finished with it.

# i2c\_transfer

## LINUX

Kernel Hackers Manual March 2019

### Name

`i2c_transfer` — execute a single or combined I<sup>2</sup>C message

## Synopsis

```
int i2c_transfer (struct i2c_adapter * adap, struct i2c_msg *  
msgs, int num);
```

## Arguments

*adap*

Handle to I2C bus

*msgs*

One or more messages to execute before STOP is issued to terminate the operation; each message begins with a START.

*num*

Number of messages to be executed.

## Description

Returns negative errno, else the number of messages executed.

Note that there is no requirement that each message be sent to the same slave address, although that is the most common model.

## i2c\_master\_send

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_master_send` — issue a single I2C message in master transmit mode

## Synopsis

```
int i2c_master_send (struct i2c_client * client, const char *  
buf, int count);
```

## Arguments

*client*

Handle to slave device

*buf*

Data that will be written to the slave

*count*

How many bytes to write

## Description

Returns negative errno, or else the number of bytes written.

## i2c\_master\_recv

**LINUX**

Kernel Hackers Manual March 2019

## Name

`i2c_master_recv` — issue a single I2C message in master receive mode

## Synopsis

```
int i2c_master_recv (struct i2c_client * client, char * buf,  
int count);
```

## Arguments

*client*

Handle to slave device

*buf*

Where to store data read from slave

*count*

How many bytes to read

## Description

Returns negative errno, or else the number of bytes read.

# i2c\_smbus\_read\_byte

**LINUX**

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_read_byte` — SMBus “receive byte” protocol

## Synopsis

```
s32 i2c_smbus_read_byte (struct i2c_client * client);
```

## Arguments

*client*

Handle to slave device

## Description

This executes the SMBus “receive byte” protocol, returning negative `errno` else the byte received from the device.

# i2c\_smbus\_write\_byte

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_write_byte` — SMBus “send byte” protocol

## Synopsis

```
s32 i2c_smbus_write_byte (struct i2c_client * client, u8
value);
```

## Arguments

*client*

Handle to slave device

*value*

Byte to be sent

## Description

This executes the SMBus “send byte” protocol, returning negative errno else zero on success.

# i2c\_smbus\_read\_byte\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_read_byte_data` — SMBus “read byte” protocol

## Synopsis

```
s32 i2c_smbus_read_byte_data (struct i2c_client * client, u8
command);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

## Description

This executes the SMBus “read byte” protocol, returning negative `errno` else a data byte received from the device.

# i2c\_smbus\_write\_byte\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_write_byte_data` — SMBus “write byte” protocol

## Synopsis

```
s32 i2c_smbus_write_byte_data (struct i2c_client * client, u8
command, u8 value);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

*value*

Byte being written

## Description

This executes the SMBus “write byte” protocol, returning negative `errno` else zero on success.

# i2c\_smbus\_read\_word\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_read_word_data` — SMBus “read word” protocol

## Synopsis

```
s32 i2c_smbus_read_word_data (struct i2c_client * client, u8
command);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

## Description

This executes the SMBus “read word” protocol, returning negative `errno` else a 16-bit unsigned “word” received from the device.

# i2c\_smbus\_write\_word\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_write_word_data` — SMBus “write word” protocol

## Synopsis

```
s32 i2c_smbus_write_word_data (struct i2c_client * client, u8
command, u16 value);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

*value*

16-bit “word” being written

## Description

This executes the SMBus “write word” protocol, returning negative `errno` else zero on success.

# i2c\_smbus\_process\_call

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_process_call` — SMBus “process call” protocol

## Synopsis

```
s32 i2c_smbus_process_call (struct i2c_client * client, u8
command, u16 value);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

*value*

16-bit “word” being written

## Description

This executes the SMBus “process call” protocol, returning negative `errno` else a 16-bit unsigned “word” received from the device.

# i2c\_smbus\_read\_block\_data

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_read_block_data` — SMBus “block read” protocol

## Synopsis

```
s32 i2c_smbus_read_block_data (struct i2c_client * client, u8
command, u8 * values);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

*values*

Byte array into which data will be read; big enough to hold the data returned by the slave. SMBus allows at most 32 bytes.

## Description

This executes the SMBus “block read” protocol, returning negative `errno` else the number of data bytes in the slave’s response.

Note that using this function requires that the client’s adapter support the `I2C_FUNC_SMBUS_READ_BLOCK_DATA` functionality. Not all adapter drivers support this; its emulation through I2C messaging relies on a specific mechanism (`I2C_M_RECV_LEN`) which may not be implemented.

## `i2c_smbus_write_block_data`

### LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_write_block_data` — SMBus “block write” protocol

## Synopsis

```
s32 i2c_smbus_write_block_data (struct i2c_client * client, u8
command, u8 length, const u8 * values);
```

## Arguments

*client*

Handle to slave device

*command*

Byte interpreted by slave

*length*

Size of data block; SMBus allows at most 32 bytes

*values*

Byte array which will be written.

## Description

This executes the SMBus “block write” protocol, returning negative errno else zero on success.

# i2c\_smbus\_xfer

## LINUX

Kernel Hackers Manual March 2019

## Name

`i2c_smbus_xfer` — execute SMBus protocol operations

## Synopsis

```
s32 i2c_smbus_xfer (struct i2c_adapter * adapter, u16 addr,
unsigned short flags, char read_write, u8 command, int
protocol, union i2c_smbus_data * data);
```

## Arguments

*adapter*

Handle to I2C bus

*addr*

Address of SMBus slave on that bus

*flags*

I2C\_CLIENT\_\* flags (usually zero or I2C\_CLIENT\_PEC)

*read\_write*

I2C\_SMBUS\_READ or I2C\_SMBUS\_WRITE

*command*

Byte interpreted by slave, for protocols which use such bytes

*protocol*

SMBus protocol operation to execute, such as I2C\_SMBUS\_PROC\_CALL

*data*

Data to be read or written

## Description

This executes an SMBus protocol operation, and returns a negative errno code else zero on success.
