# **DDRescue-GUI Developer Documentation**

***Release 2.0.0***

**Hamish McIntyre-Bhatty**

**Oct 17, 2018**

## CONTENTS

1	Documentation for the main executable file (DDRescue_GUI.py)	3
2	Documentation for the py2app setup file (setup.py)	9
3	Documentation for the unit tests runner file (tests.py)	11
4	Documentation for the unit tests package (Tests)	13
5	Documentation for the tools package (Tools)	15
6	Documentation for the backend tools module in the tools package (Tools/tools.py)	17
7	Documentation for the ddrescue tools package in the tools package (Tools/DDRescueTools)	19
8	Documentation for the setup module in the ddrescue tools package in the tools package (Tools/DDRescueTools/setup.py)	21
9	Documentation for the decorators module in the ddrescue tools package in the tools package (Tools/DDRescueTools/decorators.py)	23
10	Documentation for the allversions module in the ddrescue tools package in the tools package (Tools/DDRescueTools/allversions.py)	25
11	Documentation for the ddrescue tools for ddrescue version 1.14 in the ddrescue tools package in the tools package (Tools/DDRescueTools/one_point_forteen.py)	27
12	Documentation for the ddrescue tools for ddrescue version 1.18 in the ddrescue tools package in the tools package (Tools/DDRescueTools/one_point_eighteen.py)	29
13	Documentation for the ddrescue tools for ddrescue version 1.20 in the ddrescue tools package in the tools package (Tools/DDRescueTools/one_point_twenty.py)	31
14	Documentation for the ddrescue tools for ddrescue version 1.21 in the ddrescue tools package in the tools package (Tools/DDRescueTools/one_point_twenty_one.py)	33
15	Documentation for the ddrescue tools for ddrescue version 1.22 in the ddrescue tools package in the tools package (Tools/DDRescueTools/one_point_twenty_two.py)	35
16	Indices and tables	37
	Python Module Index	39

---

**Note:** Most of the docstrings in this project don't follow any particular format at this time, and don't always provide helpful information. This will be remedied in due course.

---

Contents:

## DOCUMENTATION FOR THE MAIN EXECUTABLE FILE (DDRESCUE\_GUI.PY)

This is the main script that you use to start DDRescue-GUI.

```
class ddrescue_gui.DDRescue_GUI.BackendThread (parent)
    Handles getting input from ddrescue during a recovery, and forwards it back to the GUI thread as required.

    calculate_time_remaining ()
        Calculate remaining time based on the average read rate and the current amount of data recovered

    change_units (number_to_change, current_unit, required_unit)
        Convert data so it uses the correct unit of measurement

    process_line (line)
        Process a given line to get ddrescue's current status and recovery information and send it to the GUI Thread

    run ()
        Main body of the thread, started with self.start()

class ddrescue_gui.DDRescue_GUI.CustomTextCtrl (parent, wx_id, value, style)
    A custom wx.TextCtrl that provides features that are broken on Linux and macOS.

    Features: A version of PositionToXY() that works on macOS. A version of XYToPosition() that works on
        macOS and fixed a bug on Linux. carriage_return(): Handles carriage returns correctly. up_one_line():
        Moves insertion point up one line.

    PositionToXY (insertion_point)
        A custom version of wx.TextCtrl.PositionToXY() that works on OS X (the built-in one isn't implemented
        on OS X).

        Note: Still not implemented on OS X on wxPython 4 (random numbers).

    XYToPosition (column, row)
        A custom version of wx.TextCtrl.XYToPosition() that works on OS X (the built-in one isn't implemented
        on OS X).

        This is also helpful for LINUX because the built-in one has a quirk when you're at the end of the text and
        it always returns -1

    carriage_return ()
        Handles carriage returns in output

    up_one_line ()
        Handles '[A' (up one line) in output

class ddrescue_gui.DDRescue_GUI.DiskInfoWindow (parent)
    DDRescue-GUI's disk information window.
```

```

bind_events ()
    Bind all events for DiskInfoWindow

create_widgets ()
    Create all widgets for DiskInfoWindow

get_diskinfo (event=None)
    Call the thread to get Disk info, disable the refresh button, and start the throbber

on_exit (event=None)
    Exit DiskInfoWindow

on_size (event=None)
    Auto resize the list_ctrl columns

receive_diskinfo (info)
    Get Disk data, call self.update_list_ctrl(), and then call MainWindow().update_file_choices() to refresh the
    file choices with the new info

setup_sizers ()
    Set up the sizers for DiskInfoWindow

update_list_ctrl (event=None)
    Update the list control

class ddrescue_gui.DDRescue_GUI.ElapsedTimeThread (parent)
    Keeps track of elapsed time during a recovery. A separate thread is used for this because wx.Timer wasn't
    working on macOS, and the BackendThread blocks if ddrescue pauses.

    run ()
        Main body of the thread, started with self.start()

class ddrescue_gui.DDRescue_GUI.FinishedWindow (parent, disk_capacity, recovered_data)
    This is displayed after a recovery is finished/aborted. Used to provide the user w/ options to restart the GUI,
    mount the output file, or close the GUI.

    bind_events ()
        Bind all events for FinishedWindow

    create_buttons ()
        Create all buttons for FinishedWindow

    create_text ()
        Create all text for FinishedWindow

    mount_disk ()
        Mount the output file

    on_exit (event=None)
        Close FinishedWindow and trigger closure of MainWindow

    on_mount (event=None)
        Triggered when mount button is pressed

    restart (event=None)
        Close FinishedWindow and call MainWindow().restart() to re-display and reset MainWindow

    setup_sizers ()
        Set up all sizers for FinishedWindow

    unmount_output_file (event=None)
        Unmount the output file

```

**class** ddrescue\_gui.DDRescue\_GUI.**GetDiskInformation** (*parent*)  
Used to get disk information without blocking the GUI thread. Calls `parent.receive_diskinfo` when info has been retrieved.

**get\_info** ()  
Get disk information as a privileged user

**run** ()  
Get Disk Information and return it as a list with embedded lists

**class** ddrescue\_gui.DDRescue\_GUI.**MainWindow**  
DDRescue-GUI's main window.

**add\_line\_to\_output\_box** (*line, crs, uols, char\_number*)  
Adds a new line to the custom output box. Also handles calling `carriage_return()` and `up_one_line()` when required.

**bind\_events** ()  
Bind all events for MainWindow

**check\_for\_updates** (*event=None, starting\_up=False*)  
Check for updates using the plist-formatted update file on my website. If some startup, only display info to the user if there was an update. Otherwise (aka requested by user), always display the information.

**create\_buttons** ()  
Create all buttons for MainWindow

**create\_choice\_boxes** ()  
Create all choiceboxes for MainWindow

**create\_menus** ()  
Create the menus

**create\_other\_widgets** ()  
Create all other widgets for MainWindow

**create\_text** ()  
Create all text for MainWindow

**define\_vars** ()  
Defines some variables used elsewhere in this class/instance

**file\_choice\_handler** (*\_type, user\_selection, default\_dir, wildcard, style*)  
Handle file dialogs for `set_input_file`, `set_output_file`, and `set_map_file`

**focus\_on\_control\_button** (*event=None*)  
Focus on the control button instead of the TextCtrl, and reset the insertion point back after 30 milliseconds, preventing the user from changing the insertion point and messing the formatting up.

**get\_diskinfo** (*event=None*)  
Call the thread to get Disk info, disable the update button, and start the throbber

**make\_status\_bar** ()  
Create and set up a statusbar

**on\_abort** ()  
Abort the recovery

**on\_about** (*event=None*)  
Show the about box

**on\_control\_button** (*event=None*)  
Handle events from the control button, as its purpose changes during and after recovery. Call `self.on_abort()` or `self.on_start()` as required.

**on\_detailed\_info** (*event=None*)  
Show/Hide the detailed info, and rotate the arrow

**on\_exit** (*event=None, just\_finished\_recovery=False*)  
Exit DDRescue-GUI, if certain conditions are met

**on\_recovery\_ended** (*result, disk\_capacity, recovered\_data, return\_code=None*)  
Called to show MainWindow when a recovery is completed or aborted by the user

**on\_session\_end** (*event*)  
Attempt to veto e.g. a shutdown/logout event if recovering data.

**on\_size** (*event=None*)  
Auto resize the list\_ctrl columns

**on\_start** ()  
Check the settings, prepare to start ddrescue and start the backend thread.

**on\_terminal\_output** (*event=None*)  
Show/Hide the terminal output, and rotate the arrow

**prompt\_to\_kill\_ddrescue** ()  
Prompts the user to try killing ddrescue again if it's not exiting

**receive\_diskinfo** (*info*)  
Get new Disk info and to call the function that updates the choiceboxes

**restart** ()  
Restart and reset MainWindow, so MainWindow is as it was when DDRescue-GUI was started

**set\_input\_file** (*event=None*)  
Get the input file/Disk and set a variable to the selected value

**set\_map\_file** (*event=None*)  
Get the map file position/name and set a variable to the selected value

**set\_output\_file** (*event=None*)  
Get the output file/Disk and set a variable to the selected value

**set\_progress\_bar\_range** (*message*)  
Set the progressbar's range

**set\_vars** ()  
Set some essential variables

**setup\_sizers** ()  
Setup sizers for MainWindow

**show\_dev\_info** (*event=None*)  
Show the Disk Information Window

**show\_privacy\_policy** (*event=None*)  
Show PrivPolWindow

**show\_settings** (*event=None*)  
Show the settings Window, but only if input and output files have already been selected.

**show\_userguide** (*event=None*)  
Open a web browser and show the user guide

**update\_average\_read\_rate** (*average\_read\_rate*)

Update the average read rate info

**update\_current\_read\_rate** (*current\_read\_rate*)

Update the current read rate info

**update\_error\_size** (*error\_size*)

Update the error size info

**update\_file\_choices** ()

Update the Disk entries in the choiceboxes

**update\_input\_pos** (*input\_pos*)

Update the input position info

**update\_num\_errors** (*num\_errors*)

Update the num errors info

**update\_output\_box** (*line*)

Update the output box

**update\_output\_pos** (*output\_pos*)

Update the output position info

**update\_progress** (*recovered\_data*, *disk\_capacity*)

Update the progressbar and the title

**update\_recovered\_data** (*recovered\_data*)

Update the recovered data info

**update\_status\_bar** (*messeage*)

Update the statusbar with a new message

**update\_time\_elapsed** (*line*)

Update the time elapsed text

**update\_time\_remaining** (*time\_left*)

Update the time remaining text

**update\_time\_since\_last\_read** (*last\_read*)

Update the time since last successful read info

**class** ddrescue\_gui.DDRescue\_GUI.**MyApp** (*redirect=False*, *filename=None*, *useBestVisual=False*,  
*clearSigInt=True*)

The wxPython app. Must be declared for application to work. This is how the application is started.

**MacReopenApp** ()

Called when the doc icon is clicked, shows the top-level window again even if it's minimised. Makes the GUI work in a more intuitive way on macOS.

**OnInit** ()

Used to show the splash screen, which then starts the rest of the application.

**class** ddrescue\_gui.DDRescue\_GUI.**PrivPolWindow** (*parent*)

DDRescue-GUI's privacy policy window.

**bind\_events** ()

Bind events so we can close this window.

**create\_widgets** ()

Create all widgets for PrivPolWindow

**on\_close** (*event=None*)

Close PrivPolWindow

```
setup_sizers ()  
    Set up sizers for PrivPolWindow  
class ddrescue_gui.DDRescue_GUI.SettingsWindow (parent)  
    DDRescue-GUI's settings window  
bind_events ()  
    Bind all events for SettingsWindow  
create_buttons ()  
    Create all buttons for SettingsWindow  
create_check_boxes ()  
    Create all CheckBoxes for SettingsWindow, and set their default states (all unchecked)  
create_choice_boxes ()  
    Create all ChoiceBoxes for SettingsWindow, and call self.set_default_recovery_settings()  
create_text ()  
    Create all text for SettingsWindow  
save_options (event=None)  
    Save all options, and exit SettingsWindow  
set_best_recovery_settings (event=None)  
    Set selections for the Choiceboxes to best recovery settings  
set_default_recovery_settings (event=None)  
    Set selections for the Choiceboxes to default settings  
set_fast_recovery_settings (event=None)  
    Set selections for the Choiceboxes to fast recovery settings  
set_soft_run (event=None)  
    Set up SettingsWindow based on the value of self.no_split_check_box (the "do soft run" CheckBox).  
setup_options ()  
    Set all options in the window so we remember them if the user checks back  
setup_sizers ()  
    Set up all sizers for SettingsWindow  
class ddrescue_gui.DDRescue_GUI.ShowSplash (parent=None)  
    A simple class used to display the splash screen on startup. After that, it starts the rest of the application.  
on_exit (event=None)  
    Close the splash screen and start MainWindow  
ddrescue_gui.DDRescue_GUI.usage ()  
    Outputs information on cmdline options for the user.
```

## DOCUMENTATION FOR THE PY2APP SETUP FILE (SETUP.PY)

This is a setup.py script written for DDRescue-GUI v2.0.0 by Hamish McIntyre-Bhatty.

**Usage:** python3 setup.py py2app

## DOCUMENTATION FOR THE UNIT TESTS RUNNER FILE (TESTS.PY)

This file is used to start the test suites for DDRescue-GUI.

```
ddrescue_gui.tests.usage()
```

Outputs usage information

## **DOCUMENTATION FOR THE UNIT TESTS PACKAGE (TESTS)**

This is the Tests package.

## **DOCUMENTATION FOR THE TOOLS PACKAGE (TOOLS)**

This is the Tools package.

## DOCUMENTATION FOR THE BACKEND TOOLS MODULE IN THE TOOLS PACKAGE (TOOLS/TOOLS.PY)

This is the tools package for DDRescue-GUI.

**class** ddrescue\_gui.Tools.tools.**AuthWindow**

A simple authentication dialog that is used when elevated privileges are required. Until version 2.0.0, this was used to start the GUI, but since that release, privileges are only escalated when required to improve security.

This is used to pre-authenticate on macOS if needed, before running a privileged task with sudo.

**bind\_events** ()

Bind all events for AuthenticationWindow

**create\_buttons** ()

Create all buttons for AuthenticationWindow

**create\_other\_widgets** ()

Create all other widgets for AuthenticationWindow

**create\_text** ()

Create all text for AuthenticationWindow

**on\_auth\_attempt** (*event=None*)

Check the password is correct, then either warn the user or call self.start\_ddrescuegui().

**on\_exit** (*event=None*)

Close AuthWindow() and exit

**run** ()

Preauthenticates macOS users with the auth dialog.

**setup\_sizers** ()

Setup sizers for AuthWindow

**test\_auth** ()

Check if we have cached authentication If so, return True. Otherwise return False.

ddrescue\_gui.Tools.tools.**create\_unique\_key** (*dictionary, data, length*)

Create a unique dictionary key of length for dictionary dictionary for the item data. The unique key is created by adding a number on the the end of data, while keeping it at the correct length. The key will also start with '...'.

ddrescue\_gui.Tools.tools.**determine\_ddrescue\_version** ()

Used to determine the version of ddrescue installed on the system, or (for macOS) bundled with the GUI.

Handles -pre and -rc versions too, by stripping that information from the version string and warning the user.

ddrescue\_gui.Tools.tools.**determine\_output\_file\_type** (*SETTINGS, disk\_info*)

Determines output File Type (partition or Device)

`ddrescue_gui.Tools.tools.emergency_exit(msg)`  
Handle emergency exits. Warn the user, log, and exit to terminal with the given message

`ddrescue_gui.Tools.tools.get_helper(cmd)`  
Figure out which helper script to use.

`ddrescue_gui.Tools.tools.get_mount_point(partition)`  
Returns the mountpoint of the given partition, if any. Otherwise, return None

`ddrescue_gui.Tools.tools.is_mounted(partition, mount_point=None)`  
Checks if the given partition is mounted. `partition` is the given partition to check. If `mount_point` is specified, check if the partition is mounted there, rather than just if it's mounted. Return boolean True/False.

`ddrescue_gui.Tools.tools.is_partition(disk, disk_info)`  
Check if the given disk is a partition

`ddrescue_gui.Tools.tools.mac_get_device_name_mount_point(output)`  
Get the device name and mount point of an output file, given output from `hdiutil mount -plist`

`ddrescue_gui.Tools.tools.mac_run_hdiutil(options)`  
Runs `hdiutil` on behalf of the rest of the program when called. Tries to handle and fix `hdiutil` errors if they occur.

`ddrescue_gui.Tools.tools.mount_disk(partition, mount_point, options="")`  
Mounts the given partition. `partition` is the partition to mount. `mount_point` is where you want to mount the partition. `options` is non-mandatory and contains whatever options you want to pass to the mount command. The default value for `options` is an empty string.

`ddrescue_gui.Tools.tools.read(cmd, testing=False)`  
Read the `cmd`'s output char by char, but do as little processing as possible to improve startup performance

`ddrescue_gui.Tools.tools.send_notification(msg)`  
Send a notification, created to reduce clutter in the rest of the code.

`ddrescue_gui.Tools.tools.start_process(cmd, return_output=False, privileged=False)`  
Start a given process, and return output and return value if needed

`ddrescue_gui.Tools.tools.unmount_disk(disk)`  
Unmount the given disk

## **DOCUMENTATION FOR THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS)**

These are the ddrescue tools.

## DOCUMENTATION FOR THE SETUP MODULE IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS/SETUP.PY)

Used to set up the GUI to use the correct version of tools for the user's version of ddrescue.

```
ddrescue_gui.Tools.DDRescueTools.setup.setup_for_ddrescue_version(ddrescue_version)
```

Selects the correct tools for our version of ddrescue.

## DOCUMENTATION FOR THE DECORATORS MODULE IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS/DECORATORS.PY)

Decorators for DDRescue tools

`ddrescue_gui.Tools.DDRescueTools.decorators.define_versions` (*function*)  
Reads the function docstring to find the ddrescue versions the function supports.

## DOCUMENTATION FOR THE ALLVERSIONS MODULE IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS/ALLVERSIONS.PY)

Tools for all versions of ddrescue.

`ddrescue_gui.Tools.DDRescueTools.allversions.get_initial_status(split_line)`  
Function to get ddrescue's initial status. Works with ddrescue versions:  
1.14,1.15,1.16,1.17,1.18,1.19,1.20,1.21,1.22,1.23

## DOCUMENTATION FOR THE DDRESCUE TOOLS FOR DDRESCUE VERSION 1.14 IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS/ONE\_POINT\_FORTEEN.PY)

Tools for ddrescue v1.14 or newer.

`ddrescue_gui.Tools.DDRescueTools.one_point_forteen.get_current_rate_error_size_recovered_data()`  
Get Current Read Rate, Error Size, and Recovered Data. Works with ddrescue versions:  
1.14,1.15,1.16,1.17,1.18,1.19,1.20

`ddrescue_gui.Tools.DDRescueTools.one_point_forteen.get_inputpos_numerrors_averagereadrate()`  
Get Input Position, Number of Errors, and Average Read Rate. Works with ddrescue versions:  
1.14,1.15,1.16,1.17,1.18,1.19,1.20

`ddrescue_gui.Tools.DDRescueTools.one_point_forteen.get_outputpos_time_since_last_read(split_line)`  
Get Output Position and Time Since Last Successful Read. Works with ddrescue versions: 1.14,1.15,1.16,1.17

## DOCUMENTATION FOR THE DDRESCUE TOOLS FOR DDRESCUE VERSION 1.18 IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS/ONE\_POINT\_EIGHTEEN.PY)

Tools for ddrescue v1.18 or newer.

`ddrescue_gui.Tools.DDRescueTools.one_point_eighteen.get_outputpos_time_since_last_read(split_`  
Get Output Position and Time Since Last Successful Read. Works with ddrescue versions: 1.18,1.19,1.20

## DOCUMENTATION FOR THE DDRESCUE TOOLS FOR DDRESCUE VERSION 1.20 IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS PACKAGE (TOOLS/DDRESCUETOOLS/ONE\_POINT\_TWENTY.PY)

Tools for ddrescue v1.20 or newer.

```
ddrescue_gui.Tools.DDRescueTools.one_point_twenty.get_time_since_last_read(split_line)
```

Get Time Since Last Read. Works with ddrescue versions: 1.20,1.21,1.22,1.23

**DOCUMENTATION FOR THE DDRESCUE TOOLS FOR DDRESCUE  
VERSION 1.21 IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS  
PACKAGE  
(TOOLS/DDRESCUETOOLS/ONE\_POINT\_TWENTY\_ONE.PY)**

Tools for ddrescue v1.21 or newer.

`ddrescue_gui.Tools.DDRescueTools.one_point_twenty_one.get_current_rate_inputpos(split_line)`  
Get Current Read Rate and Input Position. Works with ddrescue versions: 1.21,1.22,1.23

`ddrescue_gui.Tools.DDRescueTools.one_point_twenty_one.get_outputpos_average_read_rate(split_line)`  
Get Output Position and Average Read Rate. Works with ddrescue versions: 1.21,1.22,1.23

`ddrescue_gui.Tools.DDRescueTools.one_point_twenty_one.get_recovered_data_num_errors(split_line)`  
Get Recovered Data and Number of Errors. Works with ddrescue versions: 1.21

`ddrescue_gui.Tools.DDRescueTools.one_point_twenty_one.get_unreadable_data(split_line)`  
Get Unreadable Data. Works with ddrescue versions: 1.21,1.22,1.23

**DOCUMENTATION FOR THE DDRESCUE TOOLS FOR DDRESCUE  
VERSION 1.22 IN THE DDRESCUE TOOLS PACKAGE IN THE TOOLS  
PACKAGE  
(TOOLS/DDRESCUETOOLS/ONE\_POINT\_TWENTY\_TWO.PY)**

Tools for ddrescue v1.22 or newer.

`ddrescue_gui.Tools.DDRescueTools.one_point_twenty_two.get_recovered_data_num_errors` (*split\_line*)  
Get Recovered Data and Number of Errors. Works with ddrescue versions: 1.22,1.23
