11.535 lock_detectors.h File Reference

Interface of a library with a set of code and carrier phase lock detectors.

```
#include <gnuradio/gr_complex.h>
```

Include dependency graph for lock_detectors.h:

Functions

- float [cn0_svn_estimator](#) (const gr_complex *Prompt_buffer, int length, float coh_integration_time_s)
cn0_svn_estimator is a Carrier-to-Noise (CN0) estimator based on the Signal-to-Noise Variance (SNV) estimator
- float [cn0_m2m4_estimator](#) (const gr_complex *Prompt_buffer, int length, float coh_integration_time_s)
cn0_m2m4_estimator is a Carrier-to-Noise (CN0) estimator based on the Second- and Fourth-Order Moments Method (M2M4)
- float [carrier_lock_detector](#) (const gr_complex *Prompt_buffer, int length)
A carrier lock detector.

11.535.1 Detailed Description

Interface of a library with a set of code and carrier phase lock detectors.

SNV_CN0 is a Carrier-to-Noise (CN0) estimator based on the Signal-to-Noise Variance (SNV) estimator [1]. Carrier lock detector using normalised estimate of the cosine of twice the carrier phase error [2].

Include dependency graph for nonlinear_tracking.h:

Classes

- class [ModelFunction](#)
- class [CubatureFilter](#)
- class [UnscentedFilter](#)

11.537.1 Detailed Description

Interface of a library for nonlinear tracking algorithms.

[CubatureFilter](#) implements the functionality of the Cubature Kalman Filter, which uses multidimensional cubature rules to estimate the time evolution of a nonlinear system. [UnscentedFilter](#) implements an Unscented Kalman Filter which uses Unscented Transform rules to perform a similar estimation.

11.543.1 Detailed Description

Interface of a 2nd order DLL filter for code tracking loop.

Author

Javier Arribas, 2011. jarribas(at)cttc.es

Class that implements a 2nd order PLL filter for code tracking loop. The algorithm is described in: K.Borre, D.M. Akos, N.Bertelsen, P.Rinder, and S. H. Jensen, A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach, Birkhauser, 2007, Applied and Numerical Harmonic Analysis.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

Classes

- class [ConfigurationInterface](#)

This abstract class represents an interface to configuration parameters.

11.557.1 Detailed Description

This class represents an interface to configuration parameters.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com

The interface defines an accessor method that gets a parameter name as input and returns the value of this parameter, a string, as output. Property names are defined here. This is an abstract class for interfaces.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

11.559.1 Detailed Description

This interface represents a GNSS block.

Author

Carlos Aviles, 2010. [carlos.avilesr\(at\)gmail.com](mailto:carlos.avilesr(at)gmail.com)

Abstract class for GNSS block interfaces. Since all its methods are virtual, this class cannot be instantiated directly, and a subclass can only be instantiated directly if all inherited pure virtual methods have been implemented by that class or a parent class.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

11.588 ini.h File Reference

This function parses an INI file into easy-to-access name/value pairs.

Macros

- `#define INI_ALLOW_MULTILINE 1`

Functions

- `int ini_parse (const char *filename, int(*handler)(void *user, const char *section, const char *name, const char *value), void *user)`

Parse given INI-style file. May have [section]s, name=value pairs (whitespace stripped), and comments starting with ';' (semicolon). Section is "" if name=value pair parsed before any section heading.

11.588.1 Detailed Description

This function parses an INI file into easy-to-access name/value pairs.

Author

Brush Technologies, 2009.

inih (INI Not Invented Here) is a simple .INI file parser written in C++. It's only a couple of pages of code, and it was designed to be small and simple, so it's good for embedded systems. To use it, just give `ini_parse()` an INI file, and it will call a callback for every name=value pair parsed, giving you strings for the section, name, and value. It's done this way because it works well on low-memory embedded systems, but also because it makes for a KISS implementation. Parse given INI-style file. May have [section]s, name=value pairs (whitespace stripped), and comments starting with ';' (semicolon). Section is "" if name=value pair parsed before any section heading. For each name=value pair parsed, call handler function with given user pointer as well as section, name, and value (data only valid for duration of handler call). Handler should return nonzero on success, zero on error. Returns 0 on success, line number of first error on parse error, on -1 on file open error

inih and INIReaden are released under the New BSD license:

11.602 uio_fpga.h File Reference

This library contains functions to determine the uio device driver file that corresponds to a hardware accelerator device name in the FPGA.

```
#include <stdint>
#include <string>
```

Include dependency graph for uio_fpga.h:

Functions

- `const std::string uio_dir ("/sys/class/uio/")`
- `const std::string uio_filename ("uio")`
- `const std::string uio_subdir_name ("/name")`
- `int32_t find_uio_dev_file_name (std::string &device_file_name, const std::string &device_name, uint32_t device_num)`

This function finds the uio device driver device file name out of the device name and the device number.

11.602.1 Detailed Description

This library contains functions to determine the uio device driver file that corresponds to a hardware accelerator device name in the FPGA.

Classes

- class [InMemoryConfiguration](#)

This class is an implementation of the interface [ConfigurationInterface](#).

11.622.1 Detailed Description

A [ConfigurationInterface](#) for testing purposes.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com

This implementation accepts configuration parameters upon instantiation and it is intended to be used in unit testing. GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

#include <stdint>

```

Include dependency graph for Galileo_E1.h:

Variables

- constexpr double `GALILEO_E1_FREQ_HZ` = `FREQ1`
Galileo E1 carrier frequency [Hz].
- constexpr double `GALILEO_E1_CODE_CHIP_RATE_CPS` = `1.023e6`
Galileo E1 code rate [chips/s].
- constexpr double `GALILEO_E1_CODE_PERIOD_S` = `0.004`
Galileo E1 code period [s].
- constexpr double `GALILEO_E1_SUB_CARRIER_A_RATE_HZ` = `1.023e6`
Galileo E1 sub-carrier 'a' rate [Hz].
- constexpr double `GALILEO_E1_SUB_CARRIER_B_RATE_HZ` = `6.138e6`
Galileo E1 sub-carrier 'b' rate [Hz].
- constexpr double `GALILEO_E1_B_CODE_LENGTH_CHIPS` = `4092.0`
Galileo E1-B code length [chips].
- constexpr double `GALILEO_E1_B_SYMBOL_RATE_BPS` = `250.0`
Galileo E1-B symbol rate [bits/second].
- constexpr uint32_t `GALILEO_E1_CODE_PERIOD_MS` = `4`
Galileo E1 code period [ms].
- constexpr int32_t `GALILEO_E1_B_SAMPLES_PER_SYMBOL` = `1`
(Galileo_E1_CODE_CHIP_RATE_HZ / Galileo_E1_B_CODE_LENGTH_CHIPS) / Galileo_E1_B_SYMBOL_RATE_BPS
- constexpr int32_t `GALILEO_E1_C_SECONDARY_CODE_LENGTH` = `25`
Galileo E1-C secondary code length [chips].
- constexpr int32_t `GALILEO_E1_NUMBER_OF_CODES` = `50`
- constexpr uint32_t `GALILEO_E1_OPT_ACQ_FS_SPS` = `2000000`
Sampling frequency that maximizes the acquisition SNR while using a non-multiple of chip rate.
- constexpr int32_t `GALILEO_E1_HISTORY_DEEP` = `100`
Observable history length for interpolation.
- constexpr char `GALILEO_E1_C_SECONDARY_CODE` [26] = `"0011100000001010110110010"`
- constexpr size_t `GALILEO_E1_B_PRIMARY_CODE_STR_LENGTH` = `1023`
- constexpr char `GALILEO_E1_B_PRIMARY_CODE` [GALILEO_E1_NUMBER_OF_CODES][1024]

#include <cstddef>
#include <cstdint>

```

Include dependency graph for Galileo_E5b.h:

Variables

- constexpr double `GALILEO_E5B_FREQ_HZ` = `FREQ7`
Galileo E5b carrier frequency [Hz].
- constexpr double `GALILEO_E5B_CODE_CHIP_RATE_CPS` = `1.023e7`
Galileo E5b code rate [chips/s].
- constexpr double `GALILEO_E5B_I_TIERED_CODE_PERIOD_S` = `0.004`
Galileo E5b-I tiered code period [s].
- constexpr double `GALILEO_E5B_Q_TIERED_CODE_PERIOD_S` = `0.100`
Galileo E5b-Q tiered code period [s].
- constexpr double `GALILEO_E5B_CODE_PERIOD_S` = `0.001`
Galileo E5b primary code period [s].
- constexpr int32_t `GALILEO_E5B_CODE_PERIOD_MS` = `1`
Galileo E5b primary code period [ms].
- constexpr int32_t `GALILEO_E5B_CODE_LENGTH_CHIPS` = `10230`
Galileo E5b primary code length [chips].
- constexpr int32_t `GALILEO_E5B_I_SECONDARY_CODE_LENGTH` = `4`
Galileo E5b-I secondary code length [chips].
- constexpr int32_t `GALILEO_E5B_Q_SECONDARY_CODE_LENGTH` = `100`
Galileo E5b-Q secondary code length [chips].
- constexpr int32_t `GALILEO_E5B_SYMBOL_RATE_BPS` = `250`
Galileo E5b symbol rate [bits/second].
- constexpr int32_t `GALILEO_E5B_NUMBER_OF_CODES` = `50`
- constexpr int32_t `GALILEO_E5B_HISTORY_DEEP` = `100`
- constexpr uint32_t `GALILEO_E5B_OPT_ACQ_FS_SPS` = `10000000`
Sampling frequency that maximizes the acquisition SNR while using a non-multiple of chip rate.
- constexpr char `GALILEO_E5B_I_SECONDARY_CODE` [5] = "1110"
- constexpr size_t `GALILEO_E5B_I_PRIMARY_CODE_STR_LENGTH` = `2558`

Classes

- class [Galileo_Ephemeris](#)

This class is a storage and orbital model functions for the Galileo SV ephemeris data as described in Galileo ICD paragraph 5.1.1.

11.664.1 Detailed Description

Interface of a Galileo EPHEMERIS storage.

Author

Classes

- class [Galileo_HAS_page](#)

This class is a storage for Galileo HAS message page, as defined in Galileo High Accuracy Service Signal-In-Space Interface Control Document (HAS SIS ICD) Issue 1.0, May 2022.

11.672.1 Detailed Description

Class for Galileo HAS message page storage.

Variables

- `constexpr double GALILEO_INAV_PAGE_PART_WITH_PREAMBLE_SECONDS = 2.04`
Page Duration + (Galileo I/NAV Preamble bits)(Galileo E5b-I tiered Code Period(seconds))*
- `constexpr uint32_t GALILEO_INAV_PAGE_SYMBOLS = 500`
The complete Galileo INAV page length.
- `constexpr int32_t GALILEO_INAV_PREAMBLE_LENGTH_BITS = 10`
- `constexpr int32_t GALILEO_INAV_PREAMBLE_PERIOD_SYMBOLS = 250`
- `constexpr int32_t GALILEO_INAV_PAGE_PART_SYMBOLS = 250`
Each Galileo INAV pages are composed of two parts (even and odd) each of 250 symbols, including preamble. See Galileo ICD 4.3.2.
- `constexpr int32_t GALILEO_INAV_PAGE_PART_SECONDS = 1`

Classes

- class [Glonass_Gnav_Utc_Model](#)

This class is a storage for the GLONASS GNAV UTC MODEL data as described in GLONASS ICD (Edition 5.1)

11.690.1 Detailed Description

Interface of a GLONASS GNAV UTC MODEL storage.

Note

Code added as part of GSoC 2017 program

Author

Damian Miralles, 2017. dmiralles2009(at)gmail.com

Variables

- `constexpr double GLONASS_F_M_A = 0.35e9`
Gravitational constant of atmosphere [m^3/s^2].
- `constexpr double GLONASS_SEMI_MAJOR_AXIS = 6378136`
Semi-major axis of Earth [m].
- `constexpr double GLONASS_FLATTENING = 1.0 / 29825784.0`
Flattening parameter.
- `constexpr double GLONASS_GRAVITY = 97803284.0`
Equatorial acceleration of gravity [mGal].
- `constexpr double GLONASS_GRAVITY_CORRECTION = 0.87`
Correction to acceleration of gravity at sea-level due to Atmosphere[uGal].
- `constexpr double GLONASS_J2 = 1082625.75e-9`
Second zonal harmonic of the geopotential.
- `constexpr double GLONASS_J4 = -2370.89e-9`
Fourth zonal harmonic of the geopotential.
- `constexpr double GLONASS_J6 = 6.08e-9`
Sixth zonal harmonic of the geopotential.
- `constexpr double GLONASS_J8 = 1.40e-11`
Eighth zonal harmonic of the geopotential.
- `constexpr double GLONASS_U0 = 62636861.4`

Classes

- class [Gps_Ephemeris](#)

This class is a storage and orbital model functions for the GPS SV ephemeris data as described in IS-GPS-200M.

11.722.1 Detailed Description

Interface of a GPS EPHEMERIS storage.

Author

11.738 reed_solomon.h File Reference

Class implementing a Reed-Solomon encoder/decoder for blocks of 255 symbols and symbols of 8 bits.

```

#include <array>
#include <cstdint>
#include <string>
#include <vector>

```

Include dependency graph for reed_solomon.h:

Classes

- class [ReedSolomon](#)

Class implementing a Reed-Solomon encoder and decoder RS(255,K,d) where k=255-nroots is the information vector length and d=nroots+1 is the minimum Hamming distance, with symbols of 8 bits. It allows shortened RS codes.

11.738.1 Detailed Description

Class implementing a Reed-Solomon encoder/decoder for blocks of 255 symbols and symbols of 8 bits.

00053
00054 /*!
00055  * \brief Custom constructor for RS(255, 255-nroots, nroots+1). Parameters:
00056  * 
00057  * nroots - the number of roots in the RS code generator polynomial,
00058  * which is the same as the number of parity symbols in a block.
00059  * 
00060  * minpoly - primitive polynomial.
00061  * 
00062  * prim - the primitive root of the generator polynomial.
00063  * 
00064  * fcr - first consecutive root of the Reed-Solomon generator polynomial.
00065  * 
00066  * pad - the number of pad symbols in a block. If not defined, it defaults
00067  * to 0.
00068  * 
00069  * shortening - value of the shortening parameter. Defaults to 0.
00070  * If different to 0, it defines a shortened RS encoder/decoder.
00071  * 
00072  * genpoly_coeff - a vector of (nroots+1) elements containing the generator
00073  * polynomial coefficients. Only used for encoding. Defaults to empty.
```

```

00074     * If defined, the encode_with_generator_poly method can be used.
00075     *
00076     * gen_matrix - a (255-shortening)x(255-nroots-shortening) matrix containing
00077     * the elements of the generator matrix. Only used for encoding. Defaults
00078     * to empty. If defined, the encode_with_generator_matrix method can be
00079     * used.
00080     */

- `Acquisition_msg_rx_sptr Acquisition_msg_rx_make ()`

11.760.1 Detailed Description

This is a helper class to catch the asynchronous messages emitted by an acquisition block.

Author

Carles Fernandez-Prades, 2018. `cfernandez(at)cttc.cat`
