### Functions

- `gps_l1_ca_tcp_connector_tracking_cc_sptr` **gps\_l1\_ca\_tcp\_connector\_make\_tracking\_cc** (`int64_t` fs\_in, `uint32_t` vector\_length, `bool` dump, `const std::string` &dump\_filename, `float` early\_late\_space\_chips, `size_t` port\_ch0)

### 11.548.1 Detailed Description

Interface of a TCP connector block based on code DLL + carrier PLL.

## Author

David Pubill, 2012. dpubill(at)cttc.es Javier Arribas, 2011. jarribas(at)cttc.es

Code DLL + carrier PLL according to the algorithms described in: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach, Birkhauser, 2007  
GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

## Classes

- class `Bayesian_estimator`  
*`Bayesian_estimator` is an estimator of noise characteristics (i.e. mean, covariance)*

### 11.551.1 Detailed Description

Interface of a library with Bayesian noise statistic estimation.

`Bayesian_estimator` is a Bayesian estimator which attempts to estimate the properties of a stochastic process based on a sequence of discrete samples of the sequence.

### 11.570.1 Detailed Description

Interface of a library with a set of code and carrier phase lock detectors.

SNV\_CN0 is a Carrier-to-Noise (CN0) estimator based on the Signal-to-Noise Variance (SNV) estimator [1]. Carrier lock detector using normalised estimate of the cosine of twice the carrier phase error [2].

## Classes

- class [ModelFunction](#)
- class [CubatureFilter](#)
- class [UnscentedFilter](#)

## 11.572.1 Detailed Description

Interface of a library for nonlinear tracking algorithms.

[CubatureFilter](#) implements the functionality of the Cubature Kalman Filter, which uses multidimensional cubature rules to estimate the time evolution of a nonlinear system. [UnscentedFilter](#) implements an Unscented Kalman Filter which uses Unscented Transform rules to perform a similar estimation.

### Classes

- class [AcquisitionInterface](#)

*This abstract class represents an interface to an acquisition GNSS block.*

### 11.588.1 Detailed Description

Header file of the interface to an acquisition GNSS block.

## Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com Luis Esteve, 2011. luis(at)epsilon-formacion.com

This header file contains the interface to an abstract class for acquisition algorithms. Since all its methods are virtual, this class cannot be instantiated directly, and a subclass can only be instantiated directly if all inherited pure virtual methods have been implemented by that class or a parent class.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

## Classes

- class [ConfigurationInterface](#)

*This abstract class represents an interface to configuration parameters.*

### 11.592.1 Detailed Description

This class represents an interface to configuration parameters.

#### Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com

The interface defines an accessor method that gets a parameter name as input and returns the value of this parameter, a string, as output. Property names are defined here. This is an abstract class for interfaces.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

The diagram illustrates the relationship between three header files. At the top is a grey box labeled `pvt_interface.h`. Below it are two white boxes: `gnss_flowgraph.h` on the left and `rtklib_pvt.h` on the right. Blue arrows point from both `gnss_flowgraph.h` and `rtklib_pvt.h` up to `pvt_interface.h`, indicating that both implement the interface defined in `pvt_interface.h`.

## Classes

- class [galileo\\_e6\\_has\\_msg\\_receiver](#)

*GNU Radio block that receives asynchronous Galileo HAS message pages from the telemetry blocks, stores them in memory, and decodes HAS messages when enough data have been received. The decoded HAS message is sent to the PVT block.*

## Typedefs

- using [galileo\\_e6\\_has\\_msg\\_receiver\\_sptr](#) = `gnss_shared_ptr<galileo\_e6\_has\_msg\_receiver>`

## Functions

- `galileo_e6_has_msg_receiver_sptr galileo\_e6\_has\_msg\_receiver\_make ()`

### 11.611.1 Detailed Description

GNU Radio block that processes Galileo HAS message pages received from Galileo E6B telemetry blocks. After successful decoding, sends the content to the PVT block.

## 11.625 ini.h File Reference

This function parses an INI file into easy-to-access name/value pairs.

### Macros

- `#define INI_ALLOW_MULTILINE 1`

### Functions

- `int ini_parse (const char *filename, int(*handler)(void *user, const char *section, const char *name, const char *value), void *user)`

*Parse given INI-style file. May have [section]s, name=value pairs (whitespace stripped), and comments starting with ';' (semicolon). Section is "" if name=value pair parsed before any section heading.*

### 11.625.1 Detailed Description

This function parses an INI file into easy-to-access name/value pairs.

#### Author

Brush Technologies, 2009.

inih (INI Not Invented Here) is a simple .INI file parser written in C++. It's only a couple of pages of code, and it was designed to be small and simple, so it's good for embedded systems. To use it, just give `ini_parse()` an INI file, and it will call a callback for every name=value pair parsed, giving you strings for the section, name, and value. It's done this way because it works well on low-memory embedded systems, but also because it makes for a KISS implementation. Parse given INI-style file. May have [section]s, name=value pairs (whitespace stripped), and comments starting with ';' (semicolon). Section is "" if name=value pair parsed before any section heading. For each name=value pair parsed, call handler function with given user pointer as well as section, name, and value

(data only valid for duration of handler call). Handler should return nonzero on success, zero on error. Returns 0 on success, line number of first error on parse error, on -1 on file open error

## 11.701 Galileo\_E5a.h File Reference

Defines system parameters for Galileo E5a signal and NAV data.

```

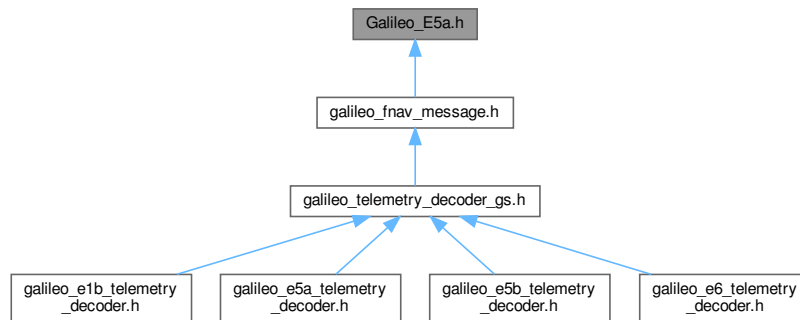

#include "MATH_CONSTANTS.h"
#include "gnss_frequencies.h"
#include <stdint.h>
#include <stdint.h>

```

Include dependency graph for Galileo\_E5a.h:

This graph shows which files directly or indirectly include this file:

### 11.701.1 Detailed Description

Defines system parameters for Galileo E5a signal and NAV data.

### Classes

- class [Galileo\\_Ephemeris](#)

*This class is a storage and orbital model functions for the Galileo SV ephemeris data as described in Galileo ICD paragraph 5.1.1.*

## 11.707.1 Detailed Description

Interface of a Galileo EPHEMERIS storage.

### Author

## Classes

- class [OSNMA\\_msg](#)  
This class fills the [OSNMA\\_msg](#) structure with the data received from the telemetry blocks.
- class [Galileo\\_Inav\\_Message](#)

*This class handles the Galileo I/NAV Data message, as described in the Galileo Open Service Signal in Space Interface Control Document (OS SIS ICD), Issue 2.0 (Jan. 2021). See [https://www.gsc-europa.eu/sites/default/files/sites/all/files/Galileo\\_OS\\_SIS\\_ICD\\_v2.0.pdf](https://www.gsc-europa.eu/sites/default/files/sites/all/files/Galileo_OS_SIS_ICD_v2.0.pdf).*

### 11.719.1 Detailed Description

Implementation of a Galileo I/NAV Data message as described in Galileo OS SIS ICD Issue 2.0 (Jan. 2021)

## 11.739.1 Detailed Description

Defines system parameters for GLONASS L1 C/A signal and NAV data.

### Note

File renamed from GLONASS\_L1\_CA.h to [GLONASS\\_L1\\_L2\\_CA.h](#) to accommodate GLO L2 addition

00055       * \brief Custom constructor for RS(255, 255-nroots, nroots+1). Parameters:
00056       *
00057       * nroots - the number of roots in the RS code generator polynomial,
00058       * which is the same as the number of parity symbols in a block.
00059       *
00060       * minpoly - primitive polynomial.
00061       *
00062       * prim - the primitive root of the generator polynomial.
00063       *
00064       * fcr - first consecutive root of the Reed-Solomon generator polynomial.
00065       *
00066       * pad - the number of pad symbols in a block. If not defined, it defaults
00067       * to 0.
00068       *
00069       * shortening - value of the shortening parameter. Defaults to 0.
00070       * If different to 0, it defines a shortened RS encoder/decoder.
00071       *
00072       * genpoly_coeff - a vector of (nroots+1) elements containing the generator
00073       * polynomial coefficients. Only used for encoding. Defaults to empty.
00074       * If defined, the encode_with_generator_poly method can be used.
00075       *
00076       * gen_matrix - a (255-shortening)x(255-nroots-shortening) matrix containing
00077       * the elements of the generator matrix. Only used for encoding. Defaults
00078       * to empty. If defined, the encode_with_generator_matrix method can be
00079       * used.
00080       */
