12.395 signal_generator_c Class Reference

This class generates synthesized GNSS signal.

```
#include <signal_generator_c.h>
```

Inheritance diagram for `signal_generator_c`:

Public Member Functions

- int **general_work** (int noutput_items, gr_vector_int &ninput_items, gr_vector_const_void_star &input_items, gr_vector_void_star &output_items)

Friends

- signal_generator_c_sptr [signal_make_generator_c](#) (const std::vector< std::string > &signal1, const std::vector< std::string > &system, const std::vector< unsigned int > &PRN, const std::vector< float > &CN0_dB, const std::vector< float > &doppler_Hz, const std::vector< unsigned int > &delay_chips, const std::vector< unsigned int > &delay_sec, bool data_flag, bool noise_flag, unsigned int fs_in, unsigned int vector_length, float BW_BB)

Return a shared_ptr to a new instance of gen_source.

12.395.1 Detailed Description

This class generates synthesized GNSS signal.

See also

[gen_source](#) for a version that subclasses [gr_block](#).

Definition at line 58 of file [signal_generator_c.h](#).

12.395.2 Friends And Related Symbol Documentation

12.395.2.1 signal_make_generator_c

```

signal_generator_c_sptr signal_make_generator_c (
    const std::vector< std::string > & signal1,
    const std::vector< std::string > & system,
    const std::vector< unsigned int > & PRN,
    const std::vector< float > & CN0_dB,
    const std::vector< float > & doppler_Hz,
    const std::vector< unsigned int > & delay_chips,
    const std::vector< unsigned int > & delay_sec,
    bool data_flag,
    bool noise_flag,
    unsigned int fs_in,
    unsigned int vector_length,
    float BW_BB) [friend]

```

Return a shared_ptr to a new instance of [gen_source](#).

To avoid accidental use of raw pointers, [gen_source](#)'s constructor is private. [signal_make_generator_c](#) is the public interface for creating new instances.

The documentation for this class was generated from the following file:

- [signal_generator_c.h](#)

12.396 SignalConditioner Class Reference

This class wraps blocks to change `data_type_adapter`, `input_filter` and `resampler` to be applied to the input flow of sampled signal.

```
#include <signal_conditioner.h>
```

Inheritance diagram for SignalConditioner:

Public Member Functions

- [SignalConditioner](#) (std::shared_ptr< [GNSSBlockInterface](#) > data_type_adapt, std::shared_ptr< [GNSSBlockInterface](#) > in_filt, std::shared_ptr< [GNSSBlockInterface](#) > res, std::string role)
Constructor.
- [~SignalConditioner](#) ()=default
Destructor.

- virtual `gr::basic_block_sptr get_left_block (int RF_channel)`
- virtual `gr::basic_block_sptr get_right_block (int RF_channel)`
- virtual void `start ()`

Start the flow of samples if needed.

Protected Member Functions

- `SignalSourceBase (ConfigurationInterface const *configuration, std::string role, std::string impl)`
Constructor.
- `size_t decode_item_type (std::string const &item_type, bool *is_interleaved=nullptr, bool throw_on_↵ error=false)`
utility for decoding passed ".item_type" values

12.398.1 Detailed Description

Definition at line 28 of file [signal_source_base.h](#).

12.398.2 Constructor & Destructor Documentation

12.398.2.1 SignalSourceBase()

```
SignalSourceBase::SignalSourceBase (
    ConfigurationInterface const * configuration,
    std::string role,
    std::string impl) [protected]
```

Constructor.

12.398.3 Member Function Documentation

12.398.3.1 decode_item_type()

```
size_t SignalSourceBase::decode_item_type (
    std::string const & item_type,
    bool * is_interleaved = nullptr,
    bool throw_on_error = false) [protected]
```

utility for decoding passed ".item_type" values

Parameters

in	<i>item_type</i>	- user provided string, should be one of the known types
out	<i>is_interleaved</i>	- if non-null, the pointed to memory is updated with whether the data is interleaved I/Q (e.g., ishort)
in	<i>throw_on_error</i>	- if true, throw an exception if the string does not represent a known type

Returns

the size in bytes of the passed type

12.398.3.2 get_left_block()

```
gr::basic_block_sptr SignalSourceBase::get_left_block () [override], [virtual]
```

Implements [GNSSBlockInterface](#).

12.398.3.3 getRfChannels()

```
size_t SignalSourceBase::getRfChannels () const [override], [virtual]
```

Implements [SignalSourceInterface](#).

12.398.3.4 implementation()

```
std::string SignalSourceBase::implementation () [final], [virtual]
```

Implements [GNSSBlockInterface](#).

12.398.3.5 role()

Start the flow of samples if needed.

12.399.1 Detailed Description

This abstract class represents an interface to signal_source GNSS block.

Abstract class for signal sources. Since all its methods are virtual, this class cannot be instantiated directly, and a subclass can only be instantiated directly if all inherited pure virtual methods have been implemented by that class or a parent class.

Protected Member Functions inherited from [SignalSourceBase](#)

- [SignalSourceBase](#) ([ConfigurationInterface](#) const *configuration, std::string role, std::string impl)
Constructor.
- size_t [decode_item_type](#) (std::string const &item_type, bool *is_interleaved=nullptr, bool throw_on_↵
error=false)
utility for decoding passed ".item_type" values

12.406.1 Detailed Description

Class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).

Definition at line 40 of file [spir_file_signal_source.h](#).

12.406.2 Member Function Documentation

12.406.2.1 create_file_source_hook()

```
void SpirFileSignalSource::create_file_source_hook () [override], [protected], [virtual]
```

Reimplemented from [FileSourceBase](#).

12.406.2.2 itemTypeToSize()

```
std::tuple< size_t, bool > SpirFileSignalSource::itemTypeToSize () [override], [protected],  
[virtual]
```

Compute the item size, from the [item_type\(\)](#). Subclasses may constrain types that don't make.

Reimplemented from [FileSourceBase](#).

12.406.2.3 post_disconnect_hook()

```
void SpirFileSignalSource::post_disconnect_hook (  
    gr::top_block_sptr top_block) [override], [protected], [virtual]
```

Reimplemented from [FileSourceBase](#).

12.406.2.4 pre_connect_hook()

```
void SpirFileSignalSource::pre_connect_hook (  
    gr::top_block_sptr top_block) [override], [protected], [virtual]
```

Reimplemented from [FileSourceBase](#).

12.406.2.5 source()

```
gnss_shared_ptr< gr::block > SpirFileSignalSource::source () const [override], [protected],  
[virtual]
```

Abstracted front-end source. Sub-classes may override if they create specialized chains to decode source files into a usable format.

Reimplemented from [FileSourceBase](#).

The documentation for this class was generated from the following file:

12.435 Tracking_2nd_DLL_filter Class Reference

This class implements a 2nd order DLL filter for code tracking loop.

```
#include <tracking_2nd_DLL_filter.h>
```

Public Member Functions

- **Tracking_2nd_DLL_filter** (float pdi_code)
- void **set_DLL_BW** (float dll_bw_hz)
Set DLL filter bandwidth [Hz].
- void **set_pdi** (float pdi_code)
Set Summation interval for code [s].
- void **initialize** ()
Start tracking with acquisition information.
- float **get_code_nco** (float DLL_discriminator)
Numerically controlled oscillator.

12.435.1 Detailed Description

This class implements a 2nd order DLL filter for code tracking loop.

The algorithm is described in: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S. H. Jensen, A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach, Birkhauser, 2007, Applied and Numerical Harmonic Analysis.

Definition at line 40 of file [tracking_2nd_DLL_filter.h](#).

12.435.2 Member Function Documentation

12.435.2.1 get_code_nco()

```
float Tracking_2nd_DLL_filter::get_code_nco (
    float DLL_discriminator)
```

Numerically controlled oscillator.

12.435.2.2 initialize()

```
void Tracking_2nd_DLL_filter::initialize ()
```

Start tracking with acquisition information.

12.435.2.3 set_DLL_BW()

```
void Tracking_2nd_DLL_filter::set_DLL_BW (
    float dll_bw_hz)
```

Set DLL filter bandwidth [Hz].

12.435.2.4 set_pdi()

```
void Tracking_2nd_DLL_filter::set_pdi (
    float pdi_code)
```

Set Summation interval for code [s].

The documentation for this class was generated from the following file:

- [tracking_2nd_DLL_filter.h](#)

12.436 Tracking_2nd_PLL_filter Class Reference

This class implements a 2nd order PLL filter for carrier tracking loop.

```
#include <tracking_2nd_PLL_filter.h>
```

Public Member Functions

- **Tracking_2nd_PLL_filter** (float pdi_carr)
- void **set_PLL_BW** (float pll_bw_hz)
Set PLL loop bandwidth [Hz].
- void **set_pdi** (float pdi_carr)
Set Summation interval for code [s].
- void **initialize** ()
- float **get_carrier_nco** (float PLL_discriminator)

12.436.1 Detailed Description

This class implements a 2nd order PLL filter for carrier tracking loop.

The algorithm is described in: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S. H. Jensen, A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach, Birkhauser, 2007, Applied and Numerical Harmonic Analysis.

Definition at line 39 of file [tracking_2nd_PLL_filter.h](#).

12.436.2 Member Function Documentation

12.436.2.1 set_pdi()

```
void Tracking_2nd_PLL_filter::set_pdi (
    float pdi_carr)
```

Set Summation interval for code [s].

12.436.2.2 set_PLL_BW()

```
void Tracking_2nd_PLL_filter::set_PLL_BW (
    float pll_bw_hz)
```

Set PLL loop bandwidth [Hz].

The documentation for this class was generated from the following file:

- [tracking_2nd_PLL_filter.h](#)

12.437 Tracking_FLL_PLL_filter Class Reference

This class implements a hybrid FLL and PLL filter for tracking carrier loop.

```
#include <tracking_FLL_PLL_filter.h>
```

Public Member Functions

- void **set_params** (float fil_bw_hz, float pll_bw_hz, int order)
- void **initialize** (float d_acq_carrier_doppler_hz)
- float **get_carrier_error** (float FLL_discriminator, float PLL_discriminator, float correlation_time_s)

12.437.1 Detailed Description

This class implements a hybrid FLL and PLL filter for tracking carrier loop.

Definition at line 29 of file [tracking_FLL_PLL_filter.h](#).

The documentation for this class was generated from the following file:

12.440.1 Detailed Description

This abstract class represents an interface to a tracking block.

Abstract class for tracking interfaces. Since all its methods are virtual, this class cannot be instantiated directly, and a subclass can only be instantiated directly if all inherited pure virtual methods have been implemented by that class or a parent class.

Definition at line 47 of file [tracking_interface.h](#).

12.440.2 Member Function Documentation

12.440.2.1 [set_channel\(\)](#)

```
virtual void TrackingInterface::set_channel (
    unsigned int channel) [pure virtual]
```

Implemented in [BaseDIIPIITracking](#), [BaseDIIPIITrackingFpga](#), [GalileoE1TcpConnectorTracking](#), [GpsL1CaDIIPIITrackingGPU](#), [GpsL1CaGaussianTracking](#), [GpsL1CaKfTracking](#), and [GpsL1CaTcpConnectorTracking](#).

- virtual void [post_disconnect_hook](#) (gr::top_block_sptr top_block)

Protected Member Functions inherited from [SignalSourceBase](#)

- [SignalSourceBase](#) ([ConfigurationInterface](#) const *configuration, std::string role, std::string impl)
Constructor.
- size_t [decode_item_type](#) (std::string const &item_type, bool *is_interleaved=nullptr, bool throw_on_error=false)
utility for decoding passed ".item_type" values

12.442.1 Detailed Description

Class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).
Definition at line 42 of file [two_bit_cpx_file_signal_source.h](#).

12.442.2 Member Function Documentation

12.442.2.1 [create_file_source_hook\(\)](#)

void TwoBitCpxFileSignalSource::create_file_source_hook () [override], [protected], [virtual]
Reimplemented from [FileSourceBase](#).

12.442.2.2 [itemTypeToSize\(\)](#)

std::tuple< size_t, bool > TwoBitCpxFileSignalSource::itemTypeToSize () [override], [protected], [virtual]
Compute the item size, from the [item_type\(\)](#). Subclasses may constrain types that don't make.
Reimplemented from [FileSourceBase](#).

12.442.2.3 [packetsPerSample\(\)](#)

double TwoBitCpxFileSignalSource::packetsPerSample () const [override], [protected], [virtual]
The number of (possibly unpacked) samples in a (raw) file sample (default=1).
Reimplemented from [FileSourceBase](#).

12.442.2.4 pre_connect_hook()

```
void TwoBitCpxFileSignalSource::pre_connect_hook (
    gr::top_block_sptr top_block) [override], [protected], [virtual]
```

Reimplemented from [FileSourceBase](#).

12.442.2.5 pre_disconnect_hook()

```
void TwoBitCpxFileSignalSource::pre_disconnect_hook (
    gr::top_block_sptr top_block) [override], [protected], [virtual]
```

Reimplemented from [FileSourceBase](#).

12.442.2.6 source()

```
gnss_shared_ptr< gr::block > TwoBitCpxFileSignalSource::source () const [override], [protected], [virtual]
```

Abstracted front-end source. Sub-classes may override if they create specialized chains to decode source files into a usable format.

Reimplemented from [FileSourceBase](#).

The documentation for this class was generated from the following file:

- [two_bit_cpx_file_signal_source.h](#)

12.443 TwoBitPackedFileSignalSource Class Reference

Class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).

```

12.443.1 Detailed Description

Class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).
Definition at line 44 of file [two_bit_packed_file_signal_source.h](#).

12.443.2 Member Function Documentation

12.443.2.1 create_file_source_hook()

void TwoBitPackedFileSignalSource::create_file_source_hook () [override], [protected], [virtual]
Reimplemented from [FileSourceBase](#).

12.443.2.2 itemTypeToSize()

std::tuple< size_t, bool > TwoBitPackedFileSignalSource::itemTypeToSize () [override], [protected], [virtual]
Compute the item size, from the [item_type\(\)](#). Subclasses may constrain types that don't make.
Reimplemented from [FileSourceBase](#).

12.443.2.3 packetsPerSample()

double TwoBitPackedFileSignalSource::packetsPerSample () const [override], [protected], [virtual]
The number of (possibly unpacked) samples in a (raw) file sample (default=1).
Reimplemented from [FileSourceBase](#).

12.443.2.4 pre_connect_hook()

void TwoBitPackedFileSignalSource::pre_connect_hook (gr::top_block_sptr top_block) [override], [protected], [virtual]
Reimplemented from [FileSourceBase](#).

12.443.2.5 pre_disconnect_hook()

void TwoBitPackedFileSignalSource::pre_disconnect_hook (gr::top_block_sptr top_block) [override], [protected], [virtual]
Reimplemented from [FileSourceBase](#).

12.443.2.6 source()

```
gnss_shared_ptr< gr::block > TwoBitPackedFileSignalSource::source () const [override], [protected], [virtual]
```

Abstracted front-end source. Sub-classes may override if they create specialized chains to decode source files into a usable format.

Reimplemented from [FileSourceBase](#).

The documentation for this class was generated from the following file:

- unpack_byte_4bit_samples_sptr **make_unpack_byte_4bit_samples_sptr** ()

12.448.1 Detailed Description

This class implements conversion between byte packet samples to 4bit_cpx samples 1 byte = 1 x complex 4bit I, + 4bit Q samples.

Definition at line 42 of file [unpack_byte_4bit_samples.h](#).

The documentation for this class was generated from the following file:

- [unpack_byte_4bit_samples.h](#)

12.449 unpack_intspir_1bit_samples Class Reference

This class implements conversion between byte packet samples to 2bit samples 1 byte = 4 2bit samples.

```
#include <unpack_intspir_1bit_samples.h>
```

Inheritance diagram for unpack_intspir_1bit_samples:

Public Member Functions

- `int work` (int noutput_items, gr_vector_const_void_star &input_items, gr_vector_void_star &output_items)

Friends

- `unpack_intspir_1bit_samples_sptr make_unpack_intspir_1bit_samples_sptr` ()

12.449.1 Detailed Description

This class implements conversion between byte packet samples to 2bit samples 1 byte = 4 2bit samples.

Definition at line 41 of file [unpack_intspir_1bit_samples.h](#).

The documentation for this class was generated from the following file:

12.450 unpack_ntlab_2bit_samples Class Reference

This class implements conversion between byte packet multichannel samples to 2bit samples 1 byte = 4 2bit samples.

```
#include <unpack_ntlab_2bit_samples.h>
```

Inheritance diagram for unpack_ntlab_2bit_samples:

Public Member Functions

- `unpack_ntlab_2bit_samples` (size_t item_size, int nchannels)
- `int work` (int noutput_items, gr_vector_const_void_star &input_items, gr_vector_void_star &output_items)

Friends

- `unpack_ntlab_2bit_samples_sptr make_unpack_ntlab_2bit_samples_sptr` (size_t item_size, int nchannels)

12.450.1 Detailed Description

This class implements conversion between byte packet multichannel samples to 2bit samples 1 byte = 4 2bit samples.

Unpack each of the four 2-bit samples in the byte 'b' into four real-valued outputs.

The NTLAB format encodes samples as sign+magnitude pairs in each byte: bits 7-6 = [M0 S0] -> sample 0 bits 5-4 = [M1 S1] -> sample 1 bits 3-2 = [M2 S2] -> sample 2 bits 1-0 = [M3 S3] -> sample 3
M = magnitude bit (1->|sample|=3, 0->|sample|=1) S = sign bit (1->positive, 0->negative)
Definition at line 56 of file [unpack_ntlab_2bit_samples.h](#).

The documentation for this class was generated from the following file:

12.458 Viterbi_Decoder Class Reference

Class that implements a Viterbi decoder.

```
#include <viterbi_decoder.h>
```

Public Member Functions

- [Viterbi_Decoder](#) (int32_t KK, int32_t nn, int32_t LL, const std::array< int32_t, 2 > &g)
Constructor of a Viterbi decoder.
- void [decode](#) (std::vector< int32_t > &output_u_int, const std::vector< float > &input_c)
Uses the Viterbi algorithm to perform hard-decision decoding of a convolutional code.
- void [reset](#) ()
Reset internal status.

12.458.1 Detailed Description

Class that implements a Viterbi decoder.

Definition at line 34 of file [viterbi_decoder.h](#).

12.458.2 Constructor & Destructor Documentation

12.458.2.1 Viterbi_Decoder()

```
Viterbi_Decoder::Viterbi_Decoder (
    int32_t KK,
    int32_t nn,
    int32_t LL,
    const std::array< int32_t, 2 > & g)
```

Constructor of a Viterbi decoder.

Parameters

in	<i>KK</i>	Constraint length
in	<i>nn</i>	Coding rate 1/n
in	<i>LL</i>	Data length
in	<i>g</i>	Polynomial G1 and G2

12.458.3 Member Function Documentation

12.458.3.1 decode()

```
void Viterbi_Decoder::decode (
    std::vector< int32_t > & output_u_int,
    const std::vector< float > & input_c)
```

Uses the Viterbi algorithm to perform hard-decision decoding of a convolutional code.

Parameters

out	<i>output_u_int</i>	Hard decisions on the data bits
in	<i>input_c</i>	The received signal in LLR-form. For BPSK, must be in form $r = 2*a*y/(\sigma^2)$.

12.458.3.2 reset()

```
void Viterbi_Decoder::reset ()
```

Reset internal status.

The documentation for this class was generated from the following file:

- [viterbi_decoder.h](#)

12.459 Viterbi_Decoder_Sbas Class Reference

Class that implements a Viterbi decoder.

```
#include <viterbi_decoder_sbas.h>
```

Public Member Functions

- **Viterbi_Decoder_Sbas** (const int g_encoder[], int KK, int nn)
- void **reset** ()
- float **decode_block** (const double input_c[], int *output_u_int, int LL)
Uses the Viterbi algorithm to perform hard-decision decoding of a convolutional code.
- float **decode_continuous** (const double sym[], int traceback_depth, int bits[], int nbits_requested, int &nbits_decoded)

12.459.1 Detailed Description

Class that implements a Viterbi decoder.

Definition at line 34 of file [viterbi_decoder_sbas.h](#).

12.459.2 Member Function Documentation

12.459.2.1 decode_block()

```
float Viterbi_Decoder_Sbas::decode_block (
    const double input_c[],
    int * output_u_int,
    int LL)
```

Uses the Viterbi algorithm to perform hard-decision decoding of a convolutional code.

Parameters

in	<i>input_c</i> ↔ <i>c[]</i>	The received signal in LLR-form. For BPSK, must be in form $r = 2*a*y/(sigma^2)$.
in	<i>LL</i>	The number of data bits to be decoded (does not include the mm zero-tail-bits)

Returns

output_u_int[] Hard decisions on the data bits (without the mm zero-tail-bits)

The documentation for this class was generated from the following file:

- auto [connect](#) (gr::top_block_sptr top_block) -> void override
- auto [disconnect](#) (gr::top_block_sptr top_block) -> void override
- auto [get_right_block](#) () -> gr::basic_block_sptr override

Public Member Functions inherited from [SignalSourceBase](#)

- std::string [role](#) () final
- std::string [implementation](#) () final
- size_t [getRfChannels](#) () const override
- gr::basic_block_sptr [get_left_block](#) () override

Public Member Functions inherited from [GNSSBlockInterface](#)

- virtual gr::basic_block_sptr [get_left_block](#) (int RF_channel)
- virtual gr::basic_block_sptr [get_right_block](#) (int RF_channel)
- virtual void [start](#) ()

Start the flow of samples if needed.

Additional Inherited Members

Protected Member Functions inherited from [SignalSourceBase](#)

- [SignalSourceBase](#) ([ConfigurationInterface](#) const *configuration, std::string role, std::string impl)
Constructor.
- size_t [decode_item_type](#) (std::string const &item_type, bool *is_interleaved=nullptr, bool throw_on_error=false)
utility for decoding passed ".item_type" values

12.460.1 Detailed Description

This class supports the following properties:

.endpoint - the ZMQ endpoint to be connected to .vlen - vector length of the input items (default 1, one item) this must match the size of the publisher! .pass_tags - boolean flag if tags should be propagated (default false) .timeout_ms - receive timeout, in milliseconds (default 100) .hwm - ZMQ high water mark (default -1, ZMQ default) .item_type - data type of the samples (default "gr_complex") (probably should be abstracted to the base class) .dump - whether to archive input data .dump_filename - if dumping, path to file for output
Definition at line 51 of file [zmq_signal_source.h](#).

12.460.2 Member Function Documentation

12.460.2.1 connect()

```
auto ZmqSignalSource::connect (
    gr::top_block_sptr top_block) -> void [override], [virtual]
```

Implements [GNSSBlockInterface](#).

12.460.2.2 disconnect()

```
auto ZmqSignalSource::disconnect (
    gr::top_block_sptr top_block) -> void [override], [virtual]
```

Implements [GNSSBlockInterface](#).

12.460.2.3 get_right_block()

```
auto ZmqSignalSource::get_right_block () -> gr::basic_block_sptr [override], [virtual]
```

Implements [GNSSBlockInterface](#).

12.460.2.4 item_size()

```
size_t ZmqSignalSource::item_size () [override], [virtual]
```

Implements [GNSSBlockInterface](#).

The documentation for this class was generated from the following file:

This abstract class represents an interface to an acquisition GNSS block.

Typedefs

- using [acquisition_impl_interface_sptr](#) = gnss_shared_ptr<[acquisition_impl_interface](#)>

13.63.1 Detailed Description

Header file of the interface to an acquisition implementation GNSS block.

Author

Mathieu Favreau, 2025. [favreau.mathieu\(at\)hotmail.com](mailto:favreau.mathieu(at)hotmail.com)

This header file contains the interface to an abstract class for acquisition algorithms. Since all its methods are virtual, this class cannot be instantiated directly, and a subclass can only be instantiated directly if all inherited pure virtual methods have been implemented by that class or a parent class.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

13.69.1 Detailed Description

This class implements a Parallel Code Phase Search Acquisition.

Acquisition strategy (Kay Borre book + CFAR threshold).

1. Compute the input signal power estimation
2. Doppler serial search loop
3. Perform the FFT-based circular convolution (parallel time search)
4. Record the maximum peak and the associated synchronization parameters

5. Compute the test statistics and compare to the threshold
6. Declare positive or negative acquisition using a message queue

Kay Borre book: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, "A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach", Birkhauser, 2007. pp 81-84

13.71.1 Detailed Description

This class implements a Parallel Code Phase Search Acquisition with multi-dwells and fine Doppler estimation for GPS L1 C/A signal.

Acquisition strategy (Kay Borre book).

1. Compute the input signal power estimation
2. Doppler serial search loop
3. Perform the FFT-based circular convolution (parallel time search)
4. Record the maximum peak and the associated synchronization parameters
5. Compute the test statistics and compare to the threshold
6. Declare positive or negative acquisition using a message port

Kay Borre book: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, "A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach", Birkhauser, 2007. pp 81-84

Classes

- class `pcps_assisted_acquisition_cc`
This class implements a Parallel Code Phase Search Acquisition.

Typedefs

- using `pcps_assisted_acquisition_cc_sptr` = `gnss_shared_ptr<pcps_assisted_acquisition_cc>`

Functions

- `pcps_assisted_acquisition_cc_sptr pcps_make_assisted_acquisition_cc` (const `Acq_Conf` &conf)

13.75.1 Detailed Description

This class implements a Parallel Code Phase Search Acquisition with assistance and multi-dwells. Acquisition strategy (Kay Borre book + CFAR threshold).

1. Compute the input signal power estimation
2. Doppler serial search loop
3. Perform the FFT-based circular convolution (parallel time search)
4. Record the maximum peak and the associated synchronization parameters
5. Compute the test statistics and compare to the threshold
6. Declare positive or negative acquisition using a message queue

Kay Borre book: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, "A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach", Birkhauser, 2007. pp 81-84

13.79.1 Detailed Description

This class implements a Parallel Code Phase Search Acquisition using OpenCL to offload some functions to the GPU.

Acquisition strategy (Kay Borre book + CFAR threshold).

1. Compute the input signal power estimation
2. Doppler serial search loop
3. Perform the FFT-based circular convolution (parallel time search)
4. Record the maximum peak and the associated synchronization parameters
5. Compute the test statistics and compare to the threshold
6. Declare positive or negative acquisition using a message port

Kay Borre book: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, "A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach", Birkhauser, 2007. pp 81-84

13.81.1 Detailed Description

This class implements a Parallel Code Phase Search Acquisition with the QuickSync Algorithm. Acquisition strategy (Kay Borre book CFAR + threshold).

1. Compute the input signal power estimation
2. Doppler serial search loop
3. Perform folding of the incoming signal and local generated code
4. Perform the FFT-based circular convolution (parallel time search)
5. Record the maximum peak and the associated synchronization parameters
6. Compute the test statistics and compare to the threshold
7. Declare positive or negative acquisition using a message port
8. Obtain the adequate acquisition parameters by correlating the incoming signal shifted by the possible folded delays

Kay Borre book: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, "A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach", Birkha user, 2007. pp 81-84

13.83.1 Detailed Description

This class implements a Parallel Code Phase Search Acquisition with Tong algorithm.

Author

Marc Molina, 2013. marc.molina.pena(at)gmail.com

Acquisition strategy (Kaplan book + CFAR threshold).

1. Compute the input signal power estimation.
2. Doppler serial search loop.
3. Perform the FFT-based circular convolution (parallel time search).
4. Compute the tests statistics for all the cells.
5. Accumulate the grid of tests statistics with the previous grids.
6. Record the maximum peak and the associated synchronization parameters.
7. Compare the maximum averaged test statistics with a threshold.
8. If the test statistics exceeds the threshold, increment the Tong counter.
9. Otherwise, decrement the Tong counter.
10. If the Tong counter is equal to a given maximum value, declare positive
11. acquisition. If the Tong counter is equa to zero, declare negative
12. acquisition. Otherwise, process the next block.

Classes

- class [Channel](#)

This class represents a GNSS channel. It wraps an [AcquisitionInterface](#), a [TrackingInterface](#) and a [TelemetryDecoderInterface](#), and handles their interaction through a Finite State Machine.

13.91.1 Detailed Description

Interface of a GNSS channel.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com Luis Esteve, 2011. luis(at)epsilon-formacion.com

It holds blocks for acquisition, tracking, navigation data extraction and pseudorange calculation.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

Copyright (C) 2010-2020 (see AUTHORS file for a list of contributors) SPDX-License-Identifier: GPL-3.0-or-later

13.143 beidou_b1i_signal_replica.h File Reference

This file implements various functions for BeiDou B1I signal replica generation.

```

#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [beidou_b1i_code_gen_int](#) (own::span< int32_t > dest, int32_t prn, uint32_t chip_shift)
Generates int32_t GPS L1 C/A code for the desired SV ID and code shift.
- void [beidou_b1i_code_gen_float](#) (own::span< float > dest, int32_t prn, uint32_t chip_shift)
Generates float GPS L1 C/A code for the desired SV ID and code shift.
- void [beidou_b1i_code_gen_complex](#) (own::span< std::complex< float > > dest, int32_t prn, uint32_t chip_shift)
Generates complex GPS L1 C/A code for the desired SV ID and code shift.
- void [beidou_b1i_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift)
Generates complex GPS L1 C/A code for the desired SV ID and code shift, and sampled to specific sampling frequency.

13.143.1 Detailed Description

This file implements various functions for BeiDou B1I signal replica generation.

Classes

- class [conjugate_cc](#)

This class adapts a std::complex<short> stream into two 32-bits (float) streams.

Typedefs

- using [conjugate_cc_sptr](#) = gnss_shared_ptr<[conjugate_cc](#)>

Functions

- `conjugate_cc_sptr make_conjugate_cc ()`

13.153.1 Detailed Description

Conjugate a stream of `gr_complex`.

Author

Carles Fernandez Prades, `cfernandez(at)cttc.es`

13.161 galileo_e1_signal_replica.h File Reference

This library implements various functions for Galileo E1 signal replica generation.

```

#include <array>
#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [galileo_e1_code_gen_sinboc11_float](#) (own::span< float > dest, const std::array< char, 3 > &signal_id, uint32_t prn)
This function generates Galileo E1 code (can select E1B or E1C sinboc).
- void [galileo_e1_code_gen_float_sampled](#) (own::span< float > dest, const std::array< char, 3 > &signal_id, bool cboc, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift, bool secondary_flag)
This function generates Galileo E1 code (can select E1B or E1C, cboc or sinboc and the sample frequency sampling←_freq).
- void [galileo_e1_code_gen_float_sampled](#) (own::span< float > dest, const std::array< char, 3 > &signal_id, bool cboc, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift)
This function generates Galileo E1 code (can select E1B or E1C, cboc or sinboc and the sample frequency sampling←_freq).
- void [galileo_e1_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, const std::array< char, 3 > &signal_id, bool cboc, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift, bool secondary_flag)
This function generates Galileo E1 code (can select E1B or E1C, cboc or sinboc and the sample frequency sampling←_freq).
- void [galileo_e1_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, const std::array< char, 3 > &signal_id, bool cboc, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift)
galileo_e1_code_gen_complex_sampled without secondary_flag for backward compatibility.

13.163 galileo_e5_signal_replica.h File Reference

This library implements various functions for Galileo E5 signal replica generation.

```

#include <array>
#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [galileo_e5_a_code_gen_complex_primary](#) (own::span< std::complex< float > > dest, int32_t prn, const std::array< char, 3 > &signal_id)
Generates Galileo E5a code at 1 sample/chip.
- void [galileo_e5_a_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, const std::array< char, 3 > &signal_id, int32_t sampling_freq, uint32_t chip_shift)
Generates Galileo E5a complex code, shifted to the desired chip and sampled at a frequency sampling_freq.
- void [galileo_e5_b_code_gen_complex_primary](#) (own::span< std::complex< float > > dest, int32_t prn, const std::array< char, 3 > &signal_id)
Generates Galileo E5b code at 1 sample/chip.
- void [galileo_e5_b_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, const std::array< char, 3 > &signal_id, int32_t sampling_freq, uint32_t chip_shift)

Generates Galileo E5b complex code, shifted to the desired chip and sampled at a frequency sampling_freq.

13.165 galileo_e6_signal_replica.h File Reference

This library implements various functions for Galileo E6 signal replica generation.

```

#include <array>
#include <complex>
#include <cstdint>
#include <string>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [galileo_e6_b_code_gen_complex_primary](#) (own::span< std::complex< float > > dest, int32_t prn)
Generates Galileo E6B code at 1 sample/chip.
- void [galileo_e6_b_code_gen_float_primary](#) (own::span< float > dest, int32_t prn)
Generates Galileo E6B code at 1 sample/chip.
- void [galileo_e6_b_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift)
Generates Galileo E6B complex code, shifted to the desired chip and sampled at a frequency sampling_freq.
- void [galileo_e6_c_code_gen_complex_primary](#) (own::span< std::complex< float > > dest, int32_t prn)
Generates Galileo E6C codes at 1 sample/chip.
- void [galileo_e6_c_code_gen_float_primary](#) (own::span< float > dest, int32_t prn)
Generates Galileo E6C codes at 1 sample/chip.
- void [galileo_e6_c_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift)
Generates Galileo E6C complex codes, shifted to the desired chip and sampled at a frequency sampling_freq.
- void [galileo_e6_c_secondary_code_gen_complex](#) (own::span< std::complex< float > > dest, int32_t prn)
Generates Galileo E6C secondary codes at 1 sample/chip.
- void [galileo_e6_c_secondary_code_gen_float](#) (own::span< float > dest, int32_t prn)
Generates Galileo E6C secondary codes at 1 sample/chip.
- std::string [galileo_e6_c_secondary_code](#) (int32_t prn)
Generates a string with Galileo E6C secondary codes at 1 sample/chip.

13.165.1 Detailed Description

This library implements various functions for Galileo E6 signal replica generation.

13.167 geofunctions.h File Reference

A set of coordinate transformations functions and helpers, some of them migrated from MATLAB, for geographic information systems.

```
#include <armadillo>
```

Functions

- arma::mat [Skew_symmetric](#) (const arma::vec &a)
Calculates skew-symmetric matrix.
- double [WGS84_g0](#) (double Lat_rad)
- double [WGS84_geocentric_radius](#) (double Lat_geodetic_rad)
- int [topocent](#) (double *Az, double *El, double *D, const arma::vec &x, const arma::vec &dx)
Transformation of vector dx into topocentric coordinate system with origin at x Inputs: x - vector origin coordinates (in ECEF system [X; Y; Z;]) dx - vector ([dX; dY; dZ;]).
- int [togeod](#) (double *dphi, double *dlambda, double *h, double a, double finv, double X, double Y, double Z)
Subroutine to calculate geodetic coordinates latitude, longitude, height given Cartesian coordinates X,Y,Z, and reference ellipsoid values semi-major axis (a) and the inverse of flattening (finv).
- arma::vec [Gravity_ECEF](#) (const arma::vec &r_eb_e)
Calculates acceleration due to gravity resolved about ECEF-frame.
- arma::vec [cart2geo](#) (const arma::vec &XYZ, int ellipsoid_selection)
Conversion of Cartesian coordinates (X,Y,Z) to geographical coordinates (latitude, longitude, h) on a selected reference ellipsoid.
- arma::vec [LLH_to_deg](#) (const arma::vec &LLH)
- double [degtorad](#) (double angleInDegrees)
- double [radtodeg](#) (double angleInRadians)

- double **mstoknotsh** (double MetersPerSeconds)
- double **mstokph** (double MetersPerSeconds)
- arma::vec **CTM_to_Euler** (const arma::mat &C)
- arma::mat **Euler_to_CTM** (const arma::vec &eul)
- void **ECEF_to_Geo** (const arma::vec &r_eb_e, const arma::vec &v_eb_e, const arma::mat &C_b_e, arma::vec &LLH, arma::vec &v_eb_n, arma::mat &C_b_n)
- void **Geo_to_ECEF** (const arma::vec &LLH, const arma::vec &v_eb_n, const arma::mat &C_b_n, arma::vec &r_eb_e, arma::vec &v_eb_e, arma::mat &C_b_e)
From Geographic to ECEF coordinates.
- void **pv_Geo_to_ECEF** (double L_b, double lambda_b, double h_b, const arma::vec &v_eb_n, arma::vec &r_eb_e, arma::vec &v_eb_e)
Converts curvilinear to Cartesian position and velocity resolving axes from NED to ECEF This function created 11/4/2012 by Paul Groves.
- double **great_circle_distance** (double lat1, double lon1, double lat2, double lon2)
The Haversine formula determines the great-circle distance between two points on a sphere given their longitudes and latitudes.
- void **cart2utm** (const arma::vec &r_eb_e, int zone, arma::vec &r_enu)
Transformation of ECEF (X,Y,Z) to (E,N,U) in UTM, zone 'zone'.
- int **findUtmZone** (double latitude_deg, double longitude_deg)
Function finds the UTM zone number for given longitude and latitude.
- double **clsin** (const arma::colvec &ar, int degree, double argument)
Clenshaw summation of sinus of argument.
- void **clksin** (const arma::colvec &ar, int degree, double arg_real, double arg_imag, double *re, double *im)
Clenshaw summation of sinus with complex argument.

This file implements various functions for GLONASS L2 CA signal replica generation.

```

#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [glonass_l2_ca_code_gen_complex](#) (own::span< std::complex< float > > dest, uint32_t chip_shift)
Generates complex GLONASS L2 C/A code for the desired SV ID and code shift.
- void [glonass_l2_ca_code_gen_float](#) (own::span< float > dest, uint32_t chip_shift)
Generates float GLONASS L2 C/A code for the desired SV ID and code shift.
- void [glonass_l2_ca_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, int32_t sampling_freq, uint32_t chip_shift)
Generates complex GLONASS L2 C/A code for the desired SV ID and code shift, and sampled to specific sampling frequency.

13.170.1 Detailed Description

13.180 gnss_sdr_flags.h File Reference

Helper file for gnss-sdr cmdline flags.

```
#include <cstdint>
#include <string>
#include <absl/flags/declare.h>
#include <absl/flags/flag.h>
#include <cstdlib>
```

```
#include <iostream>
#include <sys/stat.h>
#include <vector>
```

Functions

- [ABSL_DECLARE_FLAG](#) (std::string, c)
Path to the configuration file.
- [ABSL_DECLARE_FLAG](#) (std::string, config_file)
Path to the configuration file.
- [ABSL_DECLARE_FLAG](#) (std::string, log_dir)
Path to the folder in which logging will be stored.
- [ABSL_DECLARE_FLAG](#) (std::string, s)
Path to the file containing the signal samples.
- [ABSL_DECLARE_FLAG](#) (std::string, signal_source)
Path to the file containing the signal samples.
- [ABSL_DECLARE_FLAG](#) (std::string, timestamp_source)
Path to the file containing the signal samples.
- [ABSL_DECLARE_FLAG](#) (bool, rf_shutdown)
Shutdown RF when program exits.
- [ABSL_DECLARE_FLAG](#) (int32_t, doppler_max)
If defined, maximum Doppler value in the search grid, in Hz (overrides the configuration file).
- [ABSL_DECLARE_FLAG](#) (int32_t, doppler_step)
If defined, sets the frequency step in the search grid, in Hz, in Hz (overrides the configuration file).
- [ABSL_DECLARE_FLAG](#) (int32_t, cn0_samples)
Number of correlator outputs used for CN0 estimation.
- [ABSL_DECLARE_FLAG](#) (int32_t, cn0_min)
Minimum valid CN0 (in dB-Hz).
- [ABSL_DECLARE_FLAG](#) (int32_t, max_lock_fail)
Maximum number of code lock failures before dropping a satellite.
- [ABSL_DECLARE_FLAG](#) (int32_t, max_carrier_lock_fail)
Maximum number of carrier lock failures before dropping a satellite.
- [ABSL_DECLARE_FLAG](#) (double, carrier_lock_th)
Carrier lock threshold (in rad).
- [ABSL_DECLARE_FLAG](#) (double, dll_bw_hz)
Bandwidth of the DLL low pass filter, in Hz (overrides the configuration file).
- [ABSL_DECLARE_FLAG](#) (double, pll_bw_hz)
Bandwidth of the PLL low pass filter, in Hz (overrides the configuration file).
- [ABSL_DECLARE_FLAG](#) (int32_t, carrier_smoothing_factor)
Sets carrier smoothing factor M (overrides the configuration file).
- [ABSL_DECLARE_FLAG](#) (std::string, RINEX_version)
If defined, specifies the RINEX version (2.11 or 3.02). Overrides the configuration file.
- [ABSL_DECLARE_FLAG](#) (std::string, RINEX_name)
If defined, specifies the RINEX files base name.
- [ABSL_DECLARE_FLAG](#) (bool, keyboard)
If set to false, disables the keyboard listener. Only for debug purposes (e.g. ASAN mode termination).
- bool **ValidateFlags** ()

Variables

- const int32_t **DEFAULT_CARRIER_SMOOTHING_FACTOR** = 200

13.184 gnss_sdr_string_literals.h File Reference

This file implements the `""s` operator for `std::string` in C++11, and puts it into the `std::string_literals` namespace. This is already implemented in C++14, so this is only compiled when using C++11. The `.cc` file is required for avoiding the duplication of symbols.

13.184.1 Detailed Description

This file implements the `""s` operator for `std::string` in C++11, and puts it into the `std::string_literals` namespace. This is already implemented in C++14, so this is only compiled when using C++11. The `.cc` file is required for avoiding the duplication of symbols.

13.186 gnss_signal_replica.h File Reference

This library gathers a few functions used for GNSS signal replica generation regardless of system used.

```
#include <complex>
#include <cstdint>
#include <string>
#include <gsl-lite/gsl-lite.hpp>
```

Functions

- void [complex_exp_gen](#) (own::span< std::complex< float > > dest, double freq, double sampling_freq)
This function generates a complex exponential in dest.
- void [complex_exp_gen_conj](#) (own::span< std::complex< float > > dest, double freq, double sampling_freq)
This function generates a conjugate complex exponential in dest.
- void [hex_to_binary_converter](#) (own::span< int32_t > dest, char from)
This function makes a conversion from hex (the input is a char) to binary (the output are 4 ints with +1 or -1 values).
- std::string [hex_to_binary_string](#) (char from)
This function makes a conversion from hex (the input is a char) to binary (the output is a string of 4 char with 0 or 1 values).
- void [resampler](#) (const own::span< float > from, own::span< float > dest, float fs_in, float fs_out)
This function resamples a sequence of float values.
- void [resampler](#) (own::span< const std::complex< float > > from, own::span< std::complex< float > > dest, float fs_in, float fs_out)
This function resamples a sequence of complex values.

13.186.1 Detailed Description

13.190 gps_l2c_signal_replica.h File Reference

This file implements signal generators for GPS L2C signals.

```

#include <complex>
#include <stdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [gps_l2c_m_code_gen_complex](#) (own::span< std::complex< float > > dest, uint32_t prn)
Generates complex GPS L2C M code for the desired SV ID.
- void [gps_l2c_m_code_gen_float](#) (own::span< float > dest, uint32_t prn)
Generates float GPS L2C M code for the desired SV ID.
- void [gps_l2c_m_code_gen_float_cl_zeroed](#) (own::span< float > dest, uint32_t prn)
Generates float GPS L2C M code with double chip rate and L component zeroed for the desired SV ID.
- void [gps_l2c_m_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq)
Generates complex GPS L2C M code for the desired SV ID, and sampled to specific sampling frequency.
- void [gps_l2c_m_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq, bool cl_zeroed)
Generates complex GPS L2C M code for the desired SV ID, and sampled to specific sampling frequency, optionally zeroing CL slots.

13.192 gps_l5_signal_replica.h File Reference

This file implements signal generators for GPS L5 signals.

```

#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void [gps_l5i_code_gen_complex](#) (own::span< std::complex< float > > dest, uint32_t prn)
Generates complex GPS L5I code for the desired SV ID.
- void [gps_l5i_code_gen_float](#) (own::span< float > dest, uint32_t prn)
Generates real GPS L5I code for the desired SV ID.
- void [gps_l5q_code_gen_complex](#) (own::span< std::complex< float > > dest, uint32_t prn)
Generates complex GPS L5Q code for the desired SV ID.
- void [gps_l5q_code_gen_float](#) (own::span< float > dest, uint32_t prn)
Generates real GPS L5Q code for the desired SV ID.
- void [gps_l5i_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq)
Generates complex GPS L5I code for the desired SV ID, and sampled to specific sampling frequency.
- void [gps_l5q_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq)
Generates complex GPS L5Q code for the desired SV ID, and sampled to specific sampling frequency.

13.194 gps_sdr_signal_replica.h File Reference

This file implements functions for GPS L1 C/A signal replica generation.

```

#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>

```

Functions

- void `gps_l1_ca_code_gen_int` (own::span< int32_t > dest, int32_t prn, uint32_t chip_shift)
Generates int GPS L1 C/A code for the desired SV ID and code shift.
- void `gps_l1_ca_code_gen_float` (own::span< float > dest, int32_t prn, uint32_t chip_shift)
Generates float GPS L1 C/A code for the desired SV ID and code shift.
- void `gps_l1_ca_code_gen_complex` (own::span< std::complex< float > > dest, int32_t prn, uint32_t chip_shift)
Generates complex GPS L1 C/A code for the desired SV ID and code shift.
- void `gps_l1_ca_code_gen_complex_sampled` (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq, uint32_t chip_shift)
Generates complex GPS L1 C/A code for the desired SV ID and code shift, and sampled to specific sampling frequency.

13.196 item_type_helpers.h File Reference

Utility functions for converting between item types.

```

#include <stdint>
#include <functional>
#include <string>

```

Typedefs

- using [item_type_converter_t](#) = std::function<void(void *, const void *, uint32_t)>

Functions

- bool [item_type_valid](#) (const std::string &item_type)
Check if a string is a valid item type.
- size_t [item_type_size](#) (const std::string &item_type)
Return the size of the given item type, or zero if unknown.
- bool [item_type_is_complex](#) (const std::string &item_type)
Determine if an item_type is complex.
- item_type_converter_t [make_vector_converter](#) (const std::string &input_type, const std::string &output_type)
Create a function to convert an array of input_type to an array of output_type.

13.196.1 Detailed Description

Utility functions for converting between item types.

13.208 qzss_signal_replica.h File Reference

This file implements signal generators for QZSS signals.

```
#include <complex>
#include <cstdint>
#include <gsl-lite/gsl-lite.hpp>
```

Functions

- void [qzss_l1_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq)
Generates complex QZSS L1 C/A code for the desired SV ID, and sampled to specific sampling frequency.
- void [qzss_l1_code_gen_float](#) (own::span< float > dest, uint32_t prn)
Generates real QZSS L1 C/A code for the desired SV ID.
- void [qzss_l5i_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq)
Generates complex QZSS L5I code for the desired SV ID, and sampled to specific sampling frequency.
- void [qzss_l5i_code_gen_float](#) (own::span< float > dest, uint32_t prn)
Generates real QZSS L5I code for the desired SV ID.
- void [qzss_l5q_code_gen_complex_sampled](#) (own::span< std::complex< float > > dest, uint32_t prn, int32_t sampling_freq)
Generates complex QZSS L5Q code for the desired SV ID, and sampled to specific sampling frequency.
- void [qzss_l5q_code_gen_float](#) (own::span< float > dest, uint32_t prn)
Generates real QZSS L5I code for the desired SV ID.

13.208.1 Detailed Description

This file implements signal generators for QZSS signals.

13.232.2 Macro Definition Documentation

13.232.2.1 Rx

```
#define Rx(
```

```
    t,  
    X)
```

Value:

```
do  
{  
    (X)[0] = 1.0;  
    (X)[1] = (X)[2] = (X)[3] = (X)[6] = 0.0;  
    (X)[4] = (X)[8] = cos(t);  
    (X)[7] = sin(t);  
    (X)[5] = -(X)[7];  
}  
while (0)
```

Definition at line 85 of file [rtklib_rtkcmn.h](#).

13.232.2.2 Ry

```
#define Ry(
```

```
    t,  
    X)
```

Value:

```
do
{
    (X)[4] = 1.0;
    (X)[1] = (X)[3] = (X)[5] = (X)[7] = 0.0;
    (X)[0] = (X)[8] = cos(t);
    (X)[2] = sin(t);
    (X)[6] = -(X)[2];
}
while (0)
```

Definition at line 96 of file `rtklib_rtkcmn.h`.

13.232.2.3 Rz

```
#define Rz(
```

```
    t,
    X)
```

Value:

```
do
{
    (X)[8] = 1.0;
    (X)[2] = (X)[5] = (X)[6] = (X)[7] = 0.0;
    (X)[0] = (X)[4] = cos(t);
    (X)[3] = sin(t);
    (X)[1] = -(X)[3];
}
while (0)
```

Definition at line 107 of file `rtklib_rtkcmn.h`.

00046 * \brief This class implements a PvtInterface for the RTKLIB PVT block
00047 *
00048 * Global configuration options used:
00049 *
00050 * GNSS-SDR.pre_2009_file - flag indicating a file older than 2009 rollover should be processed
00051 * (false)
00052 * GNSS-SDR.observable_interval_ms - (20)
00053 *
00054 * It supports the following configuration options:
00055 *
00056 * .dump - (false)
00057 * .dump_filename - (".pvt.dat")
00058 * .dump_mat - (true)
00059 * .rtk_trace_level - debug level for the RTKLIB methods (0)
00060 *
00061 * .output_rate_ms - (500)
00062 * Note that the actual rate is the least common multiple of this value and
00063 * GNSS-SDR.observable_interval_ms
00064 * .display_rate_ms - (500)
00065 *
00066 * .flag_nmea_tty_port - (false)
00067 * .nmea_dump_filename - (".nmea_pvt.nmea")
00068 * .nmea_dump_devname - ("/dev/tty1")
00069 *
00070 * .rinex_version - (3) overridden by -RINEX_version=n.nn command line argument
00071 * .rinexobs_rate_ms - rate at which RINEX observations are written (1000). Note that
00072 * the actual rate is the least common multiple of this value and
00073 * .output_rate_ms
00074 * .rinex_name - (-RINEX_name command-line argument)
00075 *
00076 * .flag_rtcmm_tty_port - (false)
00077 * .rtcmm_dump_devname - ("/dev/pts/1")
00078 * .flag_rtcmm_server - (false)
00079 * .rtcmm_tcp_port - (2101)
00080 * .rtcmm_station_id - (1234)
00081 * Output rates ... all values are LCM with the computed output rate (above)
00082 * .rtcmm_MT1019_rate_ms - (5000)
00083 * .rtcmm_MT1020_rate_ms - (5000)
00084 * .rtcmm_MT1045_rate_ms - (5000)
00085 * .rtcmm_MSM_rate_ms - (1000)
00086 * .rtcmm_MT1077_rate_ms - (.rtcmm_MSM_rate_ms)
00087 * .rtcmm_MT1087_rate_ms - (.rtcmm_MSM_rate_ms)
00088 * .rtcmm_MT1097_rate_ms - (.rtcmm_MSM_rate_ms)
00089 *
00090 * .kml_rate_ms - (1000)
00091 * .gpx_rate_ms - (1000)
00092 * .geojson_rate_ms - (1000)
00093 * .nmea_rate_ms - (1000)
00094 *
00095 * .positioning_mode - The RTKLIB positioning mode. ("Single") Supported values are "Single",
00096 * "Static", "Kinematic", "PPP_Static" and "PPP_Kinematic". Unsupported modes
00097 * include DGPS/DGNSS, Moving Baseline, Fixed, and PPP-fixed
00098 * .num_bands - number of frequencies to use, between 1 and 3. Default is based on the channels
00099 * configured
00100 * .elevation_mask - (15.0). Value must be in the range [0,90.0]
00101 * .dynamics_model - (0) 0:none, 1:velocity, 2:acceleration
00102 *
00103 * .iono_model - ("OFF"). Supported values are "OFF", "Broadcast", "SBAS", "Iono-Free-LC",
00104 * "Estimate_STEC", "IONEX". Unsupported values include QZSS broadcast, QZSS
00105 * LEX, and SLANT TEC.
00106 * .trop_model - ("OFF"). Supported values are "OFF", "Saastamoinen", "SBAS", "Estimate_ZTD", and
00107 * "Estimate_ZTD_Grad". Unsupported values include ZTD correction and ZTD+grad
00108 * correction
00109 * .phwindup - phase windup correction for PPP modes (0)
00110 * .reject_GPS_IIA - whether the GPS Block IIA satellites in eclipse are excluded (0). Only applies
00111 * in PPP-* modes
00112 * .raim_fde - whether RAIM (receiver autonomous integrity monitoring) FDE (fault detection and
00113 * exclusion) is enabled (0)
00114 * .earth_tide - (0)
00115 * .navigation_system - mask of navigation systems to use. Default based on configured channels
00116 * 0x01:GPS, 0x02:SBAS, 0x04:GLONASS, 0x08:Galileo, 0x10:QZSS, 0x20:BeiDou,
00117 * 0x40:IRNS, 0x80:LEO
00118 *
00119 * .AR_GPS - Ambiguity Resolution mode for GPS ("Continuous"). Supported values are "OFF",
00120 * "Continuous", "Instantaneous", "Fix-and-Hold", "PPP-AR". Unsupported values
00121 * include PPP-AR ILS, WLNL, and TCAR.
00122 * .AR_GLO - Ambiguity Resolution mode for GLONASS (1). Value must be in the range [0,3].
00123 * (0:off,1:on,2:auto cal,3:ext cal)
00124 * .AR_DBS - Ambiguity Resolution Mode for BeiDou (1). Value must be in the range [0,1]. (0:off,1:on)
00125 * .min_ratio_to_fix_ambiguity - (3.0)
00126 * .min_lock_to_fix_ambiguity - (0)
00127 * .min_elevation_to_fix_ambiguity - minimum elevation (deg) to fix integer ambiguity (0.0)

```

```

00122 * .outage_reset_ambiguity - (5)
00123 * .slip_threshold - (0.05)
00124 * .threshold_reject_gdop - if GDOP is over this value, the observable is excluded (30.0)
00125 * .threshold_reject_innovation - if innovation is over this value, the observable is excluded (30.0)
00126 * .number_filter_iter - number of iterations for the estimation filter (1)
00127 * .bias_0 - (30.0)
00128 * .iono_0 - (0.03)
00129 * .trop_0 - (0.3)
00130 * .sigma_bias - process noise stddev of carrier-phase bias(ambiguity) (cycle/sqrt(s)) (1e-4)
00131 * .sigma_iono - process noise stddev of vertical ionospheric delay per 10km baseline (m/sqrt(s))
(1e-3)
00132 * .sigma_trop - process noise stddev of zenith tropospheric delay (m/sqrt(s)) (1e-4)
00133 * .sigma_acch - process noise stddev of the receiver acceleration horizontal component
(m/s2/sqrt(s)) (1e-1)
00134 * .sigma_accv - process noise stddev of the receiver acceleration vertical component (m/s2/sqrt(s))
(1e-2)
00135 * .sigma_pos - (0.0)
00136 * .code_phase_error_ratio_l1 - (100.0)
00137 * .code_phase_error_ratio_l2 - (100.0)
00138 * .code_phase_error_ratio_l5 - (100.0)
00139 * .carrier_phase_error_factor_a - (0.003)
00140 * .carrier_phase_error_factor_b - (0.003)
00141 *
00142 * .output_enabled - (true)
00143 * .rinex_output_enabled - (.output_enabled)
00144 * .gpx_output_enabled - (.output_enabled)
00145 * .geojson_output_enabled - (.output_enabled)
00146 * .kml_output_enabled - (.output_enabled)
00147 * .xml_output_enabled - (.output_enabled)
00148 * .nmea_output_enabled - (.output_enabled)
00149 * .rtcm_output_enabled - (false)
00150
00151 * .output_path - directory to which output files are written (".")
00152 * .rinex_output_path - (.output_path)
00153 * .gpx_output_path - (.output_path)
00154 * .geojson_output_path - (.output_path)
00155 * .kml_output_path - (.output_path)
00156 * .xml_output_path - (.output_path)
00157 * .nmea_output_path - (.output_path)
00158 * .rtcm_output_path - (.output_path)
00159 *
00160 * .enable_monitor - enable the PVT monitor (false)
00161 * .monitor_client_addresses - ("127.0.0.1")
00162 * .monitor_udp_port - DO NOT USE THE DEFAULT (1234)
00163 * .enable_protobuf - serialize using protocol buffers (true). Monitor.enable_protobuf if true, sets
this to true
00164 *
00165 * .enable_monitor_ephemeris - enable the ephemeris monitor (false)
00166 * .monitor_ephemeris_client_addresses - ("127.0.0.1")
00167 * .monitor_ephemeris_udp_port - DO NOT USE THE DEFAULT (1234)
00168 *
00169 * .show_local_time_zone - (false)
00170 * .enable_rx_clock_correction - (false)
00171 * .max_clock_offset_ms - (40)
00172 */

Classes

- class [rtklib_pvt_gs](#)

This class implements a block that computes the PVT solution using the RTKLIB integrated library.

Typedefs

- using `rtklib_pvt_gs_sptr` = `gnss_shared_ptr<rtklib_pvt_gs>`

Functions

- `rtklib_pvt_gs_sptr rtklib_make_pvt_gs` (`uint32_t` nchannels, const `Pvt_Conf` &conf_, const `rtk_t` &rtk, const `SensorDataSourceConfiguration` &sensor_data_configuration)

13.272.1 Detailed Description

Interface of a Position Velocity and Time computation block.

Classes

- class [Rinex_Printer](#)

Class that handles the generation of Receiver INdependent EXchange format (RINEX) files.

13.300.1 Detailed Description

Interface of a RINEX 2.11 / 3.01 printer See <ftp://igs.org/pub/data/format/rinex301.pdf>.

Receiver Independent EXchange Format (RINEX): The first proposal for the Receiver Independent Exchange Format RINEX was developed by the Astronomical Institute of the University of Berne for the easy exchange of the GPS data to be collected during the large European GPS campaign EUREF 89, which involved more than 60 GPS receivers of 4 different manufacturers. The governing aspect during the development was the fact that most geodetic processing software for GPS data use a well-defined set of observables: 1) The carrier-phase measurement at one or both carriers (actually being a measurement on the beat frequency between the received carrier of the satellite signal and a receiver-generated reference frequency). 2) The pseudorange (code) measurement, equivalent to the difference of the time of reception (expressed in the time frame of the receiver) and the time of transmission (expressed in the time frame of the satellite) of a distinct satellite signal. 3) The observation time being the reading of the receiver clock at the instant of validity of the carrier-phase and/or the code measurements. Note: A collection of the formats currently used by the IGS can be found here: <https://igs.org/formats-and-standards/>

00001 /*!
00002  * \file rinex_printer.h
00003  * \brief Interface of a RINEX 2.11 / 3.01 printer
00004  * See ftp://igs.org/pub/data/format/rinex301.pdf
00005  *
00006  * Receiver Independent EXchange Format (RINEX):
00007  * The first proposal for the Receiver Independent Exchange Format RINEX
00008  * was developed by the Astronomical Institute of the University of Berne
00009  * for the easy exchange of the GPS data to be collected during the large
00010  * European GPS campaign EUREF 89, which involved more than 60 GPS receivers
00011  * of 4 different manufacturers.
00012  * The governing aspect during the development was the fact that most geodetic
00013  * processing software for GPS data use a well-defined set of observables:
00014  * 1) The carrier-phase measurement at one or both carriers (actually being a
00015  * measurement on the beat frequency between the received carrier of the
00016  * satellite signal and a receiver-generated reference frequency).
```

```

00017 * 2) The pseudorange (code) measurement , equivalent to the difference
00018 * of the time of reception (expressed in the time frame of the receiver)
00019 * and the time of transmission (expressed in the time frame of the satellite)
00020 * of a distinct satellite signal.
00021 * 3) The observation time being the reading of the receiver clock at the
00022 * instant of validity of the carrier-phase and/or the code measurements.
00023 * Note: A collection of the formats currently used by the IGS can be found
00024 * here: https://igs.org/formats-and-standards/
00025 * \author Carles Fernandez Prades, 2011-2026. cfernandez(at)cttc.es

Classes

- class [Rtklib_Solver](#)

This class implements a PVT solution based on RTKLIB.

13.306.1 Detailed Description

PVT solver based on rtklib library functions adapted to the GNSS-SDR data flow and structures.

Authors

- 2017, Javier Arribas

Classes

- class [signal_generator_c](#)
This class generates synthesized GNSS signal.

Typedefs

- using [signal_generator_c_sptr](#) = gnss_shared_ptr<[signal_generator_c](#)>

Functions

- [signal_generator_c_sptr](#) [signal_make_generator_c](#) (const std::vector< std::string > &signal1, const std::vector< std::string > &system, const std::vector< unsigned int > &PRN, const std::vector< float > &CN0_dB, const std::vector< float > &doppler_Hz, const std::vector< unsigned int > &delay_chips, const std::vector< unsigned int > &delay_sec, bool data_flag, bool noise_flag, unsigned int fs_in, unsigned int vector_length, float BW_BB)

Return a shared_ptr to a new instance of gen_source.

13.328.1 Detailed Description

GNU Radio source block that generates synthesized GNSS signal.

Author

Marc Molina, 2013. marc.molina.pena@gmail.com

13.328.2 Typedef Documentation

13.328.2.1 [signal_generator_c_sptr](#)

using [signal_generator_c_sptr](#) = gnss_shared_ptr<[signal_generator_c](#)>

Definition at line 29 of file [signal_generator_c.h](#).

13.328.3 Function Documentation

13.328.3.1 [signal_make_generator_c\(\)](#)

```
signal_generator_c_sptr signal_make_generator_c (
    const std::vector< std::string > & signal1,
    const std::vector< std::string > & system,
    const std::vector< unsigned int > & PRN,
    const std::vector< float > & CN0_dB,
    const std::vector< float > & doppler_Hz,
    const std::vector< unsigned int > & delay_chips,
    const std::vector< unsigned int > & delay_sec,
    bool data_flag,
    bool noise_flag,
    unsigned int fs_in,
    unsigned int vector_length,
    float BW_BB)
```

Return a shared_ptr to a new instance of gen_source.

To avoid accidental use of raw pointers, gen_source's constructor is private. signal_make_generator_c is the public interface for creating new instances.

Signal source for the Analog Devices ADRV9361-Z7035 evaluation board directly connected to the FPGA accelerators. This source implements only the AD9361 control. It is NOT compatible with conventional SDR acquisition and tracking blocks. Please use the fmcomms2 source if conventional SDR acquisition and tracking is selected in the configuration file.

Classes

- class [Adrv9361z7035SignalSourceFPGA](#)

13.332.1 Detailed Description

Signal source for the Analog Devices ADRV9361-Z7035 evaluation board directly connected to the FPGA accelerators. This source implements only the AD9361 control. It is NOT compatible with conventional SDR acquisition and tracking blocks. Please use the fmcomms2 source if conventional SDR acquisition and tracking is selected in the configuration file.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

13.340 file_signal_source.h File Reference

Interface of a class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).

```

#include "file_source_base.h"
#include <string>

```

Classes

- class [FileSignalSource](#)

Class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).

13.340.1 Detailed Description

Interface of a class that reads signals samples from a file and adapts it to a [SignalSourceInterface](#).

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com

This class represents a file signal source. Internally it uses a GNU Radio's gr_file_source as a connector to the data.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

Classes

- class [MultichannelFileSignalSource](#)

Class that reads signals samples from files at different frequency bands and adapts it to a [SignalSourceInterface](#).

13.365.1 Detailed Description

Implementation of a class that reads signals samples from files at different frequency band and adapts it to a [SignalSourceInterface](#).

Author

Javier Arribas, 2019 jarribas(at)cttc.es

This class represents a file signal source. Internally it uses a GNU Radio's `gr_file_source` as a connector to the data.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

Copyright (C) 2010-2020 (see AUTHORS file for a list of contributors) SPDX-License-Identifier: GPL-3.0-or-later

Classes

- class [RawArraySignalSource](#)

This class reads samples from an antenna array RF front-end signal sampler.

13.375.1 Detailed Description

CTTC Experimental GNSS 8 channels array signal source.

Classes

- class [rtl_tcp_signal_source_c](#)

This class reads interleaved I/Q samples from an rtl_tcp server and outputs complex types.

Typedefs

- using [rtl_tcp_signal_source_c_sptr](#) = `gnss_shared_ptr<rtl_tcp_signal_source_c>`
- using [b_io_context](#) = `boost::asio::io_service`

Functions

- `rtl_tcp_signal_source_c_sptr rtl_tcp_make_signal_source_c (const std::string &address, int16_t port, bool flip_iq=false)`

13.403.1 Detailed Description

Interface of an rtl_tcp signal source reader.

Author

Anthony Arnold, 2015. anthony.arnold@uqconnect.edu.au

The implementation of this block is a combination of various helpful sources. The data format and command structure is taken from the original Osmocom `rtl_tcp_source_f` (<https://git.osmocom.org/gr-osmosdr>). The asynchronous reading code comes from the examples provides by Boost.Asio and the bounded buffer producer-consumer solution is taken from the Boost.CircularBuffer examples (<https://www.boost.org/>).

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

13.405 unpack_2bit_samples.h File Reference

Unpacks 2 bit samples samples may be packed in any of the following ways: 1) Into bytes [item == byte] 1a) Big endian ordering within the byte 1b) Little endian ordering within the byte 2) Into shorts [item == short] 2a) Big endian ordering of bytes, big endian within the byte 2b) Big endian ordering of bytes, little endian within the byte 2c) Little endian ordering of bytes, big endian within the byte 2d) Little endian ordering of bytes, little endian within the byte.

```

#include "gnss_block_interface.h"
#include <gnuradio/sync_interpolator.h>
#include <stdint>
#include <vector>

```

Classes

- class [unpack_2bit_samples](#)

This class takes 2 bit samples that have been packed into bytes or shorts as input and generates a byte for each sample. It generates eight times as much data as is input (every two bits become 16 bits).

Typedefs

- using [unpack_2bit_samples_sptr](#) = `gnss_shared_ptr<unpack_2bit_samples>`

Functions

- `unpack_2bit_samples_sptr make_unpack_2bit_samples (bool big_endian_bytes, size_t item_size, bool big_endian_items, bool reverse_interleaving=false)`

13.405.1 Detailed Description

Unpacks 2 bit samples samples may be packed in any of the following ways: 1) Into bytes [item == byte] 1a) Big endian ordering within the byte 1b) Little endian ordering within the byte 2) Into shorts [item == short] 2a) Big endian ordering of bytes, big endian within the byte 2b) Big endian ordering of bytes, little endian within the byte 2c) Little endian ordering of bytes, big endian within the byte 2d) Little endian ordering of bytes, little endian within the byte.

Within a byte the two possibilities look like this: 7 6 5 4 3 2 1 0 : Bit number $x_{n,1}$ $x_{n,0}$ $x_{n+1,1}$ $x_{n+1,0}$ $x_{n+2,1}$ $x_{n+2,0}$ $x_{n+3,1}$ $x_{n+3,0}$: Little endian $x_{n+3,1}$ $x_{n+3,0}$ $x_{n+2,1}$ $x_{n+2,0}$ $x_{n+1,1}$ $x_{n+1,0}$ $x_{n,1}$ $x_{n,0}$: Big Endian

For a short (`uint16_t`) the bytes are either transmitted as follows:

1 0 : Byte number Byte_n Byte_{n+1} : Little endian Byte_{n+1} Byte_n : Bit endian

The two bit values are assumed to have the following mapping:

x_1 x_0 Value 0 0 +1 0 1 +3 1 0 -3 1 1 -1

Letting x denote the two's complement interpretation of x_1 x_0 , then:

Value = 2*x + 1

We want to output the data in the order:

Value_0, Value_1, Value_2, ..., Value_n, Value_n+1, Value_n+2, ...

Interface for a structure sent by rtl_tcp defining the hardware.

```
#include <boost/asio/ip/tcp.hpp>
```

Classes

- class [Rtl_Tcp_Dongle_Info](#)

This class represents the dongle information which is sent by rtl_tcp.

13.452.1 Detailed Description

Interface for a structure sent by rtl_tcp defining the hardware.

Adapter for a GPS L2M DLL+PLL tracking loop implemented in FPGA.

13.564.1 Detailed Description

Interface of an adapter of a DLL+PLL tracking loop block for GPS L2C to a [TrackingInterface](#) for the FPGA.

Author

Marc Majoral, 2019, mmajoral(at)cttc.es

Code DLL + carrier PLL according to the algorithms described in: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach, Birkhauser, 2007
GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

- gps_l1_ca_tcp_connector_tracking_cc_sptr [gps_l1_ca_tcp_connector_make_tracking_cc](#) (int64_t fs_in, uint32_t vector_length, bool dump, const std::string &dump_filename, float early_late_space_chips, size_t port_ch0)

13.584.1 Detailed Description

Interface of a TCP connector block based on code DLL + carrier PLL.

Author

David Pubill, 2012. dpubill(at)cttc.es Javier Arribas, 2011. jarribas(at)cttc.es

Code DLL + carrier PLL according to the algorithms described in: K.Borre, D.M.Akos, N.Bertelsen, P.Rinder, and S.H.Jensen, A Software-Defined GPS and Galileo Receiver. A Single-Frequency Approach, Birkhauser, 2007
GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

A carrier lock detector.

13.608.1 Detailed Description

Interface of a library with a set of code and carrier phase lock detectors.

SNV_CN0 is a Carrier-to-Noise (CN0) estimator based on the Signal-to-Noise Variance (SNV) estimator [1]. Carrier lock detector using normalised estimate of the cosine of twice the carrier phase error [2].

Classes

- class [ModelFunction](#)
- class [CubatureFilter](#)
- class [UnscentedFilter](#)

13.610.1 Detailed Description

Interface of a library for nonlinear tracking algorithms.

[CubatureFilter](#) implements the functionality of the Cubature Kalman Filter, which uses multidimensional cubature rules to estimate the time evolution of a nonlinear system. [UnscentedFilter](#) implements an Unscented Kalman Filter which uses Unscented Transform rules to perform a similar estimation.

Classes

- class [AcquisitionInterface](#)

This abstract class represents an interface to an acquisition GNSS block.

13.626.1 Detailed Description

Header file of the interface to an acquisition GNSS block.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com Luis Esteve, 2011. luis(at)epsilon-formacion.com

This header file contains the interface to an abstract class for acquisition algorithms. Since all its methods are virtual, this class cannot be instantiated directly, and a subclass can only be instantiated directly if all inherited pure virtual methods have been implemented by that class or a parent class.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

13.630 configuration_interface.h File Reference

This class represents an interface to configuration parameters.

```

#include <stdint>
#include <string>

```

Classes

- class [ConfigurationInterface](#)

This abstract class represents an interface to configuration parameters.

13.630.1 Detailed Description

This class represents an interface to configuration parameters.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com

The interface defines an accessor method that gets a parameter name as input and returns the value of this parameter, a string, as output. Property names are defined here. This is an abstract class for interfaces.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

13.649 galileo_e6_has_msg_receiver.h File Reference

GNU Radio block that processes Galileo HAS message pages received from Galileo E6B telemetry blocks. After successful decoding, sends the content to the PVT block.

```
#include "Galileo_CNAV.h"
#include "galileo_has_data.h"
#include "gnss_block_interface.h"
#include "nav_message_packet.h"
#include <gnuradio/block.h>
#include <pmt/pmt.h>
#include <bitset>
#include <cstdint>
#include <map>
#include <memory>
#include <string>
#include <utility>
#include <vector>
```

Classes

- class [galileo_e6_has_msg_receiver](#)

GNU Radio block that receives asynchronous Galileo HAS message pages from the telemetry blocks, stores them in memory, and decodes HAS messages when enough data have been received. The decoded HAS message is sent to the PVT block.

Typedefs

- using [galileo_e6_has_msg_receiver_sptr](#) = `gnss_shared_ptr<galileo_e6_has_msg_receiver>`

Functions

- `galileo_e6_has_msg_receiver_sptr galileo_e6_has_msg_receiver_make ()`

13.649.1 Detailed Description

GNU Radio block that processes Galileo HAS message pages received from Galileo E6B telemetry blocks. After successful decoding, sends the content to the PVT block.

13.663 ini.h File Reference

This function parses an INI file into easy-to-access name/value pairs.

Macros

- #define [INI_ALLOW_MULTILINE](#) 1

Functions

- int [ini_parse](#) (const char *filename, int(*handler)(void *user, const char *section, const char *name, const char *value), void *user)

Parse given INI-style file. May have [section]s, name=value pairs (whitespace stripped), and comments starting with ';' (semicolon). Section is "" if name=value pair parsed before any section heading.

13.663.1 Detailed Description

This function parses an INI file into easy-to-access name/value pairs.

Author

Brush Technologies, 2009.

inih (INI Not Invented Here) is a simple .INI file parser written in C++. It's only a couple of pages of code, and it was designed to be small and simple, so it's good for embedded systems. To use it, just give `ini_parse()` an INI file, and it will call a callback for every name=value pair parsed, giving you strings for the section, name, and value. It's done this way because it works well on low-memory embedded systems, but also because it makes for a KISS implementation. Parse given INI-style file. May have [section]s, name=value pairs (whitespace stripped), and comments starting with ';' (semicolon). Section is "" if name=value pair parsed before any section heading. For each name=value pair parsed, call handler function with given user pointer as well as section, name, and value (data only valid for duration of handler call). Handler should return nonzero on success, zero on error. Returns 0 on success, line number of first error on parse error, on -1 on file open error

inih and INIReaden are released under the New BSD license:

13.683 uio_fpga.h File Reference

This library contains functions to determine the uio device driver file that corresponds to a hardware accelerator device name in the FPGA.

```

#include <stdint>
#include <string>

```

Functions

- const std::string **uio_dir** ("/sys/class/uio/")
- const std::string **uio_filename** ("uio")
- const std::string **uio_subdir_name** ("/name")
- int32_t **find_uio_dev_file_name** (std::string &device_file_name, const std::string &device_name, uint32_t device_num)

This function finds the uio device driver device file name out of the device name and the device number.

- uint32_t **get_num_devices** (const std::string &device_name)

Returns the number of devices (tracking multicorrelators) of type device_name available in the FPGA.

13.683.1 Detailed Description

This library contains functions to determine the uio device driver file that corresponds to a hardware accelerator device name in the FPGA.

Classes

- class [FileConfiguration](#)

This class is an implementation of the interface [ConfigurationInterface](#).

13.697.1 Detailed Description

A [ConfigurationInterface](#) that reads the configuration from a file.

Author

Carlos Aviles, 2010. carlos.avilesr(at)googlemail.com

This implementation has a text file as the source for the values of the parameters. The file is in the INI format, containing sections and pairs of names and values. For more information about the INI format, see https://en.wikipedia.org/wiki/INI_file

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

Classes

- class [GNSSBlockFactory](#)

Class that produces all kinds of GNSS blocks.

13.699.1 Detailed Description

Interface of a factory that returns smart pointers to GNSS blocks.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com Luis Esteve, 2011. luis(at)epsilon-formacion.com Javier Arribas, 2011. jarribas(at)cttc.es Carles Fernandez-Prades, 2014-2020. cfernandez(at)cttc.es

This class encapsulates the complexity behind the instantiation of GNSS blocks.

GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.

Classes

- class [InMemoryConfiguration](#)

This class is an implementation of the interface [ConfigurationInterface](#).

13.703.1 Detailed Description

A [ConfigurationInterface](#) for testing purposes.

Author

Carlos Aviles, 2010. carlos.avilesr(at)gmail.com

This implementation accepts configuration parameters upon instantiation and it is intended to be used in unit testing. GNSS-SDR is a Global Navigation Satellite System software-defined receiver. This file is part of GNSS-SDR.
